Additions to our working staff would be necessary for administering this additional relief. Adequate material relief, however, can be administered at no greater cost than can inadequate. Material relief represents in part the tools with which the visitor or nurse, or dietitian, works for the up-building and rehabilitation of the family whose distress summons her to its side. The need of personal service in addition to material relief, that we need not again emphasize, but they must go together. The strength of one will give strength to the other. The personal service rendered by the Good Samaritan to the sufferer by the roadside, the money spent to restore him to health and efficiency,—one was as essential as the other to the accomplishment of that end. The service, the sympathy, the love which has gone into the lives of the women and children of the 43 pensioned families has meant larger accomplishment by way of better and stronger lives because with it has gone adequate treatment of material needs. To all of our families as they need would we render this combined service.

MRS. LINTON A. COX

Friend and supporter of the housing movement.

“Beauty for Ashes”

Chapter VIII

First Experiences in the Legislature

Albion Fellows Bacon

LINTON A. COX

President of the Indiana Housing Association.

THE family sat and listened to my story of the charities conference and the Commercial Club luncheon. They heard the climax without flinching—I was to go to the Legislature.

“But how can I manage about leaving you?” I asked, looking from one to the other.

“Go!” said the family. “We’ll manage all right.”

“I will keep house and see to the children,” said my womanly eldest daughter who was just out of school.

“I will come right up and stay,” said my mother who had dropped in for a little visit.

Then there was nothing to worry about. My mother took intense interest in my housing work. How glad she was to contribute to it in this way!

Listening for the knell of the telephone, to summon me to the committee hearing at Indianapolis, I set about my preparation for absence, I knew not how prolonged. Photographs, reports and clothes were packed and ready. Then there were the family supplies and wardrobe to look after, to see that nothing lacked. The last thing was to tack a type-written card on the wall of the nursery, lest some of my many directions should be forgotten:

THE CHILDREN’S HEAVY UNDERWEAR IS ON THE SECOND SHELF IN THE LINEN ROOM.

BE SURE TO KEEP THEM HOME FROM SCHOOL IF IT STORMS.

IN CASE OF SORE THROAT, USE ———, ETC.

At last the dread summons came. I tore myself away from the family. My husband put me on the train with many last services and injunctions, and set the bag that held the precious bill on the seat beside me. All the way up to Indianapolis I thought how Daniel felt, on his way to the lions’ den. It was not facing the committee that I dreaded but the public ordeal, and the fear of doing the wrong thing that might wreck the whole undertaking. Every time I thought of that, it gave me that “gone,” faint feeling, which seems like heart failure, but is really, I’ve been told, only a trick of the pneumogastric nerve. It was the same sensation that the Big Dog always gave me in childhood.

The Fight in Prospect

As the train whirled me nearer to the Legislature, the step I was taking seemed more serious, though I had realized from the beginning what it would involve. There was no glamour of misconception over it. There would be opposition. It would be a fight to win, not all those things I wanted for the poor, not comforts, not conveniences, only bare decencies; not those things that would make life worth living, but only a few of those things that would make it less terrible. It would be only taking the first step on a long, weary road. It would be only laying the foundation for the tall, shining castle of my dreams, the fortress of the people’s rights, that could hardly be finished, with dome and spire, in my life-time, perhaps not in another generation.

All we could expect to win was a tenement law,—not a law regulating

all houses, though I felt keenly how much that was needed, as so many of our poor lived in shacks and hovels. But no other state had yet gone so far, and we could not expect to take such a stride at our first attempt. I felt how remote was the ultimate ideal of housing reform, which would regulate all buildings, insuring them to be safe and sanitary, and not a menace in any way to public health or morals.

Yet, even supposing we could attain that ideal, at one bound, in a perfect law, perfectly enforced, still there would be all those essentials of environment for the betterment of the poor that law could not secure, that only philanthropy or an awakened civic spirit could provide. Not matters of convenience only, and of comfort, or at least the lack of discomforts, but of beauty and of outlook that means so much to the moral development of a people—not one of these would be secured.

But, the law had to come first,—to come, then to be enforced, as I am often reminded. I cherished no fond delusion that the moment the governor signed the bill (if it passed), it would automatically take effect, and that crystal water would burst at once from thousands of faucets in all our cities, sunlight break into dark rooms, slimy yards grow a firm velvety sod, and Death and Destruction slink away, leaving rosy children playing among flowers around all our tenements. No, indeed! But, even though only the first step were to be taken, so vital was it, so necessary, that it was worth one whole life-time of toil and struggle just to take that first, biggest, hardest step.

MRS. J. D. FOOR
Whose watchful care saved the bill
from disaster.

Although I had friends in Indianapolis, I thought best not to let them know that I was coming, surmising that my business would be all-engrossing. So I went at once on arrival to the Claypool, near the state house. It had been arranged that Senator Ezra Mattingly and Representative Homer McGinnis should introduce the bill simultaneously in their respective houses. This had been done. These two, with Senator Linton A. Cox, Dr. J. N. Hurty, C. S. Grout, and others interested in the bill, came over to the hotel after dinner, that we might have a brief consultation before the committee hearing.

The state house loomed big and gray against the night. The lights at its gloomy entrance seemed to intensify the darkness. Inside, the great empty corridors, dimly lighted, seemed like caverns of Night, and echoed dismally to our steps.

We emerged like bats into a brilliantly lighted committee room that was fairly well filled. I was grateful to find a number of women present. Afterwards I found that Senator Cox's wife was one of them, and Dr. J. D. Foor's wife was another. From that moment until this, those two splendid women have stood by me.

Before Committees

Dr. Foor was chairman of the health committee in the house. He was there with his committee and so was the senate committee on health, for this was to be a joint hearing. The members of both were gathered informally about, but I could not distinguish them from citizens of Indianapolis, a number of whom were present, among them members of the Commercial Club whom I had met.

Everyone was as grave as if awaiting a public execution. The opening speech, by one of our men, sounded to me like the hammering of the carpenter who was

preparing the scaffold. Now I was called. The side of the great table which I had to pass seemed miles long, and the silence was so deep that if a whole paper of pins had been dropped it would not have touched bottom.

To address a legislative committee, I found, was very different from speaking before a missionary society, a charity organization, or a civic club, who are eager to listen and anxious to be convinced.

Many of these men were fagged, their minds overcrowded with details of numerous bills. Some were haggard and sleepy from a late caucus of the night before. I had thought to speak with some of the fire that burned within me, but my sentences seemed to me as if just taken out of an ice-box. My well-considered reasoning and rhetoric sounded, I felt, as meaningless as the rattling of a fusillade of dried peas. The silence grew oppressive. The tired men shifted in their hard chairs. Two, under the brilliant light, closed their eyes. One man came in at the door, two went out, with a slight confusion in the room. Were they bored? The idea was insupportable, so I fired a few more dried peas and sat down, without being half through. A few others gave short, vigorous talks, and the hearing was at an end. Everyone woke up, and, to my surprise, the meeting ended in enthusiasm, and we were given the assurance that both committees would report favorably on the bill. "You have won the first round," one of the men said, with congratulations.

Oh, the relief of common talk, after that strain! How good every friendly face looked, and they all seemed to be friends.

Friends of the Bill

Between us we had presented the case so clearly as to give the committee the whole situation, and nothing more was needed. Almost all of them were doctors, who had been fighting the very conditions that the bill was planned to remedy. From that time on they were the most enthusiastic supporters of the bill, and my kindest friends.

The next day the health committee of the house asked me to attend a separate hearing, to make certain points plain. Dr. Hurty was there, and Mrs. Foor sat by me. But with what good cheer and high-spirits I went. Daniel was at the king's table now. There were matters of policy to decide which made it necessary for me to remain at the capital. It was important, too, for me to meet as many of the members as possible. I was told.

My first glimpse of a legislature gave me the impression that Professor William James said the world gives to a baby. It seemed "a blooming, buzzing

J. D. FOOR, M. D.
Chairman health committee in the
house.

confusion." What were those men all shouting about? And who were all these people who were trying to get in and out? But presently the seething subsided, I caught a clue, and listened with interest.

After the session, my new friends gathered around me and brought up files and battalions of members for introduction. In a short time I had met almost every one, and found that, from the presiding officers down to the chubbiest cherub of a page, all were kindness and interest. Members assured me of a welcome to the floor, and offered the use of their desks at any time. Doorkeepers and sergeants were as hospitable as real hosts. The custodian of the statehouse himself saw to the stringing of my poster exhibit of city slums on wires along the corridor.

The main business, now, was to make friends for our bill, and all that was necessary, I felt, was that every man in the Legislature should know the facts about the homes of the poor and the remedial powers of the bill. But here were two big rooms full—one hundred and fifty men. It would take a long time to tell each of them the story and go over that long bill.

Before Senate and House

Our men—and their number was growing—decided that it would be a good stroke to have me speak to the whole Legislature, if possible. The plan was arranged late one night, at the Claypool, when Senator and Mrs. Cox and some others were there to dinner.

The next day the consent of both houses was secured, and the senate adjourned to sit in the house and listen to my argument. At that time I was too anxiously engrossed in planning for our cause to think of what a great personal honor was given me, though only once before had such a privilege been granted any woman. All I thought of was the opportunity to present the cause to

so many at once, and the need of white-hot, driving sentences.

The house filled up with my audience, and I sat in the rear with my friends, waiting for a long drawn out debate to come to an end. Then the gavel sounded; a few men conferred, near the front, and I heard Speaker Honan say, "Will the good-looking member from Morgan please escort the lady to the desk?" That meant Mr. McGinnis and myself. Up the aisle we passed, and the speaker gave me a cordial introduction. Standing a moment, to await silence, I looked up and down over the room. What a huge place! Our state house must have been built for giants. How far it seemed across the speaker's great desk! How remote were the lofty galleries! Oh, just for once, to be a man, with a big brass voice! But my friends, standing back by the door, could hear me, and they nodded encouragement. On the front seats were some kind human eyes that never wavered. They cared about the poor, I could see.

Enthusiasm Spreads

It was all over in a little while. I knew now how Vesuvius felt after an eruption, only that Vesuvius would just as soon do it again.

"Things look pretty well for the bill now," Senator Cox said. The enthusiasm of our men was spreading to the others. It would be several days before it would have a second reading in either house, and in the meantime we should all be working. "I believe I'll just stay up here a few days and help push it through," I said innocently, and Senator Cox explained, with a twinkle in his eye, that it would take weeks, not days.

Now and here let me say that if I had not found out what vague ideas people in general have about legislative processes I might not be so willing to admit my own ignorance. But I have found that the majority of people are hazy on such matters. I was a truly humble pupil, and acted only as I was directed, learning to venture, little by little, but with extreme caution.

It was a point of pride with me to avoid all the little things that cause the reproachful remark, "That's just like a woman," and to take, at least outwardly, all the fates of war in the calm impersonal way men do. To no one would I admit fear, or doubt of our ultimate victory, even in the darkest hours, for I realized the value of a confident bearing. Besides, could one engage to take a hand in this tremendous game, and fail of being sportsmanlike? It was my care to avoid sentimentality, and to stick to the practical issues in a practical way, having ready all the business arguments in favor of the law. I wouldn't have let one of those men know that I had ever written a verse.

My entire days were spent at the state house, strengthening our fortifications in every way possible. When the members were free, I explained the points of the bill to them, if they wished, showed them my photos of the slums, and told them plain facts about the poor. When they were busy, I talked with their wives. They were as horrified as I wanted them to be over the conditions I described.

Many of the wives came from little towns or rural districts. How I thanked my years in the country, for there was not an experience in these

J. N. HURTY, M. D.
Indiana State Health Commissioner.

women's lives into which I could not enter. We were good friends at sight, and they were ready to help me by explaining the situation to their husbands and even to the latter's seat mate or neighbor across the aisle.

At all times I had to be ready to meet all questions, not only of members, but of outsiders; and what questions, what arguments had to be answered! But no matter what ignorance, stupidity, avarice or hard-hearted indifference confronted me, I was determined that nothing should tempt me into antagonism or belligerency, for what I could not win I did not want.

The exhausting strain of these all-day sieges, amid bad air and tobacco smoke, and the confusion of a crowded room, may be imagined. I was glad by evening to plod back to the hotel, and, after a lonely dinner, to steal away to rest.

Members and their wives who stayed at the Claypool invited me to join their card and theater parties, but I could not spare the hours that would give strength for the next day's ordeal.

Having been always accorded respectful attention at the state house, I took it for granted that every one understood my footing. But one day a senator surprised me by asking, "Who pays your expenses?" "Why, my husband," I answered, taken aback and indignant. "Well, but what organization sent you here? Isn't some club paying your expenses?" It was hard to make him understand that I was not a paid lobbyist, but, when convinced, nothing gave him a higher appreciation of my work. I saw, then, why a disinterested individual had influence that a club could not wield.

The fact became established that I had come to the Legislature as the ambassador of the poor, not in a personal capacity, and I met people on this plane, even at first acquaintance. It began to have a strange reaction, this eliminating of personalities, and made me feel like a "voice in the wilderness." Even had I wished, I could not detach myself from my work for one moment, for the first sentence, after every introduction, was: "This is the lady who is interested, etc." I was content to have it so, and had neither breath nor strength for other conversation after the day's work was over.

Winning Helpers

One evening as I sat apart for a few moments on the balcony where the guests gathered after dinner, a member of the house, whom I had met most casually, a modest lawyer from a small town, came up and joined me. He began at once to make kindly inquiries about our bill, drawing out the story of its origin. He seemed much aroused by the stories I told him of the slums of our various cities. In return he told of his own experiences with the poor of his town, and then took up some of the problems of poverty. Step by step, forgetting that I was a stranger, he went on to talk of the higher life, and finally, with glowing face and kindling eyes that seemed not to see me, but to be fixed upon the future, he poured out his aspirations for larger and better things.

The next morning I met him in the state house, and he said:

"Mrs. Bacon, I sat up till two o'clock last night, to work for your bill."

This was only one of the many instances in which high appeal met with high response. Sometimes a simple story or a photograph would bring a look of pity and a word of compassion, or a burst of sudden anger against those who wronged the helpless. Often, in a few quiet sentences, would come a glimpse of the inner life, the "better self," as if a shutter had suddenly opened and a light flashed out. These were the men whose enthusiasm kept our cause alive, the men upon whom we could depend.

It is a wonderful thing to look back

upon, that in all my experience with that Legislature composed of men from every walk of life,—farmers, mechanics, lawyers, teachers, ward politicians, men of varied culture and limitations, there was never one occasion where I was not given to feel that womanhood was upon a pedestal. Sometimes I wonder if ever a woman had such royal treatment in any assembly. It is no wonder that I came out of my legislative experiences with a greater faith and pride in the chivalry of our Indiana men, not only for their attitude toward me, but in many instances, toward the weak, the poor and the helpless. Even after opposition developed to our bill, its enemies were no less courteous to me, personally. Indeed, they were as polite as French executioners. Some of them took pains to explain that they were friendly to me, even though they could not support my bill. It was "too ideal," they said!

"I'm sorry to see you wearing yourself out. You are getting thin and pale," one of them said, kindly. "Why don't you go home and rest?" "I will, if you will come over on our side, and see the bill through," I laughed.

"I'll declare, if that frail little woman can come up here and fight for such a cause, it looks like we big strong men ought to help her," said one man, who wavered unhappily between his pledges and his principles.

Public Responsibility

I had to be fair to all of our opponents and remember that housing reform was a strange new thought to all of them. I preferred to believe, as long as I could, that even the worst landlords did not know or realize the wrongs they were committing, for attention had never been called to these things, and custom placed poor folks in old houses, blaming them for the filth they could not prevent. And so long as public sentiment tolerated, nay, was complacently satisfied with filth, vice, degradation and disease, what better should we expect of landlords? So I said nothing about the men, only showing what enormous rentals were collected from the old death traps, and what were the sufferings of the poor who lived in them.

I have said much of our "enemies," or, more rightly, our opponents. How much more is there to be said of our friends. In fact, if I should set down their names, their graces and their kindnesses, as gratitude dictates, "the scroll could not contain the whole," and the story would have to end untimely.

There were a few who stood by me both in and out of working hours. Foremost of these, and most constant, were the Coxes and the Foor. They often came over to the hotel, and sometimes beguiled me out of it. Mrs. Cox

was in the senate sometime every day, if possible. She often sat in Senator Cox's seat. Few men there could have filled it as well as she. Although a most devoted wife and mother, her broad and active mind took in the range of club, school, church, social and civic affairs, and even politics. What a stay she was, with her unfailing sympathy and cheer!

A Philosopher of Housing

Senator Cox was a very busy lawyer and real estate owner, prominent in the Commercial Club and interested in the larger development of the city. He was also a philosopher, better fitted to cope with our present day legislation than my old teacher, Marcus Aurelius, though their spirits were akin. In all the years of our housing movement I have never seen him ruffled or discouraged, or unable to find some good to believe of everyone. He it was who arranged meetings, dissolved difficulties, removed barriers, planned steps, and brought the impossible to pass. Even those whose measures he fought loved and respected him, and his word was like a gold certificate.

The Foor's gave invaluable help. It was a great thing to have Dr. Foor's championship. A man of few but forceful words, he was a power in the house. Men followed his lead because they had faith both in his judgment and his integrity. I can see him now, as he strode to the front of the house, and, with a word, set in motion wheels that had refused to turn. Mrs. Foor was a constant comfort, partly because of her own interest in our case and partly because that increased her husband's. She had taken a clerkship to be with him, as they had no family. Being also a newspaper correspondent, she had the freedom of the floor, and knew everyone there. Quiet, modest, womanly, she was held in a respect that gave her distinct influence.

Her experience had taught her all the little ins and outs of legislative matters that I didn't want to bother the men by asking about. She was always ready to accompany me to one of the rooms or offices where our business took us, and her watchful care more than once saved our bill from disaster. When I went home, she took my place, and went without rest or meals, if necessary, when emergencies arose.

As the men had other bills to look after, and were kept busy in their seats much of the session, they gave me instructions as to the different processes our bill had to go through, so that I might keep close track of it. Every inch of the way, from clerk to clerk, to the engrossing room and back again, I watched its goings and comings, lest strong and jealous hands should harm it. In all of this, and in

the reading of the proof, Mrs. Foor was untiring.

Other friendly faces lighted the gloom of the assembly rooms, and redeemed the arid wastes of hotel life. I can see now the sweet, bright face of Mrs. Will Wood, of whom even a glimpse or greeting would "gie strength anew to me." Senator Wood was the dean of our senate, an authority whom we all consulted, and an orator whose eloquence was always ready for our cause.

If I should fail to record my gratitude to Representative Joe Cravens, so many years majority leader of the house, my story ought to plant its feet squarely in the road and refuse to proceed. That big, breezy, cheery "Don't you worry" of his—he was too busy for more than that—did more to keep my heart up than he ever knew. Mr. Eschbach, the minority leader, calm, cool and quiet, was another tower of strength. With two such men believing in our cause and its vital importance to public welfare, the others must at least listen to our arguments.

Havens of Refuge

Sometimes friends came up from Evansville on business. How good the home-folks looked, especially those that I knew stood for civic improvement and all I was fighting for. Some of them undertook missions and errands for me, and one of our most active civic workers, Will French, stayed over to help at the state house, and we went in to call on Governor Marshall together. After our kind reception I felt new courage.

In the state house my headquarters were in the office of Amos W. Butler, secretary of the State Board of Charities. There I was "at home," and could hang up my coat upon its own hook, and likewise hang up my confidence upon the whole office force. To Mr. Butler I went for tutelage and advice. When things went wrong, I took haven there, and when luck came my way, I stopped to tell them all the good news.

The office of the State Board of Health was another refuge. No other board in the country has taken such a part in housing reform. But it wasn't only Dr. Hurty's direct help in our battles that I valued.

To know that Dr. Hurty, Dr. Wishard, and the whole board were giving our cause their moral support, that they felt about dirt and disease, water and sewerage, space, light and air, just as I did; and that they were willing to share the responsibility of the reform, with absolute fearlessness, was a comfort to me beyond words.

There was one friend who was the angel of my darkest hours. In the hotel was living at the time a lovely, gracious widow, with two grown sons. Once over the threshold of her apartments I breathed peace, and forgot my battles.

While she brewed tea she kept a gentle rillery on the bubble. For headaches and heartaches there were soft pillows and soft words, hot water bottles and warm encouragement. May all space and eternal sunshine be hers—the blessing of a housing reformer!

I was feeling pretty much at home, and had hardly seen a hint of trouble, when our bill came up for its second reading in the house.

By this time, I was used to hearing debates, but—how different debates sound when they are about our own bill! And it was trying not to be able to say one word, myself, to those arguments whose answers I knew so well. From all over the house came discussion and dissention. I was aghast to see that some of those pleasant gentlemen with whom I had talked were hurrying little pink slips up to the desk, and amendments were hurtling like cannon balls. It was terrifying. And here, beside me, uprose one old gentleman, whom I was sure I had converted from some errors of thought. He stretched out his hand, and showed me an amendment he was about to offer, that would have cut down the application of our bill to just a few cities!

Half rising, I laid my hand on his sleeve. "Oh, Mr. S— don't do that! Please don't do that"; I implored; and he sat down. Afterwards the ludicrous side of my appeal struck me. What an argument! But he knew the arguments that were choking me, and it was these that stayed his hand.

I began to think that the cannon balls would never stop flying, when our men brought the battle to a close by a skillful movement, and the amendments were all referred to the Health committee.

Studying Amendments

When the committee convened to pass upon them, I was asked to sit with them. Dr. Foor, the chairman, sat at the head of the long table in the committee room, with members ranged down both sides, and I sat at the foot. Then it was that I saw the good of my long summer of study. It facilitated matters greatly to know what would be the effect of each amendment, as the progressive steps of housing legislation in other states had shown.

In their enthusiasm the men would have gone farther than I dared. So, yielding some points, and standing our ground on others, we were able to keep the bill from being materially injured.

Now there came a lull, and I went home, to await another call.

How good it was to be at home, to find all well and safe; to sit quietly with the family around the fire, away from the noise and tobacco smoke. It was good to find that all the cataclysms

of the Legislature had not made one crack in the earth's crust in our yard. I wanted to lave in domesticity; to scrub the children, to dust and make beds, to cook a little, as a way of shaking off the nightmare of publicity and strain.

Some of our friends came up to express their interest.

"But didn't you feel odd up there, among all those men?" one asked.

"Not any more than you do in a bank or a church or a theatre or a hotel or a street car, or on the street, where men are coming and going," I answered.

Then I described how the wives of the members were always present; how, often, they would bring the children over from their hotels to meet the father, about time for adjournment. I told how I had seen a father, with a small baby in his arms, stand at the rear of the house, while the mother occupied his seat, then give the child back to the mother and stride forward to make a motion. Besides, high school classes came to listen, and clubs often attended.

My friend was still incredulous.

"But I should feel so conspicuous", she insisted.

"If you were trying to save a child who was in a burning building, you wouldn't think about the firemen or the by-standers, and they wouldn't notice you", I answered.

When I went back to the capitol I found that enemies had been busy. Letters had been pouring in, and a horde of landlords had come in my absence, and camped on the grounds. They had raised a great outcry about their "rights", and had been stirring up opposition and sowing doubts. Some of my new made friends came to me with anxious questions about various passages of the bill, and I had to go over all my arguments again and again, and show what other states had done in the way of tenement laws. Some of our enemies were frank and open in their opposition, and fought face to face. Others came, sowed their tares and slunk away, not dreaming that we had their names.

The most vicious lobby of all stayed with us, and was at my heels like a black shadow, wherever I turned. We knew its manifold work by signs of a familiar "hidden hand", at every step, until we felt that we were fighting the Powers of Darkness. We had no weapons to match with men who, as evidence showed, employed thugs in their home towns to carry out their evil purposes by force.

Watching the course of legislation, I learned one by one, all the ways in which a bill may be killed, by strangling, mangling, delays, jokers, interpolations, even theft, as several stories told. Sadder and wiser was I, indeed. Each new evidence of cunning and craft made me more alert and determined.

One day our bill disappeared!

An important step had been delayed, while we waited with impatience, for some of the "red tape" to unwind, that we supposed was holding it. Our insistent demands started a search, and clerks ransacked tables, desks and pigeonholes. "It's gone! We can't find it", they declared. I brought Mr. Cox, and he set others to searching.

In that anxious half hour I realized the lengths to which I should have gone if foul play or outrage had overtaken us. I thought of all the powers of right and justice that could be ranged on our side, and a new and sudden strength came to me. If necessary, we would lay siege to the whole administration. Just as I was making up my mind whether I should go to the Governor first, the clerk stooped down and looked into the big safe. We held our breath. "It's not there", he said in a tone of finality. "Let me see", I said, stooping also. "Yes, *there* it is—that big one, there. Take it out."

Sure enough, it was ours, safe and sound. We had been hurt only by delay. But the incident made us more watchful.

The Opposition

Now, members of the Legislature who owned property were becoming aroused. Some of our strongest and most dangerous opposition came from men in both houses who owned tenements, or whose brothers, cousins or clients owned them, as we discovered later. One member wanted to build stores on twenty foot lots, and put tenements above them. Another fought the law for two sessions, under the impression that it would apply to his single houses, not reading the bill carefully enough to get the definition of "tenement."

One man wanted to change the whole law, so that his wife could cover an entire lot with apartments, that would have dark rooms on the inside with only a small air shaft. He followed me from house to senate, through the corridors and back again, arguing for amendments to fit the plan which he held in his hand. "Go and talk to the men about it", I said worn out, finally. "No, I want to talk to you, because the men will do whatever you say", he insisted. "Indeed, they will not", I said, "but we can't entertain a thought of any such amendments."

Still he hung on. "Then tell me what to do with that land, that will pay as much on the investment, and I'll be satisfied."

Even though I had expected the opposition of selfish interests, I was surprised to see the unabashed way in which money, "vested rights", were weighed against human life, health, safety and

(Continued on page 288.)

Unemployment Insurance in France

By Katharine Coman

UNEMPLOYMENT is a less frequent and far less discouraging phenomenon in France than in England or the United States. Population increases but slowly and consequently the supply of labor does not keep pace with the demand. The more usual difficulty is indeed a shortage of labor.

Wages are high compared with those in England or Germany, and the thrifty French workman is prone to put by some portion of his earnings against a period of enforced idleness. France is still the land of *la petite industrie*; workshops and factories are producing for an immediate market, and over production—the curse of modern business enterprise—does not often occur. Commercial crises originating in England or America have their influence upon French markets, but financial depressions are here neither so acute nor so prolonged as in lands where individual initiative is less strongly developed. The problem of casual labor, so sinister in London and Liverpool, is not apparent at the ports of France.

According to the data on the number of unemployed taken on a given day in March under each of the last three censuses, the proportion of wage-earners involuntarily out of work to total wage-earners is steadily decreasing (3.1 per cent in 1896, 2.97 per cent in 1901, and 2.33 per cent in 1906), and the general average for the whole country is at present estimated at 300,000—a figure that could easily have been duplicated in New York city during the past winter.

Insurance against unemployment through the agency of trade unions aided by municipal subvention has been in operation in some thirty French towns for more than a decade. In Limoges and Dijon, this method, now generally known as the Ghent system, has been practiced since 1896. It was not, then, an entirely new idea which M. Millerand, minister of commerce and industry, brought before the Superior Council of Labor in 1902. The proposition to further this form of foresight by adding a state subvention to the quotas already contributed to the unemployment funds by the several towns, was approved by the council in the following year, and an annual appropriation of 110,000 francs (\$22,000) was voted by Parliament in 1905.

The conditions under which the subvention is awarded to the trade organizations maintaining unemployment funds,

The eighth of Professor Coman's series on social insurance abroad; the fourth to take up problems of unemployment.

vary from the Ghent model in that: 1. the state grant is reckoned according to benefits, and is paid every six months into the unemployment fund maintained by the union, and not directly to members; 2. the rate of the allowance varies, being 20 per cent for local organizations and 30 per cent for federated trades, i.e., organizations with a membership of at least 1,000, representing not less than three departments.

The reason for this preference lies in the assumption that the federated trade union is likely to be more enduring, that it is better able to control its members and to provide them with opportunities for work. In 1912, for example, the five federated unions recognized under the law paid 86,604 francs in out-of-work benefits and received 25,592 francs subvention, whereas the 109 local funds paid 122,960 francs in benefits and received only 21,950 francs, from the state.

It is stipulated that the state grant is to be used only for involuntary unemployment due to lack of work. Sickness and strikes as contributing causes are expressly eliminated, and any attempt at falsification on the part of the individual man or of the administrators of the funds is ground for withdrawal of aid.

In towns of less than 50,000 population, the unemployment fund need not be limited to a special trade, but in such case, the organization must be so far approved by the municipal authorities as to be in receipt of a municipal grant. Mutual aid societies may be brought within the terms of the appropriation, but there were only four such funds with 509 members in 1912. In France, as elsewhere, the *esprit de corps* inherent in a trade union seems to be essential to success in inducing men to insure themselves against the hazard of unemployment.

	1905	1912
Funds	47	114
Members	33,682	49,595
Unemployed	6,645	8,420
Benefits paid	187,713 fr.	209,564 fr.
State aid	25,690 fr.	47,542 fr.

The progress recorded during the first eight years' administration of this state appropriation has not been entirely reassuring, as may be seen in the preceding table:

Although the number of men insured against unemployment has steadily increased, it has not yet reached the 50,000 mark and one half the state appropriation has never been used. Meantime the fifty-one towns and twelve departments which grant subventions in aid of unemployment insurance, have been placing appropriations at the disposal of trade associations to the amount of 130,000 francs per year, but not more than two-thirds of these appropriations have been called for.

The decree of 1905 has been modified from time to time with a view to making insurance against unemployment more feasible or more attractive. The limitation to towns of 20,000 population, of the privilege of organizing all-trade funds has been extended to towns of 50,000. The ratio of the state grant to benefits paid was raised from 16 per cent to 20 per cent in case of local funds and from 24 per cent to 30 per cent for federated unions. The benefit allowance recognized in computing the state subvention was advanced from two francs a day to two and a half francs. Little progress has been made, however, in the way of inducing the men who suffer most from unemployment to undertake insurance funds. Of 49,000 reported as insured at the end of 1912, 38,000 belonged to four well-paid trades in which risk of unemployment is comparatively low. These are: the typographers and lithographers with their 15,300 members entitled to out-of-work benefits; the textile operatives with 10,187 men and women insured; the commercial clerks with 7,555, and the metal workers with 5,366. Butchers and bakers, garment workers, stone masons, carpenters, leather workers, among all of whom the percentage of unemployment runs high, have done little or nothing to avail themselves of the advantages of state-aided insurance. Only seven in every thousand of the wage-earners employed in industry and commerce are as yet insured under the terms of the law.

It is to be hoped that the wisdom of putting out a sheet anchor against the winds of this adversity may gradually be impressed upon the minds of French workmen. Already labor leaders are beginning to realize that the payment of unemployment benefits may prove an at-

traction to men not otherwise easily reached, and the subject of requiring contributions is being discussed in trade congresses. The example set by the typographers is having considerable influence upon other federated trades.

The Federation du Livre requires of all fully qualified members a contribution of fifty centimes (ten cents) a week. Of this one-fifth is set aside for the payment of benefits in case of sickness, death, or unemployment. Strike benefits come under the latter head, and it is noteworthy that the men out of work because of an authorized strike are paid $3\frac{1}{2}$ francs a day until the difficulty is settled; whereas members unemployed for what would be considered legitimate cause under the British system of unemployment insurance, receive but two francs a day, for six days in the week and for a limited number of weeks in the year. The state subvention of 24,000 francs for 1912 is based on benefits paid for involuntary unemployment only.

The question whether France might now enter upon a policy of compulsory insurance against unemployment, following the British precedent, was discussed with Max Lazard, publication secretary of the International Association for the Fight against Unemployment, Professor Edouard Fuster, secretary of the International Association for Social Insurance, with the secretary of the Federation du Livre, and with Maurice Bellom, professor of industrial economics in the Ecole Supérieure des Mines. It is generally agreed that such a step cannot wisely be taken for many years to come. The state could hardly meet the expense without imposing a very heavy tax upon an already over-taxed people.

An obligatory contribution would doubtless be resented by the very syndicates which are at present favorably disposed to voluntary insurance, and the state subsidy would not be regarded as sufficient inducement to accept this measure of state intervention unless the government should raise its rate of contribution. The contemporary French, and the Latin races in general, are instinctively individualistic, and they challenge every measure that extends the field of state regulation.

France's experience with compulsory insurance against old age offers an unfortunate precedent. By the law of April 6, 1910, all wage-earners and artisans, men and women, whose annual earnings amount to less than 3,000 francs (\$600) are required to insure their support during old age. Contributions to the insurance fund are to be made, after the German precedent, by employer and employe in equal sums, and the state undertakes to add a bonus to the retiring allowance. Registration of the persons coming within the scope of this obligation began in July, 1911.

On December 31, 1912, the date of the last official report, there were 7,077,630 persons on this list, while only 1,964,173, or 27.7 per cent of the number required to do so, were actually paying subscriptions into the fund.

Several reasons besides the Frenchman's innate hostility to compulsion may be given for this fiasco. An unfortunate decision of the Cour de Cassation handed down in December, 1911, exonerates the employer from responsibility for the collection of dues from his workmen, as well as from any penalty for failure to pay on his own account. While the large employers of labor are favorably disposed toward the law, the small producers, who are just able to keep their heads above water, are loath to pay this tax. This is especially true of the peasant farmers and *métayers* whose income is little more than that of their agricultural laborers. Very few of them have conformed to this law. Employes, on the other hand, hesitate to exact payment from their unwilling masters, and many of those who are eager to insure pay nine francs a year for themselves and nine on their employers' account. It is to be noted that 62.8 per cent of the insured are over forty years of age, and 46 per cent over fifty, proof positive that only as the years of superannuation approach do men begin to think of making provision for old age. Apparently the great majority of wage-earners over fifty years of age have got themselves insured in anticipation of the speedy realization of benefits.

The French Point of View

There are other special circumstances which militate against the success of compulsory insurance of old age in France. The Caisse des Dépôts et Consignations and the Caisse Nationale des Retraites pour la Vieillesse have a long and honorable history, and they provide means for putting by a nest-egg which are highly attractive to the *petite bourgeoisie*. Investment is dear to the French temperament, and even the wage-earner who can lay aside only a few francs a year prefers to put it into a bit of land with a house upon it than to turn it over to a fund which offers no chance of a rise in value.

The less thrifty elements of the population are pretty effectively provided for by the law of July 19, 1905, which guarantees a pension to every Frenchman over the age of seventy, as well as to any invalided before that age, whose income from all sources does not in the estimation of the communal council, cover the necessary cost of living in the locality. The pension involves no civil disqualification.

Today, seven years after the opening of this pension fund, 668,356 men and women are in receipt of pensions varying from 60 to 360 francs a year, and

the state expenditure on this account amounts to 92,208,128 francs. Clearly according to Professor Fuster, the pension system should have been abolished before the policy of compulsory insurance was undertaken.

Professor Fuster, protagonist of compulsory insurance, and Professor Bellom, its chief opponent, are agreed that the law of 1910 is a failure. It is to be hoped that the number of insured may gradually increase as the principle underlying this form of investment becomes familiar, as well as the fact that though a pension may never amount to more than 360 francs to be paid after the seventieth year, under the insurance act a man secures a minimum allowance of 416 francs a year after sixty years of age. The question still remains, Would not the same results have been achieved under voluntary insurance?

The prime need in France today is not more extensive insurance against unemployment, but a more effective system of helping men to find work. This all-important service is still left to private employment agencies, which operate for profit and which not infrequently resort to underhand methods in dealing with their clients. Such practices are particularly in evidence in Paris where the placing of domestic servants and of assistants in bakeries, butchers' shops, hair-dressers' establishments, restaurants and hotels, has been entirely in their hands. Complaints of extortionate charges and inefficient service, of favoritism toward the Swiss, Italians and Germans whose competition is deeply resented, were voiced in the labor press and thus brought to the attention of the government.

The provisions of the law of 1904 were permissive in character. Municipal councils might, at their discretion, cancel the licenses of objectionable employment agencies, allowing compensation for the unexpired terms. Also, where this step was deemed necessary, they might establish municipal bureaus offering gratuitous service. Mutual associations on the part of patrons or laborers interested was likewise permitted. Few towns beside Paris undertook the proposed reforms, and many of the sixty private agencies bought out at considerable expense by the city, were quickly reopened as mutual associations. The members' dues, fully equivalent to the former charges, were pocketed by the agent, and the service was no better than before. The employment bureau set up in the Bourse du Travail with twenty branches in different parts of Paris, was managed by amateurs, with no regard to co-operation or specialization, and the results were pitifully meager.

Meantime, mutual employment agencies, set up by the employers of the trades represented in the campaign

against the private bureaus had secured practical control of the furnishing of labor to their several constituencies. The law of 1905 which offers subventions to the syndicates providing unemployment benefits, requires that every such body should maintain an employment agency for the placing of its own members, but these are comparatively undeveloped.

By 1911, the discontent of the various clientèles suffering at the hands of these unreformed employment agencies took organized form. National syndicates of hotel employers, hair-dressers, and others, demanded that municipal bureaus, under a management in which both employers and employes must be repre-

sented, should be established in every considerable town and given a monopoly of this delicate but essential transaction.

At the same time, the French Association for the Fight against Unemployment took up the question, and, on the basis of a series of expert inquiries, promulgated a scheme of reform in essential agreement with the conclusions reached by the syndicates. The scheme is confessedly inferior to the highly developed labor exchanges of Great Britain, but it presents as revolutionary a program as is practicable in France at the moment. This program includes:

(1) The establishment of municipal employment agencies to be obligatory on all French towns of more than 10,000

inhabitants;

(2) Direction of such bureaus to be entrusted to a council representing the employers and employes of the trades concerned;

(3) The organization of district agencies dealing with special trades, wherever required;

(4) The summary suppression of all private agencies, even though they appear to be gratuitous, whenever this step shall be demanded by a clear majority of the employers and employes represented on the council.

This project of reform, the French experts in remedies for unemployment have presented to Parliament as "an irreducible minimum."

The Writing of Social Poetry

By Charles Wharton Stork

UNIVERSITY OF PENNSYLVANIA

IT would be impossible for any American who cares for poetry not to be interested in the idea of social hymns presented by *THE SURVEY*.¹ The whole function of poetry is, of course, wider, being, in the words of Shelley, "to redeem from decay the visitations of the divinity in man." But a very important duty of poetry is to apply the general principles of goodness, truth and beauty to present conditions.

In one sense poetry should not attempt anything new; its appeal being to the permanent and universal passions; but it may and should arouse the noblest emotions of each age in a new and vital way. In other words it should show the application of universal principles to the spirit of the time. For example, the spirit of patriotism which spoke to the Greeks in the songs of Tyrtaeus, to the Romans in the songs of Ennius, takes a very different tone in Kipling's *God of Our Fathers*. In America this spirit should now express the feeling of brotherhood, which alone can solve the problems of class warfare.

There should, however, be no antagonism toward the old poetry of beauty, which has in fact a great practical value. By beauty the mind of man is freed from the clash and oppression of the present so that he may examine himself and learn to look beyond himself. Thus he will learn to care less for money and more for the things of the spirit. Also they who have seen ideal beauty can hardly be satisfied with moral ugliness and social injustice.

To come to the question of awakening a widespread feeling of social responsibility, Professor Patten thinks this can best be done by hymns, but *The Man with the Hoe*, and *The Song of the*

Shirt, are not hymns. My opinion is that it does not matter whether we have a hymn or a poem so long as it does the work of arousing the social conscience. The hymns will be more sung, the poems will be more thought about; who can tell which will do most good? The hymn unites us, but surely *The Man with the Hoe* makes us identify ourselves with the oppressed toilers of the world. How often in singing we forget the meaning of the words in the pleasure of the tune! The important thing, then, is not whether hymns or poems will do the work best, but *what kind* of hymns and poems will do it best.

In the first place, these social poems (including hymns) must deal with the emotions. All poetry must be simple and concrete, appealing far more to the heart than to the head. Abstract subjects like the minimum wage or child labor bills may be debated in the legislatures and the courts, but if we wish to make them vital to large masses of people, we must translate them into terms of humanity, into pictures of noisome tenements and starving children. Dickens, Charles Reade and Mrs. Stowe realized this, hence the power of their novels. The specific picture of a shop-girl's position in *Within the Law* caused six New York stores to raise the wages of their employes.

Therefore poetry which is to bring about social betterment must deal not with the technical terms of economics but with the general spirit needed to bring about the desired result. The people must be made to demand that "something be done." When poetry has excited this feeling, it has performed its part, after that the economist and the legislator must step in. But these technical authorities should not step in too

soon; otherwise the people, instead of surging along together, will be puzzling their individual heads with definitions and distinctions. Let poetry display the wrongs to be righted and inspire the spirit of demanding that "something be done." The definition of what that something shall be belongs to the more intellectual province of prose.

But how should one set out to compose this poetry of social aspiration? Many persons have the impulse to write who have not mastered the technique of verse. The aspirant must first make himself imaginatively a part of the collective emotion he is to voice. There is deep truth in Professor Patten's remark that the poet is not born, but is made by the spirit of the community. This spirit he must express with sincerity and with passion.

Next someone will ask: What about the form of this poetry? In the past all good poetry has depended upon regular rhythm and imaginative figure. The psychological value of rhythm is so easy to recognize that it is only the scholar who worries over the question whether all poetry must be in meter. The child and the man in the street have no doubt on the subject, and they are right.

But suppose our social poet does not know what meter to use. To this there is but one answer: let him read the best poetry of the kind he is attempting and feel what emotional effects are produced by various meters. Then, if his ear does not tell him what meter to choose or how to invent a new one, let him give it up and seek some other means of helping his fellow-men. Certain of the poet's faculties are, after all, innate, though in any case the poetic craft requires practice and the study of models. Nobody would attempt to

¹See *THE SURVEY*, January 3, 1914.

give a song recital without learning the control of the voice, yet the infinite varieties of cadence and verbal music are supposed to come of themselves. This was not so even in the case of Burns, who was brought up on centuries of Scotch song. He studied his predecessors carefully and was very critical of his own technic, as we see by the variants in his poems.

It may be objected that in the proposed hymns strength is wanted rather than refinement, but all true strength must be controlled and flexible. The neophyte in verse, let him be as vigorous and earnest as you like, will at first produce only wooden results. It is true, however, that an intelligent student can learn the technic of verse for himself better than from any text-book. The safest guide is Tennyson. Read aloud the lines of Break, Break, Break, of The Splendor Falls on Castle Walls, of The Brook, and Crossing the Bar. Forget that you have ever read them before and feel how perfectly the meter of each corresponds to the mood. The idea is not to copy these lyrics, but to copy the correspondence of thought and rhythm in whatever you are doing. Finer points will come of themselves later on. Of the old hymns Jerusalem, the Golden is especially rich in verbal music.

THE really difficult question, it seems to me, is that of poetic figure. It is an interesting thought of Professor Patten that we ought now to discard the imagery of war which has been so effective in hymns like Onward, Christian Soldiers. I incline to think that this principle is right, since war as a reality is passing out of our lives. Most important of all, however, is the fact that poetry must have sensuous imagery of some sort.

On this point misconception should be prevented. That excellent critic, Mr. Watts-Dunton, says that mere statement without imaginative figure is not poetry at all, and Professor Max Eastman in his very sane volume, *The Enjoyment of Poetry*, gives us the reason. The best imagery, he says, is not a decorative addition to the thought but a means of intensifying it. That is the reason why all speakers who appeal to the emotions of their audience make use of a "flowery" style. Such a method, even when rather badly managed, has a recognizable value; but how much more is this the case with good poetry? Take Rossetti's line describing a pair of lovers:

"Two souls, the shores wave-mocked of sundering seas."

No one can fail to note how the emotion is intensified by the power of the picture. The written word of fact conveys but little sense of conviction; the poet must show the strength of his feeling by a new and illuminating, but al-

ways sincere, form of expression.

The use of figure is inherent in the human race: it is found in slang, in proverbs, notably in the Bible, and in the speech of the simplest as well as that of the most cultured men. We need but cite, "Money makes the mare go," "A stitch in time," and in a higher spirit, "Man is born to sorrow as the sparks fly upward" and "Though your sins be as scarlet." Many of our words are forgotten metaphors. To "thrill" means literally to pierce, an "impending" evil is one that hangs over us. Thus it appears that we can only describe the world of thought and spirit in terms of physical comparison.

As imagery is so essential, let us see how it should be used. Obviously conventional figures must be avoided or given some new turn, so that the reader may be sure the poet has felt the truth of the comparison and not copied an expression blindly. On the other hand, a figure should not be far-fetched or inconsistent. These faults, especially the former, are a principal reason why hymns as a whole are colorless and unsatisfying.

A proof that this quality counts is found in the fact that the four favorite hymns of those selected by the jury of THE SURVEY are all above the average in imagery, and three of them are remarkably concrete. Richard Watson Gilder's God of the Strong, God of the Weak, is a little uncertain; W. P. Merrill's Not Alone for Mighty Empire, is very concrete but not especially original; Oliver Wendell Holmes's Lord of All Being Throned Afar is true poetry with a somewhat conventional but finely sustained figure, and Kipling's Recessional is the most vivid and original of all. England is represented as having "dominion over palm and pine." And take the passage:

"If, drunk with sight of power, we loose
Wild tongues that have not Thee in awe."

This is both striking and consistent: the drunken man is the man most prone to boasting and blasphemy. Of course we can feel the force of such a comparison without needing to analyze it.

Among the most recent of THE SURVEY's hundred hymns are many which indicate that the imagery of the new hymns is to average better than that of the old. Notice, for example, the picturesque lines of Katherine Lee Bates:

"O beautiful for spacious skies,
For amber waves of grain,
For purple mountain majesties
Above the fruited plain."

or the forceful passage in W. Russell Bowie's poem, the first of the selections:

"Lo, from out the heavy dark
Strained and haggard eyes
Turn toward that breaking dawn
With their dumb surmise."

How this helps us to realize the longing of oppressed millions for the coming of social justice! Of the well-known church hymns some of the best are: O Jesu, Thou Art Standing; Eternal Father, Strong to Save; and In the Cross of Christ I Glory, Towering O'er the Wrecks of Time.

No one has a higher regard for Professor Patten's ideals than I have, but as he does not lay claim to being a poet, it is perhaps fair to examine some passages in his hymns which lose force by transgressing the principles of imagery. When, speaking of the "man below," he writes,

"Uplift his social standard,"

he speaks as an economist, not as a poet. The social standard is a scientific abstraction, about which we can reason and argue, but not sing. Again in

"Our doctrine gleams with promise,"

I am unable to visualize a gleaming doctrine.

"Our goal shines bright with promise,"

would be trite but not impossible. Also Professor Patten pays in general so little attention to figures that he changes repeatedly from one to another, thus confusing the picture in the reader's mind. In this way the real strength of the emotion is never fully transmitted.

The ability to use effective imagery is, like a good ear for rhythm, partly instinctive, but it can, I believe, be largely cultivated by observation. A knowledge of the principles involved will at least give a test for any given case. Less important details, such as rhyme, need not be dwelt on here. It is, however, a good rule to get the second rhyming syllable and make the first agree with it, rather than vice versa.

ENOUGH has been said to make it clear that preparation is necessary for the writer of the new social poetry. That such a poetry will be written there is little cause to doubt. The purpose of this article has been to suggest that the hymns of the future will gain by being, among other things, good poetry. It is not enough that the ideas be worthy or the writers sincere; to be effective, all poetry, whether for the few or for the masses, must obey the laws of its nature. These laws have been briefly given: they are, after all, as the reader will have seen, laws laid down by common sense. Like the rules of any art or craft, they seem very simple, but high quality in workmanship comes only by careful observation and practice.

Those who strive and fail will in the process find out much that is worth learning and will give to others a higher standard of accomplishment. It is greatly to be hoped that so inspiring a purpose may call forth the time and attention needed for its fulfillment, and that America will soon have a poetry which shall embody our noblest social ideals in a form of permanent artistic worth.

A MAKER OF AMERICANS

JANE E. ROBBINS

“I WOULD not have missed being in it all for anything,” said Mr. Riis—“I have been very happy. No one ever had so good a time.”

Years ago at the College Settlement he spoke of the meadows and fields near the old town of Ribe with tears in his eyes and explained afterward, that his audience had suddenly disappeared from view, and in its place he saw only the north sea-coast. It was this wonderful imaginative genius of Mr. Riis, that caused a roomful of students to lay down their pencils and note-books as they realized that they were listening not to a lecture but to a living, breathing prose-poem.

“Over against the tenements that we fight in our cities,” he said, “ever rises in my mind the fields, the woods, God’s open sky, as accuser and witness that his temple is being so defiled, man so dwarfed in body and soul. How little we have of the making of ourselves. I was born on the edge of the moor, and once its majesty has sunk into a human soul that soul is forever after attuned to it.”

The power of imagination in the boy Jacob caused him in the theater at Copenhagen to spring toward the stage with a cry of “murder,” which made such a sensation that the play was held up while he was put out.

In spite of the tramping and starving of the first three years in America, he knew that he was out to twist the wheel of fortune his way if he could only get his hands upon it.

In Buffalo when the editor of the *Express* laughed at the desire of the green young carpenter to become a reporter, the boy shouted, shaking his fist: “You laugh now—but wait!”

The principal of a telegraph school to which he went in New York city sent him, just as his hopes were almost gone, to the New York News Association, where he began his life as a newspaper man. For over twenty years he spent most of his waking hours with murders, fires, suicides and robberies.

“We talk a great

deal about city toughs,” he wrote in *The Making of an American*. “In nine cases out of ten they are lads of normal impulses whose resources have all been smothered by the slum, of whom the street and its lawlessness and the tenement that is without a home, have made ruffians. With better opportunities they might have been heroes.”

Mr. Riis caught the human drift of things and portrayed it with a pen consecrated to what he thought was the highest and noblest of all callings. It was his work to make his police reports the best in the city and he liked it and got a lot of fun out of it.

“We must have,” he said, “a good sprinkling of fun to keep our dreams from spoiling. The longer I live the more I think of humor as in truth the saving sense.”

Once when there was some fear of a cholera epidemic, Mr. Riis took his camera, went up to the Croton watershed, spent a week photographing the sources of pollution and forced the city to buy a strip of land along the streams that discharged into the Croton River. “It takes a lot of telling to make a city know when it is doing wrong,” said he. “It is just a question of endurance. The right has got to be moved along like everything else in this world by men. That is how we take title to the name.”

For years Mr. Riis worked at night. “At 3 a.m.” he said, “the veneering is off and you see the true grain of a thing.” He was delighted to find that Roosevelt as police commissioner was willing to get up when other people slept and see what the town looked like in the night.

“The power of fact” he called “the mightiest lever of this or of any day.” At the College Settlement where young enthusiasts were collecting facts of neighborhood life he acted as a voluntary auxiliary and helped to make the New York settlements a fulcrum, as it were, whence the lever of reform was applied. In the year 1888 he had written a letter to the news-

SO far as our letterhead shows, Jacob A. Riis was a member of the National Council of Survey Associates. But those who would know of his real relationship to this magazine and adventure in co-operative journalism will find evidence of it in the pictures, the graphic writing, the challenges to the unashamed best that is in us, that crop out from page to page and week to week; from one contribution to the next, and from one city and another. These may be traced back to the technique and power of imagination which a police reporter applied with joy and determination to his night’s work. They are echoes, many of them imperfect, of the human cry caught up by this marvellous Voice of the City Wilderness.

Members of the Board of Directors, National Council, and staff of the Survey Associates joined their names to a telegram to Barre the evening of Mr. Riis’s death (May 26). But for our editorial page, we have turned to the headworker of the Jacob A. Riis Neighborhood House, who as a pioneer head of the College Settlement was a fellow worker with Mr. Riis on the East Side in the early days as well as the new. Friend to 10,000 immigrants, we asked her to set down something of what “the finest immigrant” she has ever known meant to his kind—and to all of us.

papers, asking that flowers be sent to Mulberry street, and they came in such abundance that five stout patrolmen were necessary to give them out to the howling mobs of children. From the distribution of these boxes of flowers and their revelation of the hunger for beauty on mean streets, there developed the settlement at 48 Henry Street, which bears the name of Mr. Riis. It stands within a stone's throw of many a door in which he sat friendless and forlorn trying to hide from the policeman who would not let him sleep, and of the Bowery lodging-house where almost starved to death he lay senseless on the stairs after his first day's work in the newspaper office.

The comfortably lodged who had not red blood enough in their veins to feel for those to whom everything was denied and not sense enough to make out the facts when they saw them about school houses, playgrounds and better tenements always aroused his special scorn. His creative imagination showed him instantly the value of the city school. Half the tenement house population is always moving and he knew that it was only through the schools that the neighborhood feeling could be restored. "In its ultimate development," he said, "as the neighborhood center of things, I would have the school the first care of city government, always and everywhere at whatever expense."

How Mr. Riis came to be a speaker he never knew, and he greatly enjoyed reading in a country newspaper that "a voluble German with a voice like a squeaky cellar door" had been in town. At first the churches were most unwilling to give a hearing to the wrongs of Mulberry street, but at last he obtained permission to show the pictures he had taken by flashlight in the homes into which he had gone as a police reporter. His description of his joy when he read accidentally in his morning paper a four-line dispatch telling of the discovery of flash-light photography gives one an understanding of his enthusiasm. After one of his illustrated lectures the editor of a leading magazine asked him for an article. How the Other Half Lives was the result.

During an attack of illness late in life, Mr. Riis found comfort in knowing that one of the best of the young county officials and a city commissioner in whom he had much confidence both said that this book had first turned their thoughts to public service.

With tongue or pen, his argument shaped itself into the fundamental one of the rescue of the home and the making of tenements which sheltered two million human souls as nearly fit as might be. He summoned the American people to look the matter squarely in the face. James Russell Lowell wrote to him after reading *How the Other Half Lives*: "I felt as Dante must when he looked over the edge of the abyss, at the bottom of which Geryon lay in ambush. I found it hard to get to sleep the night after I had been reading your book."

In 1896 Mr. Riis put before the New York Health Board a list of sixteen of the worst rear tenements and they were torn down in defiance of vested interests. The officeholders who thrive by

propping up the greed of landlords always stirred in him the love of fight, derived perhaps from his Viking ancestors. "Every defeat is a step toward victory," he said. "The cause of justice and right is bound to win. The power of the biggest boss is like chaff in our hands."

His ideas of good government began and ended with the people's life. After thirty years of work he knew that the conditions of New York's crowded tenement quarter still made for unrighteousness and that the great mass of respectable workmen of the city must dwell there with their families. "Yet the work," he said, "was not wasted for at last we see the truth and seeing, it is impossible that the monstrous wrong should go unrighted. We have only begun to find out what government can do for mankind in the day when we shall all think enough about the common good, the *res publica*, to forget about ourselves."

"He was no saint," his reporter friends will tell you, "but a man with a mind and an honest will." He refused a cabinet position at one time because he could do better work elsewhere. "I value the good opinion of my fellow men," he says, in *The Making of an American*, "for with it comes increased power to do things."

To most of us Jacob Riis was the finest immigrant that we have ever known. To all of us, from editor to office boy, he was a friend.

When we fight the bad tenement houses—"dens of death" he called them—we lay a flower upon his grave. We know how he felt about "the perfectly good" child spoiled by the lack of a chance to play, and we must fight for childhood and its playgrounds.

"In my dreams," he said, "I listen to the whisper of the reeds in the dry moats about the green castle hill, and hear my mother call me once more her boy, and I know that I shall find them with my lost childhood, when we all reach home at last."

PREPARE VERSUS REPAIR

STEPHEN S. WISE
Rabbi of the Free Synagogue

THE statement was made not very long ago, and I believe it is accurate, that as head of the Children's Bureau, Julia C. Lathrop has done her work during the past year with just enough money to cover the repairs on one torpedo boat for a year. The manner of the statement is unmistakably American and the conditions which it describes are no less American. Once upon a time, we said: "Millions for defense and not one cent for tribute." Now we seem to act upon the principle: Millions for repair but not one cent to prepare; or, putting it more accurately: Almost any amount for repair and a grudging minimum with which to prepare.

A year ago, Congress enacted a law which, at the suggestion of a small group of social workers, created the Industrial Relations Commission. That commission was by enactment allowed \$100,000 with which, for the period of one year, to prosecute the work of investigating the problems involved in the unrest that obtains indus-

trially and socially throughout these United States. Rather a tall order for \$100,000!

It may or may not be true, but the rumor is current that a distinguished lawyer, who had a part in the adjustment of an industrial dispute in New York a few years back, would have received \$100,000 if his bill had been allowed. A very generous reduction was made in the amount of the bill, though the "cut" was not disproportionate to the amplitude of the charge. But the fact remains that one man for his personal service in an industrial dispute asked a sum of money and received a goodly moiety of it, the total asked being equivalent to the entire sum allowed by the United States for one year to a commission which is to investigate in nation-wide fashion the industrial unrest of which the Los Angeles affair was no more than an incident, though it happened also to be the starting-point to those who urged that something more than reckless incrimination, and recrimination be the ultimate outcome of the incident.

One hundred thousand dollars, let it be baldly stated, with which to ascertain how to adjust the world of social-industrial relationships in America, and exactly the same sum of money asked by one man for his personal service in the adjustment of a single dispute, though it involved a considerable number of people in one city!

But one might go on forever and point out parallel incidents. Not very long ago in England, after a mine disaster, £100,000 was secured for the relief of the dependents of the victims of the mine. But for years, one of the departments of the cabinet had vainly sought to secure the same

amount in order to work out a protective system, the adoption of which would probably have averted this and similar disasters.

It is said that \$1,000,000 was expended a few years ago by the Consolidated Gas Company in order to avert the passage, and finally to test the constitutionality, of the bill which lowered the rate of gas for consumers in New York city. The figures may not be accurate, but, judging by the character of the members of the bar involved, it is credible that a very large sum of money was expended before the constitutionality of the bill was finally confirmed.

One hundred thousand dollars was collected to free Ellen Stone, a fine woman missionary who some years ago was held for ransom. It surely was not grudged. Yet the National Child Labor Committee has never secured \$100,000 in one year with which to do its work of securing life, as well as liberty, for multitudes of children toilers throughout the nation.

To repair is better than to prepare seems almost to have become our thought as far as we may be said to think upon social problems. Why? Because we lack imagination, because, as some one has said, the news of a disaster in China which caused the destruction of one hundred millions of people would not affect the average man quite as sharply as would the loss of one of his fingers.

Imagination is just another name for visioning, and one cannot vision without forevisioning and foreseeing. And to foresee is to prepare and to prepare is of the essence of statesmanship in a democracy.

DRAFTED

SARAH N. CLEGHORN

COLLEGIANS, stretched reposeful
Along your campus greensward,
Between the halls of Science
And fanes of Art and Law,
Your tranquil meerschaums smoking
And nonchalantly turning

The pages of the last romance of Bennett, Wells or Shaw,

Have you not heard the news, then?
The draft of many soldiers?
What boots us then your learning
If here we look not for
The forward scouts of freedom,—
The engineers of justice,—

The drummers and the ensigns that lead the bloodless war?

O haste and join the army!
Equip for long campaigning.
Hear you not ghostly music?

But threescore years before,
Shades of your sires were singing
As fast they filled the muster,

"We are coming, Father Abraham, a hundred thousand more!"

Results Compared with Theories

Here we have:

Ten telephones for each hundred persons.

Nearly one rural telephone to every two farms.

Reasonable rates fitted to the various needs of the whole people.

Telephone exchanges open continuously day and night.

Policy—prompt service.

There they have:

One telephone for each hundred persons.

Practically no telephones on the farms.

Unreasonable rates arbitrarily made without regard to various needs of the whole people.

Telephone exchanges closed during lunch hour, nights and Sundays.

Policy—when your turn comes.

"BEAUTY FOR ASHES"

VIII

First Experiences in the Legislature
(Continued from page 280)

happiness, to see how individual interest was urged against public good. It was sickening, shocking, to see a man fight against the interests of all the people in the state, and seek to fasten upon the thousands of poor in our cities, and upon their children, preventable miseries, all for the sake of the paltry rental of a few wretched dark rooms, or the cost of a little plumbing.

Many of them did not even plead the common cause of landlords.

It was, "MY house", "It will cost ME."

There were no other arguments to offer against the bill. No one came forward to say that society would be better off if our dwellings were unregulated and unsanitary. No one could show that it was against the interests of the state to protect the poor. True, there was a faint murmur of "paternalism", though we already had on our statute books laws requiring light and air in factories and stores, sanitation in mines, etc. "Paternalism"! Yet this Legislature was soon to vote appropriations to provide for the paternal care of the state over hundreds of its unfortunate citizens. And every one seemed willing that the state should be a step-father to the orphans of the working men who died of tuberculosis and typhoid in our old death traps, leaving their children wards of the state. Why shouldn't the state *prevent* these deaths and their cost?

But most people do not get wildly excited over public cost, I found. Parties do, but ours was a non-partisan bill.

The strongest opposition came from little towns, that were not willing to yield even as much space on their building lots as New York city gives!

It seemed that the landlords and builders of the whole state were all awake, and were uniting their forces against us. But the friends of the poor—where were they? Sound asleep, for all they knew of our fight, having bestowed their alms and said their prayers, and carefully shut their windows on the slum side. Oh, to rattle all those windows, and shake those beds, and summon the sleepers to help us!

It gives me a pride in our men to remember that almost all our active fighting was done by supporters inside the assembly. We had no lobbies, as our enemies had. Our men did their own rallying. True, members of the Commercial Club came and went, and Mr. Grout was with us and others of the charities organization. Some of the wide-awake ministers of the city called to give help and cheer. A few influential women of the city came with Mrs.

Cox, Mrs. T. C. Day foremost and most enthusiastic. But these were a scattering few, and none of them could stay on the ground, as the landlords did.

If our bill could have gone to a final vote, the first week of the session, we would have had a sweeping victory, for enthusiasm was white hot. But it took much stoking to keep up the necessary warmth of feeling, with all the cold water our enemies were pouring on. Any day, we could have polled a majority of members, by counting those who were sorry for the poor, and were willing to see their wrongs righted.

But to get a majority who had no doubts that the bill would do all it was planned to do, and still be fair to the landlords, was another thing. It began to be a question with our doubting and wavering friends whose arguments should prevail, ours or our enemies'. We brought men whose judgment and integrity were beyond doubt, to pit their arguments for humanity and public welfare against those of narrow self-interest. I was ready, in my desperation, to have summoned Jove himself from Mt. Olympus, if we could have reached him.

At this point William J. Bryan came to Indianapolis, and it was arranged that he should address the Legislature. Great was the enthusiasm, and an honor guard was sent to escort him to the state house.

Waiting in the empty rooms, with Edward Meeman, a young newspaper man from Evansville, I mused unhappily upon the thunders that this mighty man should hurl, that we could no more borrow than those of Jove. And yet, why not? His subject was to include many themes of social welfare. Why not housing reform?

"Come with me, quick!" I said to Mr. Meeman. "I'm going to ask Mr. Bryan to say a word for housing reform. Hurry! we have just time to get to the Governor's rooms before they get back!"

Through the long empty corridors we sped, and down the marble stairway, not waiting for the elevator. A guard was pacing up and down in front of the Governor's outer room, which was empty.

"When Mr. Bryan arrives," I said to him, "I want you to see that I have a chance to speak to him, just one moment, before any one else does, without interruption. It's very important. Please, won't you?"

The guard promised, and we took our stand just inside the open door, exactly where a receiving party would have stood. Governor Marshall's broad policy and his strong stand upon all matters of the poor, and of public health and morals, were well known. Here, I felt, under the protection of the father of his state, at the fountain source of Jus-

CAMPING FOR BOYS

H. W. GIBSON

Illustrated. Canvas \$1.00

Written out of a twenty-year experience, this is an authoritative handbook on camping in all its details, sites, fires, cooking, sanitation, etc. Used and recommended by the Boy Scouts.

AT HOME IN THE WATER

G. H. CORSAN, *Univ. of Toronto Athletic Ass'n.*

Illustrated. Cloth .75

This noted master and teacher of the art here gives unexcelled instruction in swimming, diving, life-saving and water sports; everything copiously illustrated and explained in detail.

AROUND THE FIRE

H. M. BURR.

Illustrated. Buckram .75

"My children read 'Around the Fire' often and eagerly. I picked it up at random and spent the whole evening over it. It is real story-telling and at the same time conveys a great deal of information."—WALTER RAUSCHENBUSH.

TOLD BY THE CAMP FIRE

F. H. CHELEY, *Boys' Work Secy. Y. M. C. A., South Bend, Ind.*

Illustrated .75

Tales of camp life in the Rocky Mountains, full of exciting adventure of a novel sort, and with a refreshing sparkle of humor. Manly qualities are appreciated in a helpful way. Fine for the camp-fire hour.

ROUGHING IT WITH BOYS

G. W. HINCKLEY, *Supervisor Good Will Home Ass'n.*

Illustrated. Cloth .75

"A book for the worker with boys who really wants to get next to them. Sketches of camps in the Maine woods, with plenty of fun in the incidents. Attractive to boys."—*Sunday School Times.*

tice, I was in sanctuary, and my cause would be heard.

Down the corridors came the sound of voices, and the tramp of many feet, steadily drawing nearer. I had the feeling of standing on a railroad track, in front of an approaching train, as if I must step aside. But I stood fast. And now they were at the door. Mr. Bryan himself stepped across the threshold, and I greeted him, as a rather timid hostess might have done.

"I must speak to you one minute", I said, earnestly.

Instantly, with smiling courtesy, he stepped aside and gave me audience. In three or four sentences I presented the situation, and asked him if he could not include housing reform in the topics of his speech. "If it comes within the line of my subject, I will", he said heartily and kindly, and I slipped away, having been hardly noticed by the crowd.

Among the great throng of listeners who heard Mr. Bryan in the assembly room, no one was more attentive than I, waiting to hear some word upon our subject. One great theme of public welfare after another was taken up. Suddenly a little page whispered to his mother, "Listen, Mamma, Mr. Bryan is speaking for Mrs. Bacon's bill." Neither bill nor name had been mentioned, so it is obvious how clear he made his meaning. I was indeed profoundly grateful for those eloquent and forceful words, for I knew how much they meant to our cause.

And now the days dragged on, while we fought for every inch of ground upon which we stood. I began to get tired and discouraged and homesick. Once, when a senate reading of our bill was due, I had been waiting all day to hear it called. The Coxes were kept at home by illness, and all of my friends were busy and preoccupied. A great mass of bills clogged the machinery of the senate. Long windy debates took up the time, and, while they were proceeding, I would steal out into the corridors, too nervous to sit still and listen. Every time the clerk picked up another bill, and would call out "Senate bill number—", a bullet seemed to have struck me over the heart. But he never got to "No. 51." When it was too late in the afternoon for another bill to be brought up, I went wearily back to the hotel. Even the sight of the little pages made me homesick. Appreciating the effect of physical conditions on spiritual states, I ordered a substantial dinner, but I couldn't swallow it. There seemed to be lumps in everything, even the consommé.

Dr. Simison, a member of the health committee in the house, and one of our most valued supporters, came out from dinner and found me sitting limp and dismal on the balcony which overlooks the lobby.

"What's the trouble?" he asked, kindly.

"I want to go home, and *stay*,—but I won't", I said, and stopped and set my teeth for fear of choking.

He had some new ideas and some good vigorous plans to suggest, and offered to start them going. That, of course, was more cheering than sympathy, and set me up at once with new hope.

That was the nearest I ever came to bolting.

The next day was spent in the same anxious waiting, until the suspense became unbearable. Finally I called a page and sent a card up to the Lieutenant Governor. It read:

"Dear Governor Hall: *Please* make senate bill No. 51 a special order for tomorrow. I've been waiting so long, and I must go home to my children."

He might have told me to run along home, then, and 'tend to my children, that the others could look after the bills. But he didn't. He was too kind-hearted. Our bill was made a special order for the next day.

A brief visit home found the family thriving and prospering, and sent me back with renewed courage, to cheer our fagged and weary leaders. As the end of the session drew near, delays were more dangerous, and the danger of losing our bill was more serious.

It would be too long a story to tell of the successive stages of the fight, and the agony of suspense at critical moments when loss or injury threatened. Though I would not admit it, fear corroded my heart. I tried to argue myself out of an unreasonable solicitude about the bill. None of the men seemed to feel about their measures as if they were matters of life and death, however in earnest they were. And it was the Lord's work for His poor. He would take care of it. But suppose I failed in my part, and hindered the cause! The lash that had driven me to leave my home still hung over me now. I knew that the loss of the bill would be something deadlier than failure, more desperate than defeat.

A sense of responsibility added largely to this feeling. The measure was called "Mrs. Bacon's bill", by every one, even by the press, and actually scheduled that way, a few times, on the legislative bulletin boards, though, of course, it should have borne the names of Mattingly and McGinnis, the men who introduced it. And, even though doctors and lawyers, architects and real estate men, as well as the members of the Legislature themselves, had mended and amended, carved and whittled it, I knew that I should be held accountable by reformers for all it failed to do, and by landlords and builders for all that restricted them.

—when you buy a Remington Typewriter

It is not a question of your judgment only, or of ours; when you buy a Remington you are backed by the judgment of *over three-quarters of a million Remington users*. There is no other army of typewriter users like it. The collective voice of the typewriter using world says "Remington."

You are backed in your judgment by Remington sales of *a machine a minute*—the high water mark of typewriter production—unanswerable evidence of Remington progress and Remington leadership.

When you buy a Remington you *know* what you are getting.

Are You Going to Boston?

Ladies going to Boston without male escort find the FRANKLIN SQUARE HOUSE a delightful place to stop. A home hotel in the heart of Boston for young women, with a transient department. Safe, comfortable, convenient of access; reasonable. Address MISS CASTINE C. SWANSON, Supt. 11 East Newton St., Boston.

All these months I had seen before me the cities of the state spread out as on a map with all their black spots. I had seen the poor in those spots. Now, as if rising up out of all those spots, and lowering over the poor, I saw a storm-cloud of angry faces, the faces of the owners of the slums. Their anger, resentment and greed we had to confront, as well as the poverty, illness, and misery of the poor whom I was there to represent. But I knew I could face the anger, if we won, better than the misery if we failed.

The situation was growing critical. We seemed to be losing ground, and our men were grave and troubled. Then came days when I could not eat, or read, or sleep, when every breath was a prayer. I was almost "out of the body" with fastings and vigils. Once I had heard Dr. Farr speak of "the loneliness of leadership." Now I knew what that meant.

I was alone in a desert place. The sky shut down over me like a great transparent bowl, shutting out everything else. I stood in the center of a vast bare space, bounded by the rim of the bowl. All around the edge of the great circle were my friends, reaching out their hands to me, smiling and trying to help me, but they could come no nearer. The loneliness would have been insupportable, only for this: inside the circle, all the space about me, under the bowl of the sky, was filled with the Presence.

No matter where I went, that circle seemed to be about me, visible to the inner eye, and to hold every one away. The men I talked to, in the assembly, were all outside of it, and it seemed to me they must be as conscious of it as I was.

At last the decisive hour came, with the third reading of the bill, in both houses. By a coincidence these readings came at the same time. An excited messenger from the house found me in the corridor and hurried me in, just in time to hear the debate beginning. It was hardly under headway when a still more excited sergeant came post haste from the senate, saying I was wanted at once, as the fight was on.

The battle was going bravely in the house, so I followed the messenger across the corridor to the other skirmish line. We had a hasty conference and, to my consternation, I was directed to sit in a chair in front of all the desks, for hasty conference when amendments came up. Our men had made a last poll of the senate, and now went up and down the aisles, rallying adherents to our standard. One of our men was absent, on account of sickness, and Senator Durre, from home, took his place, and was doing the work of four men, in a strong, whole-souled way that was inspiring to see.

271 Ninth Street

Brooklyn, N. Y.

There came an ominous lull, and then the storm broke. Of all the contests I had witnessed, this was the most severe. The whole senate was on its feet, and the men would draw into a great knot, to be driven back to their seats repeatedly by the thundering of the gavel. Then, word came that the bill had passed in the house! But here came an amendment from a Terre Haute member which would cut the bill off by a population classification just above his city, and leave only our largest two. An uproar—the amendment carried!

Then began the final roll-call.

The men drew close together in the front of the room, as the voting began. Now we lacked seven votes! Absent members were rounded up. Two votes were lacking—another canvass! Then two came over to our side—we had won!

I came to myself to find that I was pacing the aisle, inside the railing, with hands tightly clenched, unconscious of having gone upon the floor. It was an hour and a half past the noon closing hour, but no one had thought of time. Only then did I realize that exhaustion and strain had reached their limit. I was dizzily happy.

Quietly, after congratulations, the men and women melted away out of the senate chamber. The heroes of the day in house and senate, who, by superhuman efforts, had saved the bill, turned to other business, as if they had done nothing especial. I tried to tell them something of what I felt, but words! for such service! And it was done for their state, too. It seemed to me that they should have had a salute of cannon; at least there should have been martial music, and a roll of drums. It is for such deeds that men used to be given bay-wreaths, and knighthood. But theirs are the bays, and they are knights who need no accolade.

There were a few final things to be done. Then came the audience with Governor Marshall, and his gracious promise to sign the bill. There were some last little meetings and social gatherings with our friends, and then, farewells. Everyone was so cordial and so glad for me. One of the senators, who had been most helpful said:

"Mrs. Bacon, I'm a hold-over member, and I hope we will see you back next session."

"Oh, thank you", I said, "but I'm through now, and I never expect to come again."

"I think you'll be here again," he said, smiling. But I was sure in my heart, that it would not be necessary.

With a light and care-free heart I gathered up my belongings, packing among them, for souvenirs, some worn and marked copies of our bill.

And then, HOME!

WILSON'S OUTSIDE VENETIANS

For Windows and Piazzas

Artistic Combination of Blind and Awning for town and country houses. More durable and slightly than fabric awnings. Very easily operated; slats open and close to admit air yet exclude sun rays; can be pulled up out of sight if desired; provides much summer comfort. Adds architectural distinction to the house.

For illustrated booklet specify "Venetian A-4"

WILSON'S ROLLING PARTITIONS

Made to Roll Overhead or from Side.

Most effective method for dividing large rooms in Churches and Buildings into small rooms, and vice versa; made from various kinds of wood; sound proof and air tight; easily operated and lasting. Made also with blackboard surface. Fitted to new and old buildings. Used in over 25,000 Churches and Public Buildings. Write for "Partition Catalogue A-4."

JOTTINGS

SMILE ON THE FACE OF THE CENSUS

At a luncheon of graduates of the Chicago School of Civics, Julia C. Lathrop told a story on the Census office. In the table of classified crimes was one entry under "Cruelty to animals". Somebody had doubts and looked up the original card. The charge was "keeping a blind tiger."

FOOD AND DRUGS SURVEY

The National Civic Federation announces that it will make a national survey of food and drugs. A questionnaire has been sent to federal, state and city officials. Vincent Astor is chairman of the committee in charge.

ECONOMIC PRIZE ESSAYS

The following subjects have been announced for the Hart, Schaffner & Marx economic prize studies for 1915: A Local Study of the Immigration Problem; A Study of the Protocol in the Needle-trades Industry; The Economic Validity of the Single Tax; Price Maintenance; Reciprocity and Retaliation in Foreign Trade; Ship Subsidies by Indirection; The Development of Trade with Latin America. Information as to conditions and dates may be obtained of Prof. J. Laurence Laughlin of Chicago University.

THE HOUSE OF SERVICE

The House of Social Service of the Stockyards District of the Chicago United Charities was formally opened in April. A description of the house, with its quarters for all sorts of public and private agencies for the sick and the needy, was published in THE SURVEY for December 27, 1913.

Judge Julian W. Mack, one of the speakers, rejoiced in the housing of public and private charity under one roof. He ventured the prophesy that the needs of the poor will be met more and more by public charity. Dr. Henry B. Favill advocated similar houses of service in every district rather than an expensive central building.

INDIANA FARM FOR MISDEMEANANTS

Indiana has just bought a penal farm for misdemeanants of 1,567 acres in Putnam county, paying \$57,000, or \$36.37 an acre for it. It is thought that nearly a thousand prisoners can live on the farm and that the products raised on it will support this number. The land has stone deposits which can be used for road making, and shale and clay for brick making.

Many states have penal farms for more serious offenders, but Indiana is the third to provide the bracing advantages of outdoor life for her tramps and vagrants. Two cities, Cleveland and Kansas City, have such farms.

The GIST of IT—

"BURN it," said Conan Doyle after a visit to Sing Sing. Page 297.

THE South's new spirit about the Negro is not new at all, but a return to older and gentler days and ways. Page 295.

PREVENTIVE health work has crystallized in one big campaign after another for ten years past. Now the movement for mental hygiene—to conserve the nation's brain power—has held its first meeting on a national basis and blocked out the work ahead. A sound mind in a sound body for all of us is the ideal. Page 299.

PORTLAND has taken up with a vim the "1915" idea that failed in Boston. An Oregon state conference of charities is one of the first fruits. Page 298.

SETTLEMENT workers in conference reaffirmed the interpretive function of the settlement and turned their social microscopes on the work of their own governing boards. Page 296.

NEW YORK state has put into operation an extensive code of regulations for canning camps. Page 297.

IMMIGRANT workers in a New York white goods shop have been given diplomas for learning English in a factory school run by the Board of Education. Page 295.

EXHIBITS of the results of alcohol on the human mind and body have proved effective propaganda in driving home the character of John Barleycorn to all sorts and conditions of men. Page 306.

CO-OPERATION in marketing and in securing rural credits may be ranked now as a national movement. Widely as some of the co-operators differ on methods, the recent conference in Chicago showed that they have enough in common to form a federation. Page 307.

FOR three score years and fifteen the Union Bethel has served the people of Cincinnati, turning its experienced hand to meet the new needs of new times. Page 308.

HOME-WORK and cannery conditions were vigorously scored in last week's hearings before the Industrial Relations Commission. Page 303.

CLOSING the present discussion of Dr. Williams' article on Temperance Education in Public Schools. Page 309.

MR. LAIDLER'S interpretation of the closed shop and the boycott in the light of recent decisions. Page 304.

THE Binet test applied to 118 consecutive admissions to the Geneva Training School for Girls, showed that all but six were backward—105 of them three years or more. Page 302.

OVER \$50,000 was raised during Chicago's baby week by publicity schemes—advertising, articles, posters, lectures, movies and sermons. Page 296.

THE SURVEY

COMMON WELFARE

FIRST GRADUATES OF A SHOP SCHOOL

IN THIS WEEK of commencement exercises no diplomas have been awarded of more significance than thirty-five "certificates of literacy" tied with red, white and blue ribbon presented to the graduates of the first school for immigrants conducted in a factory in New York, possibly in the world, under the auspices of a Board of Education.

They were a strange little graduating class, these operators of the D. E. Sicher & Co. muslin underwear factory as they sat on the platform of the recreation room in the Sicher factory on June 5. They ranged from 16 years of age to 38. And twenty weeks ago none could read, write or speak English.

"We thank you," said Rebecca Meyer when she spoke her "greeting," to the relatives, friends and notable guests who had assembled, "we thank you for giving us teachers, for giving us a bigger view of life, an understanding of our materials and machines—we thank you in the language you have taught us."

The idea of the factory school originated with Dudley E. Sicher, senior member of the largest muslin underwear firm in the world. Two years ago he allowed a few workers time off with pay to attend certain classes at public school No. 4 in charge of Lizzie E. Rector. The improvement in the work of these girls caused Mr. Sicher to request the Board of Education for a teacher to instruct employes in his factory. Last October Florence Meyers, an experienced teacher, was assigned to the work by the board, under direction of Miss Rector.

Classes were held in the recreation room of the factory from 9 a. m. to 12 m. each girl receiving three-quarters of an hour instruction every day. The classes were not compulsory, but if a girl elected to join she was paid for the time in school pro rata her average earnings.

The practical nature of the instruction was demonstrated at the graduation exercises where five girls described The Evolution of an Undergarment. Three told How to Get and Hold a Posi-

tion; the whole class went through exercises in physical training, and Antonetto Fiore multiplied and added sums on a big card-board "work report."

The Sicher school is to be distinguished from the continuation class established in many cities and in two department stores in New York city to continue the work of the public school and from the vocational school which is chiefly concerned with trade instruction. It does, however, come under the head of industrial education. As William H. Maxwell, superintendent of New York schools, said in his address at the graduation, instruction in the English language is industrial education since "without English the morals, limbs and life of the factory worker are in danger."

Mr. Sicher claims, since the introduction of the school, a decrease of 10 per cent in illiteracy among the foreign workers of his factory and a gain of from 20 to 70 per cent in efficiency among the girls who have received training.

A chart has been tabulated showing that the earnings of 10 girls who attended the school regularly 16 weeks rose from an average of 19.5 cents an hour to 22.2 cents an hour while the earnings of 10 girls who did not attend school remained practically the same.

THE SPINGARN MEDAL

To be awarded to the colored person who has rendered the most distinguished service to the human race the past year.

THE SOUTH DIVIDED ON THE BLACK MAN'S CASE

PERHAPS A BIT self-consciously, as though not wholly sure of its welcome, the National Association for the Advancement of Colored People held its sixth annual conference recently in Baltimore.

Partly from accident and partly, no doubt, because the conference was held in a southern city, the discussion was largely on the southern attitude toward the Negro. There were several southern white speakers on the program and they were quite as insistent upon justice and fair-dealing for the black man and as pronounced in their opposition to "Negro-baiting" as those who came from other parts of the country.

Oswald Garrison Villard, president of the New York *Evening Post*, made perhaps the most valuable contribution to the conference in an address entitled, satirically, *Some Traitors to the South*, in which he pointed out that the movement for equal opportunities for the black man had now enlisted some of the more courageous spirits of the South as well as of the North. He quoted from living men and women and from leading southern newspapers to prove his contention that the South was no longer "solid" and unanimous regarding its treatment of the Negro. This address is being widely quoted through the South and has drawn considerable editorial attention from the southern press.

Adalene Moffat, formerly of Nashville, Tenn., and now a well-known social worker in Boston, speaking on the Southern Renaissance described it as a "gradual return" which she had observed "on the part of the white people of the South to that attitude of mind which gave the old South its reputation for courtesy and high-minded ideals, an attitude which my own crude generation, born since the war, claims without so well deserving."

Ex-Attorney General Charles J. Bonaparte, of Baltimore, spoke on Legal and Economic Equality. He combatted the historical theory that the signers of the Declaration of Independence did not have the Negro in mind when they de-

CHICAGO'S "BABY WEEK"

Facing the fact that it has greater mortality of infants than any other city in this country or Europe, Chicago planned heroic measures this spring to make its baby-saving campaign more effective. A "baby week" was designated during which scores of publicity schemes were counted upon to bring a big popular subscription of funds for the Infant Welfare Society. The goal was money enough to increase the number of infant welfare stations to fifty.

The Baby Week campaign was outlined by the advertising men of Chicago. Lorado Taft made a bust of a mother and child, plaster casts of which were exhibited in downtown store windows. Pictures of it appeared on all the posters. Bill board men gave space. Newspapers ran display articles. Coupons were inserted in theater programs. Street-car advertising space was given and signs were all put on elevated railway cars and platforms. Motion pictures and slides were used in all the movies. Lectures were provided. The ministers were urged to preach appropriate sermons on the Sunday which started the week. Milk dealers put wrappers around each bottle of milk delivered during the week, and large numbers of canvassers volunteered to carry the appeal personally.

The Mexican war scare reached its most acute stage on the very days designated as Baby Week. So to all the other ravages for which war and the war spirit are responsible must be added the needless deaths of Chicago babies because public attention was so monopolized by the Mexican situation that this remarkable campaign for publicity fell short of the highest success. A total of \$51,692 was finally raised.

A baby week in New York, June 14-20, has just been announced. At the request of Commissioner of Health Goldwater, Mayor Mitchel has called a conference to enlist the co-operation of many child welfare agencies and associations devoted to the general welfare of the city. It is proposed to conduct an educational campaign to give impetus to the regular summer baby-saving work.

clared "all men to be free and equal."

Aside from these addresses which bore upon the southern relationship to the race question, the most notable address of all was the brief paper submitted by Dr. Jacques Loeb of Columbia University on The Theory of Racial Inferiority in the Light of Modern Biological Knowledge. Dr. Loeb pointed out that modern biology no longer countenanced the naïve theories, popular in the last half of the nineteenth century, that there are biological proofs of the innate inferiority of certain races

to other races.

The Spingarn medal, which was to be awarded to the colored man or woman who had done the most distinguished service for the human race during the year just past, was not awarded at the conference. The committee of award, which included William H. Taft, Oswald Garrison Villard, James H. Dillard, President John Hope and Bishop John Hurst of Baltimore, chairman, announced that it had been unable to reach a decision in time. The award will be announced later.

THE TASK OF THE SETTLEMENT TODAY

"THE SETTLEMENT movement must free itself from all the ties that bind it to the present industrial and social system and be itself at liberty to teach and work for the real liberty of all human beings." This was the message which Howard Bradstreet, president of the New York Association of Neighborhood Workers, gave in his welcoming address to the Inter-city Settlement Conference recently held in New York. This end must be sought, he declared, not through any change of a materialistic nature, but by the continual application of education in the ideals of democracy.

John L. Elliott urged that "while we shall have to have an entirely different system of social production, we are doomed to failure unless we understand the force and power of the personality of every individual and the fraternity of all groups. We need business and political efficiency, but what we, as settlements, must stand for is social efficiency."

Robert A. Woods explained the settlement method as that of working with a "microscope in one hand and a telescope in the other." With this method properly applied, the true settlement worker can interpret the life of a limited neighborhood to the entire community, and can understand the nation-wide social movements because of his intimate personal knowledge of the local group.

It seemed a general opinion that the settlements had not been as active in recent industrial uprisings as they should. Mrs. Florence Kelley challenged the workers to face the facts of congestion and of industrial competition. Paul Kennaday questioned the organization of the settlement itself, by declaring that too many "boards" were undemocratic at heart, and too many "residents" were content to be boarders. He felt that settlement workers should get in closer touch with the people by living in their tenements and working at their trades or occupations wherever possible.

The need for genuine settlement federation was clearly defined. The New York Association of Neighborhood Workers will undoubtedly in the near future have a central office and a paid secretary, so that it can duplicate the excellent work of the Boston Social Union.

The opportunity presented by an inter-city conference for the discussion of some problem common to a whole section of the country was made clear by the suggestion of Mr. Woods that next year the garment trades, largely centralized in the district lying between Boston and New York, be made a special subject of inquiry.

The study of the adolescent boy, which

the National Federation is to make this year, will be begun at once. A comprehensive outline of the book was presented by Philip Davis, who will conduct the inquiry for the federation. In final form this will be a companion study to *The Girl Problem*, published last fall.

An eloquent tribute was paid to the life and character of Jacob A. Riis, one of the first, and surely one of the best, interpreters of the social needs and social possibilities of the "other half."

Mrs. Raymond Robins spoke of the need of educated men and women joining in the movements of working people to develop their own leaders who must be of a high standard of intelligence if they are truly to lead their fellows into a real industrial democracy. She told of the work of the new school for industrial leadership which has been established by the National Woman's Trade Union League.

URGING ON THE PUBLIC CRY AGAINST SING SING

THE CREATOR of Sherlock Holmes has seen and condemned Sing Sing. Not, he says, to make literary use of his observations, but because of his interest in law-breakers and their treatment, Sir Arthur Conan Doyle went up to New York's century-old prison on the Hudson a few days ago and had himself locked in a cell.

"Burn it, burn it," he said afterward. "The buildings are antiquated and unsanitary. It is a disgrace for a state so great and wealthy as New York to have such a prison."

Sir Arthur was amazed to be told that occasionally the prison becomes so crowded that two men have to be put in a cell. It was the smallness and unhealthiness of the cells that especially impressed him. "They ought to be knocked three into one," he said.

Sir Arthur stated he did not believe in making prisons "comfortable hotels." He does believe, however, in individual treatment, in decent living conditions, and in educative work.

"As a medical man, I took great interest in the appearance of the prisoners," he said. "It seemed to me that probably a third of the whole number were defectives—calling for medical treatment or care of some kind. Perhaps another third were young men who ought never to have been put in with hardened criminals."

Sir Arthur declared he believed that James M. Clancy, warden of Sing Sing, is doing the best he can under the conditions.

Organizations for prison reform are agreed that Sing Sing ought to be abolished. An aggressive public opinion demanding this, it is suggested, might be fostered by prison reformers making it a practice to nab illustrious visitors, whose names make good newspaper headlines, and take them to Sing Sing as soon as they land.

UNIVERSITY EXTENSION

The little wash lady, the doll and the doll's clothes are parts of the University of Wisconsin's extension division. Demonstrations of correct wardrobes for infants proved so popular a part of the community institutes held the past year, that a correspondence course has been worked out to include planning, buying, designing and laundering baby clothes.

LIVING QUARTERS IN NEW YORK CANNING CAMPS

THE FIRST extensive code regulating the sanitation of living quarters in cannery labor camps has been formulated by the Industrial Board of the New York Department of Labor. It went into effect June 1.

For many years there has been constant agitation about the dirty and crowded living quarters provided for immigrants who are brought every summer from cities to work in country canning factories. Until 1913, however, the Labor Department had no authority over the sanitary conditions in such camps. One of the laws enacted last year, upon the recommendation of the New York State Factory Investigating Commission empowers the Industrial Board to make rules for the sanitation of such living quarters.

The new regulations adopted in accordance with this law are based in the main on suggestions made by Joseph Maper acting chief for 1913 of the Division of Industries and Immigration of the New York Labor Department.

There must be maintained in connection with all living quarters kitchen and dining room accommodation under shelter; sleeping bunks arranged one above the other must go, as well as the mattress on the floor, and all beds must be clean and free from vermin the beginning of each season. There must be one privy or water closet for every 20 persons of each sex (one for every 25 if there are more than 100 persons in the camp) and each closet must be water tight, fly proof, well screened and sanitary. Water

must be supplied in every camp. Floors of camps must be tight and raised above ground; interior partitions must be solid, and premises of all camps must be properly drained and kept clean.

One of the most flagrant evils in the labor camps has been room over-crowding. The new ruling demands that in every room used for sleeping purposes 400 cubic feet of air space be allotted for each adult and 200 for each child under 14 years of age. Furthermore, at least two rooms must be provided for every family composed of husband, wife and one or more children above the age of 10 years. Sleeping accommodation must be separate for each sex except in the case of immediate families.

Undoubtedly, comments the report of the State Factory Investigating Commission on canneries, the general insanitary condition of many camps is the direct result of long hours of work in the factory by the women of the colony, leaving them little time and less vitality to attend to cleaning house.

Yet the commission found that in but 6 out of 36 cases did the employer who demanded these long hours of labor provide a caretaker for the premises. The new code requires every camp composed of ten or more persons, to have at least one employe to enforce the rules as to cleanliness. The general enforcement of the code will be left to the inspectors of the Department of Labor.

The rules were drafted at a conference of cannery and experts on housing conditions among immigrants. Pauline Goldmark was the member of the Industrial Board acting as chairman of this committee.

TO MAKE SOCIAL WORKERS OF POLICEMEN

THAT THE CALLING of the common "cop" is soon to become a profession of dignity and interest was the prediction made at the annual meeting of the Health Federation of the City of New York, representing 150 organizations interested in civic and social advancement.

Suggestions for a more intensive neighborhood interest for the policeman were made by representatives of various organizations. The Association for Improving the Condition of the Poor wanted policemen commended for reports regarding social needs rather than for the number of arrests made. The Consumers' League suggested that a policeman should understand more thoroughly the sanitary code of the city; that he could be of service in observing whether the 54-hour law for women was being complied with in business places on his beat; that he should have lists of laws governing the buildings in his district, and should carry a list of reputable boarding houses for working girls.

The Women's Municipal League hinted at discarding the uniform of the policemen; wanted stricter inspection after contagion in apartments, and supervision which would put a stop to throwing things in the streets. The Recreation Alliance wanted the Health Department to inspect playgrounds, and it sought a closer policing of parks so that the common "bum" might be moved on and the places made safe for women and children. It made a plea for certain streets to be closed and used as playgrounds, and visualized a "social squad" to be partly composed of women.

The neighborhood organizations recommended conferences for policemen and health inspectors as something to lift them out of their routine and arouse a greater interest in their work.

Commissioners Goldwater, of the Health Department, and Woods, of the Police Department, told of progress made toward a socialized police force, but pointed out that the lack of awards for social service made it difficult to interest the men in work outside of their routine.

NEWSPAPER MEN IN CONFERENCE IN KANSAS

JOURNALISM took another step away from business toward a profession when the National Newspaper Conference and Kansas Newspaper Week, held at the University of Kansas, brought together newspaper men with ideas and ideals for the advancement of the entire publishing industry.

Whether a newspaper ought to give the public what it wants, what are its obligations to its advertisers, and the effect of the daily and weekly press on the public mind—these were the questions which drew the largest crowds.

Led by such eminent journalists as

The Puritans in 1614.

GOING TO CHURCH

The Rockefellers in 1914.

Hamilton Holt, editor of the *Independent*; Oswald Garrison Villard, editor of the *Nation* and president of the New York *Evening Post*; Roy Howard, president of the United Press; Frank LeRoy Blanchard, editor of the *Editor and Publisher*, and James Melvin Lee, head of the department of journalism at New York University, 232 Kansas editors discussed problems that are worrying politicians and reformers all over the country. The endowment of free public newspapers, the licensing of practicing journalists as lawyers and doctors are licensed, the establishment of a state board of censorship for advertising, conducted under the auspices of the department of journalism at the state university, and methods of checking the growing subordination of the editorial to the advertising side of the publishing business, were freely discussed.

Kansas Newspaper Week, held with the conference, consisted of a series of short courses for editors and newspaper men of the state. It was the first instruction in journalism to practical workers offered by a state university. Courses in advertising and news-gathering and lectures on editorial problems were conducted by specialists and were regularly attended by the editors.

Resolutions were adopted asking the state editorial association, of which all the editors are members, to request the Legislature to provide state aid for newspaper men through the department of journalism at the University of Kansas, much as the agricultural college helps the farmers. A committee was appointed to suggest revisions of the code of ethics adopted two years ago by the state editorial association.

That the problems of Kansas newspaper men are not those of the metropolitan press was recognized by the speakers. At the same time it was pointed out that country newspapers are read by more people than are big city dailies, and that there is a greater opportunity for efficiency and improvement in method by the country press. The moral side of the issue was emphasized, also, as affecting every branch of the publishing industry.

REED COLLEGE CONFERENCE ON "PORTLAND 1915"

EXPRESSION of community ideals and a look ahead to the definite steps for next year characterize the "Portland 1915" Conference held May 14-16 at Reed College, Portland, Ore.

In the neighborhood of 3,000 people registered as guests of the college and signed blanks enumerating the things they would like to see achieved in the city by the end of next year.

All the organizations which are definitely at work for the city's welfare were invited to take part, and seventy—municipal, civic, religious, educational, artistic and social—responded with speakers or exhibits or both.

One of the important results of the conference was the organization of the first State Conference of Charities and Correction. Two afternoons were given up to the discussion of case work, widows' pensions, charities endorsements, and team work.

Forehandedness in dealing with the problem of unemployment was shown in the appointment of a committee to draw up definite plans now for meeting the expected problem of unemployment next year. This was the result of a Survey of Portland's Unemployed in 1914 with Prospects for 1915, undertaken by a group of investigators from Reed College, and presented by Arthur Wood, instructor of social economics.

The aesthetic and recreative life of the city was represented by May-pole and folk dances on the lawn; the former by the girls of the freshman, sophomore and junior classes of the college; the latter by the immigrant classes of the city—Russian, Spanish, Italian, German, Welsh, Scotch, Swiss and more—who, dressed in their native costumes, gave their own country dances.

The needs of the city and goals to be reached were indicated in lectures on immigration, co-ordination of social agencies, feeble-mindedness, housing, commercialized pleasure, public defender, oral hygiene, socializing of medicine, city planning, public markets, medical inspection, high cost of living, municipal government, Oregon resources, and loan sharks.

HEALTH

CONSERVING A NATION'S BRAIN POWERS—MENTAL HYGIENE STUDIED IN BALTIMORE

IT IS A LONG day since Crabbe dared in poetry such realism as a sympathetic allusion to the.

"Sad sufferers under nameless ill That yields not to the touch of human skill," or Wordsworth built an entire poem upon a case of senile dementia.

How interest in the "sad sufferers" from mental disorders has passed from poetic sympathy into charitable and legislative activity, is recorded in annals of the nineteenth century. How tentative were the beginnings of this activity, and how much greater is the task than was realized at first, scientific progress and human interest of the twentieth century are demonstrating.

Two years ago, at the Congress for Hygiene, one sub-section meeting was devoted to the question of mental hygiene. But the first convention of mental hygiene societies ever assembling was held in Baltimore May 25, under the auspices of the National Committee on Mental Hygiene. This convention, immediately preceding the annual meeting of the Medical-Psychological Association, was the result, not of efforts of the central committee, but of the expressed desires of a number of societies for mental hygiene from Connecticut to Illinois.

"This seems to me an historic day," said Dr. Paton, in opening the afternoon session. "When we look at mental hygiene in its broad sense, the significance of this meeting is neither more nor less than that we are beginning to take an intelligent interest in the study of human activity."

Careful organization of the meetings made it possible to view many aspects of the problem in a brief time. The sessions convened in Osler Hall, in the building of the Medical and Chirurgical Faculty. At the afternoon session, when Dr. Stewart Paton, of Princeton University, presided, concrete details of mental hygiene societies, their beginnings, specific aims, and some definite activities, filled the time, leaving a margin for personal acquaintance and interchange of questions. The significance of the work to education, legislation, to medicine and sanitation were emphasized in the evening addresses, when Dr. Lewellys S. Barker, president of the National Committee on Mental Hygiene, presided.

Some foundations for successful work by state societies and committees for mental hygiene were indicated by Dr. Thomas W. Salmon. A definite aim, accurate information, relations with other agencies in this field—these he pointed out as the *sine qua non* of successful work. Not necessarily the most attrac-

tive work, nor the most spectacular will form the immediate duty of a mental hygiene society; nor, on the other hand, can definite rules of procedure be laid down for every organization. In one state, the problems are those of the seventeenth century, and a society must get its insane out of jails and into hospitals. In another state, the problems are distinctively those of the twentieth century, and concern occupations and after-care.

Certain of the practical problems which Dr. Salmon outlined as facing each new society may be thus summarized:

1. AIM—Shall a society deal with cases of mental disorder only? Or with cases of mental deficiency also? Both, if possible.
2. INFORMATION—No precedents in this field, no experience to profit by. Doubly necessary to have accurate information.
 - a. community—How deal with insane, both officially and unofficially.
 - b. institutional care—facilities? status?
 - c. after-care—supervision? employment? attitude of community?
 - d. legislation—existing laws? changes needed? danger of haste here is great? need of careful intensive study.
3. CO-OPERATION—A mental hygiene society's relation:
 - a. to hospitals for insane. Remember their longer experience in actual work.
 - b. to courts. Offers of help often accepted.

A MENTAL HYGIENE BILL

One result of the work of the National Committee for Mental Hygiene is a provision in the bill now before the House of Representatives, to create divisions of mental hygiene and rural sanitation in the United States Public Health Service.

The division of Mental Hygiene would "study and investigate mental disorders, and their causes, care, and prevention."

Such a ruling would obviously be of great importance to the mental hygiene movement. Under it, the federal government would become responsible for a large part of the work which now, if done at all, must be done by the National Committee for Mental Hygiene and by state societies. These organizations would then be free to develop special lines of work not provided for by the government.

c. to other agencies in social work. Few of these realize yet how mental defects complicate their problem.

4. PUBLICITY—Sometimes just the name of the society on its office door will bring inquiries to prove a means of contact. Newspapers usually are glad to co-operate.

Following Dr. Salmon's address, representatives from mental hygiene societies of eight different states gave in quick succession the story of their beginnings, their problem, and certain lines of their work.

In opening the evening session, Dr. Barker spoke briefly of recent progress of the National Committee on Mental Hygiene. As a result of the first large gift of money the committee has been able to establish an office, with secretary, medical director and office assistants. Various pamphlets have been prepared and distributed, many public meetings held, and a mental hygiene exhibit arranged and sent to a number of cities. Several thorough investigations of local conditions have been made, local societies formed, and a large correspondence is maintained.

In Miss Lathrop's absence, Dr. Stewart Paton gave the address originally planned for the afternoon. Speaking of the significance of the present interest in mental hygiene, Dr. Paton emphasized the word "Conservation." This word, grown so widely popular of late, is at last applied to measures for protecting the brain-power of the race. The great problem of life, the true meaning of "culture," is just adaptation of the mind to forces of nature already hostile or made so through ignorance and superstition.

The only optimistic outlook possible for the race Dr. Paton believed to be based upon an increased knowledge of the individual and of the mechanism of his adjustment. For the true meaning of this startling increase of insanity and feeble mindedness, this trend of multitudes toward the slums, the hundreds of cases of nervous breakdown, all mean just this: that the individual has failed to adjust himself. Wherefore, this matter of adjustment becomes the vital point in the problem of existence; and social workers, lawyers, alienists and judges have not separate and distinct problems, but one great problem in common.

Applying this specifically to education, Dr. Paton suggested that it would be well if schools, colleges, and universities might become transformed into educational institutions. For the thing of first importance is not whether a boy shall study Greek or mathematics, but that he shall learn to live. So then, the true order in education is, first, how to live, then how to study, last, what to study. And the problems of education

THE EXHIBIT OF WORK BY PATIENTS IN INSANE HOSPITALS

Courtesy Sheppard & Enoch Pratt Hospital

During the recent Medical-Psychological Association Convention, an exhibit of work done by patients in the occupational classes of the different hospitals was shown in the ball room of the Hotel Belvidere. In alcoves of the ballroom were booths containing a great variety of skillful work ranging from fine laces and embroidery to wicker work, furniture, articles of hammered brass and even a hospital magazine. Photographs, charts, samples of records, order blanks and other administrative details, and ground plans, almost filled the main floor.

are seen to be the problems of adjustment, and of mental hygiene.

Dr. Paton told of some experiences of his own at Princeton. An informal suggestion was made in the university,—that there might be a few students who would care to talk over problems of adjustment in their own life and experience. The men responded in numbers that would have taxed the activities of three advisors. But, as the symptoms of maladjustment are by university age so far developed that readjustment is difficult, and often impossible, the work must be begun earlier—with studies in human conduct, and means in schools whereby students may be assisted at the right time in this most vital point of education.

The paper by Senator McLean, of Connecticut, on The Conservation of Mental Health: a National Problem, was read, in Senator McLean's absence, by Dr. C. Macfie Campbell, of the Phipps Clinic.

Reviewing the achievements in conservation and progress in Commerce and agriculture, Senator McLean paid tribute to the work of Reed, Carroll, Gorgas, White, and others, and urged that similar achievements be reached in the domain of mind. Some of the federal government's work to this end, Senator McLean indicated briefly, mentioning the hospital at Washington, primarily for officers and enlisted men and the army and navy and beneficiaries of the Marine Hospital Service, the work for insane Indians, at Canton, S. D., the new institution at Ancon, soon to be completed, the new St. Lazaro at Manila and the examination of immigrants at Ellis Island. The only territory under the American flag where no provision is now made for the insane is Alaska.

Senator McLean referred to the work of the Bureau of Education which was establishing classes for backward children all over the country, and seeking better means for selecting the children for these classes.

Introducing the last speaker, Dr. William H. Welch, of Johns Hopkins Medical School, Dr. Barker mentioned a few facts recalling not only the speaker's interest in all problems of hygiene, but his influence in this field as well. It was through Dr. Welch that the first large gift of \$50,000 for the National Committee for Mental Hygiene was obtained. It was through Dr. Welch's presentation of the need that Mr. Phipps gave over \$1,000,000 for the Phipps Psychiatric Clinic at Johns Hopkins Hospital. He trained Reed, Carroll, Lazaer and Agramonte, whose names are well-known in the records of sanitary progress.

When he began to speak, after the applause of recognition, Dr. Welch traced a large part of the organized effort, characteristic of this age, to new scientific knowledge. This knowledge, originally in possession of a few, has been extended for the benefit of the many.

Quite as important as the direct success of such campaigns as that against tuberculosis, have been some by-products of these campaigns. For instance, anti-tuberculosis work has not only reduced the amount of tuberculosis, but has led to a study of conditions in homes and work-shops, and has influenced mankind to ways of better living—living in open air, sleeping in open air, and using wholesome food. The campaign against typhoid fever has meant also an improved water supply, improved milk and food supply and more decent conditions of living in many different ways. The anti-malaria campaign has meant also restoration of waste marsh land,—has meant the riddance of such pests as the mosquito and much else.

Dr. Welch pleaded for a saner attitude toward the insane. The realization that insanity was a disease, or one of many diseases, not a demonic possession or an "affliction," has been much too long delayed. Education on subjects of mental hygiene is, he said, needed

for people and for doctors as well. Research is needed, study of conditions from whence insanity springs; study of the institutions which care for the insane; study of debatable questions, of "border-line" cases; study of the laws giving commitment of the insane; study of those committed and of the after-care of those same patients.

Dr. Welch closed with a note of strong encouragement to workers who are doing this pioneer service in teaching humanity how to live.

The reports from individual societies, called for in chronological order, beginning with the society first organized, indicated the special problem and interest of each state.

Connecticut.—First of the states to organize a Mental Hygiene Society, organized 1908, Miss Macdonald, secretary: The problem of this society is one of publicity and individual assistance. The public must be reached both to make known the opportunities of aid for those mentally afflicted, and to arouse interest and public support. A free clinic has been established, and has been advertised by means of leaflets, letters to the medical profession, personal explanatory visits to organized charities, visiting nurses, teachers, settlements, churches, clubs. The most wide-spread results have come from the exhibit prepared by the National Committee. Interest and support in various sections of the State have been secured by sending letters to lists of people carefully selected from local information.

Illinois—organized 1909, Elnora Thomson, secretary: Illinois was the first state in the Middle West to organize a society for mental hygiene. But actual work of this kind began in Chicago several years ago, when Miss Lathrop, now head of the Children's Bureau, was on the State Board of Charities. In co-operation with Rabbi Emil G. Hirsch, Miss Lathrop introduced some methods of mental hygiene.

The society's first work, 1909, was a

EXHIBIT OF THE STATE HOSPITAL FOR INSANE NEGROES, CROWNSVILLE, MD.

This booth was awarded the first prize of the exhibit. Dr. Winterode, superintendent of the Crownsville hospital, gave interesting explanations of the different items. The rustic cabin background was suggested by a man of sixty, a case of senile dementia.

Crownsville has a farm of twenty acres. It grows its own willows for the wicker work. The burlap which comes wrapped around the meat supplies, is cleansed, dyed and woven into such attractive, fluffy rugs as those shown in the picture.

study of cases pending commitment to the county hospital. This was done at the request of Judge Owen, of the County Court, who, having often fifty to seventy-five cases to pass on in the one day given each week to this work, often felt his information inadequate as a basis of judgment. From three to five nurses now carry on this inspection. An automobile ambulance and a limousine have replaced stretcher and patrol wagon for transferring patients. The Illinois society's problem is financial. The work is hampered for lack of office room, and office assistants. The State Board of Administration has just granted \$50 a month toward the services of an after-care worker,—this is the beginning of the city's taking over such care.

New York—organized 1910. Dr. W. L. Russell gave a brief historical sketch of the development of the society from relief work of the civil war, and alluded to its work of education, after-care, and in securing better legislation. The Social Service Department was reported by Miss Tucker. No trouble existed in finding cases to begin on, she said. The society was formed in response to calls from all over the state for information about care of cases of individuals and social agencies, cases of mental disorders, methods of follow-up work, etc. Much has been done by correspondence. Much by consultation, in New York city, with other social agencies. The East Side clinic,—now transferred to the Cornell Clinic—was organized at first for those who were prejudiced against hospitals, and to ensure better after-care to those

in the neighborhood. Reporting was more faithfully done when patients signed a little card promising to return.

The chief problem in New York is facilities. For example, to secure employment for patients is very difficult. Again, a place is needed to which convalescing patients may be sent. Legislation has been secured which permits the quiet transfer of patients to and from hospitals without the publicity of patrol and policemen.

New Jersey—organized 1912. Dr. Schaeffer: Mental hygiene work is represented in this state by a committee of the Sanitary Association. But work thus far is being done by individuals rather than by co-operative effort. As president of the State Board of Education, Dr. Schaeffer conferred with teachers, and endeavored to detail incident cases of insanity among school children.

Massachusetts—organized 1912. Dr. Charles E. Thompson: Work in this state is distinctly medical because so many institutions are already doing extensive social service work. The aim is to educate the public in this subject of mental hygiene. Funds are nearly complete which will secure the services of a medical director for three years, and allow the society to begin its campaign.

Maryland—organized 1911, Dr. W. B. Cornell, secretary: Little propaganda work has been done; rather, attention has been demanded for practical work with individual cases. Close co-operation between all social agencies adds to the effectiveness of the work. Some of these agencies that send cases to the society—

besides the state hospitals—are police magistrates, police captains, juvenile courts, public schools, the child labor bureau and the federated charities. About five hundred cases have been handled in the past seventeen months. These have been preventive cases, cases for after-care, and a few that were stranded in hospitals. One aim for the immediate future is an adequate system of records, covering the entire history of every case. The state legislature appropriated at its last session \$2,500 for two years. This will be of material aid in the work.

Pennsylvania—organized 1911. Mr. R. D. Dripps: In this state large numbers of insane are cared for in almshouses and institutions. A careful survey of this care through the entire state is the society's first plan, looking toward legislation for improved conditions.

North Carolina—organized 1913. Dr. Albert Anderson: Work began with the National Committee's exhibit at Raleigh, at the time of the Teachers' Assembly. Dr. Adolf Meyer's address at the meeting also created interest. Work has been preliminary, consisting chiefly of distributing literature on mental hygiene.

In closing, Dr. Paton called on Clifford W. Beers, secretary of the National Committee, to summarize reports from several states. Mr. Beers told of the special situations in Maine, where political and personal forces had created a difficult problem, which, it is believed, societies for mental hygiene can help solve. Societies are about to be formed in eight or ten states; Sydney, N. S. W., is deeply interested, also Canada and South Africa.

DELINQUENCY AND MENTAL DEFICIENCY—By OLGA BRIDGEMAN, M. D.

DURING RECENT years, the vice question has been assuming an important place among social problems, and many different causes for sexual immorality have been studied with the hope that some improvement of conditions may result.

It has been argued by many, that the inadequate wages, which so many working girls receive, should be regarded as one important cause. On the other hand, it has been held that immorality is the result of natural immoral tendencies on the part of the girls themselves rather than of incidental causes. There are many causes underlying this problem. Among them is one which is undoubtedly important but which has never received due consideration. This cause is mental deficiency.

In the Illinois Training School for Girls, in Geneva, there is a group of young girls, most of whom have failed to lead a moral life under the conditions in which they had lived, and so have "gone wrong." The Geneva institution has, at present, a population of approximately 400 girls, varying in age from ten to twenty-one years, the majority of whom have been guilty of sexual immorality, and of whom nearly 60 per cent are on admission suffering from a venereal disease.

The vast majority of children sent to Geneva have been held for delinquency alone. Many of these children, but by no means all, have attended the public schools where they have usually been the dull children in the classes and have been distinctly below their normal school grades. With the exception of those coming from the Chicago juvenile court, none have received mental examination, and if it has been noted that the child is "not bright," this has been taken merely as an incidental fact and not at all recognized as having a vital relationship to the child's delinquency.

Such a child is committed to Geneva in the hope that a period of rational living, with plenty of good food, comfortable clothing, regular hours of sleep and an abundance of fresh air, will give new interests to replace the old, bad ones, and that as a result of her stay in the institution, she will go out with fresh ambitions and a wealth of physical strength sufficient to fulfill them.

To be sure, not nearly all of the girls appearing in the courts are sent to such an institution as Geneva. With the establishment of juvenile courts, there has developed a tendency to continue the hearings of these cases from time to time, permitting the child to remain in her old home or in some suitable family home, where she is subject to the friendly supervision of a probation officer. The results of this system have been so good that at present a comparatively small proportion of the girls appearing in court are ever committed to Geneva, and those who do arrive here are, as a rule, incorrigible offenders for whom satisfactory supervision outside of an institution has proved impossible.

As an exception to this general type

of old offenders may be taken a small number of cases sent from districts which have no system of juvenile supervision, and which still persist in committing girls for very trivial offenses or even because of mere financial dependence. This practice of sending dependent children or those guilty of the mildest offenses to an institution, compelling them to associate with hardened offenders and degenerates, cannot be too severely condemned.

Simple contact during daily work with these girls, was enough to show that a surprisingly large number were quite irresponsible and were definitely inferior to normal children both in and out of school. When we had recognized this fact we began the routine application to all new admissions of the Binet tests as modified by Dr. Goddard for American children, for the purpose of making a rapid estimate of the mental plane of the children. The results were startling and fully justified the idea that mental deficiency and delinquency are closely associated.

We examined in all, 118 consecutive admissions. Of these, 105, or 89 per cent, showed a retardation of three years or more, thus ranking as mentally defective; seven, or 6 per cent, were backward, being one or two years retarded; and six, or 5 per cent, were graded as normal.

When it is recalled that dependent as well as delinquent children may be sent to Geneva, the fact that three of the six normal and five of the seven backward children were simply dependent, makes the inter-relationship between mental deficiency and delinquency even more striking. Of these 118 children examined, fourteen had been committed as dependent or uncontrollable at home, and none of these had been sexually immoral. Of the 104 remaining, all of whom had been sexually immoral, 101 graded as mental defectives and three as normal. According to the Binet tests, then, 97 per cent of the children sent to this institution because of sexual immorality are mentally defective.

By far the larger proportion of this group of delinquents are of the weak-willed, irresponsible type, who invariably behave as do those with whom they are thrown. These girls are usually friendly and anxious to please everyone and frequently do very well under careful supervision, but when thrown on their own resources are a constant menace to themselves and to society.

An example of this type is Amelia A., a girl who had been placed in an excellent home, and had for years led a seemingly happy existence. She earned a fair livelihood and was assured of a permanently good home where real affection was felt for her. At twenty-one years of age, because the law so decreed it, she was formally released from all supervision and her bank book was turned over to her. She was, however, strongly advised to remain with the family who had given her a home for so long a time. She expressed her full in-

tention of doing this, but before many days had elapsed, she left this home and with a chance acquaintance she made, proceeded to spend most of her money in a drunken spree, and was sentenced to jail for thirty days.

Since that time, her life has been simply a series of jail sentences, interspersed with periods of debauchery and immorality. This complete downfall in a few months, after years of orderly and apparently contented life, is only one of several similar instances showing the vital importance of proper supervision of such girls.

Another example is Pearl S., who was sent to Geneva in a most deplorable physical condition, with both gonorrhea and syphilis, after having worked for a few months in a factory at a most meagre wage. She did not know why she had been "bad," but "couldn't help it." The court committing her sent her to Geneva with the recommendation that she be allowed to return to her home after having received thorough treatment for the diseases from which she was suffering. This girl had the mentality of a child of seven years.

Of a decidedly different type is Helen L., who, though only ten year old, has most vicious and aggressive sexual tendencies. She is not a passive victim like Pearl S., but has herself such strong perverted impulses, that constant watching is necessary to keep her from indulging them. This child has the mentality of a five-year-old.

The moral and mental defects which these girls show are being considered more and more as permanent and incurable, and yet, as the law now stands, this institution keeps them through their girlhood, developing in them strong and healthy bodies, and at the age of twenty-one turns them out, physically vigorous but mentally weak, and the very best that can be looked for is that they will marry as they very often do. Yet such marriages of Geneva girls are already furnishing more material for our various state institutions.

These girls are not criminals whom a sentence in a reformatory and a little training will reform. In most cases they can be demonstrated to be mentally defective and utterly "incapable of competing on equal terms with their normal fellows, or of managing themselves or their affairs with ordinary prudence."

Their vicious habits and criminal tendencies soon alienate them from their friends and families, who in despair of controlling them, abandon them to the fate of picking up a living on the streets. Drunkenness, petty thieving and prostitution bring them back to reformatories time after time, the only value of the institution being the temporary protection it affords them from the perils of the street, which in the case of feeble-minded girls are appalling.

What they need is protection and friendly detention in some institution other than a reformatory for a period far longer than the gravity of their offenses would warrant, where they can be properly supervised and their anti-social tendencies be held permanently in abeyance.

INDUSTRY

SEARCHLIGHT TURNED ON CHILD LABOR AND THE TAILORING TRADES—BY CHRISTINA MERRIMAN PROBING THE CAUSES OF UNREST—V

THE MOST interesting testimony of the week before the Commission on Industrial Relations was brought out when the commission, grown restive under conflicting stories of conditions under which men's garments were finished in the tenements, called Mary Minora to the stand.

Mrs. Minora is a fair-haired Italian girl of fifteen years. She has been married two years, has a baby six months old, and has worked at "finishing" since she was ten. She didn't know what grade she was in during the two or three years she had gone to school. She had helped her mother work on garments three days a week and had gone to school two.

With her husband, baby, father, mother and little brother she lives in a tenement of three rooms, and works from eight o'clock in the morning to nine o'clock at night finishing "pants." If she works very fast, she can make as much as 60 cents a day.

Her mother, who because of her long practice is more skillful, makes usually 80 cents. And on the combined earnings of these two live the six members of the household, for the father and husband have been out of work for the past nine months. They take turns at the housework in between looking for jobs, so the two women need lose no time from their work. Their rent is \$13.50 a month and they try to put aside five cents a day for clothing.

Mrs. Falzone, who followed her on the stand, explained that she worked as a finisher for nine years, on the best custom made garments. She matches Mrs. Minora's record of about 60 cents for a good day's work, and to lose no time starts the day at four or five o'clock in the morning. Her husband, too, is out of work which makes it hard, but she "lives as God provides," she told the commission. However, she has meat at least once a week and the rest of the time lives on macaroni and cabbage.

The two women told their stories with a direct simplicity that had the weight of truth; and the commission decided to spend Saturday afternoon investigating for themselves at first hand.

Mrs. Minora testified that she had never seen a factory inspector in her life. This went home alike to those who had attacked home work as being a carrier of disease, and to the contractors who had denied that bad conditions could possibly exist as they sent their work only to "licensed" tenements.

Lillian D. Wald of the Nurses' Settlement, felt "unequivocally" that home work should be abolished, not only be-

cause of the bad sanitary conditions and inadequate inspection, but because children were kept at work for long hours when they should be at school.

Indeed, Miss Wald said, there was little or nothing done to prevent the spread of contagious disease, and she had herself seen a garment, sent out to be finished, spread over a scarlet fever patient.

These conditions are in strong contrast to those in the women's garment industries, where the Joint Board of Sanitary Control has done revolutionary work. Miss Wald felt that a drastic law absolutely prohibiting home work was needed.

The chief mercantile inspector of the New York State Labor Department, James L. Gernon, thought it highly improbable that his inspectors got around more than once in any one year. "To be perfectly candid," he said, "I doubt if they've gotten around more than once in the six years I've been in office."

Charles A. Rosenwasser, a garment contractor, told the commission that the witnesses were prejudiced. Most of the women had husbands at work, so what they made at finishing was extra money in their pockets. And, so far as sanitary conditions were concerned, "there's one thing that comes between the scarlet fever and the man who wears the coat, and that's a hot iron."

"Um-m-m," remarked Commissioner Garretson, "assuming for a moment that a hot iron is a good disinfectant, what protection has the man in the shop who's doing the ironing?"

"Well, of course, I don't advocate spreading germs," said Mr. Rosenwasser.

Mayer Schoenfeld, a representative of the contractors, who directly preceded Mrs. Minora in his testimony, was quite sure the commission should not pay too much attention to what they heard about East Side conditions.

"These issues are all sentimental," said Mr. Schoenfeld.

"Do you know Miss Wald?" asked Chairman Walsh.

Mr. Schoenfeld had known her for years, and thought her a very distinguished person. "But she is like all good people who go slum visiting. She has a good heart, but she's apt to be carried away by her sympathy with the under dog."

Jacob Panken, an attorney for the United Brotherhood of Tailors, said that the unions "were deadly opposed to home work," and that there was no child labor in union shops. He discussed the agreements under which the unions and some

of the manufacturers worked, and held strongly that where the manufacturer did something which clearly violated a contract, it should result in a strike, not arbitration; and he stuck to his point in the face of sharp challenges by Commissioners Garretson, Lennon and O'Connell, who held that the terms of contract were never so clear-cut that they could not be subject to different interpretations.

The query into state intervention in industrial disputes developed the interesting statements that the mere threat of investigation of strike difficulties was often enough to make the two sides come to terms.

John Lundrigan, formerly on the New York State Mediation Board, told of conducting an investigation into the strike at the International Paper Company's mills in 1910. Both sides had refused to arbitrate. There had been some violence, and the militia had been called in.

"The investigation was held at Corinth, and we adjourned for the purpose of making a report. The same night we were requested by some of the union officials to make another effort at conciliation, and were notified soon after that the company would deal with any union leaders other than the ones they had already conferred with. A settlement was reached in five or six days."

"As a matter of fact," said Mr. Lundrigan, "These investigations were seldom completed—we never even got to the place where we called a witness. The mere fact that the investigation was to be held induced the parties to get together."

Labor Commissioner Lynch was asked which side, in his opinion, feared to have the facts brought out.

"Well," he parried, "I suppose the unions, if they were wrong, or the employers, if they were wrong."

Mr. Lennon was curious to know whether the unions or the corporations were usually first to ask arbitration.

"Well," said Mr. Lundrigan, "Neither side wanted to see you until it was licked, and then the licked fellow was keen to have you step in."

Mr. Lundrigan and William C. Rogers, chief mediator of the New York State Labor Department, believed that the state should be able to compel mediation. The mediators might be called in upon the demand of either side, or of the municipality affected. Most of the witnesses favored also a federal bureau of mediation, to be called in whenever there was a strike which involved more than one state.

George L. Basford, who has acted as advisor in installing continuation schools in many railroad shops, feels that it is the work of the school to prepare the minds of the boys, but the work of the

employer to teach the trade. "It is absolutely the corporation's business," said Mr. Basford.

"What's to be done with the boys who don't measure up to a certain standard?" asked Mr. Lennon.

"It is the business of every employer to find some place where almost anybody will fit," said Mr. Basford. "They pay great attention to steel and iron, and almost none to human beings."

Dr. C. R. Richards, director of Cooper Union, New York, thought the ideal system would be part-time industrial schools up to the age of eighteen. The control of these schools he would place at first in the hands of the board of education, with an advisory committee consisting of laymen, directly connected with the trades. Those who have spent a year in such schools, should have credit on their term of apprenticeship.

Mr. Lennon wondered whether such schools wouldn't overstock the labor market.

"That would be possible only if there were trade schools all over the country turning out a large number of graduates. But the economic pressure is too great for many of the boys to take time for the training."

Dr. S. Josephine Baker, of the New York City Health Department, felt sure that neither boys nor girls were physiologically fitted for work at fourteen. Nor did she believe that economic pressure was generally a valid reason.

Just here came Elizabeth Watson, a special investigator of the New York Child Welfare League, with a tale of child labor and peonage in southern canneries that brought the listless to attention with a jerk. She told of a child of three, so small that it had to stand on a box to reach its work, shucking oysters for many hours at a stretch. She told of one family consisting of a woman and five children who sometimes made jointly as much as \$3 a day. At other times their earnings were as low as 60 cents. She cited cases of women who for six Sundays in succession worked from two o'clock in the morning to eleven o'clock at night.

"And one Monday afternoon," said she, "a group of them were discharged for sitting down, and weren't given their return tickets."

The long hours were not the only disagreeable conditions Miss Watson found, however. The first time she came across a bad oyster, she asked a man next to her where to throw it.

"Throw it!" said he. "Say, are you crazy? Put it in the can."

The rough oyster shells make the fingers of the workers sore and festered, and Miss Watson told of seeing the oysters handled by workers whose hands were in a shocking condition.

When workers are needed, the canneries send out their "padrones" on a still hunt for families. The best families are those who have the most children. The padrone is paid one dollar a head for workers.

In the Anchor Mill at Rome, Georgia, where heavy cotton twist drill is made for uniforms for the United States Navy, Miss Watson found children work-

ing from six in the morning until six at night. She did not feel that it was just, however, to speak of the conditions in this mill without calling attention to the fact that many other mills in the South making fabrics for the government, were large employers of child labor.

The testimony of Edward F. Brown corroborated Miss Watson's story at many points. Mr. Brown is vice president of the International Child Welfare League, and was formerly connected with the National Child Labor Committee. He declared that one great difficulty in the way of getting better conditions was that the present laws were inadequately enforced, partly because of insufficient state grants, and partly because the laws were administered in a great many cases by politicians who were not always immune to the interests of the manufacturers.

Asked by the commission as to the best machinery for enforcing child labor laws, Owen R. Lovejoy, secretary of the National Child Labor Committee, thought that we should adopt some plan of co-ordination of the activities involved in the administration under one department. He made a strong plea for a federal child labor law which would make it illegal to transport from one state to another the products of any industry which employed children under sixteen years of age.

The commission learned that New York is giving a definite and constructive answer to those who fear that minimum wage legislation will mean dropping the less experienced workers from the pay-roll. In New York city, the Department of Education has started continuation schools in several of the department stores, to give the younger girls something which will make them more valuable to the store. The work is under the direction of Mrs. Anna H. Willcox, who told the commission that while the work was still in the experimental stage, it promised remarkable results. The first class was started last October. In one store, nine out of the sixteen pupils have had their pay raised as a direct result of increased efficiency, and five out of the nine were advanced in their positions.

So far the work has been confined to the "Juniors" under seventeen years old. Mrs. Willcox hopes to be able soon to raise the age to twenty-one, and

to include instruction in salesmanship, in the methods of making materials, and in how to tell the different qualities of fabrics.

Frederick C. Howe, director of the Peoples' Institute was called upon for his views as to the significant and underlying causes for industrial unrest. He felt that two definite assumptions prevailed in the testimony so far given.

The first accepted the present capitalistic system as inevitable and permanent, dividing society into employers and employees.

The second contended that the relation of capital and labor should be abolished and a system of Socialism introduced.

"There is another alternative which covers the objections to both of those systems," said Mr. Howe. "It is just as complete a social program as Socialism itself, but it avoids all the possible evils of a Socialistic society. . . . It is the philosophy which for twenty-five years has gone under the name of single tax—an industrial and social philosophy as well as a financial philosophy."

The single tax, he thought, would do away with the need of labor exchange, minimum wage and social legislation. It would release so much land for building purposes that the demand for labor would far exceed the supply. Wages would go up and the laborer could care for himself without minimum wage laws, employment exchanges or social legislation.

"The proposition is so very simple that its very simplicity makes people incredulous. It could be introduced in New York by the adoption of an amendment one inch long, providing that all taxes would be abolished except the tax on land."

The commission listened attentively for over an hour while Mr. Howe expounded his thesis.

"Do you believe," asked Chairman Walsh, "that the public could be induced to adopt such a philosophy in our time, considering the present institutions of property in land?"

Mr. Howe thought yes, emphatically and asked Mr. Walsh to remember the time when the man who believed in woman's suffrage was thought crazy, and when not so long ago workmen's compensation and widows' pension laws were put down as the figments of the social reformers' brain.

THE CLOSED SHOP AND THE LABOR BOYCOTT—BY HARRY W. LAIDLER

AUTHOR OF BOYCOTTS AND THE LABOR STRUGGLE

OF considerable significance to labor is the decision recently handed down by the Supreme Court Commission No. 2 of Oklahoma, upholding the right of the union to strike for the closed shop and declaring that a suit in damages against a union for causing the discharge of a non-unionist will not be upheld.

The court thus placed itself on record in favor of the legality of the strike for the closed shop, as well as of the accompanying compound labor boycott.

The decision of Judge Brewer in the Oklahoma case is in line with those in New York and Indiana courts, though contrary to precedents established by the courts of many other states, notably Connecticut, Massachusetts, Maryland, New Jersey, Pennsylvania, Illinois and Missouri.

In this case, J. H. Roddy, a miner, brought an action for \$100,000 damages against the members of the Phillips Local, United Mine Workers of America, for causing his discharge from the

employ of the Western Coal and Mining Company. The unionists, it is alleged, stated to the foreman of the company that the plaintiff was "unfit to work with union men and that if Roddy was retained in the service, the union would strike." Roddy claimed that he was discharged because of this demand, as well as on account of the agreement between the union and the company that non-union men would not be employed.

These charges, the court decided, did not state a cause of action, inasmuch as any man, in the absence of a contract to work for a definite length of time, had a right to quit. The same right, the court affirmed, extended to a combination of individuals.

The decision of the Oklahoma court followed that of Justice Parker in the well known case of the National Protective Association v. Cumming, decided a dozen years ago. As a result of this decision and subsequent declarations of the lower courts, it is now generally legal in New York state for a union to strike in order to enforce the closed shop principle; consequently non-unionists who are discharged as a result of a strike or a threatened strike cannot hold the union liable in damages.

There are, however, two or three limitations to this right. Should the sole motive of a strike of this nature be to do injury to non-unionists or should the strike be prompted by malice, it might be considered illegal. In the second place, an agreement would be illegal that provided for the exclusive employment of unionists, thus virtually preventing non-unionists from obtaining any work at their trade in the vicinity of their former occupations, and automatically giving a monopoly to organized labor. A strike entered upon in pursuance of this purpose would probably be enjoined.

Preceding the more liberal decisions of the New York courts, the Indiana supreme court had decided that it was legal for miners to strike to obtain the discharge of non-union men.

The courts which favor the closed shop principle generally take as their starting point the rights of the union worker. The reasoning is simple, and follows that of the Oklahoma court. One man has a right to refuse to work for any reason he may deem sufficient, and the employer has no right to demand a reason. He may give a reason, if he desires, and may frankly state that he does not care to work with a non-unionist. Such a statement or "threat" does not give a ground for action to non-unionist or employer, nor does it justify the injunctive or criminal process. The same reasoning applies to a body of men.

The higher courts in Connecticut, Illinois, Maryland, Missouri and New Jersey, among others, have sustained actions in damages against unionists for securing the discharge of non-union labor. In Massachusetts, New Jersey and Pennsylvania, injunction proceedings have been sustained, and in Vermont criminal proceedings have been brought to a successful issue. In some instances the breaking of contracts, extortion, etc., have been involved.

Courts deciding that a strike for the closed shop is illegal have concentrated attention on the rights of the injured non-unionist or of the employer: the non-unionist's right to enjoy a free labor market and to dispose of his labor as he sees fit; the employer's right to employ whomever he may desire. It is at times stated that a strike for the closed shop and a consequent labor boycott violate the constitutional provisions which declare that no person shall be deprived of life, liberty or property without due process of law and that no state shall deprive any person of the equal protection of the laws.

An employer, the courts declare, has a right to carry on his business in any way he sees fit, to employ or refuse to employ men for any reason or without reason. Interference with this right is against public policy, as it tends to destroy competition and to deprive a man of liberty and property. The non-unionist also has a right to work for others without molestation, and interference with such a right without justification, is illegal.

Some courts distinguish a strike to secure the discharge of non-union men from a strike to obtain better wages, etc. on the ground that the immediate object of the former is that of injury and that the law does not look beyond the immediate loss and damage to the remote benefits which might result to the union.

It is seen from the foregoing that little attempt has thus far been made by courts to decide the question of the legality of this form of labor activity from the broader standpoint of social welfare. While the writer agrees in general with the conclusions reached by Oklahoma and New York courts, he believes that the judges who have heretofore favored the legality of the closed shop and the accompanying labor boycott have, for the most part, failed to consider such vital questions as that of the character of the union and of its terms of membership. Should the qualifications for membership in a union be fair and reasonable, the courts might do well to approve the principle of the closed shop on the grounds of social advantage. For a strong labor movement is essential to social progress, and experience has taught the value of the closed shop as a means of strengthening the union forces.

If the union is a worthy one, and non-unionists refuse to join and assist in the struggle for better conditions, the latter's interest should not be decided superior to the interest of organized labor. On the other hand, if the union is a "closed union" or if the terms of admission to membership are frivolous, proper protection should be given to non-unionists unjustly denied the privilege of membership. In the words of Justice Holmes: "The true grounds of decision are considerations of policy and social advantage, and it is in vain to suppose that solutions can be attained merely by logic and general propositions of law which nobody disputes." Finally, the decisions in these cases indicate the great need for legislation, state and national, that will clearly define the rights of all parties.

LABOR AMENDMENTS TO THE ANTI-TRUST BILL

TWO AMENDMENTS to the Clayton anti-trust bill were accepted last week by the House of Representatives which involve some of the exemptions for which organized labor has been fighting for a number of years. The first amendment applies to labor unions and farmers' associations, and reads:

"Nor shall such organizations, orders, or associations, or members thereof, be held or construed to be illegal combinations in restraint of trade under the anti-trust laws."

The second amendment establishes the principle that no injunction shall be granted in a United States court in the case of a labor dispute, "unless necessary to prevent irreparable injury to property or of a property right for which injury there is no adequate remedy at law." Under the amendment no restraining order shall prohibit the cessation of work or peaceful picketing, boycotting or peaceable assembling.

The first amendment may accomplish directly the object that was sought by indirection in the bill that was passed by the last Congress prohibiting the use of any part of the appropriation in the sundry civil bill for the prosecution of labor unions. It has been criticized sharply, however, as being so vague in wording that both those who want labor unions exempted and those who don't, think they have gained their point. It was enacted by unanimous vote of the House.

There was considerable opposition to the second amendment. In the course of debate, Representative Moore of Pennsylvania denounced supporters of the amendment, and pointing to the gallery where Frank Morrison and other labor leaders were seated, declared that he had not "waited for a nod from the gallery to tell him how to vote." THE SURVEY will later publish a review of these amendments.

A. F. OF L. CONTEMPT CASE DISMISSED

The Supreme Court of the United States on May 11, reversed the decision of the lower courts and dismissed the contempt case involving Samuel Gompers, Frank Morrison and John Mitchell which has been in the courts since 1911.

The case grew out of an alleged violation of the injunction granted in the Supreme Court of the District of Columbia against publishing the name of the Bucks Stove and Range Company in the unfair list of the American Federation of Labor. Justice Wright of the Supreme Court of the District of Columbia sentenced these men, as the three highest officials in the American Federation of Labor, to terms of imprisonment ranging from nine months to a year. In the United States Court of Appeals, the sentences were reduced to a fine of \$500 each and imprisonment of one month for Gompers alone.

This final action of the Supreme Court is based chiefly on the statute of limitations. The action was begun on May 16, 1911, while the most important acts which were declared to constitute contempt of court were committed more than three years prior to that date.

SOCIAL AGENCIES

FIGHTING ALCOHOL WITH EDUCATIONAL EXHIBITS —BY CORA FRANCES STODDARD

SECRETARY, SCIENTIFIC TEMPERANCE FEDERATION, BOSTON

ELEVEN YEARS AGO the writer saw in Bremen, Germany, the first anti-alcohol exhibit. It was a creditable affair even then, with diagrams, pathological models, wealth of literature, and "alcohol-free" drinks. But the plan has been developed until today in continental Europe the anti-alcohol exhibit is one of the great factors in the educational propaganda which is apparently beginning to cut down the consumption of alcohol in Germany, enlisting all classes and receiving well-planned government support. In Germany alone there are three traveling exhibits going constantly from city to city. Switzerland has one, as has Sweden.

There was no serious attempt in the United States to utilize the exhibit plan on any comprehensive scale in work against alcoholism until the Scientific Temperance Federation was invited to exhibit facts concerning alcohol at the exposition of the International Congress on Hygiene and Demography at Washington, in September, 1912.

As it was practically a new idea in this country, the amount of money that could be gathered for the purpose was discouragingly small, and expensive devices were obviously out of the question. Ingenuity was set to work to supply what could not be had by money, and when the exhibit was completed it was accounted creditable and attractive, with variety of illustrative methods, and it won a diploma of merit from the jury of awards of the Hygienic Congress Exposition.

The exhibit method was not entirely new to the Scientific Temperance Federation. For four years, the federation had been renting and lending all over this country and Canada hand-made diagrams representing the results of physiological and social investigations concerning the effects of alcohol, and literally millions of persons had been reached with the facts in this way. The formal exhibit, therefore, was simply an extension of previous plans.

The subject matter of the exhibit deals with the relation of alcohol to physical and mental working ability, to sickness, accidents, mortality, heredity, and to such social aspects as crime, suicide, divorce, child neglect, poverty and pauperism. The model, picture-model and diagram all have a place in portraying the facts.

One finds in it the striking comparative mortality of babies born of sober and of drinking mothers worked out in tiny dolls, those dressed in black representing the babies who died under two years of age.

The insurance statistics of abstainers

and non-abstainers are shown by small gravestones for the percentage which died, and dolls to represent the living.

Cylinders of varying heights tell the story of the proportionate amount of work done with and without alcohol. Prisms show the relative amount of sickness, duration of sickness and death in benefit societies requiring abstinence and in those requiring none.

Diagrams illustrate the detrimental effect of alcohol in tuberculosis; the frequent coincidence of the alcohol habit with feeble-mindedness and other mental defects; the alcoholic factor in non-support and other domestic tragedies which tax the social worker and the public welfare; the disorganizing effect of alcohol upon industry in lowered efficiency, increased accident and sickness rate, loss of time and deterioration in skill.

Once finished and its feasibility demonstrated, the exhibit was in demand in connection with other great expositions. The result has been attendance in numbers and personnel which might not have been secured otherwise, since some of these many people, believing that there is nothing new under the sun on the alcoholic question, might not have seen it had they not come upon it in general expositions.

Ten weeks of the year following its

preparation were spent at the two great missionary expositions, the World in Baltimore and the World in Chicago. It was a part of the Baltimore Mental Hygiene Exposition; of the Buffalo International School Hygiene Exposition; won a gold medal at the New York International Safety Exposition, December, 1913; was a feature of two state agricultural fairs in North Carolina, at the suggestion of the State Board of Health; was an exhibit by itself for ten days at Richmond, Va.; won large attendance at the Brooklyn Y. M. C. A. and later was engaged by a great Brooklyn industrial corporation as a part of its social welfare work. Portions of the exhibit went to child welfare exhibits, and to several great religious conventions from Los Angeles in the West to Atlanta in the South and Washington in the East.

Meanwhile another German plan allied to the general anti-alcohol exhibit was also put into operation by the Scientific Temperance Federation—the store-window exhibit. This has already been taken up effectively in many parts of the country as a means of bringing the truth about alcohol "to the people where they are," for no educational work for any reform can expect to succeed unless it reaches out and takes the truth to the people. A pamphlet has been prepared giving suggestions for organizing such store-window expositions.

During the four years that the federation has been sending out the hand-made diagrams, many requests had come for their publications in poster form for less expensive and wider distribution. Not until after the exhibit had been organized, did this become practicable. Now about fifty of the best features of the exhibit have been published in attractive poster size by the Scientific Temperance Federation so that at a moderate expense any community can have a little anti-alcohol exhibit of its own. The posters are all illustrated, either by pictures or diagrams and many of them are printed in colors. The exhibit may be used alone or it may be combined with a general educational campaign. An illustrated hand-book with supplementary data is also available.

The illustrated posters will not, of course, take the place of the large exhibit for the most important work. For this a moderate rental is charged to cover expenses of maintenance and the cost of an expert demonstrator, because to make the exhibit of the highest possible value an attendant is required who knows the facts and how to adapt their presentation to the interests and needs of the constantly shifting and various "audiences."

For the anti-alcohol exhibit has been an "audience getter." At every exposition it has drawn proportionately an ex-

ceedingly large and interested attendance. The visitors have ranged from university professors and physicians to the eager street gamins who ask for the repetition of some favorite illustration—"Tell us about the *joins*" (germs). The college student, the business man, the day-laborer, the social worker, the policeman, the fireman, the nurse, the teacher, the parent, the school boy and girl, the clergyman, the leaders of great educational and social movements, have found subjects of practical interest and inquiry.

One of the most valuable features of the exhibit work is that it affords this opportunity of hand-to-hand work in answering questions, in meeting doubts with other evidence, and even in consoling the hearts troubled by the drinking habits of some member of one's household, for the exhibit illustrations of the effects of alcohol could be replaced with far more lurid ones if it were possible or wise to portray the bits of personal experience and observation that are told the demonstrator. Over and over again, some scientific fact is met by the confirming nod of the head of the man of affairs, and his words, "I know that is true; I've seen it in my business."

What the exhibit does in transmuting information into conviction and conviction into action, can be summarized in four comments made to the demonstrator. All are typical of statements frequently made by visitors.

A young workman not very well educated stayed some time listening intently to the explanations. After the others went out, he said, "I haven't been a drinker, but I didn't know but I should have to use it some time. Now I see that I shan't have to. I am very glad I heard this instruction."

A young man a little farther along in the alcohol question, evidently of good family and general intelligence, said that with other young men he had often indulged in the use of alcoholic liquors

This Sober Mothers were relatives of the Drinking Mothers and had Equal Handicaps

since they were easily accessible. When shown a number of charts relating to health and efficiency, he said from time to time, "I didn't know that," and, finally, with an air of conviction, "No more drink for me."

A third significant comment came from a former bartender who had seen for himself many of the facts displayed. As he passed out he said: "This is the greatest presentation of the anti-alcohol question which I have ever seen. If anything could stop young men from going to the saloon and contracting the alcohol habit, it will be conviction by such facts as you have here, and I believe these will do it."

The fourth remark came from a clergyman of one of America's largest churches who said: "This exhibit has converted me. I have always been a temperance man. Now I am going to fight alcohol."

the writer to classify those vitally interested in the movement as follows:

First, there are those who see in co-operation a great movement destined to solve all the problems that now vex suffering humanity. This class believes that the great thing for which the twentieth century will stand in world history will be the supersession of the competitive by the co-operative régime. With this class co-operation is a religion, and more than one vigorous disciple at the conference expressed his willingness to give his life if need be to this new cause of righteousness. With this group competition is not merely wasteful but "it is born in iniquity," results in the degradation of humanity, and must surrender to the principles of brotherly love as embodied in true co-operation.

Second, there is a class that sees in co-operation not a panacea for all the ills of existing society but a direct means of reducing the high cost of living by the elimination of middlemen in the marketing of farm produce. The difference in price paid by the consumer and the price the farmer secures, is regarded as largely appropriation by a class that reaps where it has not sown. Cut out the middlemen, therefore, and the high cost of living will be solved.

Third, there is a group that sees in co-operation a form of business organization that is superior to the purely competitive order. Many of the wastes of competition are heavy and can be eliminated by co-operative or unionized effort. It is recognized by this group that the function of middlemen is important; but it is believed that in many cases the performance of this function, as well as the producing of the raw materials in the first instance, can be more economically accomplished by co-operation than by competition. The elements making up this class, therefore, include farmers, business interests (middlemen) and students of economics in general.

There should perhaps be added a fourth class, namely, those who hope to serve as leaders in a popular movement of this sort. With some of these the idea is to secure good executive positions in connection with the movement and with others to gain political position through championing the people's cause.

The national organization that is attempting to bring together and keep together these diverse elements has on its hands a stupendous, if not an impossible task. In the first place there is sure to be conflict over the question of the motives of the various types of co-operators. Those who believe that co-operation should find its support in the sympathies, that it is a movement based on brotherly affection, will have difficulty in working amicably with those who believe that the strength of co-operation must lie in its appeal to the pocket-book.

Again, in attempting to embrace both consumers and producers, the movement will find a well-nigh impassable barrier. The farmer believes he is being robbed by the middleman; the consumer is equally sure that he is the one who is

A NATIONAL MOVEMENT FOR CO-OPERATIVE MARKETING AND FARM CREDITS

TWO ORGANIZATIONS joined forces in a four days' discussion of co-operation in marketing and the securing of farm credits in Chicago this spring. The National Conference on Marketing and Farm Credits, which held its first meeting last year, and the Western Economic Society, an organization which holds conferences on important economic questions of the day, co-operated in the presentation of the program, the latter organization in pursuance of its policy, taking no part in business meetings or in the passing of resolutions during the conference.

Two and one-half days were given over to the discussion of marketing and one and one-half days to agricultural credit. The program was arranged by the Western Economic Society. Co-operation was as vigorously attacked as it was extolled, and pending rural credit legislation was both praised and denounced. The conference finally passed minor resolutions urging governmental

caution in the passing of rural credit legislation and requesting an opportunity for co-operative agencies to operate under the protection and regulation of adequate trust legislation. A permanent organization was effected to carry on propaganda work throughout the year and to provide for an annual conference.

Co-operation in marketing and in the securing of rural credit facilities has thus assumed the dignity of a national movement. It is the hope of the leaders in the work to form some sort of a loose federation of interests, which will in a few years cover the entire country and largely supersede the present competitive and individualistic system of organization. This may be said to be the central idea of the movement, but the conference was made up of so many different elements that a clearly defined aim was quite impossible. Constant attendance at the sessions and private conversations with speakers lead

robbed. The farmer will be a co-operator in so far as he can by co-operation secure for himself the returns that now go to the middlemen. But the consumer will feel that the elimination of middlemen should give him his butter and eggs for half present prices. He cannot see how the farmer is entitled to this reduction in cost, for if it all goes to the farmer what is the use of consumers' co-operation?

The answer seems to be that producers and consumers must get together and agree upon a division of the spoils. Can they be expected to do this? They have not been able to do it in the past, and attempts on the part of consumers' co-operative organizations to buy from producers, organizations at less than regu-

lation prices have virtually always proved unsuccessful.

Will this national organization of loosely federated associations of people of diverse ideas and aims be able to bring together consumers and producers, provide an equitable division of the profits, and effect an extensive development of co-operation as opposed to competition? To the writer it seems extremely doubtful; for as yet economic self-interest, whether for good or ill, is a very powerful factor in the affairs of practical life. Producers' associations will doubtless be developed and consumers' organizations will probably gain no little headway; but a great concerted movement in this connection is quite improbable.

A N OLD INSTITUTION TUNING ITS WORK TO THE DAY'S NEEDS—BY W. J. NORTON

THE OLD CANNOT grow young; but who says an old social institution cannot keep its purpose whole, and its ear tuned to new winds of inspiration?

During its life of three quarters of a century the Cincinnati Union Bethel has done just this. At first a Sunday school on the river front, with prominent business men of the day as teachers; then a missionary center for the swarms of boatmen who plied the Ohio River before the decadence of our inland waterways commerce; next a combination Sunday school (with two thousand in attendance), missionary endeavor, lodging-house, and relief work; today the Cincinnati Union Bethel is a social settlement with medical clinics, milk stations, day nursery, a lodging-house, a young women's hotel, and recreation activities in the country.

The seventy-fifth anniversary ceremonies of the Bethel began on Sunday with a celebration by the Sunday school. The present generation of pupils mingled with pupils of past generations. Many of the latter have climbed the ladder of success, and the faces of men prominent throughout the city were seen. A spirit of reminiscence pervaded the meeting, not the

least interesting part of the program being remarks by neighborhood women who attended the school forty years ago.

The next evening the people of the neighborhood, one of the most congested in the city, gathered to lay emphasis upon the settlement activities.

The exercises closed with a gathering of the contributors to the Bethel and its friends. Addresses were made by ex-President Taft and Owen R. Lovejoy of the National Child Labor Committee.

The Bethel work was organized by O. S. Powell, a Presbyterian minister,

in 1839 in a building on the river bank. In a few months the Boatmen's Bethel Society was formed and a larger building rented. In 1853 the work had so increased that a permanent home was sought, and the floating Bethel was constructed from the hull of an old steamboat. For six years the activities, which were almost exclusively religious and missionary at this time, were carried on in the old boat moored at the foot of Broadway. The following year the Bethel acquired its first real property, the present site of its lodging-house.

In February, 1865, the institution was incorporated: "The object shall be to provide for the spiritual and temporal welfare of river men and their families, and all others who may be unreached by regular church organizations; also to gather in and furnish religious instruction and material aid to the poor and neglected children of Cincinnati and vicinity, and to make such provisions as may be deemed best for their social elevation; also to provide homes and employment for the destitute."

Two years afterward the Union Bethel Church was organized. An old report says it was "with the hearty sanction of the leading pastors in the city at that time. The church stands upon the simple but comprehensive doctrinal basis known as the Apostle's Creed with the phrase 'He descended into hell' omitted, and the phrase 'the Holy Catholic Church' changed to read 'the Holy Church of God.'" Surely a broad foundation for narrow times!

Although emphasis was steadily laid upon evangelical endeavors, there developed interest in social service, which grew until it commanded the same energy as the church activities.

It remained for Mr. and Mrs. J. O. White, who assumed charge of the Bethel about a dozen years ago, to build on this foundation the present structure of social service. Bethel Church activities which had declined became secondary. The social settlement came to the fore and was launched in a new building in 1905. In 1909 came the Anna Louise Inn, a splendid hotel for working women. In 1912 the country home at New Richmond was added.

TEACHING TEMPERANCE

Three letters and comment thereon by
the Editor

TO THE EDITOR: In view of the large number of letters I have received from readers of *THE SURVEY*, since the publication of the article, *Temperance Education in Public Schools and Its Results* by Edward H. Williams, M. D. (April 18), I ask in the spirit of justice and fairness that the other side be heard.

Allow me to say that Dr. Williams seems entirely ignorant of the work of the Woman's Christian Temperance Union in the department of Scientific Temperance Instruction during the last decade. Since the death of Mary H. Hunt, there has been no such thing as text-books authorized or endorsed by the Woman's Christian Temperance Union.

With the remarkable advance in scientific research as to the nature and effect of alcohol, it became clear to the leaders of the organization that text-books ten, or even five years old, might be outgrown, and should not contain their endorsement. Then, too, the necessity for endorsing such books was passed. The pioneer work was over. The path of teaching an entirely new subject had been blazed. They decided, therefore, not to endorse any text-books, but simply to recommend, when called upon so to do, the books which were up-to-date in scientific research, and best in truthfulness and accuracy.

The department has for counselors some of the best-known men in medical circles in the world—G. Sims Woodhead, professor of pathology in Cambridge University, England; Sir A. Pearce Gould of London; W. L. Reid, for so many years head of the Medical Association of Glasgow, Scotland; Dr. T. Alexander MacNicholl of New York city; and Dr. T. D. Crothers of Hartford, Conn., that veteran in the study of alcohol.

It has also educators of world-wide repute—David Starr Jordan, ex-president of Leland Stanford, Jr., University; George H. Martin, ex-secretary of the State Board of Education of Massachusetts; Arthur Holmes, dean of the State Teachers College of Pennsylvania; and others of like standing. It is self-evident that they would not endorse the absurd statements, "quoted at random" by Dr. Williams. I do not say the statements are not in some text-book, but in my wide study of such books I have never seen them.

It is not my duty to reply to an attack made upon the past. Such attacks have already been answered. But it is my prerogative and duty to reply to an attack upon the present. The following letter is a sufficient reply as to the advisability of this teaching:

"A careful observation has confirmed me in the opinion that children in the public schools should be taught in the most effective way possible the things pertaining to physical and mental health. This certainly would include the effects of alcoholic drinks, tobacco, and narcotic drugs. The purpose of the schools is to prepare children for life. Certainly their physical and mental health are among the most important factors in this preparation."

(Signed) P. P. CLAXTON,
Bureau of Education, Dept. of Interior, Washington, D. C.

Dr. Williams says that in the last analysis, educational movements and methods of any kind must be judged by results. Martin E. Brumbaugh, Ph.D., LL.D., superintendent of the Philadelphia schools, clearly states this year the results of temperance teaching. He says:

"The essays written by the children in our public schools here on scientific temperance, particularly upon the laws of health as they relate to the question of temperance have accomplished an immense amount of good. The children have learned important guiding principles for their lives, and the whole procedure has been so uniformly satisfactory that I wish to give it my cordial approval."

Dr. Williams also quotes government records on the consumption of alcohol and tobacco since scientific temperance instruction has been in operation. Had he quoted other government records his readers would have seen how vast has been the immigration from liquor-making and liquor-drinking countries during the same year. With one million of such immigrants each year, the wonder is we have held the consumption down as low as it is.

Dr. Williams' chief criticism, however, is against the text-books. From that I select the books only which have been recommended by this department, through me as superintendent. One is from *The Body and Its Defense* by Frances Gulick Jewett. Dr. Williams criticises the introduction by Mrs. Jewett of the effect of alcohol upon the blood vessels. This she does by means of an illustration, showing how by electricity through the point of a needle many capillaries may be destroyed, and the red nose of the drinker be relieved of its redness. Certainly Dr. Williams does not belong to the class of teachers, who are "born, not made." He does not quickly grasp what Mrs. Jewett has done with the illustration—introduced the truth in such a way as to rivet the attention of the child.

Mr. McKenny, when superintendent

of the Milwaukee Normal School, told me Mrs. Jewett had the true child's instinct. All over the nation, educators have spoken in highest praise of the Gulick Hygiene Series. Mrs. Ella Flagg Young told me that she read, *Control of Body and Mind* at one sitting, did it up and sent it to the president of the Chicago School Board, receiving from him this reply: "Had I had that book twenty years ago I would be a different man today, but all life henceforth will be somewhat different from having read it, and I cannot tell you how I estimate its value."

Dr. Charles F. Hodge, a member of the Committee of Fifty, wrote Mrs. Jewett his great appreciation of the splendid way in which she had used his investigation of the effect of alcohol upon the cocker spaniels.

The other book criticised is Book I of the Health Series of Alvin Davison, Ph.D., professor of biology in LaFayette College. Dr. Davison introduces an illustration of a rattle-snake on the left and a box of cigars on the right. This is termed in *THE SURVEY*, *Teaching by Innuendo*. Dr. Williams entirely fails to comprehend the use made of it and fails to mention the careful, sane, and scientific way that Dr. Davison teaches the danger of the use of the cigarette.

To wrench one sentence from its context and make it appear ridiculous is unworthy of a scholar. This Dr. Williams does. He leaves out the previous discussion of why lighter clothing should be used in warmly heated houses and says this sentence is used in a book for advanced pupils: "The body can be made comfortable out-of-doors in cold weather by wearing an overcoat or wrap."

We wish it were possible to take up the discussion of the food value of alcohol which Dr. Conn tersely says, "has the same food value as gunpowder has fuel value" and also reply to the number of lessons in this subject required by law. There are but a few states in which the number of lessons is mentioned at all, and where it is the lesson in the lower grades is never expected to be more than ten minutes long while the whole subject of hygiene is covered by it.

Mr. Taft is quite evidently criticising something of which he has little knowledge. But when he said to the young men of Cornell, "to the man who is engaged in responsible work, who must have at his command the best that is in him, at its best, to him I would with all the energy that I possess, advise and urge, leave drink alone absolutely," he must have realized that the ordinary student would wish to know the reasons for such advice and such urging. Scientific temperance instruction gives the reasons.

EDITH SMITH DAVIS.

[Supt. of Scientific Temperance
Instruction of the World's and
National W. C. T. U.]
Hartford, Wis.

TO THE EDITOR: This morning I received the enclosed article by Dr. Williams, a reprint from your issue of April 18. As the names of the persons issu-

ing this reprint are not given, and as the typographical work, size of sheet, etc., are intended to be like those of *THE SURVEY*, and as your name appears in upper left-hand corner of the envelope, the whole thing purports to come from you.

This, of course, I do not believe. Though mailed in New York, this paper was issued and sent out to the clergymen of New Jersey by the Manufacturers' and Merchants' Association, 776 Broad street, Newark, N. J. The name of this association is a euphemism for the Publicity Bureau of the Liquor Interests. They are carrying on a constant warfare in the defense of their business, and have seized upon this article as ammunition.

Without raising the question as to the merits of Dr. Williams' paper, which I read with great interest when it appeared in *THE SURVEY*, I want to utter my protest, as one of your subscribers, against the use of your name as a mask behind which these people may do their fighting. I hope you will not let it pass unnoticed. If they had a right to reprint the article, they should acknowledge it and not dishonestly put it up to you.

RALPH B. URMY.

[Pastor Central M. E. Church],
Newark, N. J.

TO THE EDITOR: I have your favor of this date, and am extremely sorry for the indefensible way in which some of the reprints of Dr. E. A. Williams' article have been sent out. Those that were mailed from this office went in our own envelopes, but we received a large order from the Merchants' and Manufacturers' Association of New Jersey, which we shipped in bulk, and are not responsible for the envelopes in which they were mailed, but we will take precautions to guard against a repetition of such misuse of any similar publications in the future. As Dr. Williams lives in New Jersey, the large demand for the article from that state did not surprise us. The Merchants' and Manufacturers' Association is a reputable body, and I believe that their action was due to sheer thoughtlessness.

We maintain a clearing house of information, and when an article of scientific value appears, we order reprints of it, and furnish them to our correspondents for their distribution. Our feeling is that whether an article is copyrighted or not, the publishers are fairly entitled to the advantage of reprinting it. Of course, a magazine is soon out of date, but the reprint of a particular article is current for some time.

HUGH F. FOX.

[Secretary, United States Brewers' Association]
New York.

[The main point of Dr. Williams' article in *THE SURVEY* for April 18 was as to the method of instruction. He held, in brief, that some text-books on temperance are untruthful and many are unscientific; that such instruction will tend to make pupils skeptical and will thus defeat its own purpose which,

in his own words, is to "lessen the steadily rising tide of alcoholism and pernicious cigarette smoking in this country."

As to methods of teaching, readers of *THE SURVEY* may differ. As to the appropriateness of publishing a criticism of teaching methods in *THE SURVEY*'s Education Department, there can be but one opinion, whether the subject be alcohol, sex hygiene or shop work.

The difficulties of handling any aspect of the temperance question are well illustrated by the whole incident.

On the one hand was the unfair use of the reprints. As furnished to Hugh F. Fox, secretary of the United States Brewers' Association, and by him supplied to the Merchants' and Manufacturers' Association of New Jersey, these contained the article in full and nothing else. The latter organization, whose name conceals its relation to liquor interests, mailed them out in envelopes which not only lacked its own name but bore an unauthorized imprint which gave the impression that *THE SURVEY* had mailed them. Such use of *THE SURVEY*'s name was contemptible.

On the other hand, friends of the temperance cause profess to have found in this article proof that *THE SURVEY* is "a secret ally of the whiskey business" and that Dr. Williams is a tool of the brewers. The ardor of their conviction burns brightly through some of the letters received.

Dr. Williams, it may be fair to state at this point, has a long record of activity in behalf of scientific temperance teaching.

In the columns above, Mrs. Davis states the official position of the W. C. T. U. In *THE SURVEY* for May 23, six writers expressed their views pro and con. Space forbids the publication of further letters received from Jessie J. Brainerd, Washington, D. C.; Catherine P. Wheat, Los Angeles; Margaret B. Platt, Seattle; John E. Parmly, Newark; Lucia Faxon Addition, Portland, Ore.; the Rev. C. A. McKay, Ottawa, Ill.; James V. Chalmers, New York; Julian Zelchenko, Boston; Ansley B. Blades, Sunbury, O.; the Rev. A. M. Williams, Columbus, Ga.; John Reed, Boulder, Col.—Ed.]

SOCIAL WORKERS AND ALCOHOL

TO THE EDITOR: It may interest Mr. Hunt to know that Harvard University hopes to follow its western brothers by introducing a course on alcohol next year. What is needed is that the experiments that have been made in the laboratories of Germany should be made in the laboratories of our universities. President Emeritus Eliot, telling in a recent statement why he has become an anti-alcohol convert, says (among other reasons):

"Later, I had the opportunity of studying the German investigations on the mental effects of very limited doses of alcohol, doses which most people have always supposed to be completely innocuous. The German investigations seemed to me to prove that even twenty-four hours after taking a small dose of

alcohol the time-reaction in the human being is unfavorably affected. Now the quickness of the time-reaction is important to every mechanic; to every artisan, and particularly to every person who is engaged in a dangerous occupation, like driving an automobile, for instance, or managing a circular saw, or, indeed, in the tending of any powerful machine or hot furnace."

It is interesting to note editorials in the press recently on Secretary Daniels' order of "no alcohol" in the navy. The newspapers seem to feel that heavy intoxicants should go, of course, but that interference with beer is outrageous. In other words, the American people have yet to realize the efficiency loss resulting from moderate use of alcohol. This teaching should come out of the laboratories of our universities. Harvard hopes some day, I am told, to have the apparatus for making "time-reaction" tests with very small quantities of alcohol, less than that contained in a quart of 4 per cent beer, but the apparatus for these tests is rather expensive.

ELIZABETH TILTON.

[Chairman Alcohol
Education Committee.]
Cambridge, Mass.

LABOUR IN THE TRANSVAAL

TO THE EDITOR: Your issue of February 14 contains an article entitled Labour Conditions in Transvaal Mining Fields to which you give great prominence. I cannot quite make out whether the writer, W. S. Rainsford, has ever been in South Africa or not, but if he has he displays a woeful ignorance of present day conditions. I would not have taken the trouble of replying to him were it not for the fact that I know *THE SURVEY* has a large circulation and its articles, so far as I have been able to judge, have always been written in a fair and temperate spirit.

Mr. Rainsford conveys the impression that we are living here under a dual oligarchy, viz., that of the unscrupulous mining magnate and that of the ignorant Boer. It is quite true that a Boer government is at present in power, but its record is perhaps as good as that of any other government. It does not please everyone, but it is the government put into power by the majority of the people of the South African union under a constitution which is probably more democratic than any other in the world. With regard to the magnates, they may have been a power at one time, which I doubt very much, but today our House of Assembly contains only four men (out of 126) who have anything whatever to do with mining. There are two of them on each side of the House. I do not love the Boer very much, but it is only fair to say that here in the Transvaal it was a Boer government that made education free and compulsory, and today no boy or girl can leave school until they have passed "Standard V" or are fifteen years of age.

But I take the strongest exception as a large employer of labour myself to some of Mr. Rainsford's assertions. He

¹See *THE SURVEY*, April 25, 1914, page 103.

says that labour has been dealt with "shortsightedly, brutally." This is a big topic in itself, but the answer is contained in the so-called economic commission's report which has just been published. We claim to be just as humane here as you are in America, and as I know at first hand the industrial conditions of your great country, my very strong impression is that we are much more humane than your average employer.

Then he goes on to say that the white man cares little for the native, and follows this up by some wild statements in amplification. Now it is quite true that some white men do not take much trouble about the native, but most of us are keenly interested in his welfare and advancement, if only from purely selfish motives, for he is the foundation of our entire economic structure.

Mr. Rainsford asserts that China and India were called upon to feed our hungry stamp mills. It is true that for rather more than four years we had Chinamen here, to our own and their mutual benefit, but it is now a long time since all were repatriated. The Indians have never worked on the mines of the Transvaal, but a large number are engaged in husbandry in Natal.

Mr. Rainsford makes a point about the magnates' preference for the "indentured labouring man." As a matter of fact this preference is not confined to the magnates but is universal. It is the custom of the country, even for house or garden work, to indenture a native for a period. It is the only method the native understands, but otherwise he is as free as you or I. On the mines he seldom if ever works longer than a year, but the average period is more like five months. The native is exactly in the same position as I and most members of my staff. We make an agreement to work for a certain period for certain remuneration, but we do not feel any the worse for having done this.

I take, however, the strongest exception to the following: "I have met many of these men (the magnates). I have known some of them. Generally speaking they don't impress you favourably." Exactly the same thing could be said of parsons and railway conductors, but the imputation is that the magnates as a class are a worthless lot. Probably some of them are, but I happen to know most of them, some intimately, and taking them through and through they are keenly interested in social welfare, not at all abnormally concerned with the making of money, and most of them do their share of unpaid public work—that kind of work to which no particular kudos is attached. But as a matter of fact there are very few magnates. Some have died—Rhodes, Werhner, Beit, names to conjure with, men who left millions of pounds, not dollars, for education and other public causes. Quite a few have returned to their native America, where I know they are as much respected today as they were here by all sections of the community.

Reference is made in the article to the strike and the more recent deportations. The miners did not come out on strike. It was our railwaymen, or rather

a few of them, and a few miners came out in sympathy. What the trouble was all about it is difficult to say, for both are the highest paid men of their class in the world. I do not say they had not grievances—who has not?—but unfortunately the two organizations were captured by revolutionaries or syndicalists, now deported, and the men followed them blindly.

The strike received absolutely no support from any section of the community, and though I do not like deportation without trial I must confess that the strong action taken by our government averted anarchy and untold misery, and possibly the loss of a great many human lives. Broadly speaking, there are many things in our economic condition which many here do not like, but I have had the opportunity of studying industrial conditions at first hand in many parts of the world and I do not think that on the whole we have much to feel ashamed about, excepting the terrible toll on human life which miners' phthisis takes. Even that, however, is being bettered, but it will take many years before we can feel the full benefit of the remedial measures which are now being carried out with great thoroughness.

WILLIAM CULLEN.

Modderfontein, Transvaal.

TO THE EDITOR: Mr. Cullen's letter, I think, answers itself. If, as he says, the exportation of the labor leaders without trial was necessary to avert "anarchy and untold misery," then surely the government of the South African union, which Mr. Cullen boasts is the "most democratic in the world" would seem to rest on a precarious foundation.

Mr. Cullen declares that his chief objection to my article is based on my unfair treatment of the mining magnates. I named no man, Mr. Cullen gives names of men well known to history by now, and says they are names "to conjure with." That is his opinion. He has a right to it.

For my part I believe as I said in my article, that the men he names had a chief part in bringing on a bloody and unnecessary war. This is not my opinion only—it is a matter of record. To do so they plotted, planned and raided and lied—these men whose names are names to conjure with. The money they left when they died to philanthropic objects is beside the question.

Politically, the government of South Africa may be democratic; industrially, as Mr. Cullen himself implies, it is oligarchic or feudalistic in the extreme. There never can be peace, between capital and labor—until to our industrial as well as to our political affairs we apply democratic principles. Democracy is ridding itself of the oligarch in politics; in time he must be banished from the field of industry as well.

W. S. RAINSFORD.

New York.

HALVING THE TAX RATE

TO THE EDITOR: It is a privilege to engage in a controversy with so fair-minded a man as Professor Seligman, because one may be sure that the end

sought under such circumstances will be the truth of the matter rather than any mere technical victory. His article on Halving the Tax Rate on Buildings in THE SURVEY for March 7 should have a very reassuring effect upon those who oppose the Herrick-Schaap bill. If they accept his conclusions there is clearly nothing for them to be alarmed about. Professor Seligman believes:

a. The proposed change will not reduce rents;

b. The proposed change will increase congestion;

c. The proposed change will exempt the rich.

If Professor Seligman could only induce his own side of the controversy to accept his beliefs there would be complete unanimity. It is because his friends believe, as a matter of fact, that none of these consequences would result that we have had such numerous delegations opposed to the bill.

I pointed out in my previous communication (March 7 issue) that the supporters of the Herrick-Schaap bill are not fomenting a revolution. They are proposing an experiment. An opportunity to try this experiment must first be submitted to the public and, unless adopted by a majority vote, the experiment will not be made. If after a trial it should be found to work disadvantageously to the public interest, it will be easy to return to the existing status.

There is a regrettable tendency in a general discussion of the question, and it is not quite absent from Professor Seligman's paper, to ascribe to the public a sordid and selfish view of public questions and hence to deprecate the submission to a plebiscite of such questions as this. My own impression is that on the whole the people have decided questions submitted to them with a general regard for the principles of morality. We need go back no further than 1896 to see how the electorate treated specious proposition offering apparently individual advantages. The hope of some day being property owners, burns in the breasts of a great majority of our citizens. They believe in a square deal for others who own property that they may have it when their time comes, if for no higher reason.

But I do believe that the great mass are guided in passing upon public questions by their sense of justice. They are often mistaken, but it is only when appeals are made to special interests that orators make the argument of personal advantage.

Again, it is urged that such subtle influences may flow from the adoption of this measure that it needs deep study for its comprehension and hence is not suited to public action. But, as a matter of fact, is it difficult for the ordinary man to determine whether we should tax one class of property, whose value is due in a quite exceptional way to the growth of population and public improvement, more heavily than another class of property, which owes its existence entirely to individual human enterprise, capital and labor?

In view of the fact that the daily press is almost a unit in opposing the measure, it should be tolerably certain that the public should be well informed as to the demerits of the proposition. If, in spite of this consideration, a favorable decision is rendered, no believer in democratic government can find fault.

Some of the arguments advanced by Professor Seligman deserve to be examined seriatim. He contends that there is in some so-called land value a measure of improvement value in cases of lots which have to be brought down or up to grade. No one questions this fact, or doubts that there might be for a period long enough to reimburse the owner, an allowance made in taxes for the money so expended. A lot having rock on it or having a marshy bottom is in the position of land "at the margin." It will take a long time after adjacent property has risen in value before such a lot will have any value whatever. Hence it will bear a small proportion of taxes or of the cost of local improvements. It is only when the cost of adjacent property has risen to a height which justifies building on the lot, and the removal of the rock on it, that it will have any real value. It therefore appears that owners of such property do receive consideration which offsets any real disadvantage under which they may labor.

I am unable to see Professor Seligman's point that there is any fundamental distinction between the demand for houses and the demand for any other products of human labor. If the general welfare is increased the opposite of what occurs during hard times should manifest itself. Under the latter condition, there is an obvious shrinkage of demand due to people contracting their room—space—sometimes going to the extent of two families occupying space previously regarded as only enough for one family. If there should be an improvement in industrial conditions due to the untaxing of a very important industry—the building business—is it not fair to expect that the reverse process will occur and that there will be an expansion of demand?

Professor Seligman is at odds with most housing reformers in regarding congestion per acre as more obnoxious and undesirable than congestion per room. Of course neither condition is desirable, but if we must choose let us have increased density per acre.

In my last article I pointed out the fallacy of believing that the lower rate on buildings would increase the height or size of buildings and I do not think it necessary to canvass that question further at this time.

Professor Seligman seems to think that the slump in building in Vancouver tells against the proposal. As a matter of fact it merely proves that even the exemption of buildings will not stimulate building beyond the point of adequate supply. If it did, there would be grave objection to the policy. Would it not have been well had he pointed out that a corresponding diminution of building operations had occurred throughout the West? Really well-informed single-taxers have not urged

Vancouver as an example of the benefits to be derived from their plan, because they knew that much too low a percentage of land value was being taken in taxes to affect the wild speculation there in evidence. But they have believed and do believe that the exemption of buildings was a step in the right direction and nothing has occurred to disabuse them of that belief.

Professor Seligman believes that new houses built in the suburbs are erected by owners who hope to recoup themselves by an increase in the value of their land. This has not been my experience and I think it enough to point out that the New York building and loan associations are a unit in favor of the Herrick-Schaap bill. Surely such a body ought to know what are the desires of the small house owners. Indeed, if one builds for a home, rise in land values may put taxes up to an uncomfortable height and force one to move on.

Can Professor Seligman seriously contend that a plan which proposes to materially reduce the tax on small suburban homes will impair the security for the loans on such homes? If the land value is reduced by such a tax, is it not reasonably clear that the intending home-builder can get his site for less and hence that he will not have to borrow so much?

I find myself at odds with Professor Seligman as to the effect of the proposed legislation on the homes of the rich. Let him adduce some typical cases. My own experience is that the homes of our very wealthy people are worth less than the sites on which they stand. Professor Seligman takes it for granted that the opposite is the case. A casual inspection of the assessments rolls indicates that north of fifty-ninth street in the best residence section of Fifth avenue, the land values represent more than two-thirds of the value of land and buildings. Where land is worth over \$150,000 for a lot 25 by 100 feet the land must ordinarily be worth more than the house.

If the rich would be favored it is to their great honor that they have not shown the slightest favor to the measure. Even the owners of great buildings, like the Woolworth, have been so blind to their own interest (if it be to their interest) that they have not aided the Herrick-Schaap bill in any way. Is it to be believed that they act with so much more public spirit than the multitude, or is it that their owners feel that in some fashion the proposed legislation is not really in their interest? Their action on this proposal is more eloquent than Professor Seligman's words.

Professor Seligman favors a proposal to levy an increment tax but he does not indicate at what point of value such a tax should begin. I am quite sure that he realizes that capitalized land value is a pure mental figment and that land value is like our grain crops which grow from year to year. There is no point at which one may say: "This much is future increment and that much past increment." If it is not taken as it arises, just as cream rises on the

milk, it is lost forever. The future increment tax abroad tends to stagnate the transfer of land and not to promote it.

Professor Seligman does not understand why a man who has invested in land should be in danger of having a part of his property taken away from him. But is not this an indictment of all taxation rather than merely of the proposed measure? General property taxes cast a shadow upon all ownership of property of whatever kind. State after state in the exercise of the police power has ruthlessly destroyed property in the name of the public welfare. Private appropriation of publicly created increment has rarely aroused a protest nor does it seem unjust to most of us because we are used to it, but public appropriation of future publicly created increment seems a horrible injustice because it is a new and strange proposition.

It is quite unnecessary to hold that there are no vested rights in land to maintain the latter theory. Individual possession and occupancy are necessary to full use and utilization. The owner or user is entitled to the full enjoyment of the full fruits of his labor. But this constitutes no claim to values created by other efforts than his own labor or other expenditure than of his own capital.

JOHN J. MURPHY.

[Commissioner, Tenement House Department.]
New York.

MR. PORTER'S CRITICISMS

TO THE EDITOR: I have, from time to time, read H. F. J. Porter's numerous letters to the press, on the fire hazard problem, and what the Factory Investigating Commission has failed to do to solve it.

The gist of these letters seem to be, first, that Mr. Porter is a highly accomplished fire hazard expert, and second, that the Factory Commission has failed to do the work for which it was appointed, namely to secure the enactment of laws that would bring about safety in factories, in case of fire. The second, is so obviously unfair and unreasonable, that I never felt it worth while to reply to any of Mr. Porter's periodical contributions to the press on the subject.

But when THE SURVEY, as it does in its issue of April 11, gives a prominent place to an article based on Mr. Porter's criticism of the work of the Factory Commission, it is high time to show what little merit there is to this criticism or attack, however it may be characterized.

It is obviously impossible in a letter to specify in detail just what the Factory Commission has done toward solving the fire hazard problem in factories. That is fully set forth in the second report of the commission.

Mr. Porter makes the astounding statement that "the commission has actually legalized the very conditions which it was created to relieve and correct."

It would be well therefore to refer

briefly to the conditions that resulted in or contributed to loss of life in the Triangle Waist Company fire, and what measures have been taken as a result of the Factory Commission's recommendations to remedy them.

The fire was said to have been caused by a lighted cigarette—smoking in factories has been prohibited.

The lighted cigarette was said to have been thrown in a heap of cuttings—fireproof receptacles for waste material and cuttings are now required, and such waste material has to be removed from the floors of the work-room and from the building itself, at frequent intervals.

The fire spread with amazing rapidity through the work-room, because of the quantity of inflammable materials that were kept on hand—an automatic sprinkler is now required. Chief Kenlon and other experts testified that if there had been an automatic sprinkler system in the building, there would not have been a single loss of life. Since the fire, such a system has been installed in the building.

Valuable time was lost because many of the employees did not know that a fire had taken place—a fire alarm signal system is now required that will notify the occupants of the building when and where a fire occurs.

The employees were not familiar with the exits provided and there was panic and confusion, when the cry of fire was heard—fire drills have been made mandatory and exits are required to be marked.

The tables and machines were placed so closely together that it was difficult for employees to reach the exits—adequate provision has been made for the proper spacing of machines and machinery and for adequate aisles leading to exits.

The doors opened inwardly and thus obstructed egress—all doors must now be constructed so as to open outwardly.

A locked door contributed largely to the loss of life—that, of course, was prohibited before the fire, but as the result of the commission's recommendation, provision has been made for more frequent and effective inspection of factories.

The fire escapes were useless, because escape by them was cut off by the flames which burst out of the windows—windows opening on the course of fire escapes are required to be fireproof.

The fire escapes ended in a cul-de-sac, from which there was no escape—a fireproof passage-way from the foot of the fire escapes is now required.

The loss of life was due largely to overcrowding. There were about 275 people employed on the eighth floor, 300 people on the ninth floor, and 60 people on the tenth floor. The people killed and injured were largely employed on the ninth floor, where the congestion was greatest. If the law, limiting the number of occupants, that was passed as the result of the Factory Commission's recommendation had been in effect at the time of the fire, no more than 60 persons could have been employed on each floor, under the conditions then existing. The Industrial Board has power to adopt even more stringent

requirements as to occupancy wherever, in its opinion, the safety of the employees requires. How absurd, therefore, it is to say that the commission has legalized the dangerous conditions that it was created to correct.

I have a high regard for Mr. Porter. I know that he is a well meaning man, but let Mr. Porter and others like him, not waste their time in attacking the laws that have been passed. The laws are all right. Let them devote their energies to securing an intelligent and effective enforcement of these laws and they will be doing something of value to the community.

BERNARD L. SHIENTAG.

[Asst. Counsel, State Factory Investigating Commission.]
New York.

To the Editor: Mr. Shientag instead of answering my specific criticism that the present laws legalize the congested stairway exit conditions which existed at the time of the Triangle fire and which it was created to relieve merely characterizes it as absurd. Let us see.

The delegation of eminent architects, attorneys and other representative citizens who went to Albany to ask for the appointment of the Factory Investigating Commission told the governor and others at the hearing that owing to the inadequacy of the stairway exits in the loft and other crowded factory buildings the employees averaging more than 100 per floor could not escape from them in case of fire, and that they had only two alternatives, viz: "to burn or jump." They stated that these buildings were unemptiable even with a fire drill for one of the latter which would operate in a real fire could not be installed.

Such civic organizations as the Fifth Avenue Association, the Safety Committee, the City Club and the Citizens' Union concurred.

Now what does Mr. Shientag say his commission has done in the matter?

First, it has prohibited smoking; second, it has required receptacles for waste cuttings, and, third, that these cuttings be removed daily; fourth, that an automatic sprinkler system be installed; and, fifth, also a fire alarm, as well as, sixth, a fire drill; seventh, that the exits be marked; eighth, that doors open outwardly; ninth, that machines be better arranged so as to provide wider aisles; tenth, that more frequent inspections be provided to prevent locked doors; eleventh, that fire escapes be fireproof; and, twelfth, a fireproof passage-way be provided from the foot of the fire escape.

Not one of these requirements has any bearing upon an increase in stairway exit capacity.

The first four are directed towards fixing up conditions in the individual shop with the idea of lessening the tendency towards a fire getting started.

The next six are directed towards getting away if a fire should get started, but although they make it easier to reach the stairway the latter cannot take care of the people when they reach there even in a fire drill, on account of its inadequacy.

BETTER BABIES

AND THEIR CARE

By ANNA STEESE
RICHARDSON

*Nat'l Chairman Dep't of Hygiene,
Congress of Mothers and Parent-Teacher Assn.*

In this book Mrs. Richardson gives the simple instructions and advice which have enabled mothers to transform "delicate" babies into children scoring 90 to 100 per cent, perfect under the rigid examination of physicians.

It is not a book of inflexible rules to be applied alike to all cases, but a series of simple talks from mother to mother in which the general principles which govern the baby's health are made clear and—with all the facts bearing on the subject given—how they may be applied to the child in question.

Beginning with "Preparation for Motherhood," Mrs. Richardson tells in a clear and intimate way how to solve the many problems of baby's diet, sleep, clothing, development, habits, etc. It is a real text book for training a mother in her duties. 252 pages. Cloth, 75 cents net; postage extra. Weight, 20 oz.

THE RAGGED-TROUSERED PHILANTHROPISTS

By ROBERT TRESSALL

A novel by a Socialist house-painter.

Robert Hunter says:

"I fear that if I say what I think it may appear extravagant; while if I moderate my words I shall feel that I am doing scant justice to what has seemed to me the most remarkable human document that has appeared in my time.

"It is a masterpiece of realism. The work of a craftsman, it is true, unerring, and pitiless in its delineation of men and life. Were Zola and Tolstoy living, I am sure they would look upon this common house-painter with envy, as one whose novice hand had outdone them. I am sure that Gorky and Jack London would confess frankly that the work of Robert Tressall surpasses theirs. Certainly, London's 'The Call of the Wild' cannot be as true to life as these ragged philanthropists."

FREDERICK A. STOKES
COMPANY
Publishers New York

Motion Pictures for the Church

"THE MOVIES" are America's most popular recreational feature. They are attended daily by 17,000,000 people. They rival every organization which makes an appeal to the masses.

THE CHURCH can utilize the "movies" to teach great moral and religious truth and at the same time answers the legitimate desire for recreation.

THE LOCAL CHURCH that does it *first* and does it *best* will have the biggest influence.

We are prepared to furnish a weekly service, consisting of high-grade, carefully censored films, provide a first-class machine and send an expert operator—at so low a cost that *any church can afford it*. We will show you how it can be done. Our organization is composed of experts in the various fields of religious, educational, and sociological activities, and their services are available to our clients without additional expense. We are now making contracts for next fall and winter.

Chicago, New York and Boston

The effectiveness of all of these requirements depends upon the frequency of the inspection called for under the tenth and we all know that the 50,000 factories in this state cannot be frequently visited by 125 inspectors. The result is that there is still smoking. There are still clippings lying around and they are not frequently removed. Doors are still locked, and even the proprietors of the Triangle Waist Company have been fined for this offence. Fires are occurring right along.

The last two requirements permit an increase of floor occupancy equivalent to the stair capacity of the improved escape and if the fourth requirement is complied with, the floor occupancy may be still further increased 50 per cent notwithstanding the fact that sprinkler systems have a record of 5 per cent of failures and if one of those exits should be cut off by a fire, the others would be hopelessly congested.

Although Chief Kenlon did testify that if there had been a sprinkler system in the Asch Building there would have been no lives lost, that was merely his opinion, and Chief Croker and other experts differed from him. If he is to be quoted as an authority it should be stated that at the same time he testified that when a fire breaks out the employees "do not wait for sprinklers to act or anything; they start to go at once." There is no doubt, therefore, on this same authority that sprinklers do not increase the exit facilities and that if the occupancy is to be increased on their account the exit facilities should be increased to accommodate it.

Mr. Shientag says that "if the [present] law limiting the number of occupants had been in effect at the time of the Triangle fire no more than 60 persons could have been employed on each floor [of the Asch Building] under the conditions then existing." I am not interested in what would have happened three years ago if the present law had been in effect then. All that is speculation. What I am interested in is how the present law is operating now. We do not have to speculate about that, for we have facts here on which to base our statements. Take the present Asch Building, since Mr. Shientag wants to use that as an example. At the time of the Triangle fire 650 people were occupying it. The present law has operated to the full in it and the owner has complied with all the eleven requirements mentioned above, but has not in-

creased his stairway exit facilities and each of the nine floors above the ground has a legal and permitted occupancy of 140 people.

Will Mr. Shientag please inform me how these 1260 people would get out in case of fire by means of the two 36-inch wide stairways with as bad winders in them as there ever were anywhere, and one outside fire escape?

This is an example of the legal congestion of exit facilities I mentioned in detail in THE SURVEY interview which Mr. Shientag refers to as absurd, but which I have described in further detail in a letter direct to the Factory Investigating Commission.

It is a pity the commission did not seize and put forward with all the strength at its command the division wall recommendation I brought to its attention as a remedy for this situation instead of treating it in a half-hearted way, as they were influenced to do by the interests who thought they might be affected. I am saving my clients thousands of dollars in rentable area by injecting it into their present and future structures.

The *Engineering News*, acknowledged as a technical authority in this country, has referred to my recommendation for division walls as "*by far the most practicable and meritorious suggestion ever made for safeguarding the lives of employees in the upper stories of factory buildings.*"

As I have frequently pointed out, fire drills although now compulsory by law in these structures cannot work in case of fire. By utilizing the division wall feature fire drills are unnecessary and the occupants of a building, no matter how high, can reach safety in case of a fire within a minute.

If the commission had taken up this idea and done with it what the Labor Department, the Industrial Board, the Fire Department and the Fire Prevention Bureau are all now trying to do in spite of these defective labor laws, New York state and city would have been far in the van of legislation affecting the danger to life from fire in our crowded buildings.

New York.

SAID OF THE SURVEY

TO THE EDITOR: I read THE SURVEY as regularly and carefully as I read the "advance sheets" of the law reports.

The law is today receiving and assimilating—rapidly but none the less certainly—an infusion of humanitarianism and changed social viewpoint.

The lawyer or judge who reads merely the law reports can hardly get an adequate perspective as to what is fundamentally taking place in the law. To understand what forces are at work and what tendencies are clamoring for concrete and constructive expression in law, he should read at least THE SURVEY.

Thoughts from THE UNPUBLISHED WRITINGS of the Late

CANON S. A. BARNETT

FIRST WARDEN OF TOYNBEE HALL
SELECTED AND EDITED BY HIS WIFE

To "go and talk it out with Barnett" was a first recourse for ministers of the crown, brother clergymen, trade union leaders, young men in Toynbee Hall and charity organization secretaries when faced by baffling problems.

Clemenceau thirty years ago ranked the little Vicar of St. Jude's as one of the three really great men in England.

Worship and Work shows the spirit of this unusual man and gives one explanation of his remarkable influence.

UNIQUE among the new schools—or among any schools—is the training course for women organizers, established by the Woman's Trade Union League. Page 322.

THE London treaty on Safety of Life at Sea has been reported out in the Senate with qualifications which leave the United States free to pass the La Follette bill. The House substitute for the La Follette bill has been agreed upon in committee but its provisions have not yet been made public. Page 316.

OUT-OF-DOORS instruction, play and rest periods are important parts of the school work in the Boston plan of "centers" for backward and special children. Page 326.

HERETOFORE we have carefully cut sex out of everything taught to children. Now we are putting it in—in big headlines. To find the happy mean of neither avoiding it or hunting for it would clear up some of the difficulty of teaching it in public schools. Page 327.

ONLY a magician's wand—or a lively civic spirit—could work the transformation of cool, green beauty that came to Riverside, Cal., through a tree-planting campaign and a general sprucing up of vacant lots and neglected corners. Page 323.

THE SURVEY

COMMON WELFARE

A SOCIAL AND INDUSTRIAL SURVEY OF JERUSALEM

A SOCIAL SURVEY is to be made of Jerusalem this summer, the outcome of efforts of Rabbi Stephen S. Wise of the Free Synagogue, New York, who has been planning for several years a study of social and industrial conditions among the Jews of Palestine.

With the co-operation of the American Ambassador to Constantinople, Adolph Lewisoohn and Nathan Straus the plans finally culminated in the selection of a committee to choose the investigators to carry on the study.

This committee consisted of Adolph Lewisoohn, chairman, Ambassador Morgenthau, Nathan Straus, Lee K. Frankel, Louis D. Brandeis and Dr. Wise. They have just made announcement of the appointment of a commission of three members, each an expert in his own field, to undertake the work of making "an intensive social survey of Jewish conditions within and without Jerusalem."

Prof. Milton J. Rosenau, who holds the chair of preventive medicine and hygiene at Harvard, will have charge of the medical division of the survey. Boris D. Bogen, superintendent of the United Jewish Charities of Cincinnati and prominent in the Conference of Jewish Charities, will give his energy to a study of the Jewish charities of Palestine. Meyer Bloomfield, director of the Vocational Bureau of Boston, will look into industry and its organization with special reference to the possibility of vocational guidance.

The commission will begin their work in the early fall. Upon completion of the study, when the investigators return to America, a report of their findings will be published.

In this connection it is interesting to note the growth of the survey movement. The standards and spirit of the work done in the Pittsburgh survey of 1908 popularized the survey idea and since then over twenty cities have submitted to searching investigations.

In 1912 the Russell Sage Foundation, recognizing the need of organized effort to cope with the increasing call for

social surveys, created a department to handle this work under the direction of Shelby M. Harrison of the Pittsburgh survey staff.

This department has made some noteworthy surveys. The past year comprehensive surveys have been made of Topeka, Kan., and Springfield, Ill., and plans are now under way for five-year studies of Baltimore and Cleveland, the first to eclipse the Pittsburgh survey in scope.

Thus it will be seen that this survey of the old Jerusalem by the Jews of the new world gives the social survey its first international and perhaps most conspicuous venture.

OUT OF THE WEST CIVIC WISDOM FOR THE EAST

IN AN APT and forcible address to the City Club of Chicago Mayor Mitchel of New York, facetiously but none the less correctly, marked the occasion as the first tour of a New York mayor with members of his cabinet to seek wisdom in the West for use in the East.

The school systems, the recreational developments and the civil service methods, were said to have been especially suggestive. Efficiency in public service he thought depended upon conditions of work satisfactory to the public employes, and this in turn depended upon doing them exact justice. To this end assurance of security and opportunity in the public service must be given them. Conference between the heads of departments and their subordinates should be invited and co-operation suggested.

The most important prompting of this western tour was Mayor Mitchel's proposal to organize an interchange of views and experiences derived from the conduct of municipal affairs both by city officials serving the large cities and such groups of private citizens as constitute the city clubs of New York and Chicago. Henry Bruere brought down the house by pointing up the fact that every New York official present except himself was an Irishman, with the alleged adage that "to govern one's self is God-like, but to govern others is Hibernian."

MIDWIVES AND BLINDNESS IN ENGLAND

CONVINCED that a serious relation existed between *ophthalmia neonatorum* and the competence of midwives, the New York Committee on Prevention of Blindness decided to study the subject closely, and to ascertain what laws were in force in various countries for training and licensing midwives and controlling their work. Of the fifteen countries whose legislation in the matter was studied, England was found to follow the most satisfactory system.

The results of this important investigation have just been published by the committee. Miss Van Blarcom, secretary of the committee, leads up to the important legislation of 1902 by a brief sketch of earlier days—days when midwives were licensed "by virtue of the Power Ordinary and Episcopal" of the bishops, taught how to "christen children in time of necessity according to the canons of the church," and enjoined not to "use or exercise any witchcrafts, charms, sorcerie, invocations or prayers other than suche as be allowable and may stand the lawes and ordinances of the Catholike Church."

Miss Van Blarcom continues:

"In view of the mild conceit prevailing at the present time over twentieth century enlightenment, it is particularly interesting to find that though the public at large is today almost unmoved by the ignorance and negligence of midwives, there was much dissatisfaction among the women in England during the 16th century because of the incompetence of this group of practitioners. There was even then frank recognition of the fact that education was seriously needed."

That the marked decrease in death of infants and in cases of puerperal sepsis and accidents in the past nine years is wholly due to the midwives' act cannot, of course, be claimed. But Miss Van Blarcom was assured by the English authorities that the act has certainly been an important factor in raising obstetrical

Donahy in Cleveland Plain Dealer

SAFETY AT SEA

The Senate Committee on Foreign Relations on Wednesday of last week authorized a favorable report on the treaty of London (the International Convention on Safety of Life at Sea) with qualifications reserving to the United States the right "to impose upon all vessels in the waters of the United States such higher standards of safety and such provisions for the health and comfort of passengers and immigrants as the United States shall enact for vessels of the United States." This leaves the United States free to pass the LaFollette seamen's bill as it came from the Senate.

On Thursday a delegation of seamen from different parts of the country saw the President who expressed himself in sympathy and promised to assist. Friday the House Committee on Merchant Marine and Fisheries agreed to report out a seamen's bill as a substitute for the LaFollette seamen's bill, and to ask for a rule for its consideration. Its provisions are not known, as THE SURVEY goes to press.

"If a good bill cannot be obtained now," writes Andrew Furuseth, president of the International Seamen's Union, "after the testimony furnished by the Titanic, the Volturno, and Oklahoma, the Monroe, the Columbian, the Empress of Ireland, and now the New York, the plagues of Egypt themselves could not move things. The last collision would have been more disastrous than the Empress of Ireland or as much so, if the New York had been struck about amidships instead of near the bow. That another thousand people were not drowned was the one remarkable part of the accident.

"We seamen have taken the position that disasters will increase in proportion as skill departs. The progress of events surely seems to prove us right."

work in England to a higher grade of efficiency, and also that by its enforcement obstetrical patients received medical care of a higher grade more frequently than in the old days.

A similar report on midwives in America has been made by the same committee, and the New York State Board of Health has asked it to prepare recommendations for regulating the practice of midwifery.

The committee's recommendations are especially strong as to the midwife's personal cleanliness and sterilization of her instruments. Full provision is made for after-care, a midwife's visits continuing as long as necessary. These recommendations were submitted on May 19, and are now under consideration by the State Board of Health.

FLOOD AND FAMINE ENGINEERS OFF FOR CHINA

THE BOARD OF engineers which is to make an intensive study of the Chinese "flood and famine" region, and to report on the possibility of conservancy, sailed from Vancouver June 10.

This area of 30,000 square miles, comprising one of the richest and most populous parts of a great alluvial plain, has been ravaged by floods and consequent famines for 2,500 years. The steps by which the American Red Cross induced the Chinese government to agree to spend \$20,000,000 on flood prevention were told in THE SURVEY of May 2.

The chief engineer on the board is

Col. William L. Sibert, U. S. army officer, who has been in charge of the construction of the Gatun locks and other parts of the Panama Canal. The other members are Arthur D. Davis, chief engineer of the United States Reclamation Service, and Prof. Daniel W. Mead, professor of hydraulic engineering in the University of Wisconsin. Charles D. Jameson, who made the preliminary survey of the "flood and famine" region for the Red Cross, accompanied the board as general adviser. Several assistant engineers, a stenographer and a disbursing officer, make a party of seventeen.

The board will reach the flood district in time, it is expected, to observe the summer floods this year and return by November 1.

All details of the arrangements for placing the Chinese bonds and awarding contracts for the work will wait upon the report of the board.

Mr. Jameson's preliminary report emphasized the necessity of finding suitable outlets for the Huai and other rivers, deepening channels and building regulating works. If floods in this district can be stopped, said Mr. Jameson, suffering, starving and degeneration will be eliminated from the lives of millions of Chinamen now fast becoming beggars and robbers.

UNIVERSITY LABORATORY OF PUBLIC ACCOUNTING

THE DEPARTMENT of accounting of the New York University School of Commerce, Accounts and Finance, announces that beginning October 1 it will conduct a course of field work in public accounting. The practitioners will be post graduate students in the school. The patients will be the various charitable institutions of New York city. The work will in no way interfere with the field of certified public accountants since the institutions to benefit by the scheme are ordinarily unable to avail themselves of expert services.

Students in the department of accounting have been handicapped by lack of practical experience which would facilitate the securing of positions with certified public accountants. At the same time many social agencies in the city have been unable, on account of the expense involved, to obtain efficient auditing of books. By correlating these two deficiencies John P. Wildman, head of the department of accounting, saw his opportunity to establish the first laboratory for public accounting connected with a university.

The plan is in accord with Chancellor Brown's ideal, already exemplified by the establishment of Government House, to make New York University a school where men and women may not only draw knowledge from books but from first hand experience.

IS there any difference between believing in capital punishment and being willing to execute a man with one's own hands? Presumably a majority of people in most of our states believe that the death penalty is a wise instrument of justice. Else why do they tolerate it? Yet how many of them would spring the trap or turn on the electricity? If they had the imagination to see that that is what they are really doing as citizens, in perpetrating the death penalty, would the death penalty stand on our statute books?

This question is the central idea in a new one-act play written by John D. Barry, a San Francisco newspaper man, and friend of Fremont Older. The play is intended to supply what our imaginations lack. Mr. Barry first embodied his idea in a short story. As first dramatized a hanging was actually produced on the stage and in that form the play ran for two months in San Francisco.

In bringing it to New York, where it was given a private performance at Hammerstein's Victoria last month, Mr. Barry changed the hanging to an electrocution. He also altered the ending, so that now the condemned man is not killed. This gives the warden a chance to make a short curtain speech against capital punishment.

When the curtain goes up Murray, a prison "trusty" in stripes, enters. He goes slowly to the electric chair and examines it. Then he examines the switchboard. He is standing back of the chair, yawning, as Gillespie, the executioner, enters.

After Gillespie and the trusty test the apparatus, the doctor comes in, followed shortly by a young newspaper reporter, Sheriff Harper and the brother of the woman of whose death the condemned man has been found guilty. Presently the reporter, who is anxious to get his "story" in promptly asks how long the electrocution will take.

DOCTOR—Oh, he'll be pronounced dead and you can leave the room within five minutes.

SMYTHE [Reporter]—Five minutes? I thought they died right off.

DOCTOR—So they do when it gets 'em at the right time.

SMYTHE—When is the right time?

Capital Punishment in Theory and Deed

DOCTOR—Oh, when the breath's going out.
SMYTHE—And suppose it doesn't get them?

DOCTOR—They get another shock.

SMYTHE—So they have to be electrocuted twice?

DOCTOR—They don't feel the second jolt.

GILLESPIE—We'll give Wilson enough. We're not going to take any chances.

SMYTHE—How much will you give him?

GILLESPIE—Well, we usually give about 1,800 volts. This time we'll give 2,200.

SMYTHE—How long do you keep it on?

GILLESPIE—Oh, a few seconds. Depends on the doctor.

SMYTHE—How do they take it?

GILLESPIE—Well, some of 'em take it very quiet; others almost jump out of the harness. One of the seven fellers we shot off one morning here broke the straps and went up nearly three feet. But when he come down all the jump was out of him.

After some further preparations Wilson is brought in, seated in the chair and the warden gives Gillespie the signal to turn on the current. But Gillespie's nerve deserts him, and he refuses to act.

WARDEN (to Murray)—Come over and do this job.

MURRAY—Me, Warden?

WARDEN—Yes, there's something the matter with Gillespie.

MURRAY—I can't do it, Warden.

WARDEN—Why not?

MURRAY—It's not my business, Warden. I can't shoot off a man like that. You ain't got no right to ask me to do it.

WARDEN—Will one of you men come over and do it. (No answer.) There's two hundred and fifty dollars for the man that'll do it. (No answer.) Say, Murray, don't you want to make two hundred and fifty dollars?

MURRAY—Not that way, sir.

WARDEN—Well, somebody's got to do it.

MURRAY—Why don't you do it yourself, sir?

WARDEN (looks at Wilson. He seems to be about to go forward. He hesitates. He turns to the crowd)—Is Sheriff Harper here?

HARPER—Here I am, sir.

WARDEN—You arrested Wilson, didn't you?

HARPER—I did, sir.

WARDEN—Will you do this?

HARPER—No, sir. I'm the Sheriff of Hendricks County. I ain't no executioner.

WARDEN—It'll mean two hundred and fifty dollars, Harper.

HARPER—I wouldn't do it for a million. Here's the brother of the woman that was murdered. He's got it in for that feller. Perhaps he'll do it.

WARDEN—Which is he?

FINNEY—Here, sir.

WARDEN—Will you do this?

FINNEY—No, sir.

WARDEN—I thought you wanted him killed.

FINNEY—So I do. But I can't kill a man in cold blood—not even him. That's your business. That's the business of the State.

WARDEN—Is there any one that'll do it? (Long pause... A man steps out of the crowd.)

SPECTATOR—I will.

WARDEN—Have you got anything against this man?

SPECTATOR—Anything personal, do you mean?

WARDEN—Yes.

SPECTATOR—No.

WARDEN—Have you any reason for wanting him killed?

SPECTATOR—He committed a murder, that's all. I think all murderers ought to be killed when they've had a fair trial and been convicted. I'm for the law and I don't want your money either.

WARDEN—Who are you?

SPECTATOR—What difference does that make? I'm a voter in this State. I've voted at every election for the last twenty years. As a citizen I stand for the business, and I can't see that there's any difference between standing for it and doing it.

WARDEN—Go ahead.

(As he puts hand on handle of Switchboard, a cry is heard outside.)

SPECTATOR—Well!

WARDEN—Stop (He goes to the window.)

VOICE (outside)—The sentence has been commuted to imprisonment for life.

(A man rushes to the chair and unstraps the man. The man shakes hands with the warden.)

WARDEN—Wilson, a new spirit has come into the world. It has saved your life. We are learning it is better, not to destroy the good and the bad together in a human being, but to cure what is bad and to save and strengthen what is good. Now you have a chance to make a man of yourself. While you are here you will be well treated. Perhaps, after years, when you have shown that you are fit to go back, you will be given a chance.

POWER

JOSEPH WARREN BEACH

MOVELESS he stands against the iron railing,
With all the world about him in commotion.
The mighty water races on beneath him
To storm the falls. From the unnumbered chimneys
Flutters the smoke in long wind-shredded pennons.
The switching-engines, blowing clouds of steam,
Tear back and forth, while over its granite arches
Thunders the night express, steady as fate,
With pomp of banners and proud illumination.
On every hand is power visible,

And yonder where the mills and power-houses
Are lighting up their tier on tier of windows
Intenser it moves in spinning shaft and wheel,
Or lurks disguised in sleek and humming turbines.
Yet in that quiet figure by the railing,
Frail as a wisp between the sky and water,
Labors the sovereign force of all the planet.
Master of all the powers of earth and air,
He well may gaze upon his harnessed river
And stand unmoved amidst the hurly-burly

FOR COLORED CHILDREN

Memphis houses its Juvenile Court in two buildings in different parts of the city—one each for colored and white children. The colored court is in an old house, badly equipped, its sewer connection in the back yard. But Julia Hook, the colored probation officer in charge, keeps it clean as a whistle, with plants in pots here and there. Mrs. Hook has been a paid probation officer for three years. Before that, beginning as far back as 1876, she did volunteer work for children.

A BURGLAR FOUR YEARS OLD IN THE MEMPHIS JUVENILE COURT—BY FLORENCE KELLEY

AMONG THE STRIKING and suggestive experiences afforded by the city of Memphis, during the National Conference of Charities and Correction, none compared with encountering a burglar four and a half years old, passionately hugging a Teddy bear. His record in the Juvenile Court docket reads:

May 8, Gainer —, 10 Tin Cup Alley, 4 1/2, burglary, larceny, prowling, 2:50 a. m., police, probation to Sanderlin.

Being interpreted, this brief entry means that a little boy, four and a half years old, loitering one afternoon in front of a shoe store, saw a pair of shoes which he so coveted that, between two and three o'clock the next morning, he returned, smashed the show window, crawled in through the broken glass, and was taking the little shoes when a policeman arrested him. His name is in the docket of the police court, and any future offense will stand against him as a second offense.

Gainer has no mother, no father, no home, no teacher. He is colored, and the city of Memphis—which gives its white juvenile offenders six teachers, and establishes their Juvenile Court in a beautiful building once a school house—affords no teacher for colored delinquent children. Its colored Juvenile Court is a separate building, physically

dilapidated but kept as clean as hands can make it by the unwearied effort of Mrs. Julia Hook, the probation officer for Negro children.

Gainer is under probation to a man to whom, according to the probation officers for Negro children, nine boys have been assigned. None of them has been received, or cared for by him. Gainer

remained at the Juvenile Court, uncalled for on the day I left Memphis. He is strong and active, a heavy burden for the slight little woman in charge. When her duties call her away from the first floor of the shabby six-room wooden cottage which shelters Negro boys and girls pending disposition of their cases, Gainer is perforce under lock and key in the basement room which, with bars and lock, looks painfully like a cell.

In the Juvenile Court for colored children no judge was sitting, but a policeman assigned to service as a probation officer. The juvenile court is a branch of the police court. One judge is in charge of all its work, including that of the white and colored Juvenile Court. It is physically impossible for him to perform all three tasks, and many children are, therefore, dealt with by this substitute for the judge.

Two girls were before the policeman, awaiting disposal. They were left as probationers in the possession of their mothers, whose incapacity for dealing with them was shown by their presence in court and the girls' own statements.

This is a travesty of juvenile court practice. The only probation officers for colored children, paid in their service, are the matron and her husband, whose hands are overfull with the care of the boys and girls detained day and night in the Juvenile Court Building. There is no municipal or county industrial or farm school, or private philanthropic or educational provision for Gainer.

I visited the beautiful place bought many years ago by Negro subscribers, for a home for Negro children and old people. A substantial frame house and a charming little stone church stand at the top of the hill, from which the property stretches away, embracing 25 acres of fields and woods. But it is devoted exclusively to the care of nine aged men

NO. 10 TIN CUP ALLEY

The house where Gainer lived—one of a dilapidated row of shanties on an unpaved street. His mother is dead, his father "unknown."

and women, of whom one appeared to be dying of old age. They are former servants of white families. Several of them, almost or quite blind, were tottering about the piazzas and grounds.

To my puzzled question why all this space, and this lovely country beauty, were kept for nine aged people, while the four-year-old burglar remains unclaimed in the Juvenile Court and other children were given on probation in my presence to the care of dissolute people for want of a suitable institution, I received no intelligible answer.

In the annual report of the Colored Federated Charities—a department of the Associated Charities of Memphis—the institution is described as the Colored Orphans Association and Old Folks Home. The report sets forth that: "The conditions of entrance to the Home have now been fixed; the Home requires that the applicant be past 60 years of age or that she be otherwise handicapped; that the applicant pay an admission fee of twenty-five dollars, and that if they carry a life insurance policy that same be made over to the Home. The character of the Home permits the maintenance of a shelter for Negro orphan children, but at present the limited finances of the Federation make this impossible."

For the conference visitor, the haunting question will not down: Why does Memphis, why does Tennessee, discriminate thus between its white and colored delinquent children? Why is it left to the Colored Federated Charities to do the work of the city and the state? And the task being so left, why do the Associated Charities of Memphis permit their colored department to leave the work undone?

In sharp contrast with the passive state of the Federated Charities in its failure to carry out the intent of the founders of the Colored Orphans' Home,

FOR WHITE CHILDREN

To the white Juvenile Court, the city has just turned over a disused public school building. It houses the court, separate detention rooms for delinquent and dependent children, special school rooms for backward and truant children, a large gymnasium, a model cottage and manual training rooms. Memphis has in this building one of the best equipped juvenile courts and detention homes in the country. Until now the white Juvenile Court has been housed in a dingy and inadequate building.

is the strenuous effort of the Memphis colored women's clubs to buy a suitable building in excellent surroundings for the Negro Juvenile Court. A first payment has been made, the house is in part furnished, frequent meetings are held, and much energy manifest.

But why are these Negro women of very moderate means and many heavy burdens left by the city to buy a court building, while the white children have

recently been moved into admirable quarters provided at the cost of the city?

As I think of the four-year-old burglar deprived by neglect of the community of all education and all prospect of moral guidance, I am filled with apprehension of the future citizen whom the city of Memphis is preparing for our common country. Moreover, the little burglar is only one of a mass of children whose fate is akin to his own.

MANUAL TRAINING AND HOUSEKEEPING

In the basement of the white Juvenile Court, the boys use a well-equipped shop. A small building at the rear has been made into a model cottage where the girls practice cooking and household management. This was established by the chief probation officer, Mrs. Wert, who imported the idea from the model flat at Chicago Commons.

INDUSTRY

THE LONGSHOREMAN'S CASE AND DEPARTMENT STORE CONDITIONS—By JOHN A. FITCH

IF STRONGER evidence were needed of the difficulty of finding out the truth of an industrial situation through public hearings than was presented last week at the inquiry into department store conditions conducted by the Federal Industrial Relations Commission, it is not easy to conceive what it might be. Each spectator and each commissioner might have his private opinion as to the credibility of the various witnesses who appeared, but each might conceivably be of a different opinion. The last testimony given in the three-day hearing on department stores was a denial by the witness of the testimony given previously by another witness. And that was fairly typical of the situation.

Two major subjects were under investigation last week by the commission—department stores and dock work, more commonly spoken of as longshorework. The latter was by far the more illuminating and satisfactory. The investigation was in the hands of Charles B. Barnes, who has made a thorough study of longshorework in New York city and has recently made a report of his investigation to the Russell Sage Foundation. The testimony was given by longshoremen, by superintendents of docks, and by social workers.

Apparently no census has been taken of longshoremen in Greater New York, but the number was variously estimated by the witnesses from 35,000 to 40,000. They have a union which is not recognized although the rate of wages is commonly referred to as the union rate. This is thirty-three cents an hour for day work, fifty cents for night work and sixty cents for work on Sunday. The regular work day is ten hours, and if a man were employed regularly six days a week he would earn \$19.80.

On account of the extremely casual nature of the work, however, it was admitted by everyone that longshoremen do not earn anywhere near that sum. The men themselves and their union representatives declared that throughout the year they earn an average of about \$10 a week. Some of the representatives of the steamship companies declared that they make as high as \$15 a week, and others thought the average would be about \$12.

It was brought out in the testimony, however, that the officers making the higher estimate reached their conclusions by dividing the pay roll by the number of jobs, entirely overlooking the fact, as was brought out by the commission, that men are constantly being laid off and other men taken on, so that in any given length of time there would be more longshoremen employed than the

Probing the Causes of Unrest

VI

The sixth of a series of interpretations of the hearing before the Federal Industrial Relations Commission by a staff representative of The Survey.

number of jobs as shown by the pay roll.

John F. Riley, general organizer of the New York Longshoremen's Union, testified that in the Chelsea section of New York, which runs from Twenty-third street to Fourteenth street on the North River, about 5,000 longshoremen are constantly on hand. It is within this section that some of the largest foreign steamship lines dock, such as the White Star and the Cunard. Mr. Riley declared that to do the work required in loading and unloading ships 2,500 men were needed and that in consequence practically 2,500 more were unemployed most of the time. In spite of this amazing over-supply of labor, Riley testified that men are often required to work enormous stretches of overtime in order to get ships loaded and unloaded. They sometimes work all day and all night. Twenty hours is not at all infrequent and men sometimes work as long as twenty-eight hours without rest.

Perhaps the foundation of most of the hardship attendant upon longshorework is connected with the system of hiring. According to the testimony given, the time of taking men on depends entirely upon when the ships dock. The men report at a pier where a ship is expected at 7 a. m. It may be that the ship has been delayed. If so they are not taken on, but are told to wait around and be on hand when the ship does dock. This may be in an hour, it may be in two hours or it may be in the afternoon. Whatever the situation, it is incumbent upon the men to be in the neighborhood when the work is ready for them. They are hired only for such time as work is actually done.

As a ship approaches dock, the men "shape"—that is, they gather in the form of a great horseshoe in front of

the pier. The foreman goes out among them and picks out his men. There are always more men in a shape than are needed. So after waiting for hours for a chance to work hundreds of men may be turned aside after all without receiving employment.

According to Riley and other witnesses the men have to be on hand practically all the time, even seven days a week, in order to get perhaps 200 days' work in a year, and they have to be ready to subject themselves to enormous stretches of overtime.

It was the universal testimony that Pier 60, belonging to the White Star Line, is the best in the city both in facilities for work and in treatment accorded the men. Nevertheless, it appeared that there are no facilities of any description on Pier 60 for the convenience of the men. There are no places for a man to hang his coat. There are no lavatories excepting a faucet here and there, and there are no towels. There is no hot water and the sum total of provision for the care of men who are injured consists in a medicine cabinet placed on the pier by the Longshoremen's Union.

When a man is injured in the hold of a ship—and everyone declared that such injuries are common—the "ambulance" is called for. The "ambulance" is a fruit box in which the man is laid to be hoisted out of the hold. He is then laid, sometimes on a truck and sometimes on the floor of the pier, to await the coming of the hospital ambulance.

Patrick Powers, who has been a longshoreman since 1873, told about injuries he had received.

"What did they do for you?" asked a member of the commission.

"Put me into the ambulance," said Powers, "histed me to the deck, took me time and let me go home." He received no compensation.

Anna K. Graham told of the establishment in Twenty-second street of the Longshoremen's Rest. The three-story building was secured by the Church Temperance Society and thrown open to longshoremen. Lavatories, game rooms and reading rooms were installed and the men were given to understand that they would be welcome while waiting for a "shape." The building accommodates about 600 men and it is the only place from Twenty-second street to the Battery where longshoremen may go to spend their time excepting the saloons. They have eagerly come to this building, and Miss Graham is of the opinion that if such rests were established up and down the waterfront far less money would go into the saloon and far more into the home. That has been the experience with the 600 men who are able to enjoy the accommodations at Twenty-second street.

Two witnesses testified of the methods employed at Liverpool. Louise Peters, a social worker who has investigated conditions there, told how men are taken on at regular hours in the day. The times for hiring men are 7 a. m. and 1 p. m. If a man goes to the docks at 7 a. m. and is not hired he is not required to hang around in the hope of securing employment, but he goes at once to what is known as the clearing-house which has been established under the English system of Labor Exchanges.

There is a central clearing house and six minor clearing houses. At any of these a man may report and if there is an opportunity for work before the noon hour for hiring he will receive word of it there. It is not necessary for him to visit all the docks in turn as men do in New York, for after the hiring hour no more men will be taken on unless some foreman has made a mistake and has not employed a sufficiently large force of men. In that case the foreman telephones to the clearinghouse and a man is sent to him.

Timothy Carroll was able to tell about this system too, not because he had studied it, but because he had worked under it. For five years he has been a longshoreman in Liverpool, and for the last two years he has been in New York. "It's Chinese labor in New York as compared with Liverpool," he said.

In Liverpool if a man is taken on he must be paid for a half day's work whether the work continues that long or not. In New York men are hired for an hour, laid off, told to wait an hour, during which they receive no pay, and then may be taken on after another hour. Then there is too much bullying in New York, Carroll said. "The foreman doesn't treat you like a man. From all that I can see you're treated like a dog."

"This is a personal question and you needn't answer it unless you want to," said Chairman Walsh, "but why don't you go back to London?"

"Well, I'll tell you," said Carroll with a grin, "I had some money when I came over here and I don't want to go home broke."

Perhaps the most surprising thing about all the testimony regarding longshoremen was the fact that not only were these charges corroborated by the representatives of the steamship lines who appeared, but some of them even attempted to justify them. F. W. Hersey of the Bush Terminal, Brooklyn, declared that the responsibility lay upon the community and upon the state, that the steamship companies were in no way to blame and could not be expected to remedy conditions.

In the department store inquiry, testimony was given by Gertrude Beeks, director of welfare work of the National Civic Federation, by managers of the leading department stores, and by representatives of the Retail Clerks' Union. The testimony, as indicated above, was vitiated to a large extent by the fact that it consisted so largely of charges and denials. Union organizers and former employees of department stores testified to violations of law, and low wages. The store managers, on the

other hand, presented testimony that led one of the New York papers—which, singularly enough, chose to accept the statements of the managers instead of those of the employees—to say, "It's some luck to be a saleswoman" in some of the leading stores of New York.

Miss Beeks, speaking of the investigation conducted by the National Civic Federation, declared that instead of finding conditions particularly bad, "unsuspected fine points" were discovered. "Indeed," she said, "the casual observer might think that nothing remained to be done." Nevertheless she had a list of seven or more conditions which she declared constituted the chief conditions in need of correction. This list included the long work day, slow promotion, system of fining and docking, no dismissal notice to the rank and file, lack of fire preventives, lack of rest rooms for women, and no general plan for vacations with pay.

There was considerable testimony which tended to substantiate these criticisms. Mrs. Jeanette Smith, a pleasant-faced woman of mature years, went on the stand and declared that she had worked at Wanamaker's for seventeen years. She received \$8 a week at the beginning, and when she left the store on December 24, 1913, she was receiving \$10 a week. Five minutes before closing time on that day, she says that she was approached by an official of the store and told that her services were no longer required. She said that during the course of her seventeen years' service, she had been late at the store twice. She appealed to the employment manager, but could not see him. She then wrote to him and received a reply that he could not "create" a position for her.

Other employees who had had similar experience of sudden dismissal testified, and there were many statements of low wages, overtime work, and the violation of the fifty-four hour law for women.

Benjamin Gitlow, president of the Retail Clerks' Union, mentioned a spy system which he said is in operation in most of the stores and which tends to draw employees into dishonest practices. He declared that the detectives in the stores have to make good and they entice employees into wrong-doing in order to make a record.

As to the efficiency of store employees, he declared that the most amazing thing is the high degree of efficiency prevailing in view of the low wages paid. "In no other occupation," he declared, "will you find people of so high a caliber working for such low wages."

Managers and other officials from Wanamaker's, McCreery's, Gimbel's, Bloomingdale's, Namm's in Brooklyn, and Altman's testified as to conditions in their stores. Leslie Graff, manager of Altman's testified that none of the saleswomen in that store received less than \$9 a week. The president of McCreery's said that, including commissions, the average wage paid to saleswomen in his store was as high as \$13.50 a week. At Bloomingdale's, on the other hand, a representative of the store stated that there were 208 out of 368 saleswomen employed who get below \$8;

and Benjamin H. Namm testified that out of 416 saleswomen, 146 get less than \$8 a week and 238 receive less than \$9.

The most interesting testimony had to do with the attitude of the department stores toward unionism. It is well-known that the organizers of the Retail Clerks' Union have been harassed in a number of ways in their attempt to hold meetings in the street outside of the stores, when the employees are leaving. Several dismissed employees testified that they had been discharged for belonging to unions. All the store officials who appeared, however, declared that they were not opposed to unionism. But on cross-examination most of them admitted that they were indifferent to the organization of unions only when unions conducted themselves "properly."

Preston D. Lynn, manager of John Wanamaker stores, said that he was not opposed to unionism so long as propaganda work was not carried on within the store. An employee, however, who has recently been dismissed, declared that he was told that his services were no longer required because he had been giving information about the store to the union. The store had no objection to his belonging to the union, he was told, but he must not give any information. "That," said the witness, "is like telling me that I can go to church, but must not pray."

Percy Straus of Macy & Co., said that when he came out of college he believed in unions and he believes in them, theoretically, still, but that as a practical matter, he does not favor them.

Leslie Graff was questioned to a considerable extent about the Retail Dry Goods Association, of which he was secretary for seven years. The association keeps a complete list of employees of different members, Mr. Graff testified. Whenever an employee leaves the employ of any of its members, his name is sent to the headquarters of the Dry Goods Association, together with his record and the reason for his leaving the service. If he is discharged, the reason for that is given. Then, when the employee seeks a position in any other store in the association, headquarters are called up, and the record is immediately secured for the benefit of the store where the application is made. It is not a black list, Mr. Graff insisted; and he said that no entry would be made on any of the cards that an employee had been discharged on account of belonging to the unions. If, however, the employee were a "disturber" or a "disorganizer," the facts would be duly entered.

TO DEFEND WORKINGMEN

The International Defense Workers' Conference has been recently organized in New York city to secure funds and publicity for the defense of workers. "We shall use our power," states the platform, "to save from illegal conviction agitators whom the powers of capital are to railroad to prison on a false charge, also to secure acquittal for those actually guilty of transgressing the law in the interest of the emancipation of the working class."

A TRAINING SCHOOL FOR WOMEN ORGANIZERS

WITH THE COMING of its first two pupils, one from Kansas City and the other from Baltimore, the Training School for Organizers, recently established in Chicago by the National Women's Trade Union League, has begun work in earnest. These two girls, both by a coincidence connected with the brewing industry, one in the bottling of beer and the other in the making of corks for such bottles, have come to receive a three months' training in the work of organizing of girls and women. Both these young women have had practical experience in the labor movement, as leaders in their respective trades, and now seek training which will make that experience more valuable.

The training is made possible for the Kansas City girl through the Industrial Council of that city granting her a leave of absence on full pay and to the Baltimore girl by a scholarship from the Woman's Trade Union League of her city.

Every week brings to the office of the league requests for women organizers to be sent into the field, from California to Pennsylvania. It was to cope with this situation that the biennial convention of the league, held at St. Louis last June, authorized the establishment of a National Training School for Organizers.

To quote the words of the president in her report to the convention: "There are two facts which stand out above all others in the present industrial movement in America: The first is the ever increasing number of women entering every trade, and the second is the successful social uprisings of the workers in the sweated industries. These two facts point to the need of the hour: training for and in organization among women and girls.

"In all these strikes, women and girls have been in the majority, and unless we equip ourselves for definite training in organization work we will not be able to hold what has been gained through suffering and hardship and imprisonment during the strikes. All of us know that the task after a strike is the constructive work of organization, and it is idle to think that this work can be done without organizers. No group of people can hold what they have won in the way of fairer conditions except by their courage, initiative and vigilance and their trained capacity to stand together."

The work of the school has been divided into field and classroom work. The field work, which is done under the direction of the presidents and organizers of the local leagues, consists of participation in whatever work of organization is under way. The pupils assist in the distribution of cards calling meetings, and take part in the meetings themselves. They are given practice and instruction in the taking and adjusting grievances, and in presenting them to employers.

Perhaps the most interesting division of the work is the class in public speaking. This class is under the direction of Professor Nelson of the University of Chicago, and other working girls to the number of thirty were admitted. The school

offers instruction in the history of the labor and woman movements, both in the United States and in Europe; drill in written and spoken English, and a course in economics. The students are also put in touch with current protective legislation for women, with the means of keeping in touch with it, and with the methods of obtaining and holding such legislation. Lessons in bookkeeping and accounting are also given, as well as instruction in the keeping of minutes, writing of reports, etc. Evening lectures and round table discussions are held once a week. Correspondence courses in those subjects in which it is deemed possible will be undertaken.

NEW YORK HITS AT COMPULSORY "MUTUAL BENEFIT"

IF THE White bill, recently passed by the New York Legislature, accomplishes the purpose of its backers, department stores will no longer be able to compel their employees to contribute to compulsory "mutual benefit associations," so called, maintained by the stores.

The bill was introduced in the Senate on March 19, and is an amendment in the form of an additional section to the state labor laws. The prohibitory paragraph reads as follows:

"A corporation engaged in the business of operating a mercantile establishment shall not by deduction from salary, compensation or wages, by direct payment or otherwise, compel any employee in such mercantile establishment to contribute to a benefit or insurance fund maintained or managed for the employees of such establishment by such corporation, or by other corporation or person; and every contract or agreement whereby such contribution is exacted shall be absolutely void."

Any corporation violating the act is liable to a penalty of \$100, recoverable by the person aggrieved, and any director, officer or agent who compels an employee to make a contribution in violation of the law is declared to be guilty of a misdemeanor.

The history of legislation in regard to hours of work would seem to show that the only effective laws of the sort are those which provide that the employer shall neither require *nor permit* the employee to work more than the legal number of hours. It will be noted that the White bill, which is drawn in similar form, does not enjoin the employer from *permitting* employees to pay any moneys to a fund which is controlled by the store, or to which the store has access.

The State Factory Investigating Commission and the Retail Dry Goods Clerks' Association were active in securing the passage of the bill, which followed closely on the heels of the disclosures regarding the Henry Siegel store benefit associations and the loss of thousands of dollars by the store clerks. All three of the Siegel stores which failed this winter used funds belonging to the benefit associations without giving security. Consequently the

employees in the stores lost all their savings with little if any chance of redress.

FOR BETTER FACTORY INSPECTION

The New York State Labor Department has made a change in the cards to be filled out by factory and mercantile inspectors which should not only result in releasing 50 per cent more time for actual field work, but should weed out in short order the inspector who is not familiar with his job.

The old system required a statement upon every point of the law, whether violated or not, made out on a large card. From this a condensed summary was made on a second card and both forms forwarded to the labor department's office. Where there was a violation of the child labor law, it sometimes meant that two extra cards had to be filled out. The inspectors claimed that it took them about three hours to write up the results of four hours' work.

The new form practically requires a report of violation only, which may be entered directly on the card to be forwarded to the central office, without duplication and which presupposes a thorough knowledge of the labor law.

To cover any advantage there may be in specifying all points of the law for the purpose of a check list, a reference card carried in the inspector's book is supplied.

The change is directly in line with a recommendation made in the second report of the State Factory Investigating Commission.

FROWNS ON PIECE WORK

Judge Jacob Trieber, of the United States District Court, has ruled that the payment of wages on the day-labor plan is preferable, and has also decided that it is proper for the receivers of the Missouri and North Arkansas Railroad to treat with the men as a shop federation. These views were expressed at a hearing in Little Rock, Ark., at which the receivers for the railroad urged the introduction of the piece work plan, which was protested against by the workers.

The receivers expressed a willingness to treat with the various craft organizations, but were unwilling to recognize the shop federation. In both these instances the men were upheld by the court.

MASSACHUSETTS 48-HOUR BILL DEFEATED

The Massachusetts Legislature has killed a bill to provide a forty-eight hour week for women workers in that state. The bill was presented on petition of the Massachusetts state branch of the American Federation of Labor, but its advocates were unable to secure the thirty votes necessary for a roll-call.

During 1914, the District of Columbia has taken its place beside the state of Washington in limiting the working hours of women to forty-eight a week.

CIVICS

MAKING THE WHOLE CITY BEAUTIFUL

CITIZENS of Riverside, Cal., believe that American cities ought to be made more attractive in their entirety, not merely in spots, as is so frequently done. They became convinced that through general tree planting much could be done to beautify all parts of the city—the less prominent streets where the poorer citizens dwell as well as the avenues of the well-to-do.

City government took charge of all street tree planting and care, and under the supervision of a tree warden over 15,000 trees have been planted during the first few years of this special effort. Eight or nine other California cities have followed suit.

AVENUE OF PALMS AND PEPPER TREES—WHAT EARLY PLANTING ACCOMPLISHED FOR ONE RIVERSIDE STREET

A STREET BEFORE THE TREE PLANTING CAMPAIGN AND HOW IT LOOKED AFTERWARD

Tree planting led to other efforts toward beautifying streets. Parking between sidewalk and road was improved and this in turn has stimulated the development and care of lawns.

The Chamber of Commerce and two leading women's clubs established a joint committee for civic improvement. Unkempt places and vacant lots were shown to the people at large through the newspapers and stereopticon views at a large mass meeting. Public sentiment made effective its demand for cleanliness and order.

Flowers were few in large sections, mainly inhabited by working people. Five thousand rose-bushes were secured and distributed to about a thousand such homes. The children were especially interested in securing and planting these bushes. The committee has also dis-

tributed 10,000 chrysanthemum plants.

Commercial, civic and social organizations have co-operated heartily, and

the interest of high school boys and girls was secured through prizes for essays on civic improvement.

NATIONAL CIVIC HALL—PEACE MEMORIAL TO WASHINGTON

Design by Tracy and Swartwout, New York. Chosen by a jury of award consisting of Philip Sawyer, Charles A. Platt, and Walter Cook, from designs and plans submitted by thirteen leading architects in competition.

WASHINGTON MEMORIAL CIVIC HALL

A NATIONAL civic hall as a peace memorial to Washington is planned by the George Washington Memorial Association. A site valued at half a million dollars was set apart by Congress a year ago. It is on the Mall next to the new national museum building.

The association has set out to raise \$2,500,000. The plans for the building are to be approved by the Commission on Fine Arts and the building and its endowment is to be under the administration of the Board of Regents of the Smithsonian Institute. Construction is not to be undertaken until \$1,000,000 is raised. It is reported that \$500,000 has already been pledged, of which \$148,000 is in hand.

Among other features the building is to have an auditorium seating 6,000, and smaller halls with committee rooms adjacent, to accommodate world congresses of a scientific, educational or public welfare nature. It will also provide, rent free, offices for organizations and societies of national scope along patriotic, educational, scientific or public welfare lines, provided such organizations contribute adequately toward the cost of the

building and its endowment.

Thirty-five governors have promised co-operation and a campaign has been inaugurated to secure proportionate contributions from the various states. The president of the association is Mrs. Henry F. Dimock of Boston and Washington, and the general secretary is George Milbank Hersey, 44 Bromfield Street, Boston, Mass.

SETBACK FOR PHILADELPHIA HOUSING INSPECTION

LAST JULY, nearly a year ago, the governor of Pennsylvania signed a housing law for first-class cities. This law discontinued the three divisions of drainage, nuisance and tenement house inspection in the Philadelphia Bureau of Health, and established in place of them one division entitled, the Division of Housing and Sanitation.

On January 1, 1914, the acting director of health notified the heads of the three old divisions that their offices no longer existed, and in place of them appointed a chief of the new division. At the same time he continued the services of some sixty inspectors of the three old divisions, assigning them to duties in the new division.

At once the City Councils, which have throughout been controlled by the opponents of the Blankenburg reform administration, decided not to supply funds for the Division of Housing and Sanitation. Instead, they made the customary appropriation for the three old divisions, which the acting director had declared defunct. The dispute was taken into the courts and the action of the administration was sustained in the lower court, but an appeal was taken to the Supreme Court. Meanwhile the heads of the three old divisions awaited the outcome at leisure, while the head and other employes of the new division awaited the outcome at work. The city, however, paid none of the salaries in question.

Finally, after nearly six months' waiting, the Supreme Court decided that the old divisions were still in existence. Thereupon three desks were reopened and one was closed, and salary checks for the three were drawn on the city treasury. The court in reaching this decision held that no appropriation having been made for the salaries of employes in the Division of Housing and Sanitation there was no fund upon which warrants could be drawn but that ap-

IN LINE FOR CITIZENSHIP

Rochester is the latest city to undertake the training of aliens for citizenship. Evening classes are held "to teach coming Americans to speak, read and write the English language; to give practical information; to prepare for intelligent and patriotic citizenship; to make the foreign-born familiar with our laws, customs and home ideals, our great Americans and the fundamental facts of our history."

The men shown here have just taken out their first papers of citizenship and each has been presented with a small American flag by President John Warrant Castleman of the Board of Education and Charles E. Finch who is in charge of the work in English and citizenship.

Photograph by Courtesy of Rochester Herald

appropriations to the old division were valid. The court also decided that the law creating the new division was defective in that it did not provide when it should go into effect, how the Division of Sanitation and Housing should be organized and by whom, or who should determine the number of inspectors to be appointed and the salaries to be paid them. The inference, according to the court, is that the City Councils must take the initiative. As they did not act, there was no organization of the Division of Housing and Sanitation.

The purpose of the law was to consolidate three branches of the city government whose work overlapped and to reorganize them on a more efficient basis. The Philadelphia Housing Commission, which was largely instrumental in drafting and securing the enactment of the law, is attempting to institute proceedings through the district attorney's office to compel councils to appropriate the money for the new division. The basis for its suit is the opinion delivered by Frank P. Prichard and John G. Johnson, leaders of the Philadelphia bar, that the law in question imposes upon councils the specific duty of maintaining the division and that the performance of this duty can be legally compelled. The secretary of the Housing Commission, Bernard J. Newman, says that the Supreme Court went out of its way to hand down an opinion as to the status of the law which had the result of throwing out of court proceedings brought by advocates of the law.

THE PUBLIC LIBRARY AND THE TOWN HISTORY EXHIBIT—By Mabel Rainford Haines, Librarian Free Public Library, Summit, N. J.

A RARE opportunity for public service by town libraries is to be found in local history exhibitions. Building up such an exhibit will bring into close relationship the various community forces and will, in re-creating past associations, awaken new loyalty and responsibility. It will emphasize the importance of preserving and absorbing all that is good from out the old order, and of developing what is best in the new.

Most towns grow by periods. Let us take for example, a certain New Jersey town or group of three towns, for which a successful history exhibit was recently held in the library. There were the periods of early Indian history, white settlement, and Revolution. Quiet growth and simple home living followed. With the building of the railroad, came new activity and expansion. Then came the civil war, followed by a second period of quiet growth and assimilation. The establishment of a silk mill, the coming of the foreign laborer and the settlement of Armenians, Syrians and Italians in colonies, herald the arrival of the immigrant problem. The exhibit should correlate these periods and serve purposes historical, social and civic.

History exhibits also offer opportunity for exchange of institutional interests and co-operation. Friendship between institutions is an essential for co-operative achievement. Nowhere is this more

necessary than in the suburban town where factions and petty jealousies or personal exploitation have so many and various destructive possibilities.

The difference in suburban and metropolitan outlook is amusingly illustrated by the following true story. In getting up a subscription for fairy books for some poor Syrian children, a young tutor appealed to her two small pupils for contributions from their personal allowances. They were French children and very carefully brought up. With a sigh each drew from her little purse the precious weekly quarter. "We would much rather give fairy stories to those Syrian children if they hadn't stolen our watermelons," they declared.

In a small town each man's right hand neighbor knows exactly what his left hand neighbor does. In a large city there are just as many if not more metaphorical melons stolen but we do not know the thief.

The town exhibit offers an effective channel for town betterment.

THE PRIME MINISTRY IN AMERICA

Such is the way in which civic secretaryship as public service is characterized by Edward J. Ward, social center adviser at the University of Wisconsin. Recognizing that the great present need in social center development is leadership, a conference has been called by the Wisconsin state superintendent of schools to meet at Madison, July 2-3.

A preliminary conference will be held June 19 and 20 at which Margaret Woodrow Wilson, Dr. William H. Allen, Zona Gale and others interested in social center development are expected to be present.

CORNELL CITIZENSHIP COURSE

The course on citizenship established at Cornell on the initiative of a group of alumni and alumnae, described in THE SURVEY for March 21, is to be repeated next year. There are also plans to make it permanent. Prof. Walter F. Willcox, who was in charge of the course this year, recently sent to Presi-

dent Schurman a report indicating the stimulating and broadening influence which the course had upon the undergraduates in attendance upon it. The total registration was 120. Many of the students told of social work which they had undertaken in their home towns, suggested by the various lectures.

TRAVELING CITY PLANNING EXHIBITION

Above is shown one panel in the exhibition which is now visiting various cities throughout the country, under the auspices of the American City Bureau of New York. It has already been in New York city, Jersey City, San Francisco, Los Angeles and other places.

There are 152 panels, showing what city planning means, the site, communication, health and sanitation, guarding against disaster, public convenience, recreation, education, encouragement of industry, suburban development, public control of private activity, city planning procedure, financial aspects of city planning.

EDUCATION

SKETCHING CLASS IN HISTORIC COPP'S HILL BURYING GROUND, BOSTON—THE ONLY PLAY-GROUND THESE CHILDREN HAVE

A N "APARTMENT" SCHOOL FOR MENTALLY DEFICIENT BOYS—BY ADA M. FITTS

OUT IN THE North End of Boston an apartment originally arranged in six rooms with a laundry in the basement has undergone some novel remodeling. By removing partitions, building shelves around the walls, introducing benches and a few similar touches it has been converted into—not a sweatshop, but a school for some of Boston's mentally deficient boys.

Boston was one of the first American cities to provide special classes for mentally defective children, two being formed in 1899. The city now has thirty classes with nearly 500 children in attendance. Great care is taken to select only improvable cases. Unimprovable ones are gradually being placed in the state schools for feeble-minded at Waverly and Wrentham.

In Boston, as in many other cities, the special class has usually occupied a room in an elementary school building and has cared for the mentally deficient children of the immediate neighborhood. In 1912 an attempt was made to work out the so-called "center" plan.

Under the leadership of Helen E. Mead such a center was established in an apartment house in a district in the North End having a school membership of over 2,000 boys. Twenty-five children were selected and two teachers provided.

The equipment of this center differs from that of the usual schoolroom. Instead of desks and chairs ordinary kitchen tables and chairs are used. These tables have been cut down, the drawers removed and boards nailed in

SUPERVISOR OF SPECIAL CLASSES, BOSTON

their places thus converting them into serviceable desks. All this work was done by the boys with the assistance of pupil teachers. The table serves as a desk, a lunch table, a couch and as it is unpainted, as a demonstration for cleanliness, for the boys scrub it.

The kitchen has been fitted up by the boys with shelves around the room. On these shelves are 25 wash basins and underneath towels and face cloths. There are individual cups, combs, brushes, tooth brushes, nail brushes, soap and looking glasses. Each child has a number and all the things he uses are marked. Time has proved that the boys like to be clean and a marked effect on behavior has resulted.

A lunch is served daily for two cents and free to the boys who sweep and wash the halls and sanitariums. The lunch consists of a sandwich made of

crackers or homemade bread spread with peanut butter, fruit of some kind, nuts, raisins, and occasionally a lump of sugar. The drink is a cup of cocoa made with malted milk. Many of the children come to school without breakfast. It is not strange that at half past nine they are more interested in a sandwich than a book.

The work after morning lunch is largely individual. The purpose is to teach these boys to do a few things well: writing their names, measuring, counting, spelling or word study, reading, drawing, modelling, telling time, oral language interspersed with physical exercises. Eleven o'clock brings a short period of play out of doors, after which the school work is continued till noon.

A large number of these children eat on the street so it is no hardship for them to re-enter school about one o'clock. They do manual work until 1:30, then wash their hands and go to the class room to rest. What seems to the careless observer laziness in these children is in reality fatigue, the effect of late hours, overcrowded sleeping quarters and poor ventilation. Often half of the children sleep at this rest period. Those who do not are taught to close their eyes while the teacher reads or tells a story, but for all there is almost complete relaxation.

After the rest period two boys from fourteen to sixteen years of age come from the neighboring North Bennet Street Industrial School to act as pupil teachers, a position which they consider an honor. They do excellent work without compensation and are much interested in the progress of their pupils. A general oversight is kept by the teachers but so little is needed that they can carry on basketry, weaving, caning, modelling and brass work in an adjoining room. Later comes the cleaning of the manual training room, putting rooms in order and recess. From 3.00 to 3.30, four days in a week, oral work, sense training, observation lessons out-of-doors or gardening are carried on. On Wednesday afternoon the last half hour is used for a bath at the Municipal Bath House.

There are obvious advantages in this "center" plan. In a crowded district the mentally deficient may be classified and those of a lower grade of development may be given the form of instruction best adapted to their needs while the more improvable types may make more rapid advancement. The older may be separated from the younger and sexes may be separated in the older groups. The teachers may specialize in the subjects they are best fitted to teach, one taking all the manual training, another the games and physical training, and so

THE STORY OF MY LIFE

Written by a mentally deficient girl of fourteen trying to do third grade primary work in a Boston school

I am a girl who would like to have more brans then I have got because a branns is a very good then to have to work by and to see by and to hear by. Some pepoles have a very good brans and some pepoles have very sleepy brans indeed but I would like a smart brans. I would not like to have the brans that I have got any longer.

on. Thus through constant co-operation they may work out their problem for the good of all.

As the special class children reach the age for leaving school the need of "follow-up work" becomes urgent. Franklin B. Dyer, superintendent of schools says: "The need is for an institution that will provide this oversight, or an officer who will watch the career of each graduate and act as adviser, who will consult with employers, co-operate with court officials and institutions and continue the guidance and control begun by the teachers. This follow-up work will eventually be one of the great means of preventing pauperism, vagrancy, crime and racial degeneracy. Two such officers have been recently appointed in New York city."

The "story of my life" printed in another column is one of the strongest appeals that can be made to the educators of the country to secure justice for feeble-minded and normal children alike.

MEASURING A TREE—OUT OF DOORS INSTRUCTION AND PLAY PERIODS ARE FEATURES OF THE SCHOOL WORK

SCHOOL CHILDREN AND SEX IDEALISM—BY LUCY SPRAGUE MITCHELL

FORMERLY DEAN OF WOMEN, UNIVERSITY OF CALIFORNIA

THE DISCUSSION about sex, with its usual accompaniment of hysteria, has found its way from the stage, the novel, the Sunday supplement and the medical journal into the public school. There it has met determined opposition on the part of many teachers and parents. Part of this opposition is directed against the subject itself; part against the method of teaching. A clear understanding of the basic points around which the opposition centers may clarify the problem and suggest a solution.

A considerable group oppose sex education on the widest of all grounds—that the subject itself is unsuited to a child's comprehension. These feel that any reference to the subject tends to arouse undesirable curiosity. They contend, moreover, that only objective knowledge can be taught and that sex knowledge does not necessarily induce the proper attitude of mind, nor strengthen the moral fiber, as is evidenced by the fact that medical students, though better informed, are not more moral than others. The conscientious parents who take this view really believe as well as hope that their reticence on the subject means corresponding ignorance and lack of interest on the part of their children. "Playing with fire" is the catch-word of this group.

A second large group of earnest thinkers are less sweeping in their condemnation. While they believe that some sex instruction should be given children to safeguard their health and to help them achieve certain ideals, they feel that such instruction is the exclusive prerogative of parents. This group, which is composed both of parents afraid for their children and teachers afraid for themselves, pass by as hopeless the children who have no parents or inadequate ones. Even if the school could give sex education successfully, they would consider such teaching inappropriate and an "invasion of the home."

The third group—the most liberal and the smallest—wish the school "to do something," but cannot agree among themselves as to just what that "something" should be. What instruction should be given? How? When and by whom? Around these questions the storm centers. The value of "objective information"—which may mean anything, from symbolic analogy drawn from flowers, to a complete course in sex anatomy, physiology and even embryology—is balanced against "subjective instruction"—which may include anything from personal hygiene to a presentation of the social results of sexual immorality or an attempt to arouse an ethical response in the child. The naturalness of a "biological approach" is discussed as opposed to an ethical or social approach. The difficulties of class-room work, with the varying standards of sophistication due to conditions of the home, the street, the nationality or the temperament of each child, are weighed against the impracticability and expense of individual work. The desirability of making sure that a child's first information be clear is balanced against the danger of arousing premature interests and excitements. The limitations of the ordinary grade teacher, because of lack of training, personality and time are set over against the temporary, superficial influence of a "special teacher" and the limelight which her presence must throw on the subject.

These objections and scores of others almost equally upsetting will never be satisfactorily answered, I believe, while they are stated in the present form. It is not enough to say that every bad result which can be foreseen from taking action can be matched, if not surpassed, by the bad results of doing nothing. Back of all these objections there lie certain common mistrusts. The first mistrust concerns the subject; the second, the method of teaching.

I believe most of the mistrust of the subject would disappear if we could stop thinking of sex as "a subject" and regard it as an aspect of a hundred subjects. We know that history includes sex, we know it is woven into the tissue of literature and art, we know that anatomy extends below the waist we know that biology and sociology and psychology all need sex to interpret some of their most significant aspects. And yet when we talk about sex, we pluck it out from its surroundings, isolate it, throw the limelight on it, and then wonder that it is difficult to explain to children. In this artificial way, it *should* be difficult to teach to children and should never be taught to them by the school nor by any other agency or person. I rejoice in the community's healthy suspicion of sex as a separate subject.

So, too, with the mistrust of the method of teaching. What we want for the child is sex ideals. No one is satisfied with giving him information, though many feel that sound ideals must be based upon honest information. Now, ideals we all feel cannot be taught, standards cannot be formed, attitudes cannot be achieved through the present classroom. To form ideals one must take account of at least two things, first, the child's point of view—the way he evaluates matters, the things he cares for and why, the way his mind works,—in technical language, child psychology; second, knowledge of the chief forces which are at work to modify or mould the child's natural outlook. The nationality, the religion, the neighborhood, the family conditions, including the social, moral and economic standards, all determine the channels which a child's mind will take. In other words, the home must be known by one who would attempt to foster ideals.

There is rapidly-growing uneasiness because the present-day school takes into account neither of these essentials for standard forming. Child psychology and knowledge of the home are patently absent from the average school-room. To some this seems desirable, to many unavoidable. Those who hold that the school's function is merely the clear exposition of facts have some slight justification for wishing to exclude sex instruction. Still, they forget the value of an honest attitude toward facts. But there are some—not many, I fear—who feel that the school's inadequacy in the matter of sex instruction is but an example (so glaring and pitiful that it has at last been seen even by the school itself) of a fundamental defect in most of our school teaching. These acknowledge that the present methods of teaching would not succeed when applied to problems of sex. But instead of abandoning the subject they would alter the method.

When these rather grandiloquent sounding criticisms are applied to the specific problem of sex instruction, what is the concrete result? It is impossible to say in detail without actually trying, but it is possible to suggest the first steps.

To begin with, the curriculum should be surveyed from beginning to end with a view to seeing not where information about sex could be inserted but where it

has been cut out to the detriment of the subject taught. Sex should not be hunted for, but it should not be avoided when it occurs. As much instruction should be given as each subject, by its nature, demands in order to be intelligible to the child. If this were done, I think it would be evident that almost everything we give to children has had sex cut out of it, no matter how greatly this surgery may have injured the subject. History has become motiveless, poetry passionless, art prudish, anatomy fragmentary, civics and ethics pedantic and psychology and sociology and economics have been avoided or so transformed that their anaemic figures are hardly recognized as human.

Now the inevitable tendency of this is to make all book-learning meaningless to the child. He learns neither to enjoy nor interpret the life around him. But the evil results do not stop here. They might if the child were what the school seems to assume him to be—a mere receptacle for facts. Even if he were it would be a tragedy to give him only facts with the breath of human passion squeezed out of them. But as he is a sensitive living creature, full of intricate impulses and desires of his own and played upon by his surroundings to a high degree, something more than boredom happens. He sees around him "grown-ups" who have inexplicable standards founded upon apparently arbitrary principles. He senses hidden emotion lying behind these standards. Dimly he feels they are hidden because of some surreptitious shame. He scorns both the emotions and the cowards who will not look them in the face.

Then perhaps he feels a disturbing emotion in himself. Certainly he feels a healthy curiosity about other people's emotions and the physical manifestations of them. He notices how all information is given to him expurgated. He fills in the asterisks himself—sometimes with the help of a discerning but rare mother—usually with the help of his street play-fellow. And so he enters into his heritage and assumes the responsibility of begetting children of his own.

The school is not to blame for all this, and the school should not attempt to remedy it all. Parents, teachers, neighbors, writers—everyone who touches life touches sex and is in so far responsible for the common attitude. The community as a whole must teach sex idealism by facing the sex question whenever it arises—frankly and positively. It arises inevitably within every child. It may come in a hundred ways, for sex affects a hundred parts of our lives. And since it can not be avoided it must be met, however and whenever it arises, and by teachers as well as by others.

To the school falls the charge of the child during the period of the awakening of sex consciousness. If the child has an adequate home where life is faced reverently and honestly it is the duty of the school not to counteract the home's influence by prudery and not to give the impression that sex is either unworthy or unimportant; if the child has an inadequate home—then the school must try definitely to counteract or supplement these inadequacies. Whatever the child's home, it is the school's duty to see that

the subjects taught are given not in a twisted or mutilated form, but in the way that will seem to the child as complete and significant as possible.

To do this it is obvious that the school must know the child as a human individual, must comprehend what emotions a child is likely to have, what curiosities and interpretations are to be looked for. And it is equally obvious that it must reckon with the child's home in the broadest sense both that it may properly interpret the child and that it may adequately supply the particular child's individual needs. If this is deemed impossible or impractical, then real education is impossible or impractical. If it is true that there is no royal road to learning, it is equally true that there is no wholesale road to learning. If education is to include more than the giving of information, if it is to embrace character-forming, standard building, it must be individualized. And if among the ideals to be striven for are sex ideals, then in justice to the subjects taught, in justice to the children and in justice to the community, educators must do their share in showing children how sex is interwoven through all of life.

The old questions—what sex instruction should be given, how, when and by whom—seem quite different when sex is regarded in this interwoven way. Give whatever sex instruction the subjects taught to children naturally include, choosing the suitable subjects on general, not on sex, grounds; give it frankly, positively, in the way the child will best comprehend it, whenever the occasion arises and with whomsoever it arises; approach it from every angle, science, art and ethics. Objective physical facts of sex will fall into their place with other physical facts, sex diseases will be associated with other diseases, sex hygiene will connect itself with general hygiene, ethical standards of sex will be linked with other ethical standards. The pathological, the abnormal will hardly arise as there is little in the normal child's life or education which would suggest it—little that demands an explanation of this negative side to make his world intelligible.

So the school, as one of the large factors in the child's world, must join in the consistent and united effort of all who love children to show them the reasonableness and the beauty and the sanctity of the sex ideals upon which our civilization rests.

TRAINING MECHANICS TO TEACH IN WISCONSIN

THE UNIVERSITY OF WISCONSIN, appreciating the demand for special industrial and trade teachers to serve in both day and night continuation schools has, for three years past, given courses in Milwaukee and in Madison for mechanics who are interested in teaching. Evidence of the demand for professionally trained mechanics to teach in industrial schools has lately led the regents of the university to create fifteen industrial scholarships.

Each scholarship carries with it a special honorarium of \$40, and the holders of these scholarships are to be organized as a mechanics institute. The

purpose of the institute will be to give intensive practice in special lines of shopwork and drawing and, connected therewith, to give a detailed consideration of organization and teaching problems met in industrial schools.

During the institute this spring three courses were offered; two three-hour courses, daily, one in shop work and the other in drafting and free-hand perspective. In each, emphasis was placed on the development of courses of study and the appropriate method of administering them. A one-hour course was given in which the problems of organization and maintenance of industrial school work will be discussed and in which demonstrations will be outlined.

The fifteen men appointed to industrial scholarships have been selected from nine cities in Wisconsin. They represent twelve trades.

No one responsible for the organization of the institute believes that one month is time enough to train men professionally for teaching. It is believed, however, that at least two ends may be accomplished in two months' time: first, the men will gain some power to organize material in their own fields of endeavor, and will be given specific instruction and practice in handling classes; second, they will be given some appreciation of the requirements of the teaching problem for particular types of schools, and should, consequently, be able either to decide to give more time to preparation for teaching, even though they may be appointed to teaching positions at the end of the period of instruction at the university, or give up the idea of teaching altogether.

A second institute will be conducted during the college year 1914-15.

TRADE SCHOOLS IN PHILADELPHIA

With the appointment of John C. Frazee as director of the recently created Bureau of Vocational Education and Guidance of the Philadelphia Board of Education, and the formation of an Executive Committee on Vocational Education representing Philadelphia organizations interested in vocational education, the prospect is that the establishment of trade schools in that city will move rapidly from now on.

The State Department of Education in Pennsylvania has established agricultural vocational schools in several counties and one industrial vocational school is now in operation as an experiment. As a result of a study of industries made by Millard B. King and a study of thirty-four trades made by the Consumers' League of Eastern Pennsylvania, one of the members of the new executive committee, it is thought that a trade school for girls will be opened next fall and one for boys shortly thereafter.

FAIRHOPE SUMMER SCHOOL

Under the auspices of the Fairhope League and directed by Marietta L. Johnson, principal of the School of Organic Education at Fairhope, Ala., a second summer school will be conducted this summer at Greenwich, Conn. The term of six weeks will begin July 6.

Personals

BY request of many Boston friends, THE SURVEY reprints here in full the obituary notice, from the *Boston Medical and Surgical Journal*, of Dr. Charles Pickering Putnam, president of the Boston Associated Charities and a leader in many social and medical movements:

"DR. CHARLES PICKERING PUTNAM, who died on April 23 last in his seventieth year, was born in Boston September 15, 1844. He was the son of Charles Gideon Putnam, M.D., and Elizabeth Cabot Jackson, both of Boston, and grandson of Dr. James Jackson. He graduated from Harvard College in 1865 and from the Harvard Medical School in 1869; continued his medical studies for a time in Germany, and began the practice of his profession in Boston in 1871. Since that time he had carried on a general practice, though for many years he made a specialty of pediatrics and did some excellent pioneer work in orthopedics. He was a lecturer at the Harvard Medical School on diseases of children from 1873-75 and a clinical instructor on that subject 1875-79. He served the Boston Dispensary as district physician from 1871-1873 and as orthopedic surgeon 1873-76. In 1898 he was elected president of the American Pediatric Society.

"Dr. Putnam had been since the beginning of his practice of medicine a leader in charitable and social work,—almost from the beginning the most important leader of such work in Boston, the first to take hold and the last to let go of each new and important enterprise.

"Dr. Putnam was one of the founders, in 1873, of the little-known but extremely important Boston Society for the Relief of Destitute Mothers and Infants, which was a pioneer in establishing the policy of keeping mother and child together, and was president of the society from 1904 until his death. In 1875 he became physician to the Massachusetts Infant Asylum, and from 1898 to 1910 he was also president of the board of trustees. The ordinary death-rate in such institutions was at that time something over ninety per cent. a year. The Massachusetts Infant Asylum had already brought the rate down to less than a quarter of that figure when Dr. Putnam became connected with it, and he by his skill and devotion again reduced it by two-thirds or more. He was one of those who in 1879 took part in the movement for establishing the Associated Charities, the second charity organization society in this country; and he was always one of the sustaining members of that society in the real, not the conventional, sense, working in many capacities, as president of a conference, as director, as chairman of many committees, including the present important one on inebriety, and, since 1907, as president.

"From 1892 to 1897 Dr. Putnam took a leading part in the very important movement for the reorganization of the Boston Institutions for the care of prisoners, of the poor, and of poor, neglected, and delinquent children, being on the special committee appointed by Mayor Matthews in 1892, chairman of the board of visitors of 1893-94, chairman of the standing committee on pauper institutions of the advisory board appointed by Mayor Quincy in 1896, a steady fighter for the reorganization bill of 1897. When the new system of separate unpaid boards of trustees was established he was appointed a member of the Board of Children's Institutions, and was its chairman from 1902 to 1911, performing in that capacity a great and harassing, though invisible and unappreciated, service to his fellow-citizens.

"Dr. Putnam was among the earliest supporters of Dr. James R. Chadwick in founding the Boston Medical Library, of which he was an original member in 1875, an incorporator in 1877, and which he served upon important committees until his death. He helped to organize and carry on the Directory of Nurses. He was active in the campaign against tuberculosis and a director of the Mental Hygiene Association. He was one of the first to take up broad social questions from the legislative end, was the first experienced charity worker to enlist in the Massachusetts Civic League, and helped secure the establishment of the State Board of Insanity, the taking over of the Boston Insane Hospital by the state, medical inspection in the public schools of Massachusetts, playgrounds, better probation service, the juvenile court, better laws dealing with tramps, with drunkards, and many others.

"In short, Dr. Putnam was for a generation the backbone of social work in Boston. We have all looked to him to do the hard things—to take up the new line at which the timid balked and which the unimaginative could not see, sustaining the old from which the glamor had worn off, stiffening up the weak places, making the hard decisions. He was here, as in all things, a man to accept responsibility, take the burden on himself and carry it,—a patient and successful physician to the community as well as to the child.

"Dr. Putnam's most distinctive characteristic was the power of enlistment. In each of the many services he undertook it seemed to those he served and to his fellow workers as if that must be the only thing he had to do. There are in every enterprise the helpful men, the wise, the brilliant men, the steady workers. And then there are the essential men, those without whom the thing will not be done. In an extraordinary number of instances Dr. Putnam was among these last. Whatever happened, however badly things might go, whoever

else became lukewarm or discouraged, his associates knew that he, at least, would see the thing through, that he had enlisted for the war, intended doing as much be it more or less, as might be necessary. The time at his disposal seemed always to be infinite, and he had no observable bias as to hours. There is no evidence, known at least outside his immediate family, that he ever ate or slept, and three in the morning was apparently the same to him as three in the afternoon.

"Dr. Putnam was a remarkably resourceful man and would reconstruct his patients' world, physically as well as morally, by his calm assumption that anything needed could be done, and in hundreds of cases by doing the most impossible parts himself. Slower minds thought him slow at laying the first brick, whereas he had completed the whole structure in imagination, and was hesitating what kind of chimney-pot to use.

"Dr. Putnam had a fairy godmother quality, as many of us know. I remember on my first visit to his much-loved shanty in the Adirondacks I came to believe that if, when walking up a mountain, you happened to want anything, from a piece of maple sugar to a volume of Shakespeare or a box of paints, you had only to look under the nearest stump and you would find that Dr. Putnam had anticipated exactly that need at that particular spot.

"To many of those who saw him, Dr. Putnam's impersonation of the policeman at the charity workers' ball a year or two ago (I personally took him for a real cop), and of the very 'disturbed' patient who brought down the house upon the same occasion, was a revelation of an unsuspected quality. His sense of humor, indeed, lived always just beneath the surface. I once saw him 'cure' a small child's hands by putting on them a couple of envelopes as mittens.

"And the best was the power behind it all in the great kind heart, that would see and know only the best, and, with a quality like the sun, could see only light wherever it was turned."

THE Chicago Woman's City Club has been fortunate in securing Harriet E. Vittum as civic director to succeed Amelia Sears, whose services it surrendered to the county's new department of public welfare.

Miss Vittum's resourceful personality, varied experience and training as nurse, head resident of Northwestern University Settlement and president of the Woman's City Club qualify her for her new and exacting opportunity. She retains her settlement head residentship, with increased assistance, and is assisted at the City Club by Mary E. Collins. Miss Collins' technical experience in editing educational publications and her long residence at Chicago Commons fit her both for editing the club's bulletin and for assistance in its general work.

Mrs. Joseph T. Bowen's accession to the presidency of the Woman's City Club rounds out a rarely efficient executive group.

MABEL C. HALLOCK, who had been stenographer to the vice-president of the Provident Loan Society of New York for eight years, and before that had been for six years with the Charity Organization Society, died on June 4 of pneumonia, one of several complications resulting from an attack of scarlet fever. She had been ill only a week.

JULIA SCHOENFELD, for three years a secretary of the Playground and Recreation Association of America, has been appointed head worker of the Irene Kaufman Settlement, Pittsburgh, Pa. Miss Schoenfeld does not come to the Irene Kaufman Settlement as a stranger. Fourteen years ago when it was called the Columbian Council Settlement, she was the first head resident.

It was during the period of her settlement work that Miss Schoenfeld became interested in recreation for working girls, a subject on which she is a recognized authority. Her investigation of public dance halls in New York city undertaken in 1908 while she was secretary of the Committee on the Amusement Resources of Working Girls, was the basis for the model New York city ordinance regulating dance halls. Later as secretary of the Playground and Recreation Association she conducted dance hall investigations in Boston,

JULIA SCHOENFELD
Head Worker, Irene Kaufman Settlement.

Mass., St. Joseph, Mo., Johnstown, Pa., Pittsburgh and other cities.

Miss Schoenfeld takes up her duties at the Irene Kaufman Settlement, September 1. In connection with the regular settlement activities she is planning to organize a public forum similar to the People's Institute in New York city.

ments, of permitting children to go to work as soon as they have passed the minimum requirements, and not providing sufficient recreational centers in the crowded districts, then not four criminals, but thousands of innocent souls would be yearly saved to their dear ones. Our minds must be turned toward preventive work, to behold the dangers which face our weak neighbor whose only sin is the "crime of poverty."

After reading the masterly article on the gunmen in *THE SURVEY* of April 4, by Winthrop D. Lane, we realize that they were unfortunate victims of Society which did so little to prevent their falling into evil hands. Our plain duty is to prevent such future happenings. The new heart will turn our vision toward making it safer for boys, and for girls, to live and play on the East Side, yes, in every crowded district throughout the land. A heart full of mercy, but governed by vision, is our great need.

RUDOLPH I. COFFEE.

Pittsburgh.

THE COUNTRY SCHOOL

TO THE EDITOR: June is here and with it commencement. Among the young graduates planning work for next fall may I make a plea for the country school? Only a few miles from our larger cities are hundreds of isolated towns whose young people are eager and hungry for many things coming to their city brother and sister. Good native stock that would well repay time spent on it.

We all know the devotion most of us felt for some attractive teacher when we were young and how growth comes by personal influence—through admiration and love to imitation. Think then of the influence a teacher—a trained social worker—could have on a whole community.

She could visit her pupils and from them go into other homes naturally and intimately—helping in all matters of everyday living. She could give advice as to vocational training—in matters of hygiene—in manners as well as morals—the school building could be used as a recreation center. How many country villages need lessons in simple human friendliness and kindness. Through isolated and narrow lives people have let jealousy and slights cause troubles, which could be helped by the influence of one person with a broader vision. In many villages there is little community spirit—it is each man for himself—the church draws in a handful of the more religious people leaving all the rest of the community almost uninfluenced. If there are two churches they really divide the community. In the few cases where any social work is attempted the church does not seem to think it necessary to ask advice of experts who have gained their knowledge by experience.

We think of the wholesomeness of country life—forgetting there are many hardly normal children growing up in families where home conditions are painfully poor.

It seems as if the school teacher could

Communications

THE WISCONSIN EUGENIC LAW?

TO THE EDITOR: The reactionary author of a press dispatch is chuckling at the absurdity of the Wisconsin law requiring a certificate of physical fitness for marriage. It seems that a woman posing as a man secured a satisfactory certificate from a doctor in Milwaukee enabling her to marry a *second* wife!

One might inquire of the brilliant newspaper critic if the former marriage was not absurd because it occurred too long ago to be "news"? Or is the Wisconsin law absurd because it does not require married couples to have children, instead of attempting simply to prevent undesirable children? If the blood test, applied by the doctor to this woman, is adequate to show the absence of venereal taint, is the law still absurd because it does not compel her to love, honor and obey her feminine mate? Are the old laws preferable that take no account of social welfare?

Is every law to be accounted absurd that does not satisfy the newspaper man's fantastic idea of what law should be? The newspapers invented Dr. Osler's weird ideas for him. It is not remarkable that the same inspired source should distort the purpose of eugenic laws. The encouraging by-product of this alleged Wisconsin fiasco is that the eugenic law in this instance does all

that eugenic laws ever ought to do—it registers society's protest; it does not attempt to determine breeding.

CHARLES ZEUBLIN.

Winchester, Mass.

THE NEW HEART

TO THE EDITOR: The prophet Ezekiel, in one of his finest utterances, spoke of removing the heart of stone from his people and substituting a heart of flesh. Were he on earth today, he would remove the heart of flesh, governed by sympathy and tenderness, and place instead a heart ruled also by vision and insight.

We need something more than a soul stung into action at the thought of four gunmen recently electrocuted. Our country requires ministers with prophetic vision to see the natural consequences of conduct before our children become criminals.

Seldom was a more determined fight waged to save human life than on behalf of the gunmen. Clergymen of various denominations were most anxious to obtain a reprieve. Their labors did honor to their sympathetic hearts. If only a fraction of that energy could be crystallized into action, guided by vision, what great blessings would result! Could we but visualize the logical outcome of dwelling in unsanitary tenements,

help in all these matters—provided she was trained to work with all the forces for the good of the community—bringing to it more energy—ambition and life through the friendliness of working together.

It has been said a young woman would have to be something of a missionary to take up this work, but do not many of our young people dream dreams and see visions? And are there not attractions to such a life—the beauty of the country, the healthy life for those to whom a city is too strenuous, the long vacations.

It's true salaries are low and boarding places difficult to find but the growing tendency for consolidating village schools is increasing salaries and in such cases two teachers could live together and so get around the loneliness that would be a great drawback. They might keep house together, for rented furnished houses including firewood can be had for a few dollars a month—even a riding horse might come in.

Perhaps one could not have many guests but surely those one did have could be given a variety of interesting and happy experiences.

A GIFT OF A NICKLE

TO THE EDITOR: It was my pleasure to serve as one of the team captains in a seven-day campaign for the purpose of raising \$100,000 for the local Y. W. C. A. During one of the noon-hour meetings when the reports were turned in, one of the young ladies serving on one of the teams reported the following story:

While going through the center of the city she was approached by a youngster, dressed very shabbily, who said that he wanted to make a contribution to the campaign. He fished down into his trousers and got out a nickel and a penny, apparently the only convertible assets he had in the world. He looked at the nickel, he looked at the penny, and then he looked up at the very fatigued worker and said, "Youse ladies look awful tired; you must be workin' awful hard for this." Then, with a second look at the coins, he put the penny back in his pocket and contributed the nickel to the campaign fund.

The individual subscriptions in this campaign ranged from \$10,000 to the five-cent piece given by the youngster, and I assure you when the story of his gift was told, there was just as much applause and enthusiasm as there was at the announcement of a large gift.

On the last day of the campaign the nickel was auctioned off and sold at a very substantial price, for it was a most interesting souvenir and surely a "widow's mite."

ROBERT E. MILLER.

Lancaster, Pa.

WIDOWS' PENSIONS

TO THE EDITOR: The well-known generosity of THE SURVEY, in printing every possible view of a subject, leads me to try and express myself frankly as to the reasons which lead me and others like me, to favor state aid for

all dependent mothers with minor children rather than some form of private charity.

The reason that should lead all others is, to my mind, that the state should take some formulative stand in the matter. Surely the matter of the prevention of poverty should be of utmost interest to the state, and not one to be pushed aside as unprofitable.

Private charity has never been able to do adequate preventative work. It leaves the children of the self-respecting widow hungry. Now, without proper food and clothing for the child, we know it does not become employable at the working age. "Most of the high hopes based upon their coming of age," says Dr. Devine in Widow's Needs in the April 4 SURVEY, "result in disillusionment as they arrive at an age when their inherent lack of energy, of ambition, of responsibility become apparent." Private charity has never been able to rightly treat this disease of stunted childhood. Though scientists have written treatises on the connection between lack of nutrition and degeneracy, nothing truly curative has been done.

Dr. Devine says: "We have seen that the charitable societies come in contact with from three to ten per cent of the widows in New York city who have small children dependent upon them. What might be said is that this small percentage includes nearly all of the least efficient, the least capable, the degenerate, the unfit."

In Boston we have, perhaps, as good a system of organized charity as any in the country. Yet, again and again I have found Dr. Devine's statement to be true. Charity does not take up a case until it is destitute, until it is inefficient, until it has degenerated below the extreme poverty line. And the children of these people have never had a chance.

Dr. Devine, to my mind, puts the whole matter in a nutshell when he says: "Tuberculosis, typhoid, fatal industrial injuries, insufficient pay, economic insufficiency, the physical strain of overwork, the exploitation of the vices and weaknesses of men and women for commercial profit, are all subjects with which social workers in the charitable societies are deeply concerned, but for which the remedies lie in other and more powerful hands. . . . "They can only lift up their voices in eloquent testimony."

We must look for the "other and more powerful hands," wherever they may be. If not in the church, and not in philanthropy, why not in the state? The times are bringing forth men who, like a wise physician, search out the hidden poisons in our body politic. One thing we know: we must begin with the child, since it is too late for his grandfather. And twenty states have recognized this fact.

Here in Massachusetts I have seen grey, wizened little faces, and hollow mother-faces, lined with grief, round up, lose their perpetual tear-stains and become hopeful under the new state regime. Cases that under the old hap-

azard dispensation, living from hand to mouth in uncertainty of the morrow never learned to save, and almost lost interest in life, have begun to take courage. Under the old rule, if you saved, aid was taken away. Here one can normally plan for one's children, even with the smallish rate which is all the state can pay.

God knows what a difference it has made in Massachusetts already, and what ten years will bring about in prevention of sickness, and crime and stunted childhood—God only knows that, too. But we can guess. The state does things better, for it has a principle of conservation to go by, it has the "other and more powerful hands," and it does things quicker, and better, and all the time, and not just once in a while.

The remedy for poverty, it seems to me, does not lie in "more trained workers with higher salaries" but in a more general knowledge of poverty-preventing measures, and public opinion to back up the campaign begun by all the United States. To this literature, the press and the stage have lent their powerful hands.

CLARA CAHILL PARK.

Wollaston, Mass.

THE POOR IN SPIRIT

TO THE EDITOR: One point we all seem to forget: the value of life can never be expressed in dollars and cents. The best things in life are actually as possible for the Siberian prisoner as for the millionaire, for no one has ever denied that the "fruits of the spirit: love, joy, peace, long-suffering, goodness, faith, meekness, temperance" flourish even better in adversity.

It is almost a platitude that the fullness of life can be possessed by every human being exactly in proportion to his capacity for holding it—and that such capacity is not necessarily increased or lessened by an income of a few dollars or thousands. But do we believe this?

If poverty and degradation of spirit were as painful and distressive as material poverty and degradation, how different would be our cry! For the root of most of the trouble is that we see our neighbor enjoying all that we long for and cannot have—or more deeply, perhaps, because we cannot give to our clamoring children what he can give to his—regardless of whether or not it is best for them.

We know that poverty and degradation of spirit are found far oftener among the idle rich than among the hard-working poor—but whoever heard of begging for laws to distribute equally—love, peace, faith, hope and temperance—the only things really worth living for?

Even the rich man's cup cannot be filled more than overflowing—and the size of his cup does not depend upon his money or his earthly goods.

M. L.

A REJECTED LETTER

TO THE EDITOR: A recent editorial in the Boston *Herald* defending "young Mr. Rockefeller's" position opened the eyes of its readers to the fact that, on one side at least, the issues are undoubtedly made up. As the *Herald* refused to publish a critical letter in reply, I am prompted to send this where I can get a hearing.

The article apparently demanded for the employer, as a natural right, that he should be able to select for his workmen (and to black-list all others) only those who believe in the present "régime of private property" and who believe that its present opportunities to gather enormous accumulations are legitimate, in spite of the facts that they rob labor of the full social value of its product and inevitably tend to create a "parasite" class. It did not even suggest any toleration for such workingmen as entertain different views, however peacefully they desire to promote them.

There was no peace-offering for those who, with votes in their hands and rising public opinion behind them, are toiling in darkness for a bare living while a few of their associates, their brethren, men of the same flesh and blood, flaunt before their eyes costly motors, palatial housing and magnificent attire and publish in the fulsome "society" broadsides of a democratic press every detail of lives of such luxury as have seldom been lived before our days and have at least been hidden in aristocratic or regal privacy. Is it singular that the unrest is greatest where the bitter sarcasm of Dr. Eliot's "joy of labor" is realized by the mine-worker as he contrasts his joy with that of the Monte Cristos of the mine-owning families?

The editorial advocated a battle in Colorado to maintain the right of self-preservation to Mr. Rockefeller and of his manner of conducting business. If the battle comes to pass in fire and blood, for which bigoted capitalism will be largely responsible, it may indeed be fought to a finish, but the victory will be won over the evil powers incarnated in Mr. Rockefeller, a victory which the prayerful and thoughtful had hoped to bring about without the terrible cataclysm thus invoked.

There is no Bible Christian who believes in the Master's teachings concerning the menace of riches and who has looked forward to the promised millennium of human brotherhood by the new apostolate of social service, seeking to act in the spheres of conciliation and arbitration, who would not be taboo as an employe to the capitalist because, of course, such a one believes in the final overthrow of the "present régime." Until the Christian church lost her crown by her "establishment" her one panacea was expressed by the practice of her members who "had all things in common." Modern sociology, through love or fear, is rousing the world to a new expression of the abandoned attitude (all but the purblind capitalists and their hirelings) which prophesies that "the present régime" is doomed.

The saving chance for those who have boasted themselves in "the multitude of their riches" is to lead frankly and heroically in the forward movement, through restitution, atonement and enlightened leadership toward general and full co-operation, where larger powers and abilities may give direction, for moderate and openly apportioned compensation,—service in the fields of commerce and industry such as always has been thus given in science, the arts and in religion.

To attempt a forcible resistance is after all almost more silly than wicked. The clever cartoonist of the *Herald* should employ his pencil upon the leader writer as King Knute ordering the tide back, or as Mrs. Partington with her broom trying to sweep away the Atlantic Ocean.

ERVING WINSLOW.

Boston.

SAID OF THE SURVEY

TO THE EDITOR: Please find enclosed \$3, my subscription for current year. I want the management to know that I greatly appreciate the magazine. I am proud of its out-and-out position on sex problems and on industrial matters—only with this statement: at this stage of the problem we must be careful to give every interest its due.

Within Prison Walls

By Thomas Mott Osborne

Society versus The Criminal

Who is responsible for the 150,000 prisoners in the penal institutions of the United States to-day? Not only between the lines but in frank open statement Mr. Thomas Mott Osborne, Chairman of the New York State Prison Reform Commission, shows where the greater part of the responsibility lies and suggests much needed improvement in the treatment of the criminal looking toward the better understanding and cure of criminal tendencies rather than a punishment to fit the crime. Every fairminded citizen should read this book.

WORSHIP AND WORK

Thoughts from THE UNPUBLISHED WRITINGS of the Late

CANON S. A. BARNETT

FIRST WARDEN OF TOYNBEE HALL

SELECTED AND EDITED BY HIS WIFE

To "go and talk it out with Barnett" was a first recourse for ministers of the crown, brother clergymen, trade union leaders, young men in Toynbee Hall and charity organization secretaries when faced by baffling problems.

Clemenceau thirty years ago ranked the little Vicar of St. Jude's as one of the three really great men in England.

Worship and Work shows the spirit of this unusual man and gives one explanation of his remarkable influence.

WASHINGTON is practically sure of social centers in its public schools though an act of Congress is necessary to authorize it. Page 337.

WITH safety at sea still befogged, comes news of the first collision in the air and the loss of the entire crews of both craft. The La Follette bill, the proposed Alexander substitute and the London treaty may drag on until protection can be included for the passengers in the heavens above.

THE SURVEY

COMMON WELFARE

BUSINESS MEN IN THE ROLE OF PEDAGOGS

IF YOU HAD stepped into the spacious auditorium on the tenth floor of the home of the Curtis Publishing Company in Philadelphia week before last you might have thought it strange that such a place had been chosen for a conference of school teachers. You would soon have discovered, however, that here was a new type of school teacher, that both speakers and audience were for the greater part business men who had come together to discuss methods of educating their employees.

The National Association of Corporation Schools was holding its second annual convention. Its members, representing fifty-two business concerns, had put aside the technics of shop and store and were exchanging experiences in the training of salesmen, mechanics, office workers, accountants, draughtsmen and the like.

The constitution of this association declares that its object is to "aid corporations in the educational work of their employees." More than once during the four days' discussions it was made evident, however, that many members are anxious to go beyond that. They want to reach out and modify established educational institutions. Again and again speakers urged those present to go back to their own towns and use their influence to make the public school what business men think it ought to be.

Some of the criticisms business men have to make of the public school were elicited recently by the association. Fifty-one member corporations were asked whether, from their experience with new employes coming directly from school, they found public school training adequate. Of the thirty-four who answered, twenty-seven said no, five gave a qualified yes, and two an unqualified yes.

Asked to list the particulars in which such training is lacking, they replied: reading, writing, arithmetic, geography, spelling, punctuation, concentration, application, definite knowledge, accuracy, knowledge of commercial needs, ability

to converse properly, courtesy, articulation of speech, initiative, discipline, co-ordination of theoretical and practical, training in exact habits, ability to follow directions, general information, thoroughness, analytical and reasoning ability, and postal regulations.

E. St. Elmo Lewis, advertising manager of the Burroughs Adding Machine Company, voiced what appeared to be the prevailing opinion when he said that what business concerns want is youths who can be taught readily the peculiarities of the business they enter, but who do not have to be further trained in the essentials of a general education. There was no expectation at the convention that corporations can escape all educational burden with respect to their employes. It was taken for granted that the corporation school has come to stay, that it is as necessary an instrument to industrial efficiency today as the apprentice course was one hundred years ago.

Indeed, a corporation school, in the minds of those who attended the convention, is the logical descendent of the old apprentice course. The latter was a means afforded by industry itself for passing a young man or woman through all the operations of a trade. But the coming of big corporations and the subdivision of labor, it was declared, left no place to learn a trade.

Representatives of railroads, of manufacturing, of mercantile houses recounted their pedagogical experiences, discussing the value of classes for particular kinds of employes, such as salesmen and office workers, debating the question of compulsory courses, and outlining their class-room methods. The General Electric Company, Burroughs Adding Machine Company, Packard Motor Car Company, New York Edison Company, Curtis Publishing Company, Pennsylvania Railroad, Atchison, Topeka and Santa Fe Railway, and the Yale and Towne Lock Company are some of the corporations which have established the kind of schools the association is seeking to spread.

A resolution was adopted urging the members of the association to support the continuation school movement.

SMALL LOAN BANKS FOR BUSINESS, NOT PHILANTHROPY

WHEN THE Industrial Finance Corporation was formally organized a fortnight ago, not only were important changes made in its board of directors and financial backers, but instead of being described as a union of business and philanthropy it was admitted to be a purely business venture. It was added, however, that it might have important "sociological results."

This corporation is chartered to conduct a chain of "Morris plan" banks in various cities of the United States for the purpose of loaning money to wage-earners and other persons of small means. The promoters claim that the only security demanded is sound character and look upon the "Morris plan" banks as effective weapons against the loan shark.

Elgin R. L. Gould, president of the City and Suburban Homes Company of New York, has withdrawn from the board of directors of the corporation and with him have gone most of the men who furnished money and moral support at his instance. Among those retiring are Andrew Carnegie, Julius Rosenwald, Vincent Astor, Nicholas Murray Butler, W. D. Sloane, Mrs. J. Borden Harriman, Oscar S. Straus, Theodore P. Shonts, Edwin S. Marston and L. S. Fuller.

When the formation of the corporation was first announced last February Mr. Gould represented himself as being interested in it chiefly because of its philanthropic nature as filling the field heretofore preempted by the loan sharks. It was understood that the men named above had the same interest in it. The corporation was designed to supersede on a larger scale the Fidelity Corporation of America, which, under the management of Arthur J. Morris, had organized and operated "Morris plan" companies in fourteen cities.

Mr. Gould is the only one of those retiring who has made a public statement of his reasons for so doing. After signing the charter, which he says he did hurriedly, Mr. Gould declares that he discovered that one vote had been given

alike to each share of common and of preferred stock. Since the shares of common stock greatly outnumbered those of preferred, this arrangement, he said, would give the control of the corporation to the Morris group of financiers, who, he declared, held a majority of the common stock. Fearing that such an arrangement would lead to the running of the enterprise as a purely business venture, Mr. Gould withdrew, even after the charter had been changed to give to holders of preferred stock the right to elect one-half of the board of directors and to holders of common stock the right to elect the other half.

Clark Williams, former New York state controller and state superintendent of banks, who was elected president of the corporation, made it a matter of virtue that the corporation is to be run frankly as a business enterprise. This, he said, is necessary to give it permanence and stability. At the same time he denied that the charter provision objected to by Mr. Gould would in any way detract from the social usefulness of the corporation as a weapon against loan sharks. He admitted that the corporation, whose banks will not make loans of less than fifty dollars, would not rob the loan sharks of those who want smaller sums, but he said that it was hoped to lower the minimum in time to twenty-five.

It is the policy of the "Morris plan" banks which will operate under it to discount loans in advance; that is, if a man borrows \$100, he actually receives \$94. He is required to purchase two shares of so-called class "C" stock of the corporation as a condition to re-

ceiving the \$94. The par value of this stock is \$50 per share. He is then called upon to pay weekly installments of two dollars each on the class "C" stock purchased. The use of the interest and of an increasing amount of the principal thus gives the corporation at the end of the year what amounts to an interest rate of 12 or 15 per cent. Each borrower is required to furnish two indorsers.

Critics of the plan have raised many questions regarding its workability. They say that detailed revenue and cost statements of the companies in operation have not been made generally public. They question the legality in some states of the stock sale device by which the legal interest is greatly increased. Without this increased return, they contend, the companies cannot pay interest on capital, operating expenses and losses. They question also whether the interest return is sufficiently large, even as worked out through this device, to make the investment a thoroughly safe one until the operating costs (including an adequate investigation of the character and financial responsibility of the borrowers and their endorsers) and losses are sufficiently determined through longer experience and exact accounting of operations.

In addition to Mr. Williams, the officers of the corporation are the following: Arthur J. Morris, Raymond Dupuy, and Stephen C. Millett, vice-presidents; Charles H. Sabin, treasurer; Joseph B. Gilder, secretary; and Herbert L. Satterlee, chairman legal advisory board. One million dollars' worth of preferred stock and \$500,000 of common have, it is said, been subscribed.

FOR BETTER HEALTH SERVICE IN CONNECTICUT

A STATE-WIDE conference on public health held at Greenwich, Conn., on June 9, brought together a notable group of health authorities.

New York state was represented by State Commissioner of Health Herman M. Biggs; by C. E. A. Winslow, director Division of Publicity and Education, New York State Health Department, and by Haven Emerson, deputy commissioner of health, New York city. Pennsylvania sent her chief medical inspector, B. F. Royer. Joseph H. Townsend, secretary of the State Board of Health, C. J. Bartlett and Yandell Henderson of the Medical School of Yale and John Phillips Street of the Agricultural Experiment Station were the Connecticut representatives. These men generously gave their services to the opening of a campaign to secure a model state health department for Connecticut in place of the present machine-ridden system of health administration.

The conference was conducted by the School of Politics of the Progressive Club of Greenwich, which in a weekly class has studied the various departments of local government during the past season. This work is essentially a part of the Progressive national service, of which Mrs. William E. D. Scott, is a field secretary, as well as chairman of the committee of the Greenwich Club.

The School of Politics has issued a Bulletin on the Public Health System of the State of Connecticut and from this it appears that the authority and responsibility of the Connecticut health system are so divided that only the willingness of officials to co-operate with each other can do any good. The one link connecting the different branches of the health service with each other and with the people they are supposed to serve is the governor of the state. On the one hand there is a State Board of Health appointed by the governor and vested with power to make investigations and publish reports. On the other hand, the actual enforcement of laws in Connecticut townships is done by some 400 town health officers appointed by eight county health officials. These county officers, who must be attorneys-at-law, report annually to the state board, but they are appointed and removed by the Superior Court and paid by the comptroller of the county.

The town health officer, says the law, must be some discreet person learned in medical and sanitary science. It does not state that he must be a practising or a graduate physician, or a local resident. He is absolutely dependent on the county official who can veto any measure and must approve every prosecution under the law. But the people of the town must pay the bills for this officer. The only voice that local resi-

dents have in the health service is expressed in the choice of town clerk who keeps vital statistics, and in the choice of the school committee.

Through the recent health conference the School of Politics expects to create a demand for an efficient state health board or commission and for expert town and county officials who shall be responsible both to a central authority and to the local citizens they serve. A non-partisan state committee on reorganization of the public health laws and a board of publicity and education are about to be appointed.

WASHINGTON SCHOOLHOUSES FOR THE PEOPLE

THE WIDER use of the school plant in the national capital is practically assured. The bill introduced in the Senate on February 2, by Senator Hollis, of New Hampshire, was passed on April 29, and introduced in the House, by request, on the following day by Representative Johnson, of Kentucky, chairman of the Committee on the District of Columbia.

The bill provides for the use of the public-school buildings and grounds by pupils of the public schools, other children, and adults for supplementary educational purposes, civic meetings for the free discussion of public questions, social centers, centers of recreation, playgrounds, and for free public library branches, as well during the school year as during vacation.

The bill rested with a sub-committee, of which Representative Claypool, of Ohio, was chairman, until June 25, when it was reported favorably to the whole District committee. It received unanimous support in the subcommittee.

When hearings on the bill are held in the full District committee, considerable interest will center in the appearance of Margaret Wilson in advocacy of the measure. This is perhaps the first time that a daughter of the President of the United States has appeared before a Congressional committee in support of legislation. Both President Wilson and his daughter are interested in the wider-use-of-the-school movement.

When the Monday Evening Club brought Edward J. Ward, adviser in civic and social center development, University of Wisconsin, to Washington last winter to tell of his experiences as a pioneer in the movement in Rochester, Miss Wilson spoke from the same platform. Addresses were also made by Senator Hollis, who introduced the bill in the Senate and by Representative Crosser, of Ohio. Besides Miss Wilson, others to appear at the hearings on the bill in the District committee are Mrs. Henry T. Rainey, wife of the Illinois congressman, John B. Colpoys, secretary of the Central Labor Union of Washington, and representatives of the Monday Evening Club.

APPLYING STANDARDS TO MOTION PICTURE FILMS —BY ORRIN G. COCKS

A revised pamphlet on the standards and policies of the National Board of Censorship of Motion Pictures may be had free of the board at 70 Fifth avenue, New York. It is here summarized by Mr. Cocks, who has recently become advisory secretary following volunteer service on the general and advisory committees of the board. For some years he was secretary of the Laity League for Social Service in New York city.

The actual criticism of pictures continues under the direction of W. D. McGuire, Jr. John Collier, general secretary and organizer of the board, retains his interest in a voluntary capacity.—Ed.]

CONTROL OVER motion pictures has recently aroused widespread public discussion. Official censorship has been established in four states and many cities and a bill is pending in Congress to create a federal motion picture commission for licensing films. Especial interest therefore attaches to a statement recently issued by the National Board of Censorship of Motion Pictures giving its present policy and standards of judgment.

The board is a voluntary self-governing organization working with the manufacturers and importers of motion pictures and in the interests of the public. It was formed by the People's Institute of New York. No member is engaged in any branch of the motion picture business. The thirty-three members of the general committee speak as skilled social workers, representing such agencies as the Y. M. C. A., Charity Organization Society, Children's Aid Association, the churches, settlements, women's clubs, Young Women's Christian Association and People's Institute.

The 105 members of the carefully selected censoring committee drawn from the most intelligent groups in New York volunteer their services. The board at present views from 150 to 185 film subjects a week covering 95 per cent of the industry. These pictures are daily seen by about 8,000,000 people in 18,000 motion picture houses in the United States. Last year 53 film subjects were condemned and parts were eliminated from 401.

The total cost of negatives and copies kept off the American market was more than \$582,000. The board sends out weekly a bulletin of all the pictures passed for the week with or without parts eliminated and those which have been condemned. These bulletins go to some 400 city authorities, social workers, local

censoring committees and interested individuals.

The board's statement of its policy and standards of judgment is an interesting attempt to crystallize in words the moral and psychological effect of this new form of recreation on the minds of people, to estimate public opinion and to criticize or exclude from the screen scenes which have dangerous effects.

Few people realize the scope and complexity of such criticism. Laws have always lagged behind public opinion and there has been startling disagreement on basic ethical principles. The members of the National Board recognize these obstacles and freely acknowledge that they are open to error. Their methods, however, are sound. They know the motion picture business. They have actual knowledge of the effects of the pictures on people of different classes and in different parts of the country. They seek advice from people skilled in a part or the whole of the field of life.

It realizes that pictures stimulating the senses require particular study from the point of view of the adolescent. It, therefore, has adopted standards "curtailing prolonged love scenes which are ardent beyond the strict requirements of the dramatic situation. It believes that it is one of the purposes of censorship to keep out of the mire the great experiences of humanity so that they may not be cheapened to the extent of losing their significance." The board restricts also very carefully the display of clothing and the person in ways to arouse the imagination and suggest immorality and indecency. It also enforces strictly the exclusion of those forms of close dancing which have the same sensuous appeal.

A bewildering variety of crimes against person and property requires careful treatment. "The portrayal of crime should not degenerate into pandering to a morbid appetite but should seek ends which are legitimate for the drama." The board insists that punishment naturally and fatally follows crime and that an adequate dramatic motive for committing a crime is always necessary to warrant picturing it. Gruesome and suggestive details are excluded.

Regarding violence the board states, "The actual deeds of violence need to be treated with the greatest discretion in motion pictures and the producer should remember that he is not writing a detailed exposition of the crime but is telling a dramatic story which most often does not need such detail but merely enough to make clear what has happened."

"The board critically examines films presenting various forms of sex lapses, for those effects on audiences which arouse rather than minimize passion,

which tend to perpetuate the double standard of morality, which reveal easy ways of gratifying desire and of making money in the 'trade' or which simply indicate the weakness of humanity or recite the dreary detail of the lives of 'prostitutes.' The board gives its support to those subjects and films which present facts in a sincere, dramatic way leading to repression or to the removal of causes of commercial or sub-rosa prostitution.

"There is a place on the screen of the motion picture theater for presentations which unquestionably indicate the causes, the dangers and the effects of sexual misconduct. Those subjects dealing with the social evil, will therefore be supported by the National Board of Censorship which arouse fear in the minds of both sexes, which develop a hatred on the part of the audience of this ancient evil, which stimulate efforts to rescue the prostitute, and which indicate sensible and workable methods of repression or suppression."

The board deals severely with films which picture maniacs, on the ground that they unduly harass the emotions of the normal person and seldom serve a real dramatic purpose. The insane character who is not a maniac is less liable to be eliminated from a picture, though if the presentation of such character be

unduly unwholesome or unpleasant, it is challenged.

The board recognizes the need of popular education as to extent and dangerous effects of habit-forming drugs and believes that motion pictures may be a medium for this purpose. But it is opposed to the portrayal of the alluring, the gruesome and suggestive, and will allow only those scenes which are dramatically necessary to point the moral. It also opposes those methods of using such drugs as would stimulate curiosity and experimentation. It will critically scan any suggestions of easy methods of obtaining such drugs.

It will support those subjects presented in a dignified, sincere and dramatic way which will enlighten and arouse the public to the enactment and enforcement of laws tending to the repression or prevention of illegal or immoral use or sale.

Though located in New York as being the headquarters of the motion picture industry for the distribution of film, the National Board does not accept as a basis of criticism the standards of the New York stage or of its complicated, liberal and abnormal life.

It seeks constantly the point of view of typical Americans and attempts to write this judgment into its standards.

PROGRESS IN PRISON REFORM IN MASSACHUSETTS— BY GEORGE LUTHER CADY

PASTOR, PILGRIM CONGREGATIONAL CHURCH, DORCHESTER

IT IS ALTOGETHER unlikely that the rest of the United States share in the hallucination general in Massachusetts that that state leads in all good reforms. Local residence even for a short while reveals the fact that such is the state of mind in and around the Hub. But this complacency received a severe jolt a few years ago when Governor Foss told what he thought of prison conditions in the state.

In the care of younger offenders Massachusetts is well abreast of the times, but in prisons for older criminals, it would be hard to find things more antiquated in the northern states at least. For three years the governor repeated his attack and at last accomplished the retirement of the chairman of the prison commission who had persistently blocked reform measures. Now the warden of the state prison is retiring so that light may have a chance to break through.

Frank L. Randall, a lawyer and former prison warden from Minnesota who has had long experience in handling prison reform problems, is the new chairman of the Prison Commission. He has outlined a splendid program and is working vigorously to put it into effect by endeavoring to put through the following measures:

A bill providing for indeterminate sentence. At present, contrary to widespread impression Massachusetts has no indeterminate sentence law. The court fixes a maximum and minimum sentence, and release is impossible until a prisoner has served at least $2\frac{1}{2}$ years of his sentence, nor is a prisoner eligible for parole until two-thirds of his minimum has expired.

A bill to allow the judge to appoint counsel for indigent defendants charged with felony. At present only those charged with a capital crime can have advantage of such counsel.

A bill providing that the courts may proceed to sentence a prisoner who has acknowledged his guilt without awaiting indictment by the grand jury.

A bill providing that a prisoner on parole from the state prison may voluntarily return thereto and at his written request be admitted and retained there. Under existing laws he may have no other place of refuge in case of sickness or misfortune. A paroled prisoner ought not to have to commit another crime in order to get needed protection from the state.

A bill granting to prisoners an allowance of a sum not exceeding \$4 a month to be paid from the treasury of the state. This will enable a prisoner to provide himself with a few of the things he needs or to help his family a little. It also affords prison authorities a disci-

plinary measure since it may be withdrawn for misconduct.

A bill putting all jails and houses of correction under the management of the Prison Commission, instead of under the fourteen county boards as at present.

The main purpose of this last measure is to utilize county jails for minor offenders only. The average county jail is bad because of conditions found there and also because it forms a link in the "county ring" system we are trying to break up. There are splendid exceptions to this average in Massachusetts as at Plymouth but it is an anomalous condition when a large share of the prisoners of the state are under no central authority.

The bill providing \$4 a month to prisoners is of splendid purpose but one can only wonder what our children will say fifty years hence when they read that only \$4 was asked for these men who either are or ought to be at work during regular working hours and ought to be equally productive with men on the outside. If we could get the public to see that if we changed our present "penal servitude" for proper rewards we would gain not only in discipline but we should be nearer what the future in all conscience will demand.

It is a grievous fact that, after some years of agitation and with the services of Mr. Randall, Massachusetts must yet close the year with little accomplished.

No fundamental principle of reform recommended by the commission has been recognized. An act providing for the appointment of women police officers has been secured, also one permitting county sheriffs to employ prisoners on highways and in redeeming waste land.

To take the place of most of the bills now before the Legislature, a bill is being drawn up providing for a special investigation of the whole problem of the state's prisons that a full and co-ordinate plan may be presented to the next general session of the Legislature. It is doubtful if the investigation will result in anything but the passing of just such acts as were recommended but it may open the eyes of the people to the shameful conditions in their state prisons.

The great need of prison reform in Massachusetts is in the direction of classification both of prisoners and prisons. The crowning effort should be the attainment of such a state farm as that at Witzwil in Switzerland. What would the people of Massachusetts say if one day they awoke to behold that their prison was paying the state 4 per cent on the investment instead of calling for \$179,000 annually for maintenance? More than that, what would they say when told that the prisoners were paid a daily wage besides? This latter, as an entering wedge is advantageous, and perhaps before a great while such a law may be enacted.

INDUSTRY

THE PATERSON SILK MILL STRIKE A YEAR AFTER— BY JOHN A. FITCH

THE HEARING was a community hearing—that of the Federal Industrial Relations Commission at Paterson last week. A full year after the strike, the local men who had borne the brunt of the conflict told, one after another, how it lay in their minds. And although a full year had passed since the strike was at white heat, and they gave their testimony quietly, like characters in a rehearsal, the commission got nearer to some of the tense issues entering into the social unrest than at any time since its hearings began. Issues were brought out which men had been willing to go to jail for—wholesale; or to send their fellows to jail for—wholesale. There were 2,238 arrests during the twenty-two weeks of the strike, Police Captain McBride told the commission. Three hundred cases went to the Grand Jury; more than 100 served jail sentences.

Two former strikers, members of the I. W. W., testified and two silk manufacturers, and after them two organizers of the United Textile Workers, an organization affiliated with the American Federation of Labor. There were two editors among the witnesses. One of them was arrested during the course of the strike and jailed for criticizing the police. The other has been a resident of Paterson less than three years, and edits a paper owned by a resident of New York. He attacked the outside leaders of the strike and said editorially that if there were no law in the community to drive them out, they ought to be driven out anyway. He was neither arrested nor jailed.

The counsel for the strikers told his story, and so did the prosecuting attorney. A police captain was on the stand for over two hours explaining the attitude of the police force. After him came a ribbon weaver who had participated in the strike, a Socialist, not a member of the I. W. W. He gave the commission his views as to the causes of the strike, and the conditions that led up to it. After him came a Catholic priest who, waving economic theories aside, endorsed the testimony of the Socialist. Then came two business men, another manufacturer and finally a reporter for a local paper.

The hearing was impressive both for issues on which everyone agreed and for issues on which they differed.

There were differences of opinion over what caused the strike. That the four-loom system had much to do with it was generally agreed. Former Mayor McBride said, however, that it was caused by low wages and bad conditions. The weavers who testified insisted that this last was the case, and Father Stein

Probing the Causes of Unrest

VII

The seventh of a series of interpretations of the hearing before the Federal Industrial Relations Commission by a staff representative of The Survey.

agreed with them. On the other hand the employers, the business men and the police were inclined to lay all the trouble on the "outside agitators."

The second names of the officials—prosecutor, mayor and policemen, of manufacturer and craft-unionist, were those of the older immigration. There was an undercurrent of feeling in what they said that if the newer immigration of Paterson—the Italians and Jews—were of a higher order, matters could have been more readily adjusted. The American Federation of Labor organizers declared that the Paterson workers are too unstable to be organized into conservative unions. They are too impatient, and when an organizer appears they want to strike first of all. A resident declared that the kind of immigrants who are now coming to this country are not capable of understanding American principles of liberty. They cannot understand the difference, he said, between liberty and license. On all sides there was a distinct though possibly somewhat unconscious attitude of superiority which stood out as much as elsewhere in the attitude of the police.

On one point employers and employees agreed. The former testified that they are handicapped by competition with Pennsylvania, where lower wages and longer hours prevail than in New Jersey. Until the Pennsylvania standard is raised, conditions cannot, they believe, be materially improved in Paterson. So serious did this matter appear to them that they were even ready to urge compulsory standardization through a federal board. Henry Doherty, Jr., a partner in the Doherty firm which operates the largest silk mill in Paterson, said that he and his father were both in favor of a government commission to

regulate wages and hours in the silk industry. On this question they stood squarely on the same platform with Louis Magnet, the Socialist, and, in effect with the I. W. W. leaders, whose remedy lay in organizing the workers everywhere and so establishing uniformity the country over.

Standing out above every other question as the hearing progressed was the subject of violation of law. Henry Marelli, counsel for the strikers, reviewed the history of the strike as it came to his attention in his professional capacity. More than 1,800 cases were handled by his firm from Recorders' Court to the Supreme Court of the state. He declared that it was a remarkable peaceful strike. So did Edward Zuercher, secretary of the I. W. W. local.

"There were 25,000 people on strike," he said. "If that number of clergymen were conducting a strike and were subject to the condition that we have faced there would have been as much or more violence." He severely arraigned the police for their activities.

Alexander Scott, who was editor of the Paterson *Issue*, a Socialist paper, told of getting out a special issue three days after the strike began, in which he criticized the police and accused them of taking orders from the silk manufacturers. For this he was arrested, and indicted for "hostility to government" under the statute enacted after the assassination of William McKinley. At the same time 5,000 copies of his paper were confiscated, without a warrant, by officers under the direction as he said of the chief of police.

That Scott was sentenced in the County Court to serve from one to fifteen years on the charge of hostility to government and that he was released when the Supreme Court reversed the decision of the lower court, is well known to *SURVEY* readers. An indictment against him for criminal libel against the police is still pending.

Marelli declared that the figures of arrest were significant in themselves of the attitude of the local government toward the strikers, since out of the 2,238 arrests made, but 300 indictments were found, and jail sentences were served by but 100 men. A number of the cases were appealed to higher courts, and thus far all but one of these appeals have been sustained. He explained further that on account of the hostility of the local papers, it became necessary to get an order from the court directing that jurors be impanelled from outside the county. Without outside juries, he said, acquittals were impossible.

Prosecutor Michael Dunn defended the authorities and cited instances of the stoning of houses and the placing of bombs. Police Captain McBride gave

similar testimony. Prominent citizens, including Father Stein, spoke of the actions of the police in terms of praise.

It is impossible here to weigh and analyze the testimony—to go back of it and examine the recorded evidence in order to determine just how violent were the strikers, and how violent the police. It is enough that it became clear that a new definition is needed of the word "violence." Adolph Lessig, a striker in 1913, and now an officer of the I. W. W., testified that he favored destruction of property if such action would help the workers in the struggle to improve their condition. His was a clear advocacy of violence. It was not a new position, but the one which more than anything else has called down upon the I. W. W. the condemnations of the law-abiding.

A new angle was given to the situation when John W. Ferguson and James M. Cooke, both prominent business men, both active in the civic life of the community, and directors of the Charity Organization Society, testified that they believed a year ago, and they believe now, that the I. W. W. leaders should

have been compelled to leave the city. Neither of them would have organized a mob to drive them out, but they held that the police should have done so, or should have met them at the train and compelled them to leave the city on the next outgoing train.

This testimony led to considerable cross-examination, in which Mr. Cooke was willing to admit that the police, in order to do this, would have to violate their oaths of office. But it is not a new thing, he argued, to violate an oath of office. The officials of the American colonies serving under the British crown violated their oaths of office when they took up arms against England. There are times when it becomes necessary to commit what he called a "technical violation of the law." Both made it clear that this should not be done unless the interests of the community clearly demanded some such extra-legal action. The interests of the community, they were convinced, did demand it in 1913. They believed that most of the trouble would have been avoided by such action.

With such testimony written into the record, the old division of the commu-

nity into the law-abiding and the lawless became sadly jumbled. Here were men on both sides who advocated breaking the law—each for his own reasons; each with his own sanctions. Lessig advocated breaking the laws of property rights when that best serves the interests of the workers. Ferguson and Cooke advocated breaking the laws of personal liberty when that best serves the interests of the community. All three were for employing force, if necessary, to accomplish their ends.

Here, then, perhaps as never before at a public hearing, was laid bare the present-day relation of the law to industrial stress. With such disparity between the holdings of petty courts and higher tribunals, and with such a clear-cut emergence of class views as to legal rights worth respecting, the Federal Commission has before it one of its greatest problems. The Paterson hearings were in a sense a challenge to the commission to put its largest resources, and those of a great profession, to work at such a constructive analysis as will help bring coherence to judicial decisions and clarity to public thought.

Testimony at Paterson Regarding Violence

ADOLPH LESSIG
I. W. W. Leader

Mr. Thompson: If in your opinion or if in the opinion of your organization a strike could be won by blowing up a mill, would it be the policy of your organization so far as it has announced its policy to do it or advocate it?

Mr. Lessig: Well, I believe that would just depend on that situation and I believe it would be dealt with at the time.

Mr. Thompson: Well, assuming that that would intimidate or in any other way bring about the settlement of the strike favorable to your people, would you then advocate it?

Mr. Lessig: Well, we probably would not hesitate to pursue that course then.

Mr. Thompson: Where you have a grievance and it has not been adjusted to your satisfaction, is it a part of the policy of your organization to do slow work and lessen production? Is it a part of your policy to make poorer goods, or try to destroy the goods in the making?

Mr. Lessig: Well, we do not make any hesitancy sometimes to say those things in order to gain our demands. We have been frank enough to admit it.

JOHN L. MATTHEWS
Editor Paterson Press

Mr. Thompson: Now, I will read you very briefly some extracts from articles that appeared in your paper and ask you whether you can recall or whether they probably did appear.

[Here follows a dispatch from Los Angeles describing methods employed in Los Angeles and San Diego to get rid of the I. W. W.]

Mr. Thompson: Now, Mr. Matthews, I ask you to state for the benefit of the Commission the reason for these articles and your views as to their necessity—the conditions which caused them to be punished?

Mr. Matthews: Well, we felt that the I. W. W. was a real menace to the community, a material menace, as afterward developed. This strike cost Paterson probably \$18,000,000. It is pretty hard to compute it, but I think that is a very conservative estimate. In reciting what took place in Los Angeles we were simply repeating a matter of record and we published it because we felt that it had a bearing on the situation here. Los Angeles and other cities had experiences with the I. W. W. They handled the situation in a way that seemed to be satisfactory to the people of those cities, and we felt that possibly the same kind of treatment here would be acceptable and legal, decent and orderly, and satisfactory to the people generally.

JOHN W. FERGUSON
Contractor

Chairman Walsh: Mr. Ferguson, apparently from what you have said here the feeling had become very intense here on both sides, had it not, as the strike progressed?

Mr. Ferguson: It was very strong. It was strong among those who were not directly interested in this trouble, but who were interested to maintain the good name and character of this city without having a disturbance and having the militia coming here, and all that sort of thing, which would only add to the notoriety which we had had in the past.

Chairman Walsh: And you probably, in any expressions you made, gave forth the sentiment of the innocent by-standers, as it were—the business men and so on?

Mr. Ferguson: I think so.

Chairman Walsh: And so deep-seated had the feeling become that you are willing to say that these outsiders should be dispersed or gotten away by means illegal or otherwise?

Mr. Ferguson: Well, I would hardly say illegal, because I believe that legal means are means taken by the authorities. That is what we were advocating. That is what I meant. It was not that I would personally form a vigilance committee and go out and misuse these people, but I believed that the city authorities should take means perhaps beyond the technical legal point to get rid of them. I thought that would be justified.

REDUCING LABOR COSTS BY SHORTENING THE WORK DAY—BY HARRY FRANKLIN PORTER,

LABOR CLAMORS for a shorter work-day; employers generally oppose it. The average manager thinks he sees an inescapable relation between shorter hours and higher costs. Off-hand, this view seems to be logical, but experience is fast proving that the reverse is quite as likely to be true. Paradoxical though it may seem, cost cutting and hour shortening frequently go together, even as do cost cutting and wage raising. All depends on the method of making the change.

Arbitrarily to shorten hours without providing for the more effective use of the reduced period will be more than likely to curtail production, hence swell costs in proportion. But to make quantity of output a condition of the shorter work period stimulates activity all along the line.

As a matter of fact, the problem, in the final analysis, is one purely of economics. The desideratum is a maximum of quality output per man each working day. So if man-efficiency is raised to the highest practical pitch, the hours of labor necessarily must be reduced to the point where the average man can maintain indefinitely the established level without injury to himself. Hence the basis for determining number of hours is strictly dependent on the character of use of each of them, and long hours, if they entail a low level of labor efficiency, are as inimical to the interests of the manufacturer as they are irksome to the workman. The manufacturer has only to see this—the vital relation between man-effectiveness and duration of the working period, and of his own accord he shortens hours to the point where he feels he is getting the best and fullest effort from each man every moment of the time. For he knows that the net result will be not less but more output, not higher but lower costs.

Here are the results in one instance—a Youngstown steel mill. Unusually long hours always have been, and to a considerable extent, still are customary in this industry, the nature of which requires continuous production. The superintendent of this plant, however, was convinced that two shifts of twelve hours each were not only inhuman but uneconomical. So firm in his belief was he that favorable results would follow the shortening of the hours to eight, with three shifts to the day, that the management finally consented, with much misgiving, to a trial. Wages were to remain the same. That is, the men were to receive the same pay for eight hours as previously they had received for twelve. In return, the men were to maintain the same production. This they did from the start and presently they began to show an increasing production. To make a long story short, the final result was an increase in the shift output of fifty per cent and in the daily output of one hundred and twenty-five per cent. That is, under the new arrangement the average production had been forty thousand pounds a shift, or eighty thousand pounds a day of

THE SURVEY published earlier this year three articles by manufacturers, discussing the change to an eight-hour shift in continuous industries (January 3 and May 23, 1914). Mr. Porter is a consultant in factory management and a contributing editor of *Factory*, and cites here several instances to show that a shorter work-day is practical as well as humane.—E.D.

twenty-four hours. With eight-hour shifts, this increased to sixty thousand pounds or a total from sun to sun of one hundred and eighty thousand pounds.

In Granite City, too, some of the steel plants have demonstrated, to the satisfaction of their officials, that in continuous processes three eight-hour as against two twelve-hour shifts pay. One plant found that the reduction in waste and inefficiency due to negligence and fatigue more than outweighed the twenty per cent addition to the payroll of the men affected. In another plant, the change to eight-hour shifts was accompanied by an increase of twenty-two per cent in the hourly rate of the men, but a decrease in the total earnings of twenty per cent. The management was dubious of the results. But when the proposal was put up to the men, it met with their enthusiastic and unanimous endorsement.

At first some of the officials were fearful lest the men take advantage of the extra hours to engage in money-making side pursuits, but this did not prove to be the case and there has been very little bad use made of the leisure. "Steel work is so strenuous," declared the president of one of the companies, "that any man who took to dissipation would be unable to keep up his efficiency even through the eight-hour shift. The fact that we do not have to discharge any of them on this account shows in itself that the time is not badly spent."

Congressman, now Secretary of Commerce, Redfield, in a speech before the House of Representatives, in 1911, told of an experiment that took place in the great shipbuilding yards of William Denny & Sons. This firm agreed with their men that they would try the eight-hour day for a year, at the end of which time, if the results showed no disadvantages to costs the eight-hour day would be retained. Otherwise the men agreed to go back to the nine-hour day. The result was the retention of the eight-hour day, because it was found to have paid.

All of which goes to show that there is an element in the question of reducing the hours of work which offhand does not appear. Farsighted managers are sensing this element and they are not waiting either for labor organizations or legislatures to compel them to action, but of their own accord they are declaring their independence of tradition and short-

ening the hours to the point where they have reason to believe they are getting the best results. Declared a Cleveland garment manufacturer, whose plant is in the forefront in matters of efficiency: "It is our aim always to be ahead both of the law and the demands of labor. Our hours are now less than the maximum prescribed by the State, and we intend shortly to reduce them still further. Why? Because we watch our people very closely and if we detect signs of over-exertion, we investigate the cause. Our organization is keyed up to the top pitch and we would not be able to maintain this level if we tolerated for a moment any conditions that detracted from their efficiency. So if we find our people can't hold the pace throughout the present number of hours, we shorten the period to the point where they can."

At the present time the number of hours worked weekly in this plant is fifty, as against a prescribed maximum for women of fifty-four, and the number contemplated is forty-eight. This by happy coincidence is the number recommended by Edward Cadbury, the English manufacturer who is so widely celebrated for his experiments in industrial efficiency.

In line also is the experience of a middle-western enameled ironware works. Like many processes in the steel industry, the operation of enameling must be practically continuous. In this particular plant the two twelve-hour shift plan long has been supplanted by the three eight-hour one.

Wages have not decreased; on the contrary, as the efficiency both of men and equipment have increased, wages steadily have risen until now it is by no means uncommon for an enameler to earn seventy-five dollars to ninety dollars a month. Output, too, has gone up. For example, under the 12-hour schedule, two men working together would enamel eight to ten bath tubs in a day; now the same men turn them out at the rate of two an hour or sixteen in eight hours. Nor are the men obliged to work continuously, but have fully one-third of the time for resting. Improvements in the appliances and methods of handling are planned which experiment has demonstrated will enable a pair of men to enamel twenty-four to thirty bath tubs in eight hours. But their rest time is cut into and the trials so far made indicate that in order to enable the men to hold the pace, it probably will be necessary to shorten the shifts still further to six hours each. Four tubs an hour, it is then expected, will prove a practical standard. As under the new plan a pair of enamellers keep two furnaces going—a preheating and a finishing chamber—this means a total of forty-eight tubs in twenty-four hours for each furnace as contrasted with sixteen to twenty under the original bi-shift plan. The total number of operatives will remain the same—that is, four to the single furnace in twenty-four hours.

It would be hard to find an instance which shows more plainly than this the vital connection between large production and low manufacturing costs, on the one hand, and on the other short hours and high wages.

CHURCH and COMMUNITY

Edited by GRAHAM TAYLOR

THE UNEMPLOYED AND THE CHURCHES: A REPLY —BY JOHN A. RYAN ST. PAUL SEMINARY, ST. PAUL, MINN.

THE SURVEY of April 25 contains a somewhat remarkable argument on this topic from the pen of the Rev. John Haynes Holmes. I should like to examine it from a different point of view.

Dr. Holmes intimates that Tannenbaum performed a useful service, inasmuch as his invasion of the churches has forced ninety million persons to think hard about the problem of unemployment.

Does mere thinking about a problem necessarily promote its solution? Suppose that the forces which have aroused the thinking convey false impressions, and suggest wrong conclusions. A prominent New York Socialist declared a few weeks ago (in a letter to the *Milwaukee Leader*) that all the educative and constructive efforts of his comrades in that city with regard to the unemployment problem had been neutralized by the performances of Tannenbaum and associates. The excesses of the latter had provoked very many persons to the conclusion that the majority of the unemployed were mere trouble-makers and anarchists. It is scarcely to be doubted that more public sympathy has been alienated than attracted. The "hard thinking" evoked by Tannenbaum's conduct has apparently received a wrong and anti-social direction.

Dr. Holmes maintains that the churches should be the refuge of all those who find or even think themselves in distress.

The churches always have taken this position. It is safe to say that on the very night when Tannenbaum's "army" invaded St. Alphonsus's, more than an equal number of men were sheltered at the expense of the churches of New York. The question is not whether the churches may properly be called upon to relieve this particular form of distress, but whether they may reasonably be required to answer favorably an appeal for assistance in the particular circumstances surrounding the I. W. W. invasion.

Dr. Holmes thinks that the churches should have so responded. He bases his opinion on the words of Christ: "Give to him that asketh of thee;" and on a quotation from the writings of Edward T. Devine.

Surely these words of Christ are not to be understood without qualification. If they are, they mean that the professional idler must not be rejected when he demands continuous support from the hard working father of a family. Evidently Christ had in mind the genuinely needy, not impostors.

The pertinent and decisive sentence from the words of Mr. Devine is: "If, however, they [the applicants for relief] are not mistaken about the fact [that their need is genuine], and have come to an appropriate place to ask for it, nothing should be taken for granted except the need which is revealed by the application." But Dr. Holmes thinks that this statement authorizes his own assertion that "the churches had no right to assume anything as true except the need for aid expressed by the application. . . ."

Mr. Devine speaks of the need that is "revealed;" Dr. Holmes makes it the need that is "expressed." In other words, he would have the churches accept as true the representations made by the applicants themselves, and forthwith assume that the alleged need is genuine. I do not believe that the most unreasoning enemy of scientific charity has ever made such a sweeping statement in favor of indiscriminate giving. Among professional "panhandlers" the clergy have the reputation of being the "easiest marks" to be found anywhere. Dr. Holmes would have them set a still higher standard of childlike faith and credulity.

In the particular case that we are discussing, the "expressed" and alleged need was not genuine, and it was put forth in notoriously bad faith. Tannenbaum and his followers could have obtained from the municipal lodging houses better sleeping accommodations than are within the gift of churches, softer beds than the pews of churches. One of the conditions laid down by Mr. Devine in the passage quoted by Dr. Holmes is that the applicants for relief should come to "an appropriate place." A church is decidedly not the appropriate place for five hundred men to sleep, when they can get better quarters elsewhere. And it would be decidedly unreasonable to suppose that any church in ordinary circumstances should pay for the lodging of that many men at a hotel, so long as the city is discharging its responsibility in the situation.

Dr. Holmes reproves the attitude of one hundred and eighty out of two hundred ministers who based their opposition to the I. W. W. performances on the ground that the men were organized, and demanded instead of requesting assistance.

Of course, the mere fact that the applicants came in a large and united group would not have been a sufficient reason for turning them away. On the other hand, Dr. Holmes' attempt to find a parallel between a refusal for such

a reason and the refusal of some employers to recognize labor organizations, is arbitrary, futile, and far-fetched. Possibly the first ground of refusal given by the ministers is really reducible to the second. Possibly they all meant that they would not respond favorably to demands and threats, when the proprieties of the situation required a respectful request. Undoubtedly they were right.

What good to society or to the applicants themselves could come from acceding to and encouraging such perverse conduct? If, indeed, the men were in real distress, had no other place to go for the night, their wants should have been relieved, no matter how insolent their bearing. So much is dictated by Christian charity. But the evidence in the case shows that Tannenbaum and his followers were in no such plight, that they could have been more effectually and more appropriately cared for elsewhere, and that their avowed aim was to harry and if possible discredit the churches, to "put the churches in bad." Again I ask, what service to the men themselves, to humanity, to society, to truth, or to sound thinking could have been rendered by weakly yielding to such perverse and dishonest conduct?

Dr. Holmes mentions as the climax of the clergy's offending, the fact that "the priests of St. Alphonsus's turned the men over to the police, and charged them with rioting and disorder."

And the priests were right. The pews of a church are not a proper place for sleeping on, when better provisions are available elsewhere. Nor is it reasonable to assume that the parishioners of St. Alphonsus (who are mainly of the working class) should pay for putting up five hundred men at a hotel or lodging house in these circumstances. When a large part of the invaders refused to leave the church, and to relieve the fright of the worshippers whom they had disturbed, the police very properly arrested them. Should the priests and the police have let them stay, or have merely coaxed them out, thus encouraging them to repeat their program of bad faith and disorder elsewhere?

As a result of the action taken by the police, the number of pestiferous I. W. W. disturbers has been reduced by at least one, and the invasion of churches has ceased. This is a clear gain, not only for public order, but for clear thinking and constructive efforts with regard to the problem of unemployment.

I am well aware that Tannenbaum and his associates denied in court the disorderly acts of which they were found guilty; but I am not so simple minded as to set a higher value on their

veracity in these circumstances than on that of the priests of St. Alphonsus and the police, especially when I recall that the accused leaders belong to an organization which openly rejects all the principles of what it calls "capitalist morality," including the prohibition of lying.

Dr. Holmes contends that the problem of unemployment is too big to be solved by the churches, and that it must be met by society, particularly by constructive methods of prevention.

In this he is certainly correct. It is not the business of the churches to provide specific measures for the solution of this or any other social problem. All that they can do, all that they should be asked to do, is to enunciate and advocate in concrete terms the principles of justice and charity upon which the solution must be based. To devise and set up effective remedial institutions is the proper task of civil society. Were the churches to shelter every unemployed "army" that applied to them they would at best merely relieve the distress of certain individuals; at the worst, and in fact, their action would confuse the situation, and delay the adoption of constructive measures. The churches must, indeed, "speak the social message and initiate the work of social reconstruction,"—but only by preaching and urging the appropriate principles of Christian justice and charity, by bringing home in specific language to society and to individuals their obligations to set up efficient institutions, not by attempting to do the work that belongs to other social agencies.

One of the most insidious obstacles to effective social reform is the presence and activity among us of revolutionary groups and movements. The I. W. W., with its open repudiation of the moral law, its advocacy of brute force, its violent methods, and its anarchistic aims, attracts and misleads many well meaning persons who might otherwise aid in bringing about rational and constructive measures of reform.

Organizations of this sort are not only a constant menace to public order and civilization, but are instrumental in casting discredit upon the whole social reform movement. For one person whose interest in social betterment is aroused by the spectacular and violent performances of these groups, it is safe to say that one hundred are provoked to the hasty conclusion that, after all, only perverse and anarchistic-minded men have any great fault to find with things as they are. The net result is that the social forces enlisted on the side of rational and feasible reform are notably less than they would have been had the I. W. W., and kindred agencies, refrained from muddling and muddying the situation.

Yet, not a few men and women of authority and influence who believe neither in the methods nor the aims of such organizations, do not hesitate to condone and even encourage their misguided activities. The theory of these influential persons seems to be that any group of men who strive for social betterment ought to be supported because they mean well! The assassins of Lin-

coln, Garfield and McKinley may have meant well; the indiscriminate givers to charity seekers mean well. It would seem that the principles of common sense which are accepted in the fields of politics and relief-giving have not yet been established in the domain of social reform.

The sum of the matter is that genuine and lasting social betterment can be accomplished only by rational methods and movements; that all other movements are definite hindrances, veritable red herrings drawn across the path of progress; that every sane reformer should make it a part of his program to endeavor by all legitimate means to eliminate these disconcerting and obstructive revolutionary agencies; that when the leaders of the latter make themselves liable to criminal prosecution, they should receive the full measure of legal punishment, not maudlin and irrational sympathy.

Sympathy is a fine quality, but only when subject to reason. It can be made an effective instrument of social betterment, but only as an ally of the colder processes of the intellect. It is not a safe substitute for careful analysis of facts, rigid distinction between appearance and reality, or reasoned judgments. After all, the universe is based on reason, not on emotion. I yield to no person in my detestation of the manifold social evils of our time, including that of unemployment, nor in my desire for constructive and permanent social solutions; but I expect to find these solutions along the road of reason and experience, not along the road of indignation, enthusiasm, or sympathy.

PRESBYTERIAN GENERAL ASSEMBLY AND SOCIAL QUESTIONS—BY HENRY SEYMOUR BROWN

PASTOR, LAKE VIEW PRESBYTERIAN CHURCH, CHICAGO

THE MOST enthusiastic applause given by the General Assembly of the Presbyterian Church, meeting in Chicago, was given to Edgar P. Hill's eloquent defense of the Home Board's Departments of Immigration, Social Service and Country Life.

Speaking of the criticism of Charles Stelzle's work as giving too much attention to union men and leaning too much to Socialism, thus making some weakly contributors withdraw their support, Dr. Hill said: "As for myself, I would rather lose a few thousand dollars given by a few supersensitive contributors, if thereby we might gain a few thousand men with good red blood in their veins." At this the assembly burst into applause.

Again there was applause when he said that the Department of Church and Country Life manifested a "stroke of

genius in approaching the subject from the economic side. The head of that department has created a literature on the subject which is highly prized the continent over. Recently when a representative of the Department of Church and Country Life visited McCormick Seminary and placed before the young men certain rural fields accurately investigated and surveyed, thirty-three of these young men volunteered for the work. One hundred Presbyteries have asked that this work go on. I wish there might be some decision of this body on this work." Here again the assembly broke into applause.

Dr. Hill waited, and then turning to the moderator said, "I think that is sufficient." This incident perhaps best interprets the spirit of this assembly and its action in unanimously adopting without debate the reorganization scheme of the Home Board as submitted by the committee.

In answer to a question from the floor, it was expressly stated by the chairman that the work of the Department of Church and Country Life would be continued under one of the four co-ordinate departments of the reorganized Home Board which would be known as the Department of Immigration and Social Service. It will deal with the special problems centering in the country and the city and will magnify the relations of the gospel to all the questions bearing upon social righteousness and moral and spiritual progress.

The assembly put itself on record as favoring a federal divorce law. This action was preferred to the suggestion of the Committee on Christian Life and Work that the assembly endeavor to bring about in every state the requirement of two years' residence before application, and one year's lapse after the decree before it shall take effect, and that any citizen moving into another state to secure a divorce or remarriage contrary to the law of his own state and then returning shall have his divorce or remarriage declared null and void.

[Continued on page 354.]

DUTIES OF PRESBYTERIANS EMPHASIZED BY THE ASSEMBLY

Every individual should feel responsible not only for those social wrongs to which he may be a contributing cause, but for those which, by his prayers and efforts, he could assist in abolishing.

The duty of Christian citizens to observe those principles of our religion which require that every man do his full share of the world's work; which oppose injustice and tyranny, even when these are entrenched in the usages of our civilization; which lead men to endeavor to maintain themselves in a self-respecting, God-fearing way, this self-maintenance being understood to include a fair return for labor, sufficient to support the man and his family, conditions of labor that are safe and healthy, opportunity to provide against illness and old age, and relief from labor one day in seven; which lead to movements to secure childhood against forced labor and woman against conditions degrading to womanhood.

SOCIAL AGENCIES

DAYBREAK IN NEBRASKA STATE PRISON—By GEORGE L. COOPER

THAT THE conscience of Nebraska citizens has been awakened since the event of five murders in its penal institution two years ago is unmistakably seen in the rapid strides for prison reform recently made in the state. Campaign promises were made in the fall of 1912, and with the convening of the Legislature there was a determined effort to make amends for the sins of former years, the responsibility for which did not rest upon any one pair of shoulders, but rather upon the citizens of the commonwealth itself.

The first rosy hue appeared on the horizon in the fall elections of 1912 when an amendment to the constitution was adopted, providing for a non-partisan board of control of state institutions. The members of this board were to be chosen by the governor for a term of six years and to receive a salary of \$3,000.

For warden of the state penitentiary the governor appointed W. T. Fenton, and for deputy warden, N. T. Harmon.

The greatest encouragement to prison reform in Nebraska was the generous appropriation by the Legislature of \$150,000 for a new reformatory. The farm and yards about the new building will consist of some 640 acres. With the new reformatory in operation, the biggest problem before the warden and the state board of control will be solved, that of classification. In the old structure with space at a premium, young, first-term prisoners have been forced to share the same cell with incorrigibles and even with degenerates. The site for the new reformatory has not yet been selected.

In addition to the large sums appropriated by the Legislature for buildings and repairs, an attempt was made to in a measure compensate for the five murders by appropriating \$5,000 for the death of an officer; \$5,000 for the wounding of a guard; \$7,500 for the death of a woman's husband, besides the many thousands of dollars for the militia and other expenses incurred by the death of six persons.

One of the most demoralizing influences of former years was prison traffic in drugs. Unscrupulous guards were the medium through which dope reached the inmates. Warden Fenton urged the inmates to turn over their money to his keeping. This uprooted the evil, for without money trading in drugs became unprofitable, and it served the double purpose of removing temptation from the guards as well as from the inmates. The guards chosen by the new warden have worked hand in hand with him to care for the drug victims.

A physician, receiving a salary of \$1,200, has charge of the pharmacy department and dispenses all drugs.

The better wages paid the guards secures experienced men. None of the guards receive less than the minimum wage of \$55, which formerly was as low as \$25. Credit must be given former Governor Aldrich for paving the way for increased salaries. He was instrumental in raising the wages of the guards to \$50 a month, and the deputy warden's salary from \$75 a month to \$1,250 a year. Under the new administration the salary of the warden was increased from \$1,500 to \$2,500.

One of the warden's right hand men in instituting his new policy was Deputy Warden N. T. Harmon, formerly prison chaplain, and preceding his appointment as chaplain, a minister of good standing in Nebraska.

An outstanding grievance under the old régime was the unwholesome cooking. Sworn statements as to the food were placed in the hands of Judge Lincoln Frost, to whom is due praise for investigating and bringing to light living conditions in the prison. Complaint was made that the food did not sustain the men for their work in the shops; that the prisoners were compelled to spend their own money for special cuts of meat. Consequently, a lively trade sprang up between the cooks and prisoners. A bill of fare was a thing unknown, the cook dishing up in stock form whatever came to his mind.

Following drastic changes in the

cooking, the kitchen equipment was improved. The old soup caldrons were replaced with ranges which permit of varied processes of cooking and eliminates monotony of diet. Barrels of insect killer were used and the kitchen thoroughly cleaned and painted.

The new dining hall and hospital building is of brick and cement. It covers 108 by 60 feet of land, rests on a high foundation and contains large windows which permit of plenty of light and air. Completed and equipped with modern kitchen and hospital conveniences it will cost \$45,000. Shower baths and laboratory will be on the second floor which will be devoted exclusively to the care and treatment of the sick. The lower floor will be used for the kitchen and dining hall.

Every able-bodied man about the institution is now employed at some kind of labor. In the summer months many men are employed on the farm. Last year a great deal of road work was done. Bricklayers, carpenters and other workmen were used in the construction of the dining hall. The institution furnishes \$12,000 worth of electricity for other state institutions. It is the only state institution that pays money into the general fund of the state, the amount totalling \$50,000 for two years. More labor for the men will be forthcoming with the erection of the new factory, for which an appropriation of \$30,000 is now ready.

Warden Fenton has made many minor changes about the institution. Shower baths take the place of the old iron tub, and inmates are permitted to use them once a week. Recreation on a broader scale has been provided. On Sunday afternoons prisoners take exercise in the yards, playing baseball and other games and soon a portion of each day will be set apart for recreation.

Night school has been established where 130 inmates gather in the classrooms for instruction in shorthand, typewriting, bookkeeping and all common school branches. A number of men are taking extension work from the University of Nebraska. They receive no credit for this work, unless after release, they enter the university as regular students. Some contemplate doing this. A member of the state board said in visiting the school: "The board of pardons will take into consideration the time and kind of work done by men who make application for pardons." Twenty-five hundred dollars has been provided for the school by the Legislature.

The warden challenged any committee of investigation recently to find a penal institution which is trying to do more for the inmates than Nebraska penitentiary.

WARDEN W. T. FENTON
Who has brought new hope to Nebraska state prisoners.

BOOK REVIEWS

MODERN INDUSTRY

By Mrs. Florence Kelley. Longmans, Green & Co. 147 pp. Price \$1.00; by mail of THE SURVEY \$1.07.

"To most young minds the idea is fascinatingly new that the transformation of industry is today the life and death question of this Republic."

"The ultimate blasphemy is the proposal to fit children for industry as industry is."

"Acid tests of the industrial morality of

every public movement are the questions:

"Does it tend to restore to the people who work a share in the ownership and control of the tools of industry?"

"Does it contribute to the ability of any group of wage earners to fit themselves in mind, character and economic position to participate healthfully in the transition?"

"Whatever is calculated to enable us as a people, or any group among us, to make a step forward on the road to peaceful service away from the battlefield of greed is a contribution to the sum total of industrial morality, and whatsoever hinders a forward step is in itself actively evil, because it prolongs the existing evil."

It may seem shirking his job for a reviewer to try chiefly to make the book itself invite the reader. But this book does just that. It is a most succinct, specific and condensed indictment of present-day industry. It presents, all the more convincingly, because implicitly, the direction of true progress. The next steps are not debated for; they are shown as the practicable things already rooted in the better side of what is. In fact, they are next steps, not visions across a gulf.

Many readers will undoubtedly shy away from the ideas contained in my quotations from Mrs. Kelley. The urge I have for such readers is—that they cannot afford to let these questions go without their own personal attempt to think them out. No president, director, or general manager will have a real estimate of what his cost statements are likely to show in the ten years succeeding this year, unless he reads this book—reads it through and ponders it. He will disagree with some of it, as I do. That isn't the point; he needs it all.

In a swift river the whirlpools and backsets, if conscious, might not be conscious of the direction of the river. Some of our best and some of our worst manufacturers today, equally do not realize that they are headed wrong.

They may not change their motions. I'm not sure that some of them should. But they ought all to get their bearings. And this book will help them to that—in one evening, without argument and with an honest tug, not only at the heart, but at the brain as well.

ROBERT G. VALENTINE.

MODEL HOUSING LAW

By Lawrence Veiller. Russell Sage Foundation Publication. Survey Associates, Inc. 352 pp. Price postpaid \$2.00.

Mr. Veiller's Model Housing Law has been awaited with eagerness by all interested in housing reform. In drafting this proposed model with its suggested adaptations to less developed communities Mr. Veiller has performed another service peculiarly grateful to persons all over the country who have come to recognize that the housing problem is not limited to the congested portions of northern cities but is found also in southern cities and in the towns of the West and Middle West. Laws that apply only to "tenements" or multiple dwellings have therefore been found inadequate, and there is a growing need for regulation of the single family house.

The proposed law consists of six articles: I. General Provisions. II. (a) Regulations of dwellings erected after the passage of the law with regard to light and ventilation, (b) Sanitation, and (c) Fire problems. III. Altered buildings. IV. Maintenance. V. Improvement. VI. Remedies.

Definitions are framed in the light of wide experience with housing control, and points likely to be overlooked are emphasized. Advance is suggested along many lines, such as larger control over buildings moved from one location to another, higher minima of floor space and of light and air than in earlier laws, windows large enough to light the entire room, ventilation for water closets and bathrooms. Newly accepted principles of ventilation are explained and the old minimum of cubic air space, raised to 600 for an adult and 400 for a child, is used as a bulwark behind which the health office, may hide in case of overcrowding. There are three provisions to which attention should be especially called:

1. That if the health officer demands it, the owner shall keep a representative on the premises (p. 189).

2. A device something like the "zone"

device is invented by which a proportion of dwellers on a block may keep the block residential, i. e. limited to private or to two-family dwellings (p. 59).

3. The requirement that the consent of the officer of health be obtained before lodgers may be received in any family (pp. 192-193).

The services rendered by Mr. Veiller are so distinguished that it may not be invidious to suggest that in his discussion of the lodger evil and in his opening statement regarding the nature of the housing problem, his treatment seems inadequate. The damage done by taking lodgers to the life of the family group and to the lodger cannot, of course, be exaggerated; but that evil grows out of inadequate community provision for a group to whom our industrial life is under great obligation, namely the unattached man or woman worker utilized in many of our great industrial plants. To treat the only housing provision now possible for these workers as analogous to prostitution is to misrepresent the situation.

In this connection, too, one may point out the confusion in the opening discussion. Surely no one thinks that amending the law of taxation alone or that assuming more intelligent control over transportation facilities will cure the evils now included in the housing problem. But this treatment of the "lodger evil" shows how impossible it is, too, to rely exclusively on restrictive regulation. This, of course, Mr. Veiller is the first to admit but, in the judgment of the writer, he fails to make clear the fact that while restrictive regulation should have the first place in a program of housing reform, chiefly because, perhaps, it can be secured, it must in every instance be ultimately and should at the earliest possible moment be supplemented by such reform in taxation as tempts to prompt and fuller uses of land, such control over transportation facilities as will give the largest freedom in selecting a home and such supplementary provision for the housing of non-family groups of men and women as the industrial practices of the time indicate to be necessary.

In new communities, where the aim is the prevention rather than the abolition of those evils that Mr. Veiller includes in the term "slum," these items would be included in the initial program of prevention. These suggested limitations surprise the follower of Mr. Veiller who expects from him leadership in all questions bearing on this problem. They do not affect in the slightest the great value of the proposed model for the law which all admit is the necessary next step in innumerable communities in all parts of the country.

SOPHONISBA P. BRECKINRIDGE.

RURAL LIFE AND EDUCATION

By Ellwood P. Cubberly. Houghton, Mifflin Company. 367 pp. Price \$1.50; by mail of THE SURVEY \$1.63.

This book is a valuable addition to the rapidly increasing literature on American rural life and rural school conditions. The author emphasizes the fact that the rural school problem "is a social, even more than an educational problem," and cannot therefore, be seen clearly if studied apart from its historical and sociological setting. Accordingly, the book falls into two parts—the rural life problem and the rural school problem.

Part One outlines in six chapters the changes which have taken place in our rural life, the effects of these changes on rural life institutions, the needs of rural life today, etc., adhering pretty closely to the ground already covered by such other writers in the field as Warren H. Wilson, but giving many new details, charts, and statistics of greatest value. Part Two is a clear-cut statement of the needs of rural school organization and administration, with excellent chapters on the new curriculum, new teacher, and new type of supervision.

The book is equipped with numerous valuable charts, maps, illustrations and a good brief bibliography. Dr. Cubberly's book should be read by every rural life student and is especially well adapted as a textbook for high, normal, agricultural and other schools having training classes for rural teachers. H. W. FOGHT.

THE HYGIENE OF THE SCHOOL CHILD

By Lewis M. Terman. Houghton, Mifflin Co. 417 pp. Price \$1.65; by mail of THE SURVEY \$1.78.

A number of good books have appeared recently on the need, organization, and methods of school hygiene and medical inspection chiefly from the standpoint of the school administrator and the school physician. This volume deals with the hygiene of the school child as distinguished from the hygiene of the school building or the environment of the school child; it is intended primarily for teachers and parents.

The first seven chapters treat of conservation of life and the conditions which are favorable and unfavorable to normal growth. The remaining fourteen chapters deal with the various physical and mental abnormalities encountered in school children. The prevalence and symptoms of each abnormality are described so clearly and fully that the teacher and the intelligent parent should be able to recognize them.

The author has wisely placed much

emphasis on the importance of ascertaining the causes of abnormal conditions and removing them whenever possible. A summary, conclusions, and a selected bibliography at the end of each chapter are invaluable features of this book.

Properly used, the study should prove exceedingly valuable in the hands of teachers and parents. By properly used, I mean that teachers and parents should not attempt to diagnose but simply learn to recognize the early symptoms of diseases and abnormal conditions requiring medical treatment.

The following statement on page 270, "The teacher can make the tests fully as well as can the physician who is not also an oculist," does not represent the opinion of the majority of oculists on the question of vision tests by school teachers. In the same paragraph with the above statement is found the following: "Dr. Frank Allport, Dr. R. C. Cabot, Dr. Myles Standish, Dr. Clarence Blake, and other oculists of the highest standing, have long contended that the ordinary routine examinations of the eyes should be undertaken by teachers and school nurses." Two of the "oculists of the highest standing" quoted here are not oculists, but eminent practitioners and teachers of other branches of medicine. Dr. Cabot practices internal medicine and Dr. Blake is an ear specialist. GEORGE L. MEYLAN.

VOCATIONAL GUIDANCE

By James Puffer. Rand, McNally & Co. 306 pp. Price \$1.25; by mail of THE SURVEY \$1.36.

The author attempts a comprehensive study of vocational guidance. From outlining the need for such guidance and the proper equipment and methods of those who are to give it, Mr. Puffer proceeds to a statement of the differences among occupations, and an analysis of home making, agriculture, the mechanic arts, salesmanship, office work, foremanship and the professions.

Though the preface declares that the book springs directly from personal experiences in the Lyman School for Boys, Boston, there is little in it that is original. It is indeed a curious tapestry of platitude, meaningless detail and questionable generalization, with occasional strands of some appreciation of the aims of vocational guidance, and tolerable grasp of its difficulties. One cannot feel sure, however, whether these strands have been supplied by the author himself or whether they have slipped in along with other borrowings from current thought.

Mr. Puffer is too willing to have wholesale vocational guidance practiced now by the army of public school teachers. He does not sufficiently see that at present we know too little about industry, and that our deductions about children's aptitudes are too much like guesswork to justify such an undertaking.

Neither does he adequately emphasize frequent need for guidance into *further training* rather than into immediate work.

He is too lenient also in accepting industry on its own terms and making boys and girls to fit. A prime duty of the vocational guide may prove to be to help to change for the better the occupations which young people are to enter. WINTHROP D. LANE.

ARROWS IN THE GALE

By Arturo Giovannitti. Frederick C. Bursch. 108 pp. Price \$1.00; by mail of THE SURVEY \$1.07.

Arrows in the Gale is the suggestive title of a little volume of verse by Arturo Giovannitti, printed at the Hillacre Book-house in Riverside, Conn. These verses are indeed winged things, and barbed. Despite the adverse winds of indifference and hostility, some of them will lodge and rankle in human hearts. For the poet unmistakably meant to sting and wound; to let blood; in all the lyrics we hear the Baptist's cry, "Repent!"

Helen Keller, at the beginning of her enthusiastic introduction to Giovannitti's work, reminds us wisely that as a poet he is to be judged by his success in rendering his ideas in verse, "and not by his relations to Syndicalism or Socialism or any other movement in which he happens to be active. The laws of poetic beauty and power, not one's beliefs about the economic world, determine the excellence of his work."

But did any critic, however well meaning his intentions, ever succeed in judging a poet merely by "the laws of poetic beauty and power"? Certainly Shelley's contemporaries failed him there; and his present-day critics, although united in appreciation of his lyrical magic, still divide into hostile camps over his message; on the one side lauding indiscriminately his revolutionary utterances, particularly the youthful rant in *Queen Mab* which has the least claim to being called poetry; and on the other, damning with faint praise the intellectual acumen informing such great poems as *Prometheus Unbound*, because the author chose to call himself a disciple of Godwin.

If Shelley has not escaped the prejudices of the critics, how shall Giovannitti escape, in whom lyrical magic is almost wholly lacking, whose rhymed verse almost always sings with a twang? How shall the uninitiated, and those who criticise by formula, find the poet under the skin of this stark rebel? Yet the poet is there. Let us listen for him first in a love song; for all the world, including the most hide-bound of critics, agrees in loving the lover.

I know not what new spell was heaved about me by the mighty mouth that breathes all the fearful gales of life, But this I do remember, that my soul became a cage full of nightingales and

her hand opened the door and they flew away in the azure of thy heavens in a long thrill of song.

And this also I do remember, that my heart in which every scythe had reaped till it was nothing but a barren desolation, bloomed up suddenly in all thy apple blossoms, in all thy almond trees, in all the flowers of thy orchards and of thy gardens, O Spring. And I could not throw out of it its myriad flowers, for she had laid her hand on my heart and I dared not break open the gentle gate of her fingers.

We shall agree also, that this is not a good example of his lack of lyrical magic. It is undoubtedly in these unrhymed recitatives that the poet finds himself most completely. Our old accepted English meters jangle upon his lyre, but the long rhythmic strophes which we usually associate with Whitman, Giovannitti has made his own by an inward music as compelling and individual as that of the elder poet. Of the twenty-four poems in the little volume, nine are in this chanting measure, and one of these, *The Cage*, which appeared in 1913 in the *Atlantic Monthly*, he has not yet excelled. Hear the prisoning cage sing to the prisoner:

"While I was hoe and ploughshare and sword and axe and scythe and hammer, I was the first artificer of thy happiness; but the day I was beaten into the first lock and the first key, I became fetters and chains to thy hands and thy feet, O Man!"

My curse is thy curse, O Man, and even if thou shouldst pass out of the wicket of this cage, never shalt thou be free until thou returnest me to the joy of labor.

O Man, bring me back into the old smithy, purify me again with the holy fire of the forge, lay me again on the mother breast of the anvil, beat me again with the old honest hammer—O Man, remould me with thy wonderful hands into an instrument of thy toil.

Remake of me the sword of thy justice, Remake of me the tripod of thy worship.

Remake of me the sickle for thy grain, Remake of me the oven for thy bread, And the anvil for thy peaceful hearth, O Man!

And the trestles for the bed of thy love, O Man!

And the frame of thy joyous lyre, O Man!"

Here is Giovannitti's message of freedom at its noblest, and the whole poem is sustained at this level. In *The Walker*, also, another poem of the prison, the same lofty dignity is found. The prisoner is listening to the footsteps of the man in the cell above his head:

"One—two—three—four: four paces and the wall.

"One—two—three—four: four paces and the iron gate."

And out of this ceaseless pacing back and forth the poem is born, with its anguished cry for freedom, its recognition of brotherhood.

Another of these rhythmic tirades,

Reprinted in full in Arturo Giovannitti, by Mary Brown Sumner, in *THE SURVEY* for November 2, 1912—*THE SURVEY*'s first review of Giovannitti's fugitive verse, and so far as we know, the first review published anywhere.

The Sermon on the Common, paraphrases satirically the Sermon on the Mount, and recalls to us those irreverent old thirteenth century parodies which the Goliardic poets used to sing in their taunting, mocking Latin:

"Blessed are the rebels" [proclaims this rebel of the twentieth century, who is at one with the bitter rebels of all ages]

"Blessed are the rebels: for they shall reconquer the earth.

Blessed are they which do hunger and thirst after equality: for they shall eat the fruit of their labor."

If we turn to the rhymed poems we shall find that the most successful, perhaps, is *The Republic*. Here is none of the banal rant which mars the better known poem called *The Bum*, and none of the jingling sentiment which occasionally finds its way into these lyrics. Shelley's description of freedom in the *Masque of Anarchy* is no more inspired than Giovannitti's vision of the goddess of the common weal:

Not hers the wisdom which decrees That time alone must wrongs allay, Not hers the craven heart to pray And barter liberty for peace;

Not hers the fear to hesitate When shame and misery cry out— Love has no patience, truth no doubt, And right and justice cannot wait.

So, loud into the midnight air She rang the tocsin's loud alarm, She called, and as by potent charm From its mysterious haunt and lair,

The Mob, the mightiest judge of all, To hear the rights of Man came out, And every word became a shout, And every about a musket ball

And when upon the great sunrise Flew her disheveled victories To all the lands, on all the seas, Like angry eagles in the skies,

To ring the call of brotherhood And hail mankind from shore to shore, Wrapt in her splendid tricolor The People's virgin bride she stood.

Whether or not we agree that the Mob is "the mightiest judge of all," there is no question that this is true poetry, exalted and simple; and the grim turn at the end, in which the People's virgin bride of the morning is shown at night in her defeat and prostitution, a drunken harlot of the street, lying "between a sergeant of police and a decrepit millionaire," is powerful in its poetic irony.

In most of the other poems the poet is not so successful in evading the lure to rhetoric, a temptation peculiarly Italian, as anyone will realize who has listened to the extempore flow of eloquence so impossible to stem at Socialist or other meetings of young Italians. Neither is the irony always on so high a level; it degenerates at times to mere scorn and taunting, and becomes in Christian ears painful blasphemy when it touches the name of Christ. Nevertheless, it is well that Christian ears should listen, for this very blasphemy is a call to repentance.

It is too soon to attempt an estimate of Giovannitti's genius. These twenty-four poems are like the tentative carolings of young birds. Our singer is trying to find his range, and to get used to

his voice. To say, as Miss Keller does in her introduction, that he is "a better poet than has come out of the privileged classes of America in our day," is premature, and, for the present at least untrue. The social feeling in some of William Vaughn Moody's poems—*Gloucester Moors*, *An Ode in Time of Hesitation*, *A Soldier Fallen in the Philippines*, *The Brute*, in New York, *I Am the Woman* is as poignant as in Giovannitti's, and unquestionably on a higher poetic level; yet who dares to say that Giovannitti may not mount as high, if we give him time.

To expect a man who was born in Italy in 1884 and lived there until he was seventeen to sing our language immediately with the abandon and distinction of a Shelley is absurd. If he has failed to infuse into his English the subtle Italian grace and passion of a Dante Gabriel Rossetti, the blame must be laid upon the Pennsylvania coal mines and the New York slums, our wells of English muddy and defiled, from which we have forced him to drink.

And if the tongue halt, how shall the thought shine clear? It is unfair to carp at Giovannitti's message, to say that he can give us only the diatribes of the rebel,—accusation, arraignment, invective. It is true that this is all that he has given us so far, but *The Cage*, *The Walker*, *The Republic* promise something more; there are foreshadowings in them of spiritual intuitions.

Giovannitti will always be the poet of emotion rather than of thought, however, and it is to be feared that the negative note will dominate. He will also be the lyricist rather than the dramatist or the narrative poet; when he tries, as in *The Bum*, to do what Masefield and Gibson do so well, to picture the bare, sordid life of the poor and the outcast, he fails because of his irresistible tendency to declaim and to accuse. In symbolic verse, like *The Republic*, where abstract emotion is set free, and in the long, chanting recitative, he is at his best; and these measures which lend themselves so well to the poet's impassioned accusations and negations, might as easily interpret the positive and constructive notes, for which we still hopefully listen, in his message.

FLORENCE CONVERSE.

PROBLEMS OF GENETICS

By William Bateson. Yale University Press. 258 pp. Price \$4.00; by mail of *THE SURVEY* \$4.25.

Although of definitely scientific content, this study will interest the many social workers who, in their own fields, have endeavored to follow the progress of modern thinking. The book records the present pause in enthusiasm over evolution and the closer consideration of evolutionary forms and processes; and its discussion centers upon the question: What are species? How did they arise?

"In the enthusiasm with which evolutionary ideas were received, the specificity of living things was almost forgotten." Species were regarded as essentially impermanent groups, the differences among them being regarded as due to natural selection of those fittest to survive in the given environments. Yet today, Bateson remarks, most systematists manifest as much faith in the fundamental reality of specific differences as if Darwin had never written. Collectors seek "typical" specimens; collections are so arranged as to mask the phenomena of variation; intermediate forms are sorted out regardless of locality and date, into separate groups, or else disregarded as unimportant.

This rigidity of the conception of species occasionally leads to absurdities. Notwithstanding the fact that no set of characters definitely diagnostic of species has yet been found entirely adequate, still Bateson believes that "the proposition that animals and plants are on the whole divided into definite and recognizable species is an approximation to the truth."

Whether specific distinctions rest on natural and physiological bases is to be determined by stricter analysis of the diversities of animals and plants on a more comprehensive scale. Heredity and variation, he suggests, affords the key to the specific characteristics of living organisms, just as chemical attributes afford a key to the intrinsic nature of the various kinds of non-living matter.

The method for such analysis of specific differences is furnished by the discoveries of Mendel and his followers, namely, the laws which govern the transmission to descendants of the "unit factors" or characters of the individual. From the Mendelian point of view, Bateson criticizes the theory that species have arisen through natural selection of the forms most fitted to the environment. To assume that the minute differences which characterize certain species which, topographically, are neighbors and systematically, are closely allied, have definite survival values, Bateson believes, is to put a gratuitous strain on belief.

His conclusion is that, while acceptance of the theory of evolution is inevitable, we know as yet little of the forces which have guided and shaped the evolutionary process.

GERTRUDE SEYMOUR.

WOMAN, MARRIAGE AND MOTHERHOOD

By Elizabeth Sloan Chesser. Funk & Wagnalls. 287 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

Survey of the "New" Motherhood

A sane, practical and scientific presentation of the "woman movement," especially its bearing upon marriage and motherhood, is contributed by Dr. Chesser to the already notable array of volumes on this vital topic. It seems strange to realize that motherhood is old as the race and yet that the past two decades have seen the rise of a "new"

motherhood in faith, as well as in works, that seems destined to place indelible impress upon future generations. Dr. Chesser surveys the subject with impartial, expert vision; broad humanity; and highest ideals of service.

The physiology of motherhood and sex; the physico-psychical sex influences and reactions; marriage and divorce; the economic and legal status of woman; and her physical, moral and mental development and claims are treated with scientific sincerity and democratic simplicity.

Dr. Chesser holds that the cornerstone upon which the whole constructive movement for uplifting motherhood should build, is the child. The book is therefore a significant contribution to the literature of child welfare. It presents in clearest terms the laws of woman's labor and protection of maternity, prenatal influences of alcohol, social disease and depravity, prison and factory systems, and the practical possibilities of eugenics. While dealing primarily with conditions in England, Dr. Chesser correlates these with similar social conditions in the United States, Germany, France and other countries.

Economic problems have perhaps been responsible for the inadequate maternity protection in England, though in protective legislation for children the national and colonial governments of Great Britain have made headway. Deploable slum conditions, intemperance, unremitting factory labor, and sweated home labor for women, have wrought havoc with infant life in England. France has gone far ahead in the race for "baby saving." Thirty-five years ago Madame Bequet de Vienne established in Paris *L'Allaitement Maternel*, a society for the care of mothers during pregnancy. Similar movements have been begun in Germany and Austria. Economic provision for expectant mothers was also a movement in which France took pioneer steps, followed by Belgium, Austria, Denmark and Sweden.

In the United States, child welfare has attained national importance. The formation of the Parents' Educational Division by the United States Commissioner of Education, under charge of Mrs. Frederic Schoff, gives government recognition to the National Congress of Mothers now under the presidency of Mrs. Schoff, whose introduction to Dr. Chesser's work gives solemn emphasis to the responsibilities of the human race toward its children.

Communications

SAFETY AT SEA

TO THE EDITOR: Harking back to your editorial of May 2 and the letter of Mrs. Florence Kelley, in the same issue, on Safety at Sea, to which must now be added the article in the June current issue by "Slocum," I want to file my protest.

For twenty-five years I have been a recognized "steamboat crank," obsessed it seems with the spirit of that pioneer of pioneer steamboat dreamers John Fitch and of the less original but more successful Robert Fulton. During that quarter of a century I have met many of the leading steamboat men and marine engineers of the world—numbering some of them as intimate friends—and out of this intimacy I am justified in saying that to give circulation to the wild cry that these men weigh gold against life, deliberately court unnecessary hazards for the sake of increased dividends, is more than an injustice—it is well-nigh a crime.

Steamboat men are not the only men who hope the La Follette bill will not become the law of the nations. As an outsider, a busy pastor of a church, not interested at all in stocks or earnings of steam-boats and holding no brief for any one but myself, I protest against some of the absurdities of the bill. But that which especially calls forth my protest at this time is what others are saying about the bill—the things that are logically deduced from it.

Take Mrs. Kelley's contention that each passenger shall have a designated seat in a life-boat as called for by the number on a coupon. Think you that frenzied men and women could be kept from a near-by life-boat because perchance the numbers upon the seat in the particular boat did not correspond with the numbers on their coupons? A week at sea is not a theater party with every body subservient to gentlemanly ushers.

Some life-boats would possibly be smashed in a collision, some could not be used by reason of a list of a ship to one side or the other, what would be done with the people whose assignments happened to be in unusable boats? Such a coupon system would not only be wholly ineffective—it would be confusion worse confounded.

And the proposition to have two able seamen for each boat. Was there ever a week in the history of steam navigation when it was found that men were too weakened by work or too ignorant to get overboard a boat for their own salvation? At such times the strength of one man becomes as that of ten. And the direct charge that there were no men who knew how, or had the strength, to lower the boats of the *Volturno* should never have found utterance in the light of what Lloyd did and what the others in the boat were ready to do.

Would to God there had not been a single life-boat to lower from the *Volturno*! The loss of life would have been less horrible. But if men are to be limited to "able seamen" when assigned to the command of life-boats, why exempt the men trained on the Hudson and Long Island Sound and some of our boys from the possibilities of such service? It is not brawn only that is needed in emergencies but brains, and I am not sure but that a steward or a purser, or even a stoker, sometimes has brains.

Then, too, there is the matter of life-boats on the Great Lakes to which "Slocum" refers. The conditions are so entirely different from those prevailing at sea that after granting all that "Slocum" claims he still fails to make his case. At sea, owing to the possibility of being a long time adrift, and to the danger of a raft being broken to pieces, boats might well be required. But a few hours after a wireless call went up from a boat on the Great Lakes would find the endangered craft encircled by boats sent to her aid and if the passengers had to leave a sinking or burning vessel rafts are much easier to get overboard and much easier to get upon when once in the water. What was needed at the time the *Empress of Ireland* went down was self-releasing rafts not boats that had to be lowered by davits.

Mr. Furuseth, as quoted by you, declares that nothing brought out in the London Convention could have prevented the *Empress of Ireland* disaster. In all fairness he should have added, "Nor could anything provided in the La Follette bill have mitigated in the least its horrors."

Let us not yield to the cry, "The rich are selfish"—only some are! Nor to the charge, "Steamboat men are heartless"—only some are! There is good in men that is not brought out by harsh names.

C. SEYMOUR BULLOCK.

Ottawa, Canada.

[Mr. Bullock has written much on steamboat history and because of his special knowledge in this field was given the place of Robert Fulton on the Clermont in the Hudson-Fulton Celebration. In his last paragraph Mr. Bullock seems to have wholly missed the point of safety legislation whether applied to ocean liners or laundries: namely, that what is done by exceptional companies who are neither selfish nor heartless has, to quote our editorial note of June 6, "no binding force upon those [companies] willing to take chances of disaster and profit by them." Rather, in the absence of safety legislation binding upon all, the latter companies make it difficult for those who are neither selfish nor heartless to do what they think ought to be done and not be driven out of business.—Ed.]

TO THE EDITOR: Mr. Bullock appears to have confused several articles and some statutes.

It is the British law which requires a seat in a life-boat for all persons on board. Senator La Follette has merely copied this in his bill.

It is Mr. Furuseth, not I, who suggested that in case the International Convention for Safety at Sea were ratified in its original form, passengers would be reduced to trying to protect their own lives by demanding that steamship tickets should carry identifiable coupons for specified seats in life-boats. This appears to be the custom at present on all trans-oceanic Japanese steamships. It appears also to give satisfaction to their passengers. But why does Mr. Bullock impute the idea to me or to my article?

Fortunately, the International Convention for Safety at Sea has not been ratified unchanged. The Senate Committee on Foreign Relations reports the following proviso:

"That the United States reserves the right to abrogate 'treaties, conventions, and agreements,' indicated in Article 68, in accordance with the terms of such treaties, conventions, and agreements, and to impose upon all vessels in the waters of the United States such higher standards of safety and such provisions for the health and comfort of passengers and immigrants as the United States shall enact for vessels of the United States."

As to the *Volturno*, all—men, women and children—saved from her burning hull owe their lives to seaworthy life-boats in competent hands sent from other ships. More and better seamen, better davits and better boats on board the *Volturno* could have saved more lives. Why blink the sinister facts?

Each day brings tidings of a collision or a steamship on the rocks or ashore. Why at such a time should any American be content with anything less than the most perfect provision for safety at sea that ingenuity has devised? Why should any vessel be allowed to clear from our ports whose standard falls below this?

FLORENCE KELLEY.

[National Consumers' League]
New York.

TO THE EDITOR: The article in your issue of June 6, entitled *Land-Locked Disaster*, by "Slocum," deserves commendation for its evident attempt at fairness in statement. At the same time, its author failed to take into account some important facts which bear upon the passenger boat situation on the Great Lakes.

Rivers have very properly been exempted from the provisions of this bill, and we on the Great Lakes feel entitled to the same exemption for the following reasons:

Actual figures taken from the latest report of the United States supervising inspector general for a period of five years, 1907 to 1911 inclusive, are as follows:

Great Lakes Rivers

Total number of passengers carried in the 5 years	82,415,716 67,293,895
---	-----------------------

Average number of passengers carried per year (5 year period)...	16,483,143	13,458,779
Total number of lives lost (passengers) all causes, in the 5 year period...	30	70
Average number of lives lost (passengers) per year, all causes, (5 year period)	6	14
Average number of passengers carried per year for each life lost (5 year period)	2,841,921	989,616

Degree of Safety, Great Lakes 133 Per Cent Greater than Rivers

We lake folks insist that this record must be taken into account, and that it does not justify placing Great Lakes vessels in the ocean-going class.

It is proper to premise that I have not a dollar invested in any lake passenger boat, and that my business as a vessel outfitter, carried on for more than forty years, naturally leads me to favor any law which would send them to my house for additional safety devices.

Yet first of all, I value fairness and justice. "Safety first" is admirable. But reason is better than hysteria. What we need is not more lightning, but more light.

Shipowners are doubtless as selfish as you or I, yet they are no more destitute of humanity. Indeed, as I have known them, they are conspicuous for it and they know that in the long run selfishness would spell ruin to their business. They are Americans, proud of their country and its commerce, and sincerely anxious to safeguard the lives committed to them. In proof of this, they have uniformly gone farther than the government requirements as to safety devices and regulations. Success has followed their efforts.

We maintain at great cost a standing army, militia and police to preserve order. Murder and robbery should be impossible; our railroads should be as safe as are those of Switzerland; our buildings, public and private, should be fire-proof and stormproof; all these are ideals which we should constantly keep before our minds. But the public is governed by common sense, it demands, and rightly, the nearest practical approach to this ideal.

The provisions of the La Follette measure as applied to passenger service on the Great Lakes, are not practical, but fatal. For example, the steamer route from Sandusky to Cedar Point, Ohio, a distance of not over three and one-half miles, far freer from the dangers of navigation than any river route, over water the depth of which would permit the average man walking ashore, is included in the provisions of this bill and would have to comply with every regulation exactly the same as ocean-going vessels. There are many routes of this kind on the Great Lakes.

I am not concerned to defend the conclusions of the International Marine Convention. Your criticism may be ac-

cepted as just. I am personally inclined to think that thirteen nations know more about the high seas than does Senator La Follette of Wisconsin, but let that pass. At any rate, these eminent representatives probably know less about conditions on our "unsalted seas" than does the present writer.

Among those who did not know, we must include the name of Andrew Furuseth, president of the Seamen's Union, from whom Senator La Follette acknowledges to have received the information upon which he based his bill, a bill which would eliminate many if not all the passenger ships on the Great Lakes. It would prevent any part of a ship's crew being assigned to duties in any other department of the ship by recognizing officially life-boats alone as life-saving apparatus, regardless of other equipment; by making no distinction between trans-Atlantic liners and boats making half-hour runs on the Great Lakes; by lowering discipline aboard ship, especially where boats are away from their docks only a few hours out of every twenty-four.

Who is this great authority? Has he ever sailed at all on the Great Lakes? Has he any real knowledge of her ships, her men, their conditions, their needs?

One of the modern steel lake steamers, built in 1911, at a cost of \$300,000, travels a course the maximum distance of which from shore to shore is five miles. If she sank at the place of greatest depth, 36 feet, three decks would remain above water. The company operating this ship has operated steamers on this route for fifty years without loss of life by accident.

Under the La Follette bill, this ship would be required to have a crew of 450, and to carry 183 life-boats. These boats would weigh approximately 230 tons. If all available deck space were utilized, she could not accommodate 183 life-boats. It would be impossible to fit her with enough davits to carry anywhere near this number.

In case of accident, she could reach shore in fifteen minutes, less time than would be required to lower any considerable number of life-boats.

To accommodate the surplus crew would necessitate the use of cabin, parlors and dining-room for crews' quarters.

To limit the number of passengers to the capacity of her life-boats it would be necessary to charge a prohibitive rate of fare.

The La Follette bill would require this ship to be equipped the same as a ship sailing around the world. There is no resemblance between this ship and an ocean liner.

I submit again, is it fair? In view of the importance lent to the utterances of this expert witness, and without any heat, I submit those fair questions before his advice is taken as final.

The excursion season on these waters covers about ninety days. Passenger line boats run about half the year. With the exception of a very few boats referred to by "Slocum" as running to the head of Lake Superior, they operate along shore or through connecting rivers, practically always in sight of

land or of each other. All are equipped with wireless. A disaster happening so suddenly that help cannot reach it is extremely unlikely, or, if such did occur, it would be so sudden as to make the launching and filling of many life-boats out of the question. Personally, in such an emergency, I would rather take my chances with a life-belt on a raft. The La Follette bill recognizes neither of these life-saving devices.

Railroads must run, steamers may.

Our lake courses are all paralleled by railroads. People travel in the summer, for example, from Cleveland to Buffalo, or from Chicago to Sault Ste. Marie, for the luxury of a trip on the water or for cheaper fare. By all means make the trip on water as attractive and as safe as you can. Do not, by prohibitive demands upon the ships, deprive the people of their wonted and safe lake excursions.

The La Follette bill as regards payment of wages at every port is worse than a misfit on the lakes. It provides that a seaman may demand wages at any time at any port, and must be paid though the trip is not completed. This would make every day pay-day on the passenger and package freight steamers plying the Great Lakes. After being paid, the seaman would be free to leave the boat in a port where it might be impossible to obtain a "certificated able seaman." A single "certificated able seaman" could thus make it impossible for a ship to proceed, regardless of passengers, mail or perishable cargo. Under this bill it would be impossible to retain a crew long enough to train them in the ship's ways. Discipline would go for naught, and discipline means safety to passengers and ship.

In conclusion, should this bill in its present shape become a statute, it is reasonably certain that there will be no further passenger steamers on the lakes to legislate about. Some rich men will still own and run their private yachts. But the common people, of whom Lincoln said, "God must have loved them best for he made so many more of them," may hereafter broil at home or take their chances of an outing on the dusty rail.

STOCKHOLDERS' RESPONSIBILITY

TO THE EDITOR: In two places in your issue of May 2 you say that John D. Rockefeller, Jr., controls the Colorado Fuel & Iron Co. He says he owns 40 per cent or less of the stock. Who speaks the truth? If your paper does not speak the truth, it cannot prosper permanently.

ELLIS MORRIS.

[President Hastings Express Co.]

Pullman, Chicago.

[In his testimony before the Congressional Committee John D. Rockefeller, Jr., stated that his father's holdings consisted of 139,807 common shares, or about 40 per cent, and of preferred stock 7,943, again about 40 per cent; that on the board he himself,

Starr J. Murphy, and Jerome D. Greene, were his father's personal representatives, and that J. H. McClement, and L. M. Bowers, chairman of the board, might be said indirectly to represent him. There are eight other directors, the best known being George J. Gould, whose holdings have been large.

So far as our reading of the testimony went, there was no attempt on the part of Mr. Rockefeller to dodge responsibility for the policies of the management on the ground that the Rockefeller holdings were less than 50 per cent. Rather, his was a clear-cut declaration that in the handling of business propositions their habit was the same as that pursued in his social investigations—viz., "select able, competent men who are accustomed to dealing with such problems, and rely upon their findings and form opinions based upon those findings." "Let me ask," said the chairman, "what, in your opinion, is the duty of a stockholder, who has a large part of the stock in an industrial concern?"

Mr. R.: "To see that, insofar as his interests entitle him to a voice, that there are placed in office the ablest, highest minded, most competent men to have charge of the affairs of the company that he can select."

Chairman: "And that is as far as his duty goes?"

Mr. R.: "His duty would then be, I should think, to keep in touch, in order that he might know whether those men were living up to all that he believed them to be, and if he found any indication that they were not, his duty would be to inquire, and replace them if necessary."

Of the officials of the C. F. & I. Mr. Rockefeller said: "If I were to look this country over, I would not know where to find two men in whose judgment, in whose fairness, and whose humanity I should have greater confidence than in Mr. Welborn, the president of the company, and Mr. Bowers, the vice-president, and in supporting those men in the positions which they have held, I feel that I have done the very best that could be done—not the best I could have, but the best that could be done in the interests of the workers as well as of the stockholders of the property."

Mr. Rockefeller offered nothing to indicate that he had considered or acted upon information as to the labor policies or conditions in Colorado, other than through these officials, while the premises upon which he based his subsequent remarkable statement on the Colorado situation showed that his information through this source was incomplete, undependable and thoroughly biased.

THE SURVEY's editorials have not borne on how much either a majority stockholder or the holder of one share could have accomplished in Colorado. In the Pullman Company and the Steel Corporation, for example, we have had striking illustrations of what individual stockholders, armed with facts, can bring about in rehabilitating the human side of a great industry. Nor did they question that the head of an organization—whether an editorial office, a government bureau, or a commercial enterprise—must depend upon and back up his subordinates unless they are clearly wrong. That in itself, however, presupposes some adequate method for forming judgments that they are right.

The editorials pointed out how insecure as a basis for action on the part of a great stockholder was Mr. Rockefeller's sole reliance on the executive officers of the C. F. & I., as to the weight to attach to grievances charged against themselves; and how far short that reliance fell of the analogy he cited: viz., his reliance on detached in-

vestigators like Mr. Flexner in sizing up a situation in which they were not personally involved.

If absentee capitalism is to persist in our economic life, it must work out a technique better than that which wrecked colonialism in the political life of this country a hundred and forty years ago.

—THE EDITOR.]

PRIZE ALCOHOL POSTER

TO THE EDITOR: I think the outcome of the alcohol poster contest (See THE SURVEY for January 10, 1914) will be a surprise, and that it needs explanation. Many good posters came in. Finally I took the following as a nucleus:

RECREATION IS A NECESSITY

Shall only the saloon furnish it?
Drunkards are products of saloons.
Recreation centers make men.
Put the recreation center in the
saloon's place.
Make men—not drunkards!

We wanted something quick, to be read by the man in the street as he passed. The above is too long, but I boiled it down to

A GOOD INVESTMENT

Recreation centers making men
In place of saloons making drunkards

Three members of the committee passed it but the fourth did not like it. I think he might have been won; however. I did not try because I found that we had gone ahead of our public. I found that my advertising man had no idea what we meant by recreation centers, so I changed to the expression social centers. I asked seven people what a social center was. Two said that it was a town; one a church; the others did not know. They were printers, with two exceptions. It was apparently no use putting out a big, quick poster on this subject yet; people had not reached the stage where it would carry.

LIQUOR BILL
\$1,750,000,000
IN THE UNITED STATES FOR ONE YEAR!

THIS WOULD —

- | | |
|---|---------------|
| 1. Build Ten Hospitals in each of the 48 States in the Union at a cost of \$500,000 each, and endowed with \$300,000 each | \$288,000,000 |
| 2. Build 4 Colleges in each State each costing \$4,000,000 and endowed with \$1,000,000 | \$384,000,000 |
| 3. Build a Road from New York to San Francisco at a cost of \$60,000,000 and give each State \$4,000,000 to build tributary roads | \$68,000,000 |
| 4. Equip 10,000 Playgrounds for Children at a cost of \$2,000 each | 20,000,000 |
| 5. Give each State \$80,000,000 for Industrial Education in the public schools | 480,000,000 |
| 6. Place 50 Libraries in each State each costing \$800,000 and endowed with \$100,000 | 480,000,000 |

And Leave \$40,000,000

MUNICIPAL RECREATION CENTRES
IN PLACE OF THE SALOON

In the meantime, the South End Alcohol Education Committee of the Boston Associated Charities handed in a poster, telling what might be done with the \$1,750,000,000 that we spend on liquor. They left \$40,000,000 unspent, so I spent the \$40,000,000 myself in municipal recreation centers in place of the saloon. The poster is reproduced on this page.

This poster is to be sent to charity conferences. It must go into mediums where there is time for the purely intellectual approach, and I personally believe for the time being that is the best that we can do.

But later, I believe we can use as slogans some of the many good posters that came in. At least, the *Liquor Dealers' Journal* and this week's *Outlook* both declare that the movement for national prohibition is coming fast, that in the next few years thinking men are going to be called upon to think it all over and thresh out the pros and the cons. If in that threshing social workers decide that on the whole prohibition will be a great economic saving, and stand with it, then they must add to national prohibition municipal recreation centers in place of the saloon. Then such a poster as the following (sent in from California) will be very useful on a flag in a parade:

Needed: Recreation Centers!
It's your fault if he's DRUNK
Unless YOU
Give him a Place to be DECENT

ELIZABETH TILTON.

[Chairman, Alcohol Education Committee, Boston Associated Charities.]
Cambridge, Mass.

CONSIDER THE OTHER FELLOW

TO THE EDITOR: The invited contributors to the discussion of Major Higginson's defense of the rich answered the usual arguments of capitalism—fostering invention, capital as the reward for risk, the superman in industry, etc. But it seems to me the spiritual bankruptcy of capitalism was not so well presented.

As the most truly religious men have been driven out of the orthodox religious camp, so the best and potentially most useful spirits of the time—the men of constructive social vision—can no longer find a field for self-expression in capitalistic society.

This fact together with the personally experienced injunction against intellectual freedom explains, though as Professor Small points out, does not excuse, the bitter attitude of many of THE SURVEY's readers toward men of wealth. The part of this hostility which is mere middle-class discontent, the disappointment of those whose ideals are in the past and who have no progressive social philosophy, I am not concerned with. So I have thought it might be enlightening to men like Major Higginson to detail some of the experiences of a social worker which might tend to create an "acrid disposition."

Someone has said that the trouble with Russia is that there are not enough po-

sitions in the government service to go around among the "intellectuals." In a country where one hundred political idealists go to the gallows each month, year in and year out, this explanation does not explain. Still there is a grain of truth in it. So, in this country, where industry and finance instead of the government, offer the largest opportunity for constructive work, business has discriminated against men of ideals, and it has come about that success depends no more upon presence of ability in the young man than upon absence of ideals.

Men of ideals do sometimes succeed, but except in rare instances they do so only by keeping a firm hand on the expression of the ideal elements in their personality. Now this negative qualification results here, as in Russia, in keeping out of the service of the nation much of the best constructive ability of the country.

My grandfather was an English bricklayer and stone mason and the only thing that enabled my father to become a clergyman and myself a social worker was his fortunate investment in some New York tenement property.

My father's unusually independent character and his culture, my own upbringing and education were paid for by the tax taken out of the meager earnings of New York's tenement dwellers. Yet I can recall that in my graduating oration at the preparatory school I voiced the sentiment that each one's advancement depended on his own exertions, etc. I can also recall in my Freshman year at college arguing long into the night with a classmate who took the side of the Homestead strikers. I certainly had no animosity toward capital at that time.

In my sophomore year the chance loan of a book opened my eyes to a new world of social values. I had to reconstruct my world, conquer it intellectually anew, before I could live in it, and a long and painful process it was. The path of ambition and advancement, which hitherto had extended straight ahead of me, become obscured.

As I had formulated no philosophy of class conflict as yet, I went around button-holing my acquaintances, thinking that if everyone could only be made to see things as I did, they would immediately line up for co-operation and order and the social millennium would be at hand. So I organized a "Socialism study class." When the faculty got wind of it I came near being expelled from the university. I found that I, a perfectly harmless advocate of peace and justice, was considered more dangerous to the university than the worst moral degenerate in the institution.

That was my first lesson on the attitude of capital toward intellectual freedom. A remark dropped by the president to a friend of mine connected the two things up beautifully and unmistakably.

Some time later Dean ——— gave me some fatherly advice in this wise: "Don't be a fool. Don't make a failure of your life. Look at Bolton Hall. Best of family and antecedents. Might have filled the pulpit of the richest congregation in New York like his father. See

what a grand failure he has made of his life."

But the "horrible example" failed to horrify. I had just been reading Bolton Hall's wonderful little book, *Even as You and I*, and I thought if the author of that book had made a failure of his life, I could do no better than to follow in his footsteps. How I despised the man who gave me this advice even before his oily ways had brought him to the position of commanding influence in my alma mater which he now enjoys!

My ideal of an academic career shattered, and realizing there was no place for me in the business world, I entered social work, not because I believed in its power to solve fundamental social problems, but because it offered an atmosphere and association in which I could at least live and breathe. The first three years, most of which was spent in a public institution, I had ample opportunity for observation and study and some business responsibilities also which I by no means disliked.

I did not have another personal encounter with the money power until after I had resigned my civil service position and had become the executive secretary of a philanthropic organization in a New England city. In visiting the homes of the poor I found some frightful housing conditions. On inquiry I discovered to my surprise that most of these houses were owned by either the president of our association and his father and son-in-law (the latter our treasurer) or by the chairman of our finance committee.

Our president was an able lawyer but the poor who had had experience of his merciless exactions mistrusted him in his new role of philanthropist. Presumably because of his interest in the cities' public utilities, he had espoused the cause of a new charter which augured ill for the city, but unfortunately was backed by some very fine people. I had the temerity to write a letter to the newspaper analyzing the proposed change. Instead of welcoming what he admitted was a very logical criticism, he flew into a rage. What right had I, a mere hireling, to take part in the discussion.

My own later experiences with capitalist-philanthropists, and those of many other social workers, would, if related, only duplicate the above. But one type new to me I did come across—the rising young man or aspiring woman who sought philanthropic connections in order to ruthlessly capitalize the poverty of the poor and the suffering of the sick. Of course I had experiences with genuinely kind-hearted rich people, but these are not to the point in this communication.

The other day a social worker refused an attractive position offered by a big insurance company. A socialist literary friend of mine, eking out a miserable existence with hack work, refused in one year two \$4,000 positions in capitalist-controlled universities. There are thousands of others whose socially valuable abilities have been penned up and yet who have not "bended the knee to Baal." Is it not clear why capitalists as a class can never have the respect of these men?

(CHRISTOPHER EASTON.

White Bear Lake, Minn.

"BEAUTY FOR ASHES"

TO THE EDITOR: In her article in *THE SURVEY* for March 7 Mrs. Bacon refers to work in a laundry in Evansville. Since it illustrates the "dawn of a better day," further news regarding it may be worth while.

The year's work in this plant seems to me significant as an instance of three things: first, co-operation between an employer and an organization existing to afford girls more abundant life; second, recreational opportunities afforded at the plant; third, the resultant spirit of helpfulness and good-will among the employees.

When Roberta L. Stahr, the efficient secretary of the Y. W. C. A. in Evansville, suggested the White Swan Laundry as a good field for industrial work, the only stipulation made by the management in negotiations with them was that we should not organize a labor union. As soon as they became familiar with the methods and purpose of the Y. W. C. A., their co-operation was so complete that, at the end of the year, the manager stated that he considered that organization a distinct asset in the business.

One of their problems through the summer months had been the propensity of the girls to loiter on the streets during the noon hour. Instead of posting impotent signs to prevent this, the management beautified the adjoining lot, erected a pergola, set out gardens, and added the cheerful touch of sunflowers along the fence. The alluring benches and swings in this attractive spot were infinitely more effective in solving the problem than hundreds of prohibitive posters.

On hot summer evenings this space became a veritable fairyland, lighted with Japanese lanterns and made festive with cherry-blossom bowers. Here the girls had several successful parties where the men helped in true brotherly style. At these the good times of the men and their wives, with their children playing about, were eclipsed only by the enjoyment of the younger employees—for each girl had brought her "beau," and each man his "girl." What attraction had the public dance or the crowded river excursion when they were having a party of their own in their very own yard! What these affairs meant in their lives was aptly expressed by one girl who said, "I've had tonight the most enjoyable time of my life!"

All the material things, however—the dining-room, the library which has been installed as a branch of the Public Library, the piano which adds to the attractiveness of the noon-meetings—all these would lose their significance were it not for the resultant spirit of good will and kindly fellowship with which the atmosphere seems charged. One day when I commented upon the fine character of the girls a forelady replied: "We aim to take only good girls; but if we find that one is not all that she ought to be, we all try to help her come up to the White Swan standard."

So characteristic was this of the spirit of helpfulness throughout the entire plant that I sometimes find myself praying, "Thy Kingdom come, in every establishment even as it is coming at the White Swan Laundry in Evansville."

VERA CAMPBELL.

South Bend, Ind.

CAPITAL PUNISHMENT

TO THE EDITOR: I am an admirer and a constant reader of your excellent paper, and am in full sympathy with most of the ideas therein expressed. But it seems to me that you, or at least some of your correspondents, are afflicted with the bacillus of unreasonableness which attacks so many reformers.

An extreme instance of what might be called the *mania philanthropica* appears in a letter from your correspondent John Collier, to which you give prominence on page 88 of your issue of April 25. He says, speaking of the execution of the four gunmen, that "the chief actor in this horror of the gunmen is society which produced the gunmen and which now expiates its own crime," etc.

So it seems that society, and not the four gunmen, is responsible for the death of Rosenthal. Society in these United States consists of Mr. Collier, yourself, myself, and about a hundred million others. Therefore, we ought to go to the electric chair for participation in that crime. Mr. Collier may go there if he wishes; I respectfully decline. On second thoughts, it occurs to me that the four gunmen were also part of society and therefore were guilty, on Mr. Collier's own theory, of the one-hundred millionth part of the crime of Rosenthal's murder, and were therefore rightly executed after all.

The theory upon which is based all such slush and gush as is contained in Mr. Collier's letter is that life is the most valuable thing in the world. If that statement is true, then all the heroes and martyrs from the beginning of the world were simply fools.

In fact, there are many things more valuable than life. When war threatens, and the country is in danger, we call upon the best and bravest in the land to come forward and face death in the battle field, and if they do not come voluntarily, we compel them to come by conscription. It is the duty of every man to give his life when his country demands the sacrifice, and that duty is as incumbent upon the criminal classes as on honest men. Now in what way could the four gunmen have given their lives to the greater advantage of the country than in the electric chair?

Mr. Collier also speaks of punishment being revenge. From whence he gets that theory of the reason of judicial punishment of crime—at least in our days, I do not know. I never heard it before, except to be repudiated.

Crime is punished for the protection of society. The death penalty is inflicted, not only for the removal of those who are a menace to society, but, mainly, as a warning and deterrent to others. If sentence were always executed speedily, and if it invariably followed the

commission of crime, crime would become nearly extinct. Can anyone doubt that New York is a much safer place to live in since the execution of the four gunmen?

All honor to Governor Glynn that he had back-bone enough to resist the appeals for sympathy and mercy. Would that we had more such public men!

A. P. ROSE.

Geneva, N. Y.

TO THE EDITOR: Such polemic discussion as Mr. Rose invites, nearly always brings not light but confusion. My letter on the gunmen was carefully framed and must speak for itself. But as Mr. Rose is a voice from the tomb, and as a good many people must think as he does, otherwise capital punishment would be done away with in New York state, a few more words are in order.

Let us be perfectly clear. Capital punishment is today maintained not as a deterrent but as a revenge. It is more a revenge and less a deterrent than it was in England when they hung corpses by the roadside. With this statement every historian of capital punishment implicitly agrees. In primitive days capital punishment was probably necessary, but the immediate psychological motive back of primitive capital punishment was cruelty, rage and revenge, emotions which are not dead in America in 1914.

Sumner briefly states: "Extreme penalties are [in ancient society] first devised to satisfy public temper." He further shows elaborately that torture, witch-burning and wholesale capital punishment were not devised by statesmanship in the middle ages, or by the church, but were literally forced on the ruling powers by the emotional demands of the mass-mind. But medieval rulers did elaborate, and acted consistently on a theory of deterrent capital punishment, and the motives of revenge and of utility, acting together, resulted in 72,000 hangings in the reign of Henry VIII in England.

William the Conqueror appears to have been the first Englishman who attempted a revision of the forms of capital punishment on the deterrent rather than the revenge theory; he prohibited death by hanging and substituted death by slow mutilation. His successors were consistent, as our modern legislatures are not, and for several hundred years in England capital punishment was meted out for anything more serious than a theft of twenty-four cents. Deterrent jurisprudence ran a similar course on the continent of Europe. "At the end of the eighteenth century the criminal law of all Europe was ferocious in its administration of capital punishment for almost all forms of grave crime. And yet," adds Craies, the English chronicler, "owing to poverty, social conditions, and the inefficiency of the police, such crimes were far more numerous than they now are!"

Primitive capital punishment was limited in its application; only on him who violated the tribal taboo was the primitive blood-lust and rage allowed to ex-

pend itself. Our modern states, quailing from that consistent application of the deterrent theory which was pursued by the later middle ages, have gone back to the primitive, and have statutorily enacted a limited number of taboos, principally the murder-taboo, and with every electrocution, fanned out of its slumbering night by the daily press, the primitive emotion arouses again.

Now, this statement of elementary history brings us to Mr. Rose's crucial misunderstanding, though I admit that the opponents of capital punishment have given an excuse for the misunderstanding through the fact that their arguments have been largely from the standpoint of the criminal who is done to death, not of the society which is de-educated and demoralized by the spectacle of capital punishment.

Mr. Rose says: "The theory upon which is based all such slush and gush . . . is that life is the most valuable thing in the world." I, for example, believe in a quite extensive application of euthanasia; I believe in the neo-Malthusian propaganda; I am concerned about the deaths from industrial accidents, from dark tenements, the death of several hundred children each year, crushed by vehicles while trying to play on the streets of New York, where, incidentally, they are forced to become criminals. I am not concerned about the death of gunmen in Sing Sing. But who, save one socially dead, could have failed to be aware of the morbid horror and—yes—the vaguely acknowledged exultation in horror, which was spread through New York city during the week of the gunmen's last struggle and their elaborately depicted death in the chair? And who, except one dead to modern psychological knowledge, can doubt that such an event means a waste of the results of civilization itself, beside which any number of mere physical deaths is of trifling importance?

The death penalty must end.

JOHN COLLIER.

EXPERIENCE IN A SCHOOL FIRE

TO THE EDITOR: As a member of the Anti-tuberculosis League of the Oranges I was superintending exhibits held in the auditoriums of the public schools. On February 27, 1913, we had an exhibit for West Orange, N. J., in the auditorium of what was practically the fourth story of the high school, a brick building. At 8 p. m., on account of rain, only about thirty persons were present.

On entering I noticed smoke and was told that the janitor was burning rubbish in the furnace. Almost immediately the fire gong rang. We all started for the stairs at the left of the stage as those on the right had been cut off by locked gates. At the bottom of the stairs, between the third and fourth stories, I turned back to see if the room had been emptied.

When I again descended the lights were out and I became separated from the crowd. There were no fire-escapes, the stairs were impossible because of smoke, and so to save my life I was

obliged to jump from a window twenty-five feet above the ground. I shall feel some effects from the injury I received all my life.

Investigation showed that the building was structurally a fire trap. A number of the beams inside were wood, most of ceilings and walls were sheathed with varnished pine and the floors were wood oiled. Stairs had slate treads and risers built into brick walls and a small flight of wooden steps led from the first to the second story. At each story the stair shafts opened directly into the halls. When the auditorium was in use gates were put across the halls to keep people from straying into the building.

The cause of the fire was probably spontaneous combustion from oily rags in the manual training room in the basement. From there it spread into the woodwork of the first story hall and then to the wooden partitions in the second story before it broke out, cutting off the stairways.

Three persons besides myself were injured. The remainder escaped by means of ladders from the second story. Only the soaking rain saved a good portion of the town from being burned.

The Oranges were the gainers by the fire because subsequent investigation showed that most of the schoolhouses were deficient in fire protection. Assembly rooms were closed that had been hitherto open to the public. A standard of construction was established far ahead of that required by the school building code of 1912 which is not retroactive, and West Orange will have a new high school with an auditorium on the ground floor of what is practically a separate building. Many of the other school buildings have been overhauled and defective fire conditions remedied.

The Oranges stand today in a position that without the fire it would have taken them years to achieve.

Every week school houses are being burned because of faulty construction and inadequate fire protection. Meanwhile we are urging their use as social centers! Does it not call for every effort on our part to make our schools safer places for the general public as well as for the children? Can we not have some discussion on this topic with a view to stirring up sentiment for legislation that will make it obligatory to have all assembly rooms on the ground floors and all school buildings properly protected against fire?

MARY EASTWOOD KNEVELS.

West Orange, N. J.

OPPORTUNITIES FOR GRADUATES

TO THE EDITOR: One of the most notable things at the National Conference of Charities this year was the continual reference to the need of more and better institutional care of the feeble-minded. It seems certain that, within the next ten years, most of the existing institutions will be much extended, and that there will be created ten, twenty, or thirty new state schools, colonies, etc., and possibly many city and county institutions as well. These will require su-

perintendents, assistants, stewards, teachers, head farmers, engineers and many other officers. For the best success all these must have had experience in dealing with the feeble-minded. At any rate those who have had such experience will surely have the preference.

In one state, wherein the system of county industrial colonies for the trained imbeciles has been begun, development is halted because of the impossibility of finding trained and experienced men and women for the responsible positions to be created.

There is only one way to get the knowledge of the feeble-minded character needed, and that is by actual work among them. The place to begin is at the bottom of the ladder, by working as an attendant in personal care of the children in a state or private institution.

The position of attendant involves much hard, confining and disagreeable work. But it is no harder nor less agreeable than that of a nurse in the early part of her training. Any bright, well-educated young man or woman, with the proper personality, who has had the benefit of one of the schools of philanthropy, can easily get a position as attendant; and if he, or she, has good health, industry, good nature, tact, and a little patience, can be sure of promotion and of a satisfactory position in a very few years.

Few of those now working as attendants have had the education necessary for the responsible positions. Many of them are little better than "hospital rounders." They move from institution to institution, secure of finding a job at a few days' notice in any of the states. Mostly they are looking for soft jobs.

The opportunities in this field for good and useful work leading to honorable and fairly well-paid positions, are, in the writer's opinion, unexcelled in social work.

ALEXANDER JOHNSON.

Vineland, N. J.

Church and Community

[Continued from page 343.]

All of the recommendations concerning prison reform, which embody the most modern and advanced ideas in dealing with criminals, were severally adopted, and then the entire matter was recommitted to an enlarged committee to report to the next assembly.

A memorial cottage for tubercular patients to be established at Albuquerque, N. M., was again commended to the generosity of the church. The assembly refused to pass on the matter of vivisection; and refused to soften its accustomed disapproval of all Sunday amusements and sports by the introduction of the adjective "commercialized."

Hearty endorsement was given to all of the recommendations of the Committee on Temperance. The body declared against the cigarette, in favor of all anti-liquor legislation, with Secretary Daniels in his insistence on a "dry" navy, and as insisting "that any member of the church should resign from any club licensed to sell liquors."

Again, as in 1910, the assembly declared itself on Christian faith and

social service. This year the same report was approved by the Assemblies of the Presbyterian Church South, the United Presbyterian Church and the Associate Reformed Synod. The report contains six statements of belief whose general tone appears in the following:

"Inasmuch as all evils, social and individual, have their source in human sin and selfishness, they can be remedied only by the divinely appointed plan for salvation from sin and through the divinely given motive which is the love begotten in our hearts through God's great love for us in the gift of his Son."

With regard to all forms of social impurity the Committee on the White Slave Traffic (this name was acknowledged to be a misnomer) reported, advising that the pulpit fearlessly and consistently oppose all forms of prenatal sin, and enter upon the systematic training of the youth in sexual and social purity.

"The church should organize counter attractions calculated to offset the influence of the dance hall and other places of questionable amusement. Part of each year's program should include thorough and frank conferences with the fathers and mothers, meeting separately, concerning social vice and the need of incessant watchfulness." These and other similar resolutions were adopted by the assembly.

This assembly gave much more time to the consideration of social questions than was devoted to the subject last year at Atlanta, and if one might venture a comparison, showed itself much more sympathetic toward advanced positions, notably in the matter of the social service work of the Home Board. Having had a year to consider these matters and to select their commissioners expressly with a view to declaring their mind, the presbyteries showed themselves as a whole heartily with Dr. Thompson and all of his associates in their progressive policies.

When J. Ross Stevenson declared that "Dr. Thompson had served the church of God as it is given few men to serve her," the assembly leaped to its feet and cheered with waving handkerchiefs. This was not merely a personal tribute to the secretary, but to all of his policies.

The New York School of Philanthropy

UNITED CHARITIES BUILDING, 105 EAST 22d STREET

EDWARD T. DEVINE, Director

ADMISSION to the one-year or two-year classes of The New York School of Philanthropy for 1914-15 will be by examination only.

Entrance examination will be held on September 7. Registration continues from September 23 to September 29 inclusive. No registrations will be accepted after October 3. The entrance examination held on June 29 required specific answers to the following questions:

- (1) State briefly the significance of the following terms:
Heredity, Congenital, Acquired Characters, Instinct, Environment, Death Rate, Standard of Living, Economic Interpretation of History, Capital (in the economic sense), Defectives, Charity, Probation, and Unearned Increment.
- (2) (a) What do you understand by "a sense of family responsibility"? (b) What social conditions are favorable to its development? (c) Is it, or is it not, desirable that it should be developed?
- (3) Describe the racial composition of the population of the United States, giving the approximate period for the entrance of each element named.
- (4) Do you consider that drunkenness, prostitution, crime and pauperism are due mainly to "depravity", or to "bad conditions"? State briefly the reasons for your opinion.
- (5) What was the "Industrial Revolution"? To what social and economic problems has it given rise?
- (6) What determines wages? Is it the productive efficiency of labor, or the standard of living, or the supply of and demand for labor, or the abundance or scarcity of capital? How is the income of wage-earners influenced by the tariff, by trade unions, by industrial education, by governmental regulation of trusts and monopolies, by immigration, by restriction of immigration, by the existence of labor bureaus, industrial commissions, etc.
- (7) How is your home city or town governed? Mention five officials of your local government and state briefly the duties of each.
- (8) Tell what you know of the method of caring for the "dependent classes" in your community, restricting yourself to one special group and explaining also what seems to you would be the best treatment of such a group.
- (9) Trace the relationship in four instances between any discoveries or advances in scientific knowledge and personal welfare among people of small incomes.
- (10) What contribution, if any, has the study of psychology to make to social work?

THE SURVEY ASSOCIATES, INC., is an adventure in cooperative journalism; incorporated under the laws of the state of New York, November, 1912, as a membership organization without shares or stockholders. Membership is open to readers who become contributors of \$10 or more a year. It is this widespread, convinced backing and personal interest which has made THE SURVEY a living thing.

THE SURVEY is a weekly journal of constructive philanthropy, founded in the 90's by the Charity Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged magazine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts.

Price

Single copies of this issue twenty five cents. Cooperating subscriptions \$10 a year. Regular subscriptions \$3 a year. Foreign postage \$1 extra. Canadian 75 cents.

The GIST of IT—

PRESENT indications are that a safety-at-sea bill will not be passed at this session of Congress. To get before the House, any bill must have a special rule, and Congress wants no special rules for fear of one requiring it to vote on prohibition. Page 355.

SAFETY-AT-SEA is backward enough, but liability-at-sea lags behind safety. If the boat goes down, passengers and shippers can recover only to the value of freight money. In the United States, the owners of the Titanic were liable for only \$90,000 while in England they were liable for \$3,000,000. Page 361.

MASSACHUSETTS has fixed its first minimum wage—\$8.71 a week in brush-making. Candy-making will come next. Page 355.

ALL St. Louis took part in the pageant and masque which showed the chief events in the city's history from the mound builders on, and forecasted the future of a united and aspiring community. Page 372.

INDIAN music by real Indians was one of the vivid parts of the Pageant of the Northwest given at the University of North Dakota. An open-air theater was dedicated. Page 357.

IN New York, pretty nearly all the tribes and races of men took part in the Pageant of the Nations. Page 356.

THE labor provisions of the Clayton bill reviewed by Edwin Witte. Page 360.

THE Bill of Rights seems to have gone by the board because it is not practical, says George W. Alger, and the Industrial Relations Commission could render no more valuable service than to get the facts about it. Page 380.

THE Greeks of old in their harmony, and the Jews in their cleanliness, had a health ideal. But we are only beginning to develop one, Mr. Devine shows. By fighting disease and by overcoming conditions that take toll of efficiency we are making toward "a society of healthy, vigorous, self-reliant and yet mutually interdependent fellow citizens." Page 376.

IN their biennial meeting at Chicago, the club women of the country set their faces squarely toward high ideals of public service. Professor Taylor's review of the sessions. Page 358.

MRS. BACON'S story of how one woman, with a few men to help, fought a state housing law half through the Indiana Legislature and lost. And of the campaign that followed to line up all the club women of the state behind it, and of the men who joined with the women for the next session. Page 366.

ELEVENTH YEAR, 1914-15

One year and two year programmes for study and training in social
service; for men and women; for paid or volunteer work.

FIRST YEAR PROGRAMME: *September 23, 1914, to June 4, 1915*—A de-
sirable preparation for any form of social service, and an introduction to specialization
in the second year or in work in the field.

SECOND YEAR PROGRAMME: *September 9, 1914, to June 19, 1915*—For
further study and training, in a selected field. Open to those who have completed the
first year satisfactorily and to others with acceptable preparation in social experience.

Practice work under careful oversight fills one-third of the first year and two-
thirds of the second year. Boston offers exceptional opportunities for it.

For the first year programme, send for the 1914 Bulletin of the school.

For advanced work, send for the circulars describing the courses offered—
Organizing Charity, Children's Work, Medical-Social Service, Neighborhood and
Community Work.

THE SURVEY, 105 East 22d Street, New York

THE SURVEY

COMMON WELFARE

MASSACHUSETTS BOARD FIXING MINIMUM WAGES

THE FIRST WAGE BOARD established in Massachusetts under the minimum wage law, the Brush Makers' Wage Board, has presented its report to the Massachusetts Minimum Wage Commission.

The board finds \$8.71 a week, or \$453 a year, to be the minimum "without which no girl worker can supply the necessary cost of living and maintain herself in health." The following estimates in a girl's cost of living are supplied by the board:

Board and lodging	\$5.25
Clothing (\$75 per year)	1.44
Laundry	.80
Doctor and dentist...	.20
Church	.10
Newspapers and magazines	.16
Vacation	.19
Recreation—moving pictures once a fortnight	.05
Theatre once a month.....	.12
Cartages	.70

The board has had before it the difficult task of setting minimum rates of wages in the brush industry, one of the industries in Massachusetts which pays the lowest wages to women. The annual report of the Minimum Wage Commission points out that after a study made of the wage records of every woman in every brush factory in Massachusetts, two-thirds of the women were found to be earning less than \$6 a week, 42 per cent less than \$5 a week, and 18 per cent less than \$4 a week.

The raising of these rates to those which might make up the \$8.71 a week necessary to maintain a girl's physical efficiency is difficult. It was the opinion of the wage board that the raise could not be made with too great suddenness, on account of the danger of permanently harming the industry. Consequently it recommended to the commission, which has the power to review its findings, an hourly rate of 15½ cents, to go into effect at once, and a rate of 18 cents at the end of the year, unless the brush manufacturers prove to the commission that such an increase is impracticable.

After a public hearing on the proposed rates, on June 29, the Minimum Wage Commission, in case it sets its final stamp of approval upon the rates, will proceed to put them in force according to the provisions of the Massachusetts law.

The second wage board established by the commission, the Candy Makers' Wage Board, is still in session. The meeting of the board on July 22 was addressed by Justice H. B. Higgins, of the Commonwealth Arbitration Court of Australia. Justice Higgins, who is making a short stay in this country, has been for several years on the bench of the Australian Arbitration Court, and has dealt constantly with interstate disputes arising over the determinations of the Australian state wage boards.

Robinson in New York Tribune.

While the Greater New York Baby Week Campaign included much instruction and many events for the mothers and babies of the congested districts, its biggest aim was to reach the great middle class of mothers. It is hoped through the publicity work to bring about the same attitude toward the Board of Health that this class now has toward the Board of Education. In other words, it is hoped to make these mothers feel that it is just as natural for them to go to milk stations for advice as it is to send their children to the public schools.

SAFETY-AT-SEA IN DANGER OF CONGRESS

How LONG will Congress delay the passage of much needed legislation to ensure the safety of life at sea?

This question looms larger as the present session wears on, with members growing anxious for adjournment, and with a general undercurrent of feeling against taking up any bill not included in the administration's program. The LaFollette and recently reported Alexander seamen's and sea safety bills are not among the measures on which President Wilson demands action before the members of the House and Senate go home to mend their political fences.

The LaFollette seamen's bill which passed the Senate on October 23, 1913, has been amended after eight long months have passed, reported by the House Committee on Merchant Marine and Fisheries, and is now on the legislative calendar. There it will stay unless a special rule is reported out to permit its immediate consideration.

The bringing out of a special rule to get consideration of the seamen's and sea safety bills is doubtful. There is a fight on in the House against voting on prohibition at this session, most of the Democratic members wishing this subject to go over and not to trouble them in the fall elections.

If a special rule is brought out to permit the immediate consideration of the seamen's bill, the bars will have been let down and there will be an insistent demand for a similar rule to hasten a vote on the national prohibition resolution. Therefore, a large number of the majority members have started a movement to kill the chances for getting special rules on any and all subjects. Only public demand will awaken the members of the House to the need of getting a sea safety law on the statute books now.

The sea safety bill which has been reported to the House is a radically amended form of the LaFollette bill. It has both good and bad points. The important thing now is to get the bill out on the floor where amendments can be discussed.

IN SOKOL HALL, NEW
YORK CITY

Supporters of the LaFollette bill are vigorous in their criticism of the House committee bill, contending that it was drafted by such expert hands that the layman cannot readily see how seriously it lowers the standard of safety. Andrew Furuseth, president of the International Seamen's Union, who is the author of several of the important features of the LaFollette bill as it passed the Senate, is plain spoken in discussing these weaknesses of the House bill, but wants to get the measure considered at this session so that there will be chance for its amendment. Mr. Furuseth's chief objection is that the House bill provides for three or more able "life boat men" to man each life boat, instead of "two able seamen," which is the labor feature of the LaFollette bill. Mr. Furuseth's attitude toward the House bill will be reflected in the minority report on the bill which at the time of writing is in the course of preparation by Representative James W. Bryan, of Washington.

Mr. Bryan, in an analysis of the bill for *THE SURVEY*, said:

"In my minority report I shall recommend the adoption of La Follette bill, Senate 136. The committee bill which is offered as a substitute is based very largely on the recent London Convention. It does not pretend to prescribe safety provisions for foreign vessels in American ports. This means that the bill, if enacted into law, is to affect only a small percentage of the vessels that carry American passengers to and from American ports. In the Great Lakes, vessels from Chicago and other American ports to Canadian ports are not to be in any way affected by the bill, as to safety at sea. The supposed restrictions placed by the law on shipping is to affect only American bottoms.

"American vessels in trans-ocean traffic are to have safety provisions for all on board, but this does not mean life boats for all on board. Seventy-five per cent of this safety apparatus is to be in boats and the balance in rafts. The manning of the boats and the specification for their construction are subject to provisions that weaken the requirements of the LaFollette bill on that point as well as on the number of boats.

"Vessels, whose course of travel is within twenty miles from shore are to have 37½ per cent life boats, 37½ per cent life rafts and no per cent whatever for the remaining 25 per cent of passengers. Those vessels, which sail within twenty miles from shore, furnish by far the greatest number of wrecks and the largest toll of disaster. On the Great Lakes vessels which sail within three miles from the shore are not affected by the life boat provisions of the bill. There are no requirements as to such vessels. Beyond three miles on the Great Lakes vessels are to carry 20 per cent life boat protection, 30 per cent life raft protection and the remaining 50 per cent no protection whatever.

"The manning of these life boats and life rafts is to be effected by certified life boat men. The experience and training required of men before they can receive such a certificate is nil, but the proposed substitute does require that applicants for such certificate by the examined in launching and rowing life boats, no term of service on the sea is required. The bill prescribes that three of these certified life boat men must be assigned to a life boat with passenger capacity up to sixty; four are required for life boats holding from sixty to eighty-five passengers; and so on up to seven for boats holding 160 to 210.

"I do not believe it would be creditable for Congress to pass any such measure as this as a response to a demand for safety at sea."

A Pageant of the Melting Pot

THE FESTIVAL AND PAGEANT of Nations conducted during the first week in June by the People's Institute of New York city answered two questions that had been puzzling those who arranged it.

It showed, first, that foreigners in New York are willing to show their native songs, dances, costumes—in a word, to reveal their national art—to Americans. And it showed that Americans, with no folk-lore of their own, no traditions, no specific expressions of mood in music, movement or color, are willing to come and see.

Every evening for a week groups of Irish, Bohemian, Croatian, Polish, Ruthenian, Jewish and Italian children and grown people occupied the platform at Public School 63, lower East Side, with snatches from their national art, arranged and rehearsed for this occasion. They had made many of their own costumes and prepared their own programs. At the end of the week a daylight ensemble of all these groups, with Dutch, Germans and Hungarians added, was held out-doors. There was music, marching and more dancing and great numbers of foreigners and non-foreigners looked on and clapped.

"But to me the wonderful part of the affair was not the physical demonstrations, not the applause of the spectators," said Nora Van Leeuwen, who acted for the People's Institute in planning the pageant. "It was the big grin on the faces of the participants—a grin that appeared the moment they started and that remained when everybody had gone."

When Miss Van Leeuwen first tried to interest the foreign societies in the pageant she was met with both enthusiasm and suspicion—a childlike desire to show their art, but a secret feeling that none but their own people would come.

"What does America care for our national customs?" she was asked.

Slowly the immigrant's confidence was won, however, and the week's success was made evident by the eagerness of the leaders to know when the next pageant was to be. One after another they prophesied that they would make the second far more beautiful and revealing than the first.

A Pageant of the Prairies

A PAGEANT of unusual interest was produced on the prairies of North Dakota the last week in May. Not only were the parts mainly taken by students in the University of North Dakota, but the text was written by eighteen undergraduates in collaboration. This Pageant of the Northwest is thus perhaps unique in its communal authorship. It was given in connection with the annual meeting of the Mississippi Valley Historical Association.

The idea of the pageant came from O. G. Libby, professor of history at the university, who furnished historical material. Its successful carrying out was due to the enthusiasm and activity of the student Sock and Buskin Society, and in large measure to Frederick H. Koch, professor of dramatic literature and oratory and founder of the society.

Three hundred persons in costume took part. The first scene depicted the explorer Radisson in the London Guild Hall at the formation of the Hudson Bay Company. Then came episodes in the achievements of La Salle and Verendrye, the first white man to follow the northern course of the Missouri river into what is now North Dakota.

The Lewis and Clark expedition was finally presented, concluding with the figure of Sakakawea, the bird-woman whose leadership brought the expedition over the mountains to the sea, and whose achievement was "an embodiment of the undaunted will and the

friendliness of the homes of our great Northwest."

Historical facts were strictly followed. Many speeches were in their original form. Native Indian music, recorded by Harold A. Loring, collector of Indian songs and folklore for the United States government, was introduced. And a group of full blooded Chippewas with their costumes, trappings and instruments were brought from the Turtle Mountain reservation to take speaking parts in the scene.

The pageant was made the occasion of the dedication of an open air theater on the campus of the university. It has been established by the Sock and Buskin Society, and the name, Bankside Theater was suggested, according to Professor Koch, by its location on the banks of a stream where in years long past the Indians met the English fur traders of the Hudson Bay Company, and also by "that region of Old London, known as Bankside, where stood the theater of Shakespeare."

THE SPIRIT OF PROPHECY

PAUGUK, THE FORERUNNER OF DEATH, HOVERING OVER THE INDIAN COUNCIL

PROF. FREDERICK H. KOCH

THE WOMEN'S BIENNIAL: SOCIAL SYMPATHY AND PUBLIC POLICIES—BY GRAHAM TAYLOR

JANE ADDAMS struck the keynote for concerted action at the greatest assemblage of organized womanhood in America. In so doing, she registered the change of key to which women's organizations are setting their programs of discussion and action. It was done on one of those rare occasions when history is seen in the making, when the present is in the act of forecasting the future, when the human spirit experiences a transition more instinctively than consciously—all under the spell of cherished memories of a secure past and under the pressure of an atmosphere surcharged with prophecies and incentives.

It was the twelfth biennial session of the General Federation of Women's Clubs. Chicago's great Auditorium never held an assembly more representative of America's best past and better future. There were 1,823 accredited delegates and other representatives from every state, Alaska, Great Britain and Canada, Japan and the West Indies. The 670 organizations added during the past two years represented the growth of the federation, within whose hospitable fellowship constituent organizations of every type are welcome, from the smaller groups devoted to literature, art and music, to the larger general clubs and suffrage associations.

Miss Addams' reminiscent review of the twenty-four years was prophetic, without intending to be so, of what actually occurred at this most transitional and greatest of all these biennials. Here again were gathered the leaders in that "gigantic quest for the essential elements of culture" which characterized the first biennial.

That quest for culture could now be seen in relation to the social sympathy which is being translated into public policies and political action. Tactful and appreciative emphasis was placed upon the attempt of the earlier clubs "to apprehend and to harmonize our common spiritual heritage as enshrined in poetry, in history, in science, in art, in drama, in music, that it might become a great apparatus for the evocation of cultural life."

It must have been with grateful reassurance that the members of those elder clubs heard Miss Addams refer to her own "short-sightedness" in supposing that their quest for the essential elements of culture "belonged to the irrevocable season of beginnings," and add this attestation:

"Perhaps nothing less universal than those first programs could have made the women's clubs conscious of the tendencies which mark each age for what it is—that summary of its experiences, knowledge, and affections found at the

root of social existence, which is called 'the trend of the times.'"

The members of the newer leagues for civic progress and political equality also profited by her caution and guidance thus well directed:

"It is always easy for a democracy which insists upon writing its own programs to shut out imagination, to distrust sentiment and to make short work of the past. It takes something like a united faith and a collective energy to insist upon their values and to make them operative upon public opinion.

"It is easy to treat lightly this period of club development, but certainly the constant co-ordination of these multiplying specialized studies reacted on the life and character of each community more deeply and intimately than anything less fructifying could."

The program laid all the old emphasis upon art, music, literature, education and library extension, in the general sessions and in the specialized conferences, where the papers, reports and discussions were as high-keyed and attractive as ever.

The next stage of development had its strong counterparts in the present discussions and action. Beginning with the introduction of the kindergarten and domestic science into the public schools, the federation steadily progressed in protesting against child labor, the overwork of women and many another evil of the times. But at no other session has such an array of topics and speakers emphasized the women's imperative insistence upon better industrial and social conditions.

The conferences devoted to their consideration were noteworthy both for their very direct presentation of actual conditions and the eager response given in the discussion and action which follow-

ed. Home economics and public health, housing and social hygiene, naturally led to strong action being taken for the promotion of public policies and legislation based upon the demand of existing conditions and the duty to realize attainable ideals. These actions ranged from a protest against immodest dress, immoral fiction and "ultra modern dances" to the teaching of sex hygiene in the schools, demands for federal and state laws against the liquor traffic and social evil, and the suggestion of constructive legislation to improve industrial conditions and relations.

How alert and alive the constituency is to the demand for better public policies was shown in the roll call for the needs of the states. Here are some of the replies:

Better education, good roads and such conditions that women can stay at home, better rural schools, eugenics, better paid teachers and better protected babies, influx of human element and democracy in clubs and community, suppression of the liquor traffic, reduction of illiteracy by compulsory school laws, improved civic consciousness, uniform marriage and divorce laws, better treatment of wage workers and a minimum wage, factory legislation and better treatment of the soil of the state.

Now, as in the past, in many localities, even such live topics as these may continue to be only themes for discussion. Even so they are initiatives. They gather the fuel which the fire of action will sooner or later set aflame. Miss Addams vividly describes the process:

"Society has a curious trick of suddenly regarding as a living issue, vital and unappeasable, some old, outworn theme which has been kicked about for years as mere controversial material. The newly moralized issue, almost as if by accident, suddenly takes fire and sets whole communities in a blaze, lighting up human relations and public duty with new meaning, and transforms abstract social idealism into violent practical demands, although still entangled with the widest human aspiration."

The women's clubs themselves are the best demonstration of this hurrying-up of the evolutionary process. When the time for action came not only were the women's clubs prepared and ready to discuss matters of public policy one after another as they came before the country, but they developed a capacity for corporate action, through parliamentary procedure and the executive ability to bring things to pass, which equaled, if it did not exceed, the same capacity to organize and manage their own households.

This ability to manage on a large scale was tested and attested by this Chicago session of the federation. The local committee's foresight and provision were said to have met every demand, and on demand. The ballots

MRS. PERCY V. PENNYBACKER
Re-elected president General Federation
of Women's Clubs

were counted and the election of all the officers was declared two hours after the polls closed. The endowment fund of \$100,000 for developing departmental work was completed by raising \$20,000 in a little while one afternoon.

They did it with good comradeship, determination and a sense of humor. The gift of \$100 was announced from "the Matrons' Club," largely composed of women who have had their first baby. One lady gave a like amount, saying, "I have a feeling that my husband wants to give \$100, and, by absent treatment, he is going to give it right now. Another lady gave \$1 for each one of her 76 birthdays.

Discipline and good spirit, which of course had developed on local fields, prepared this vast assemblage for the supreme test of their balance between self-control and loyalty to public policy, which came with the discussions of the conference on civics and the declaration of the federation's attitude on suffrage. The civics conference was marked by the freest, most constructive and suggestive discussions of such questions as these: Civic and Moral Training in the Public Schools, The New Art of City Making, The Use of Public School Buildings as Civic Centers, The Conservation of Forests and Waterways, What Seven Million Women Expect of One Million Women.

It was a trade union glovemaker who represented the 7,000,000 wage-working women, whose "going out to work," away from home and often at the expense of home, makes possible the new independence of all women at home and in a newly recognized economic status of their own. At this point the program lacked more than at any other. For women of leisure and culture owe it to wage-earning women to see that the economic and political equality up to which the working women's industrial independence led, costs their homes and children less than it has.

The living and working conditions of women and children are more and more riveting the attention of the women's clubs, but there is still occasion and need for them to discuss the question which Miss Addams has put up to them: "Have the women's clubs also learned to enlarge their definition of culture until at last it includes the abolition of all social injustice?"

She smoothed the way on the first evening of the session for the rapidly accumulating and irrepressibly insistent demand for some declaration of the federation's attitude toward suffrage. She said:

"When that wave of civic emotion surged into the focus of attention—as it is now high through the length and breadth of the nation—which had for its watchword 'the City Beautiful,' it was most important that there had long been municipal art committees, that pub-

lic schools had been supplied with good pictures, that trees had been planted in barren towns, that club women had been instrumental in saving the Palisades on the Hudson river, and in establishing a national park. It all gave reality and background to the movement.

"When the new social imperative, entitled 'Know Your City,' gathered momentum and won acceptance far and wide, so that under its impulse and sanction there is inquiry into the facts and tendencies of city life, it was again important that women everywhere had been taught the value of inspecting milk and food, the needlessness of tuberculosis, the necessity for good factory conditions, the possibilities of garden cities.

"They found that it was necessary to command a public opinion not only in the city or state in which the reform was needed, but throughout the country, so that any organization less widespread than the Federation of Women's Clubs, with interests less universal, would have availed but little.

"VOTES FOR WOMEN"

RESOLUTION PASSED BY THE
FEDERATION

"Whereas, the question of political equality of men and women is today a vital problem under discussion throughout the civilized world; therefore be it

"Resolved, that the General Federation of Women's Clubs give the cause of political equality its moral support by recording its earnest belief in the principle of political equality regardless of sex."

"All these efforts to give effective expression to new demands, demonstrating as they do the dependence of the political machine for its driving force upon many varieties of social fuel, make clear woman's need for a larger political participation. Without the franchise, woman is suddenly shut out of the game—the game played all over the world by statesmen, who at this moment are attempting to translate the new social sympathy into political action."

This was said on the first day. On the fourth day, Saturday, the irrepressible issue came to issue. The president had publicly given her word that neither this proposed resolution nor any other coming in an orderly way before the house should be in any way suppressed. The Illinois delegation had resolved to inform the General Federation through its secretary that it endorsed political equality for men and women. In the breathless attention of the crowded house the chairman of the committee on resolutions presented the women's suffrage resolution.

The president's clear voice rang out, as her gavel fell, after the overwhelming majority of affirmative votes: "The ayes seem to have it—the ayes have it." Then the assembly rose to its feet as by common consent. Songs broke forth, first Julia Ward Howe's "Mine eyes have

seen the glory of the coming of the Lord." The Illinois delegation chanted the state hymn, Illinois. They had occasion to sing it again when the announcement was made later that the Illinois Supreme Court had just declared the woman's suffrage act constitutional.

But when the big majority had gone far enough to express their enthusiasm, the president summarily cut off excessive demonstration, and afterwards declared it in order to spread upon the minutes the protest of the minority against any impression that the endorsement of equal suffrage was unanimous, which claimed that not only those opposed to woman's suffrage, but some favoring it, deemed endorsement by the federation inexpedient.

At the brilliant banquet given by the Illinois Equal Suffrage Association to nearly 1,000 women, including delegates and local suffragists, the enthusiasm expressed itself in eloquent speech and outbursts of song. When a telegram direct from Rome, brought the news that the International Council of Women, including representatives of twenty nationalities, had endorsed equal suffrage, the whole assembly instinctively arose and sang "Praise God from whom all blessings flow." This capped the climax of the spontaneous response to the three-fold endorsement of suffrage on this one day by the federation, by the State Supreme Court and the International Council.

The final day witnessed a unique scene. The great auditorium was crowded to its utmost capacity long before the closing session began. The streets were blocked by many hundreds of people disappointed in not gaining entrance. The guest and speaker of honor was the daughter of the President of the United States, Margaret Wilson. She pleaded with force and fervor for making the public school building "a common council chamber" for the people.

Then the re-elected president of the federation, Mrs. Percy V. Pennybacker, was the focus of interest. A native of Virginia and from early girlhood a citizen of Texas, this woman of slender form and erect carriage, of gentle manner and firm will, had for eleven days presided over the great assembly with parliamentary precision, with absolute control over every situation, yet with equal respect for every member's rights, with opinions of her own yet with unbiased fairness.

As the last symbolical act of the long series of great occasions, a jewel casket emblematical of the talisman of the federation was handed by her to her oldest predecessor in the presidency, and again to the guest of honor, Miss Wilson, who passed it to Ruth Pennybacker, who in returning it to her mother declared the talisman to be a word gleaming from the casket in letters of light—"Service."

THE CLAYTON BILL AND ORGANIZED LABOR—BY EDWIN WITTE

ON JUNE 5 the House of Representatives passed the Clayton anti-trust bill by the one-sided vote of 275 to 54. Several sections of this bill make important changes in trade union law. President Gompers, of the American Federation of Labor, has hailed Section 7 as "Labor's Magna Charta"; and he has termed Sections 15 and 23 as "Labor's Bill of Rights." He said editorially:

"Labor's Magna Charta and the Bill of Rights are the most important legislation since the abolition of slavery."

President Gompers claims that since the Supreme Court decision in the Danbury hatters' case in 1908, labor unions have existed only "at the sufferance of the Department of Justice." It was to secure relief from this situation that the American Federation of Labor gave active support to the Democratic party in the campaigns of 1908, 1910, and 1912. The Democratic platforms both of 1908 and 1912 pledged the enactment of legislation to make it clear "that labor organizations and their members should not be regarded as illegal organizations in restraint of trade."

In view of these platform pledges, organized labor was greatly disappointed when there was not a word about exemption of labor unions from the Sherman act, either in the President's address nor in the tentative administration anti-trust bills presented early during the present session of Congress. Then the members of Congress began to hear from their labor union constituents.

In the consolidated Clayton bill, which was favorably reported to the House early in May, labor's demands were met half way. This bill included a paragraph which said:

"That nothing contained in the anti-trust laws shall be construed to forbid the existence and operation . . . of labor organizations, or to forbid or restrain members of such . . . associations from carrying out the legitimate objects thereof."

Organized labor was not satisfied with this first paragraph of Section 7. In a circular letter addressed to members of Congress on May 5, it demanded that this paragraph should be changed to read that the anti-trust laws shall not be construed to apply to labor organizations. Organized labor threatened to carry its fight to the floor of the House, and the newspapers reported that the President would veto the Clayton bill if this amendment were adopted.

A clash between the administration and organized labor, however, was averted in the end. It was agreed that in lieu of the amendment organized labor had insisted upon, there should be added

As a student at the University of Wisconsin and secretary to Congressman Nelson of that state, Mr. Witte has for several years specialized in the study of laws affecting industrial relations. His interpretation of the amendment to the Sherman law which passed the House of Representatives last June is therefore of more than ordinary significance.—Ed.

to the moot Section 7 the following:

"Nor shall the organizations . . . enumerated, or the individual members thereof, be held as illegal combinations in restraint of trade under the anti-trust laws."

This so-called Webb amendment was adopted by a unanimous vote.

During the debate in the House most divergent views were expressed as to the meaning of this Section 7 as amended. Congressman Keating, a member of a labor union, said that organized labor felt that the Webb amendment was more favorable to it than the one it had first demanded. Many members on the other hand insisted that the Webb amendment was needless repetition, and that the section as a whole meant no more than that trade unions are not *per se* unlawful associations under the anti-trust laws. The majority report upon the Clayton bill from the Committee on the Judiciary suggests that the only effect of this section is to render impossible suits for the dissolution of labor unions. The President told the newspaper correspondents that under this section labor unions and their members might still be prosecuted for boycotting and for acts of violence.

The intent of the framers of this bill seems to have been to provide that labor unions and their members shall not be prosecuted under the anti-trust laws for conduct which is lawful at common law. Many believe that this is now the law; but some inferior courts have interpreted the hatters' case to mean that any action of organized labor which does in fact restrain trade, whether it is lawful or unlawful at common law, is rendered unlawful by the Sherman act. Section 7 guards against the danger that this extreme view may prevail.

Most of the decisions which organized labor considers unjust have been based not upon the Sherman act but upon the principles of the common law, and entirely apart from restraint of trade. The trade union boycott, for instance, has been held unlawful at common law in most jurisdictions.

It seems to be the view of the leaders of organized labor that Section 18 of the Clayton bill annuls these decisions based upon common law principles; but

this is doubtful. This section provides that certain conduct, such as quitting work, refusing to patronize any party, peaceful picketing, and peacefully persuading others to do these acts, shall not be considered unlawful by any federal court.

At common law the combining to do acts which are otherwise lawful has often been held to be an unlawful conspiracy. The acts enumerated in Section 18 are not ordinarily unlawful; but the combining to do these acts is unlawful when the intent is to injure an employer or a non-union workman. The majority report of the Committee on the Judiciary states expressly that this section does not in any manner affect the law of conspiracy.

The first paragraph of Section 18 is another labor provision of the Clayton bill whose meaning is doubtful. It enacts that no injunction shall be issued in connection with a labor dispute unless necessary to prevent irreparable injury to property or a property right of the complainant. This has been interpreted by prominent labor leaders as making impossible the issuance of injunctions to protect the employer's right to do business where no injury to tangible property is threatened. The difficulty with this interpretation is that the right to do business has been held by many courts to be property.

The other so-called labor provisions of the Clayton bill are applicable to all restraining orders and injunctions issued by United States courts, regardless of whether they do or do not grow out of labor disputes.

Sections 15-17, according to the Committee on the Judiciary, merely write into statute law the practice now followed by the most progressive judges. When restraining orders are issued without notice, a hearing must be held within ten days thereafter. No injunction may be granted unless the complainant furnishes a bond of such sum as the court may require. Injunctions are required to be specific, and may not prohibit conduct merely by reference to the bill of complaint. Finally, injunctions are to be binding only upon the parties to the dispute and those acting in concert with them.

A great change is made in existing law by Sections 19-23 of the Clayton bill. They provide that when contempt of court for violation of an injunction is charged the accused may demand a jury trial, unless the United States is a party to the suit. These sections further provide that all contempts must be prosecuted within one year after the commission of the act complained of, and fix the maximum penalty which may be imposed for contempt at a fine of \$1,000, or imprisonment for six months. Contempt proceedings, however, are to be no bar to criminal prosecution for the same offense.

When the Ship Goes Down

Liability of Vessel Owners for Losses at Sea

Thomas I. Parkinson

COLUMBIA UNIVERSITY

IF a New York-Chicago "flyer" leaves the track and plunges to destruction carrying to death or personal injury its passengers and crew, our laws, both state and federal, provide that the victims—the injured and the dependents of the killed—may recover their full damages out of the general assets of the railroad company. The railroad carrier is an insurer of the traveler's safety and this fact is largely responsible for the economic argument in favor of railroad "safety first" campaigns.

What would now be said of an act of Congress providing that the liability of the company, if any, should be limited in amount to the value of the wrecked train as it lay at the bottom of the embankment, plus the amount of the ticket money paid by its passengers?

Impossible as such a rule seems when applied to carriage by land, it states precisely the effect of the ship-owner's limited liability laws enacted by Congress and constantly applied by our admiralty courts. For the frightful loss of life and property involved in the wreck of the *Titanic* the liability of the owner, under our laws, is limited to \$90,000. This sum represents the amount of the pending freight money for the fatal voyage. Under the English law, the owners of the *Titanic* are liable for nearly \$3,000,000.

Victims of this disaster sought to have our courts apply the English rule in determining the amount of the owner's liability and secured a ruling to that effect by Judge Holt in the district court; but the Supreme Court of the United States, in an opinion handed down May 25th, declares that whenever our courts are resorted to for a remedy in such cases, the limited liability rules established by Congress will be applied. Therefore, until Congress acts by repealing or amending these rules, claimants in our courts can recover damages for ship accidents only to the extent of the value of the wreck and the pending freight. This is true even though as in the *Titanic* case the owner is liable, under the laws of the country whose flag the ship flies, for a much greater amount.

Briefly stated, our law provides that if the owner surrenders the wrecked vessel and pays into court the pending freight, he is relieved from all further liability. If the vessel is lost, he is obliged to pay only the pending freight. Insurance money payable to the owner for the loss of the ship is not available to the damage claimant. Therefore, where the vessel is lost or seriously dam-

aged there can be no substantial recovery.

These rules are applied as well to inland river and bay navigation as to the Great Lakes, coastwise and foreign trade. There is no need for further illustration of their operation. They are simple and subject to almost no exception. Their effect is to leave passengers, crew and shippers without redress for losses by accident unless they have the foresight to insure themselves.

The laws of the United States are not peculiar in limiting the owner's financial responsibility. Practically all maritime nations have adopted the limited liability

THE loss of the Titanic aroused public interest in the general subject of safety at sea. The recent decision of the United States Supreme Court that the liability of the owners of the Titanic for damages to the victims of that disaster is limited to the sum of \$90,000, whereas their liability under the English laws is in the neighborhood of \$3,000,000, has directed attention to the present state of our limited liability laws in admiralty.

WHEN Senator Smith was preparing his report on the Titanic disaster he obtained the services of the Legislative Drafting Bureau of Columbia University to assist him in the formulation of bills to carry out the recommendations of his report respecting the construction, equipment and operation of vessels. Subsequently, at the request of individuals whose interest in the matter grew out of personal bereavement due to the Titanic disaster, the Drafting Bureau undertook a study of the nature and extent of the ship-owner's liability to damages for such losses. The purpose of this study was to appreciate the effect in operation of our laws, to present some of the possibilities of amending them, and to suggest the problems involved in the drafting of amendments. Though obviously demanded by simple justice to passengers and crew, nothing has been done to bring about such amendments.

IN all the thousands of bills introduced in Congress since the Titanic disaster none provides for placing on ship-owners a substantial liability to answer in damages for losses occurring by accident at sea.

—EDITOR.

principle. It is a principle of public policy. The early Roman and common law knew no such limitation. It was developed in the Middle Ages and had become the settled law of continental Europe even before its incorporation in the Napoleonic Code of 1808. It was incorporated from an earlier statute into the English Merchant Shipping Act of 1854. It was adopted in this country in 1851 by an act of Congress obviously based on the English statute, and it has been perfected as an instrument for the protection of the ship-owners by subsequent amendment and judicial interpretation.

Though the principle of limited liability is now universally accepted, there are important differences in the nature of the limitation and its amount. Our laws are substantially in accord with those of France and Germany in permitting the owner to abandon the vessel and thereby escape all further financial responsibility. Great Britain, though limiting the owner's liability, early developed the rule that the limit should be the value of the vessel before the accident.

The importance of this rule may be appreciated when it is applied to a case like the *Titanic*. The value after the accident was nil; the value before the accident in the neighborhood of \$10,000,000. In 1682, England adopted a rule more definite, more easily applied and at the same time, more favorable to the owner, viz.—that the liability should be limited to a fixed sum per registered ton of the vessel. Under this rule the owner is liable for £8 or £15 per ton of the vessel's tonnage according to whether claims are for loss of property, or for loss of life, or both.

Though our act of Congress was modeled on the English laws, its language was sufficiently different to justify our admirably courts in interpreting it as limiting the owner's liability to the value of the vessel after the accident rather than immediately before. The result is that under our law, the fate of the vessel practically determines whether claimants recover any substantial damages. Under the English law the owner's liability is not defeated or even affected by the fact that the ship itself is no longer available for the satisfaction of damages.

If a great ship-owning country like England finds it wise policy to impose such substantial liability for losses at sea, it is difficult to understand why the United States, furnishing passengers and cargo rather than ships, should provide

such comparatively inadequate financial responsibility to secure redress to shippers and the traveling public. The late Senator Rayner in addressing the Senate on the occasion of the presentation of the *Titanic* report, said:

"No matter how many suits are brought in the state court, no matter how many suits may be brought in the federal courts, the owners of that ship, no matter how able they may be financially to answer in damages, can go into the federal courts, sue out an injunction, have a trustee appointed, bring the ship if it exists—of course, in this case the ship is gone—bring pending freight into court, and escape all liability whatever for injury to passengers, for injury to goods, or for any cause whatever.

"That is the statute that is now upon the statute books of the United States. It ought to be repealed or modified. There is no reason on earth why it should continue. When it was passed it was thought to afford an invitation to ship-owners to take to the sea and risk the hazardous character of the adventure, but I apprehend there is no more danger on the sea now than there is on land; and if these statutes are not repealed there certainly ought to be some modification of them."

Old Laws—New Conditions

We are at present scrutinizing ancient rules of law and testing them from the point of view of their effect in operation as securing justice to the individual. Does this limited liability principle operate to secure substantial justice? Are modern conditions the same as those under which it was first developed? At that time shipping was generally carried on by merchants or independent owners. A single ship frequently represented an owner's entire business investment and limited liability was an encouragement to venture in the hazardous business of navigation.

Much of our modern shipping is carried on by extensive corporations, such as the North German Lloyd, Hamburg-American and the International Mercantile Marine. These companies frequently invest heavily in a single ship, but that ship seldom represents a very large part of their entire capital. The loss of a ship like the *Titanic* is, of course, a matter of serious concern, but it does not involve the extreme hardships to which the loss of his single vessel subjected the owner in earlier times.

Moreover, the hazards of navigation have been greatly reduced through governmental activity in improving harbors, removing obstructions, marking channels, placing signals, making accurate charts, patrolling ice-fields and destroying derelicts. Wooden sailing vessels have been replaced by modern steamships. Voyages which took months have been reduced to days. General use of wireless telegraph, submarine signals, prescribed lanes, and the increase of speed, bring steamships into closer com-

munication and give to the ship-owner a control over his vessel which in so far as the prevention of accidents goes, is equivalent to that exercised by the operating department of a railroad over its moving trains. It can no longer be said that the control of the ship-owner ceases when the vessel passes beyond the horizon.

These circumstances suggest for serious consideration the desirability of repealing the special privilege enjoyed by water carriers as compared with carriers on land. If repeal be unwise or impossible, it is at least possible and seems desirable, to modify these laws as now applied in the United States so that irrespective of the value of the vessel after the accident, there may be some substantial fund to which claimants may have recourse.

The adoption by Congress of the English rule has been advocated by the Limited Liability Committee of the Maritime Law Association of the United States. The committee declares the change essential to work justice to the owner as well as to the passenger. Their report says:

"A fixed rate per ton furnishes the nearest practicable approach to equality of responsibility among all vessels in performing similar services and for damage claims incurred in performing them."

This recommendation has not been urged upon Congress and there are no bills pending to carry it into effect.

Conflict of varying rules resulting from the fact that vessels enter territorial waters and become subject to the jurisdiction of several different nations, suggests the desirability of adopting by international agreement a uniform rule governing the nature and amount of the owner's financial responsibility, just as the London Conference recently prepared such an agreement as to rules governing the construction, equipment and operation of vessels in the interest of increasing safety at sea.

The International Agreement

The problem has already received consideration at several diplomatic conferences and a tentative draft of an international convention which substantially adopts the English rule has been prepared. It was expected that another international conference dealing with this subject would be held in Brussels in September, 1913, and an appropriation was made by Congress to pay the expenses of delegates representing the United States. Congressman Montague, of Richmond, Va., Edwin W. Smith, Esq., of Pittsburg, Pa., and Judge Ward, of the Circuit Court for the New York District, were named as delegates from this country. The conference was postponed, however, and has not yet been held.

Prior to the conference an effort ought

to be made to develop a public opinion respecting the questions of policy involved in reaching an international agreement. The interests not only of the ship-owner and the cargo but of the traveling public as well, should be represented. Agreements involve compromises. If the United States, Great Britain, France and Germany along with the other maritime nations are to reach an agreement as to the rule which should in future be applied in cases like the *Titanic*, it is obvious that the position of the United States must be either to help France and Germany to compromise England down to the lower limit provided by these continental countries or to help England to compromise Germany and France up to the higher limit provided by the English law.

Policy of the U. S.

If our delegates are to exercise any influence upon the terms of an international agreement, they must fix upon a policy which the United States as a nation deems just and desirable from the point of view of owners, shippers, and passengers. Who is to determine what the policy of this country should be? Are our delegates to assume that existing acts of Congress represent our policy on this important subject, or is the State Department to determine the matter and instruct our delegates irrespective of existing acts of Congress?

Of course, there will be ample opportunity for full discussion of the terms of any agreement when it is submitted to the Senate for confirmation; but an intelligent discussion of the subject by Congress and the general public, prior to the formulation of such an agreement seems desirable.

We have no federal legislation fixing the liability of the ship-owner for injury to or the death of a member of his crew. Under the rules applied by our admiralty courts the right of the seaman or his dependents to recover for his injury is extremely limited. The injured seaman is entitled to "maintenance and care, at least during the continuance of the voyage." After the termination of the voyage the disabled seaman or his dependent family can recover nothing for loss of earning power or support except in cases of actual negligence on the part of the owner, for the owner is not liable for the negligence of the master or crew.

Even in cases of the owner's actual negligence, the claim of the seaman or his dependents is subject to the limitation of liability laws which permit the owner to abandon the ship to the claimants and thereby escape personal liability. This means in cases of wreck that even where there is a right to recover, there is no substantial recovery. In the *Titanic* case, for example, any judgment recovered by the crew or their dependents,

shares with other claimants the \$90,000 to which, under the United States law, the owner's liability is limited.

Compare this with the laws of England, France and Germany. In these countries seamen and their dependents are provided for in the workmen's compensation laws. The injured seaman or his dependent receives compensation, irrespective of the circumstances under which the injury occurred and also without regard to the limitation of liability enjoyed by the ship-owner as to other claims.

Several bills providing a system of workmen's compensation for employes engaged in interstate transportation by land, have been introduced in Congress; but none of these has provided for compensation for employes engaged in interstate or foreign transportation by water. Transportation by water is specifically referred to in but a few of our state compensation acts and it is not yet settled how far this industry is within the scope of these acts, particularly as to injuries occurring outside of the state.

Federal Compensation

The attorney general of the state of Washington has ruled that the compensation act of that state does not apply to vessels plying on navigable waters having an outlet to other states even though such vessels be engaged solely in intrastate commerce. Whether or not the state acts apply, there can be no doubt that a uniform federal rule is as desirable in the case of employes engaged in interstate transportation by water as in the case of employes engaged in interstate transportation by land.

It is difficult to obtain any statistics of accidents to seamen, but it is a matter of common knowledge that injuries to this class of labor are of frequent occurrence. In 1906, according to the report of the Census Bureau, there were 37,321 vessels of five tons or more operating under the United States laws. These vessels employed 140,929 persons, with an aggregate payroll of \$71,636,521. The figures for the last census are not as yet available.

Judge Alexander for the House Committee on Merchant Marine recently introduced a bill extending the jurisdiction of the interstate commerce commission to water carriers engaged in foreign and interstate commerce including our coastwise, Great Lakes and inland river trade. This legislation if enacted will probably be a stepping-stone toward the application to all transportation under federal control of regulatory legislation affecting any part of such transportation unless clearly inapplicable. Irrespective of such a development, however, there is immediate need for Federal legislation extending the existing Federal employer's liability acts (or if they be passed, the interstate railroad workmen's

compensation acts), to employers engaged in interstate and foreign commerce by water.

If Congress passes a workmen's compensation act covering seamen, the problem of ship-owner's liability so far as members of the crew are concerned will be entirely and satisfactorily solved. Under the English workmen's compensation act the ship-owner is liable to the full extent of his resources for the limited sums provided in the schedule of compensation. Such an act in this country would dispose of all questions as to the nature, extent and amount of the ship-owner's liability. Instead of being limited to the amount provided by the forfeiture of a stated sum per registered ton or derived from the sale of the wreck and the collection of pending freight, the seaman or his dependents would be entitled to recover from the general assets of the owner the compensation which the act provided for his case.

Accident Insurance

This would result in making the owner's liability for injuries to his seamen a matter for insurance and would probably result, as it has done in the case of other employes, in forcing the owner to keep his seamen insured for the full amount of the compensation provided by the act. This is the fairest, most economical, and in the long run, most satisfactory method of dealing with the owner's responsibility for injuries to his seamen.

Sick and disabled seamen are provided with care and treatment by the United States Marine Hospital for which Congress appropriates nearly \$1,000,000 annually. Formerly, ship-owners were required to contribute to the support of the hospital and were permitted to deduct the amount of the contribution from the seamen's wages. Later a tonnage tax was levied for its support; but now it is maintained solely by government appropriation. This institution is excellent as far as it goes and may well form a precedent for the establishment of government hospitals for sick and injured in other lines of industry; but it takes no account of loss of earning power or of support to which injury and death subject seamen and their dependents.

The freedom from personal or unlimited responsibility for his own and his agents' negligence enjoyed by the ship-owner under our laws is not confined to his position as a carrier of passengers and an employer of seamen. The common law exemptions from liability, such as an act of God or a public enemy, have been so expanded by our acts of Congress and particularly by the Harter act, that the owner is now under little or no liability for cargo losses. Not only is his liability for such losses limited in amount, but in the ordinary case he is en-

tirely exempted from any responsibility for the loss.

These exemption laws and their development form one of the most interesting and important chapters in our admiralty law. A brief quotation from the hearings of the Senate commerce committee on Senator Nelson's bill to amend the Harter act indicates the present state of these laws:

"The effect of the Harter act has been constantly burdensome to American shippers ever since its enactment. The full force of its provisions has been made conclusive by court decisions. In practically all cases of damage or loss, whatever the actual facts may be, it is almost impossible to show that the ship-owners have not used due diligence to make the vessel seaworthy and properly manned, equipped and supplied; and it is almost always possible for the ship-owners to allege, for the purpose of escaping liability, that the accident was due to faults or errors in navigation or in the management of the vessel."

Before the same committee, Howard S. Harrington, a New York admiralty lawyer, said:

"I should like to say a word from the standpoint of a practicing lawyer to whom an American cargo owner comes whose cargo has been shipped on the vessel and the vessel has gone on the strand, and she, with her cargo, is a total loss in many instances, as a result of gross negligence—and he asks what recovery he has. Under the existing state of law, with the Harter act in force, we have to advise him that he has practically no recovery whatever."

Readjustment of Liability Laws

Like the limited liability laws these exemptions from liability laws apply to all claims for damages made in our courts whether the vessel be American or foreign and whatever the nationality of its owners.

The readjustment of our laws respecting the owner's liability for cargo losses may safely be left to the shippers. But the readjustment of laws fixing the owner's responsibility for injuries to passengers and members of the crew calls for intelligent public discussion and organized public opinion.

The legislative changes suggested by the conditions described may be summarized as follows:

1. An amendment to our limited liability laws similar to the English rule, increasing the owner's liability so that where the owner is liable, the persons to whom he is liable may have recourse to some substantial fund, irrespective of the condition or value of the vessel after the accident.

2. The enactment by Congress of a law authorizing the district courts in admiralty to entertain actions to recover damages for death, so that our admiralty courts may not in future be dependent as they are now on the existence of such laws in the state or country to which the ship belongs in order to give re-

[Continued on page 381.]

AN ANTI-WAR POSTER

"The workmen of Budapest," reads the caption, "will on Sunday afternoon hold a parade and demonstration in the Tattersaal against the horrors of war. Every working-man must protest against this wholesale murder." The poster is that of the Socialist-Democratic party of Hungary.

A Cartoonist of Social Unrest

"NOT incipient socialistic art, but the expression of a great material and spiritual misery," characterizes the work of Michael Biro, which was recently the subject of an extensive exhibit at Budapest. So we are told by Daniel Varnai, writing in *Das Plakat*. With cartooning finding its way into the frames of civic and child welfare exhibits in this country and with the *Masses* and *Harper's Weekly* bringing out radical drawings of a type very different from those of the old humorous and political papers, there is especial interest to American readers in the work of this Hungarian artist, who has mirrored the proletarian

movement so faithfully we are told that "among many of the oppressed a sympathetic renown and extraordinary weight have attached to his name."

The cartoons are reproduced from *Das Plakat*, where Daniel Varnai tells of his first impressions of Biro:

"I have a vivid recollection of a hot July afternoon when one saw on the streets of Budapest those posters of his which lashed with grim irony extortionate landlords, food adulterers and other poisoners.

"With his drawing board against two chairs, and expressing his ideas with simple water-colors, the painter met the fermenting and blazing passions of the people, as storm clouds through whose collision lightning and mighty thunder

quiver through the air. From his posters the torrent of his spirit discharged like glowing lava on the lounging, dissipated proletarian crowds. All the city's misery—men who had been ruined by the usurers, emaciated women and wan, sick children, filed through the streets, and at their head marched Biro's posters, leading them to battle against all the parasites who enriched themselves at their expense. They were given close attention by the passing crowds, and he who had been in doubt and uncertainty now felt that the veil was raised—he knew whom he had to thank for his dreary, sordid existence, and what caused it. Michael Biro was an artist who felt with them. Their souls were one, and through the force of his art, full of a mighty courage he spoke to them."

Biro brings to his work a technique larger than that of the ordinary illustrator. He is a skilled draughtsman, a sculptor, a close student of his models. His reviewer is enthusiastic in telling how "at the very moment the thought flashes across his mind he realizes it on the drawing block."

"In the exhibition of his work one was distinctly aware of these effects, which he attained with the most varied subjects. Simply, clearly, without wordiness, he disposed of everything in Hungarian society that he considered pernicious, stupid, crooked and awkward. One cannot ensample a single piece of his work, for each one contains something with which he attacks the ruling classes. In such cases he does not reveal his soul, but gives his biting irony free play.

"He arouses no hatred, but compels laughter; delivers no sermons, but is able to speak wittily; he writes no bombastic editorials, but poignant epigrams, and just for that he deserves the greatest praise. He does not bring forward with a flourish the baseness and coarse maneuvers of the militant clergy—smilingly he tears off their disguise and with his pin pricks wounds all religious pretenders.

"Here is a subject, finely drawn in small compass—Mourning at Hungary's Bier. One would suppose the medium gloomy, the symbolism stern. Not at all,—Biro works with other tools. Jestingly he assumes the attitude of a provincial photographer taking a group picture. About the bier he places canteen Jesuits, soldiers and judges, whose tyranny we have often enough felt in our struggle for life in Hungary. This trick of presenting the thing is so grotesque and so characteristic that one would be almost inclined to say it was his best, were not all the other pictures done with equal skill."

It has been said that political caricature as an effective agent in molding public opinion is essentially a product of modern conditions; a successful political cartoon presupposes a certain degree of intelligence in an awakening nation. It would be wasted on feudal vassals; it has its best growth in an atmosphere of unrest, in a democracy.

PETERING MANHOOD SUFFRAGE

A cartoon against a bill requiring common laborers to be thirty years of age before receiving the franchise, unless they have attained six school grades before the age of twenty-four; barring laborers not continuously employed for two years previous to an election, etc. The inscriptions on the bonds stand for these limitations.

Varnai employs Biro as text in a further question: whether or not we have a socialistic art cropping out in this period of unrest. Jules Coulin, author of *The Socialistic Point of View of the French Painters*, uses with full conviction the term "socialistic art." Neither in Biro's work, free of blatant obtrusiveness, nor in the characteristic

THE PUBLIC REVENUE

Who swallows it up? The army, clergy, school teachers, and aged and infirm workmen are personified in a dwindling scale.

work of German and French cartoonists, nor in the heavy but often cutting productions of the Russians, does Varnai find ground for the term. A certain sympathy with social unrest, with Socialism, he finds:

"In the work of all these artists the humorous strokes of pen, pencil, crayon and engraver's point, were as if by magic transformed into whips that, now with saucy humor, now with gloomy symbolism, now with open candor, lashed all the perversion and evil which have arisen in the controlling factors of bourgeois society, the church and aristocracy."

But their attacks against what to him is a decayed bourgeois society, Varnai does not believe constitute a socialistic art.

"It has since become ever more evident to me that the embryo of social art is hardly yet discoverable. The existing art which is connected with the proletarian movement is simply the reflection of the need, strife and numerical development of labor; it neither serves the socialist morale, nor socialist science, and cannot even give expression to the vaguest contour of a socialistic state, or that of a communistic group. It is unable to do this because—although a weak reflection of a collectivistic output is noticeable in today's industrial production—the socialistic morale is not as yet powerful enough to pass over without great changes from today's order to the collectivistic."

"Only when the proletarian movement

ALCOHOL AND THE WORKING MAN

The inscription on this cartoon reads:

"Alcohol is poison. It kills, brutalizes and causes misery."

and all its battles shall have gained a final victory will a development of socialistic art begin."

Yet he concedes a sort of soul communion with the proletarian movement, and of Biro himself he says:

"His feelings, his passions, are those of the masses, the pulpit which he ascends rises out of the midst of the masses, he stands there not as a guest but as an integral part, not as a for-eigner, but rooted firmly in the populace. What he produces is not merely a vogue, but permanent truth. If he would he could not do otherwise."

"WORKMEN! CITIZENS!"

So sounds the challenge under this suffrage poster which depicts the arm of the workman rising from mill and mine before the hall of parliament.

"Beauty for Ashes"

IX.

Defeat and the Fight Renewed

Albion Fellows Bacon

"It is asked why there are not more here insisting upon this bill," said Senator Haleck.

"Those who need the bill most cannot come. They are sick and weak, poor and ignorant. They do not know how to protect themselves, and cannot afford to come."

ON a western bound train two men sat discussing a building project, in tones calculated to drown the roar of the train. They were from Indiana, as those on nearby seats soon discovered from the localities mentioned.

"No, we've given it up," said one man. "We can't build the way we wanted to because a crazy little woman down in the southern part of the state has gone and played the mischief by getting a tenement law that upsets everything."

It was the lady in front of them who told me about it.

The smoke of battle had hardly cleared away after the Legislature adjourned when an Indianapolis paper came out with an article under big black headlines:

MRS. BACON'S LAW STOPS FLAT BUILDING

The article took my breath for the moment—just as I had begun to breathe again. I knew the law wouldn't stop flat building. We had to expect the same fuss and worry that a tenement law has always created in every state, until builders get used to it and begin to see its value.

The next news from Indianapolis was that a suit had been brought to test the constitutionality of the law. The test was made in the case of a handsome flat building which failed to conform to the law in some slight particular. Of course, the enemies of the law selected a case that would make it seem the most absurd, in order to render it unpopular. But we expected that, too. We knew that the main point upon which the public had to be educated was not the necessity of improving the wretched conditions of the poor, but the reasons for including the better class of flats and apartment houses in the law. People must be made to realize that dark rooms and bad plumbing are as deadly in a fashionable apartment as in a squalid tenement and that fire is no respecter of

mansions. They must realize, too, that, as the tide of fashion ebbs, Rich Man's Row often becomes in time Poverty Flats. But they hadn't learned this yet.

While I was wondering who was to defend the suit besides the city of Indianapolis, I received a brief letter from Senator Cox, stating that he had joined in the defense, as if it were a matter of course. It was characteristic of him to do it in that way. From that time he has carried a big part of the burden of the housing movement in Indiana with all its work and responsibilities.

The case dragged for some time, but the outcome may be speedily and joyfully stated—our side won.

Now matters settled down to the enforcement of the law in the two cities to which its application had been limited by the amendment of its enemies. In Indianapolis it was enforced by the building inspector, but as Evansville had not even created such an office, enforcement devolved upon the Board of Health. Our board, though fully in sympathy, found in a very short time that both funds and force were inadequate for this purpose. In a city of 70,000 there was work enough to keep a whole force of inspectors busy, and I felt sure that we would get at least one. But it was no simple matter to create the office.

It would take too long to relate how I visited each member of the council on the subject; how, with Joseph Igleheart, president of the Civic Improvement Association, I went to the council meeting, and with him presented the need of a building inspector; how the council asked us to prepare an ordinance, and how it was finally passed. We went to every meeting until I left town for the summer, and then Mr. Igleheart kept on alone until the ordinance was passed and the office created. Later in the year, a splendid man, S. A. Brentano, was appointed to the office and has done valuable work.

I realized keenly, while engaged in

this effort, how much easier it is to do civic work with home as a center and a base. How good it was to be at home again, to resume my accustomed identity, to which I felt almost a stranger; to be again a person, no longer merely a disembodied, homeless Plea! I was avid of all those usual, homely things that all people do, and so eager to get back into the same "rut" again that I welcomed even the commonest tasks. It was good to get out of doors, after confinement in hotel and state house, to feel the fresh air and the sun, to run about the lawn and find where the hyacinths and jonquils were coming up, in their same old places. Good, even to clean house and preserve strawberries.

Doffing the Coat of Mail

When May came, and I could sit in diaphanous gowns and light slippers on the lawn by the great wigelia bush that was a fountain of rosy sprays, I could at last shake off that hateful feeling of a coat of mail. One must have the "doublet and hose in one's disposition" to endure it long. Never had feminine frills seemed so satisfying to me. I found a pleasure even in teas. My feeling was much like Robinson Crusoe's, I imagine, on his return to civilization.

Then came June with a bevy of girls in a house party for our own daughters, both home from school. June, and the world was young with the young life that filled the house with music and light and laughter. There was the flash of shimmering gowns and the glow of bright young faces. The mornings sparkled and the evenings dreamed, and the world was sweet with roses.

Midsummer came. We went away from the blazing streets to the fresh coolness of the lakes for a long rest.

I cannot remember what happened in the fall, except that I spoke once to the State Federation of Women's Clubs. The rest of the fall, and much of the whole year that followed, has been blotted out of my memory by the sudden shock of a great bereavement that overwhelmed our home.

I do not know how to go on with my story. It seems as if it ought to stop here, as our life stopped for so many long months. Again and again I have come to this place, faltered, and laid down my pen. It was a time that can neither be dwelt upon nor passed over. There is much of it, too, that belongs to this story. But—no. I cannot bring myself to write more than to say that our bereavement was the sudden death of our eldest daughter.

The winter was long and hard and dreary. The world was old now. It was old and gray. Constant illness in our family kept me close with anxious nursing. But the winter wore away and the spring dragged through. I began to feel a craving for work, employment, something to force my mind to new

channels. Though still too weak to do much, I went back to the Working Girls' Association, of which I was yet president, and began also to visit the poor again.

I mention these things because this is a story of work, and I wish that everyone upon whom sorrow has fallen could realize the healing power of some unselfish interest that is exacting enough to absorb all one's attention. Well for those who have such interests before sorrow comes, for they are difficult to acquire afterward. The man of business, the woman who makes a living, are forced to meet the world, and they find relief in work. But women of the idle class, who are shut up alone by corroding conventionalities, have no escape from themselves,—not even in travel.

If work is in itself helpful, how much more so is the spending of one's energies in a way that will help others. But most of all is there tonic and balm in the personal giving of cheer and comfort to those who, under repeated afflictions, have lost more than we have ourselves.

A Visit from Jacob Riis

One of the few things I remember in that year is a visit from Jacob A. Riis. I had been planning for two years that our state should have the privilege of hearing him; now others had taken up the plan and he was to be with us early in the winter. His tour began in the northern part of the state, and wherever he went people met him with enthusiasm.

He was to visit our city last. Our friends attended to the details of preparing for his lecture, and he was here in our home for a brief, bright space that our family can never forget.

"Here," we say, "is where he sat, on this side of the fire, when he set the children on his knee, and told them stories of his boyhood in Denmark, and legends of their heroes." We knew there were none of them braver than he, and that the little decoration of knighthood he wore, given by the hand of the Danish king, symbolized also what was heartily accorded him by the loyal love of the American people.

But we knew more—we were "receiving a prophet," and his presence was a benediction.

Later in the year, I do not remember the month, there came a challenge to all my powers. Certain men in Indianapolis and Evansville were beginning to find out that the restrictions of our tenement law hampered them, and a number of them prepared a bill purporting to correct the "mistakes" of our law but really, instead, taking all the virtue out of it.

There was no Indiana Housing Association then, but Mr. Cox did the work of president, boards and committees. He always knew just what needed to be done, and he said, "Don't be uneasy."

Of course, we were bound to see that if any bill were introduced, it should really be an improvement upon the old law by making it broader and stronger. This meant that the authors of the proposed bill should have demonstrated to them just what the effect of every change would be. There was no one in the United States who could do that with such authority and conclusiveness as could Lawrence Veiller. As secretary of the National Housing Association, he heard our call and came out twice to help us, all the way from New York, spending many days in slavish labor for which Indiana owes him her profound appreciation.

Noses and Eyes as Witnesses

While he was in Indianapolis he made a tour of the slums of that city. We took with us some prominent citizens and a number of reporters, and I had the satisfaction of having the greatest housing expert in this country, one of the foremost in the world, verify my statements as to just how bad those slums were. But noses and eyes also gave conclusive verification, and some of those who went that day are the bulwarks of our present housing movement.

All this time Mr. Cox had been quietly busy, and the Civic Commission of the Commercial Club had been made aware of our impending danger. With magnificent response they decreed a banquet in Mr. Veiller's honor and mine, at which should be gathered representative men, among them the friends of housing reform (who had grown to a goodly company) and also the framers of the proposed dangerous bill, so that we might cement our purposes with patés and coffee and friendly discussion.

The banquet was an entire success, in all the ways we desired. Sitting at the head of the tables with Mr. Veiller, between President Miller and Dr. Wynne, chairman of the commission, I looked down the long double line of men with a feeling of gratitude for our strong support and for the distinguished honor. The strength of our support was even more apparent in the speeches that followed.

The next day we got down to business at a luncheon of some of the Commercial Club men, including Mr. Cox, Mr. Grout, and Mr. Winterrowd, then building inspector of the city, who is one of our main props. Architects and builders were present at our extended session, when we mowed, reaped, shocked, threshed, sifted, ground, baked, masticated and digested every grain of the proposed bill. Mr. Veiller presided. Afterward, he gathered up the views of the company and took them back to New York, to reduce the chaos to order. Only he can tell of the time and toil it involved; only those who have taken a hand in such work can appreciate the tale of it.

Our story begins again with his second trip to Indianapolis, when he sat once more in the Claypool, with Mr. Cox and me, and took us through all his processes, till the words danced on the page and all ran together. Then Mr. Cox called in the others who were interested in any changes that might be made, and we sat again for morning, afternoon and night sessions, until everybody understood everything and all were agreed.

There I sat, in discussion with those men, architects, builders, real estate men, lawyers, doctors, bankers, charity workers; with us was the housing expert who had spent years of his life writing, enforcing, and testing out tenement laws. Yet angry landlords ring up my 'phone, and demand to know why I decreed such and such regulations, echoing the woman who exclaimed vehemently, "Vat does she mean by sich foolishness? She'd better make another law, yet."

It was great to see the masterful way in which Mr. Veiller met all questions, drawing swift diagrams to show what would happen if given dimensions were changed to certain others, etc. Finally, no one could ask any more questions, and we all shook hands and promised to work together for the bill we had agreed upon, and Mr. Veiller returned to New York.

One of the things that makes this meeting memorable is that here we became acquainted with Wilson B. Parker, of Indianapolis, who represented the state Association of Architects in this matter. He has ever since been a valuable supporter of housing reform, and has been of aid in many trying hours.

Another Effort for a State Law

Now, of course, I should have to go back to the Legislature. There was nothing else to do. How I dreaded a second term, fearing that it would give me the savor of a professional lobbyist or a "crank." But here was the opportunity to try again for a state law, and that was what I had started out to win, what I could never be satisfied without. Moreover, the architects who were joining forces for the bill, expected me to go back to remedy the shortcomings of the law of 1909 caused by hasty amendments that injured several sections.

Before the Legislature opened, taking my poster exhibit, I went up again to Indianapolis to help Mr. Cox rally our forces and to see that all was ready. I stayed over to see the installation of the new speaker of the House, Albert J. Venneman, from our city. He had been one of our men's friendly visitors, and I knew better than the others what justice every cause would have, and rejoiced for his interest in the poor—those thousands of constituents in our state whom our legislators so often forget that they represent.

Many of our old friends were back in the Legislature, and my reception was so cordial that it took away my dread of going back. Mr. McGinnis was there with his beautiful wife, and he agreed to look after our bill again in the House. Dr. Foor was there, stronger and more interested than ever, and he was again chairman of the health committee, to which our bill would go without doubt. Mrs. Foor would be again on the floor in the same capacities as before.

Senator Cox's term had expired, but he was there every moment he could spare, and, though Mrs. Cox had less occasion to come, she was present whenever possible to cheer me on. I never saw them together without a whimsical wish that I could have just such a wife, to be so interested in my work and to help in the special way that women can!

Two other friends, Mr. and Mrs. Wil-

EDGAR DURRE

Senator from Evansville, who had charge of the tenement bill in the Senate in 1911.

liam L. Taylor, had apartments at the Claypool. It was his record as attorney general of Indiana a short time before that gave me the greatest pride in quoting his opinions on housing reform. As for Mrs. Taylor, and all that her friendship has meant to me, it needs some other words than prose to tell. At the hotel where many friends of the last session were at home, we gathered all our forces, made our plans and our war maps, and prepared for the struggle before us.

I was impatient to have our bill introduced before a rush of bills began; but some of the parties to the bill began to haggle over little points, and we were delayed until well into the session. As a result, I received word from Dr. Foor that our friends feared it was too late to get the bill through, and thought best not to report it out of the committee

and run the risk of having it defeated.

Counting over our friends and forces, I felt confident that we could win. I took the next train to Indianapolis. Calling our old and new adherents together, Mr. Cox and I arranged for a committee hearing. Mr. Parker was there and spoke strongly for the state Association of Architects; Dr. C. S. Woods, representing the local Board of Health, Mr. Grout, representing the needs of the charities, and many others, were there.

But we might have spared our array of forces. "There's no need to present any arguments," said one of the committee. "We have gone over the bill and understand it and are in favor of it. All I want to know is whether Mrs. Bacon is satisfied with the bill—if it will do what she wants for the poor."

That was certainly a great mark of confidence, but a still greater one was to follow.

The bill was reported out at once, and, to save the time we had wasted in delays, the leaders of the House, both majority and minority, finding a strong majority for the bill, put it through its second and third readings, under suspension of the rules. It was all over in five minutes, before I realized what they were doing. It fairly took my breath! The papers said it was a "monument" to my efforts. I didn't know then what the monument would be used for, or what inscription would be written on it by the Senate. For the Senate was yet to try out.

The Bill in the Senate

Now we found Senator Cox's knowledge of men and of legislative methods invaluable. Moreover, his clean strong record gave him great influence with men of all parties.

We had chosen Senator Edgar Durre, from Evansville, to take charge of the bill in the Senate. Although his party was now in the minority, and our strongest enemies were on the majority side, we felt that Senator Durre, with his exceptional ability, was a match for any dozen ordinary men. Besides, from his previous experience, he understood the subject better than the others could.

There was little appearance of opposition at first, but the bill showed an ominous tendency to stick in the mill between the two Houses. Finally Mrs. Foor and I read a perfect proof, and my own hands put it into the hands of the lieutenant-governor, in the presence of the clerk. Promptly and smoothly it went through two readings, and then stuck fast.

I had been warned, on our entrance to the Senate, that we should not be allowed to pass a state law, but every poll showed a good majority in our favor. The men from my own district were "solid" for the bill, and helped strongly. Our friends in the House came in and helped, and Senator Durre threw

all his strength and energy into the fight. Mr. Cox took almost the same part as if still a member. Besides this, I interviewed every one of the men myself. We kept constant note of friends or foes or "doubtfuls" on our legislative directories, comparing notes as we made progress. And from day to day a majority showed in our favor.

But we did not dream to what lengths the opposition would go. Stronger and more determined, the same vicious lobby was there again. It was made up of many elements, and exhibited a welding of powerful interests, both inside and out of the Legislature.

There were men who made trips from their home towns to fight the bill with various weapons. Some sent their lawyers or agents. There were wealthy men in the lobby who owned rows and blocks of rotting tenements. Some of them were prominent in the church and respected in society in their own towns, and the people there were surprised later to learn of their tenements and their opposition to our bill. There were others whose infamies were as reeking as their hovels, whose names are odorous, not only in their own city, but through all the border, for intrigues and frauds and deeds of violence.

"The Powers of Darkness" I have called this element, but the powers were all allied,—brilliant brain, giant strength, and cunning hand, all worked together in the dark to carry out purely selfish ends, with no thought of the interest of the state.

And here were the friends of the state arrayed more strongly than ever, the state Board of Health, the state Board of Charities and Correction, local charities of the whole state, the press of the state,—all calling with one voice for the law, with the state Association of Architects, and many leaders of public thought besides standing for its need and its fairness. And the only arguments urged against the bill were those of the expense and inconvenience it caused the landlord or the builder! Yet we were asking only for decencies and necessities of safety and sanitation.

As in 1909, some of the members of the Legislature openly avowed their tenements. Others denied having any, and we wondered at their opposition. But when I visited their home towns later, I had the Court House records investigated to see what property they or their relatives owned; and when I went out with the charity workers of the place, I stumbled accidentally into some of their tenements,—the worst in the town!

It must not be supposed that I encountered these men, personally, in any unpleasant way. True, there was one Shadow ever at my heels as before, but I was always accorded personal courtesy and respect. I was thankful for the ethics of the Legislature that prevented

personalities, and was careful to be as fair and considerate in turn. Naturally, my name was never mentioned and "the author of the bill" meant Senator Durre.

Once, however, with significant emphasis, one of the opposition declared that "it was not fair that one will should dominate the Legislature." In a flash Senator Durre leaped to his feet. "My will is *not* dominating this Legislature," he declared.

The lobby would have been surprised to know how much of their doings came to us unsought. What was promised in saloons, what was plotted in cafés or even in private apartments, came straight to us from a myriad sources. The walls had both ears and eyes, and more "little birds" chirped information than ever broke woodland silence. But it all served only to make us aware how

MRS. CHARLES B. CLARKE
Of Indianapolis, president Indiana
Federation of Women's
Clubs in 1911.

powerful were our enemies, and to warn us of the lengths to which they were willing to go.

It was a disappointment to me that the labor unions were too absorbed in a child labor bill to give any attention to the housing bill. I had secured, through a friend, a resolution from the National Alliance of Labor, endorsing housing reform, and hoped that the working men would realize that this law was meant to improve their own living conditions. But they did not seem to grasp the idea very generally then, and many of them do not now.

It is worthy of record here that twice during that session I was given the very unusual privilege of opening the Senate with prayer. This, in itself, is enough to show that the evidences of confidence of the last session were again renewed.

There is no need to dwell upon the de-

tails of that session. Trip after trip I made, home and back again, waiting for the bill to come to its third reading. It was a bad winter. Snow storms delayed the trains, and I was sick half the time from exposure in icy sleepers and from going to and from the State House in sleet or rain. But even when I got up out of bed to go, in response to telegrams, the family only cheered me on and helped me to start. They knew how much it meant. I remember my mother's disgust at the "stupid" men who couldn't see the need of a state law. Even the maid was glad to contribute her very important part, and the children cheerfully volunteered, "We'll pray for the bill every night." There was one, too, who was ready to pray, pay and fight. Why shouldn't a woman dare, with such backing?

If we could only have fought! But we worked, watched and waited, waited in an unending nightmare of difficulties and delays. The end of the session was at hand, and our bill had not yet been allowed to come to its third reading. Four times it had been made a special order, and four times the rules had been set aside, and the order broken, on the plea of the precedence of party measures still unfinished. And still a poll showed a good majority in favor of the bill.

"I'm tired of this guerilla warfare, this being struck in the back by someone hiding in the dark," thundered Senator Durre. "I dare you to come out and fight in the open, and let the bill go to a vote now."

The last day came, and our friends in the Senate rallied for a last charge. Senator Durre fasted that day. He made me think of a lion who was being made ready for human flesh, as he paced the aisles with his jaw squarely set, and red lightning in his eye.

The panic rush of the last business swept over the Senate all day. At the end of the day we got a hearing.

"Every cause and every interest has had its hearing in this Senate," declared Senator Tilden, "but the cause of the poor has been pushed off until the last hour."

"It is asked why there are not more here insisting upon this bill," said Senator Halleck. "Those who need the bill most cannot come. They are sick and weak, poor and ignorant. They do not know how to protect themselves, and cannot afford to come."

Senator Carleton, our other home senator, pleaded eloquently for the children in our cities. There seemed at last to be hope of getting a vote, but time came for adjournment, and we had to wait till the evening session.

It was the last night now, and the lion was loose and swept the whole jungle before him. Those who heard Senator Durre's ringing, stinging speech still remember it. Men

said that not in years had such oratory been heard in that Legislature.

Can I ever forget that scene! The Senate Chamber was packed with those who were anxious about the final fate of different measures. My friends pressed to the rail. I saw Mrs. Cox and the children, Mr. and Mrs. Taylor, and many others, for the Architects' Association had adjourned its session to come over and help us. The House finished its business and adjourned, and many of these men came in to help in our fight. Everything was confusion; men were tired and excited, and the rules were relaxed. The opposing lobby boldly walked the Senate floor, and our men called me inside the rail upon the floor also with Mr. Cox and the others.

After Senator Durre's speech there was a sharp skirmish of discussion, and the bill went to a vote. How anxiously we counted over our men! Two of them were sick and absent. A few, thinking the fight was hopeless, had gone. There were some members who had dodged every vote on our bill, and they had slipped out into the corridor.

One man refused to vote at all, because, he said, "he'd never seen a tenement, and wouldn't know one if he saw one, and he wasn't going to vote about something that he knew nothing about."

The voting went on. Mr. Cox, with his brows bent, was keeping tally. I couldn't. Thud, thud—like clods on my coffin fell every "no." But "aye," aye, —I knew, by the light on the faces of those around me, that we had won. Mr. Cox showed me the tally—26 to 16. (There were 50 members, and we had to have 26.) There was applause and cheers, that the gavel could not quiet. Before it died away we had sent a message to the engrossing room to have the bill ready for the governor's signature by midnight.

"But why don't they announce the vote?" we asked each other. My friends, the senators, who had worked and helped, and all the others crowded around with congratulations. "It seems too good to be true," I said, "I'm afraid to accept congratulations until the vote is announced."

The Final Vote

The opposing lobby had gathered in a knot by the desk. We waited an hour amidst the confusion of the last night while members were packing up their belongings to leave. Finally, there was an uproar. A man had been found, by searching the cloak rooms, who was willing to change his vote. The majority was changed to 25, with 17 opposing, and the bill was lost! Lost!

In our dismay we tried vainly to get another vote for our side. Then we asked to see the roll, for some one told us there had been another change.

It was gone!

There was a murmur of anger and

disapproval from the audience. Hands beckoned from the rear. Suggestions were called to us in excited voices. Too late! No appeal would have been heard while the opposition had such power. The vote had been promptly announced, and the Senate adjourned.

Now there was a different scene. With words and looks of sympathy, my friends crowded about. Among them were reporters from the papers that had given such strong support. "It shan't happen again. We won't let it," they said.

There was nothing to do but to be game, nothing to say but "thank you," and "goodbye." The Coxes took me back to the hotel, with a sympathy that spared me words. It was my first defeat, and I had not dreamed how bitter it could taste. But when dear Mrs. Cox put her motherly arms about me in a close embrace I felt a sudden release from the grip of a hurt too deep for tears.

Defeated but not Discouraged

It was one o'clock when I crept into bed, faint and numb and chilled. But I could not sleep, for every time I shut my eyes I saw those faces I had watched so long and anxiously. I can see them now, some with a determined scowl, two with a leering smile of triumph, one face aflame, and the others—for weeks I saw them in the dark.

I could see the packed room, and over and over again a shuddering seized me at the thought of the public ordeal. For the first time, I wondered if any one were called upon to make that extreme sacrifice of one's inmost self.

At last, weariness overcame me and I slept a few hours. Early, in the gray of the morning, I left the capital in a drizzling rain, having snatched a bite of breakfast at the station lunch counter.

Seated on the train I opened the morning paper and actually laughed to see the tragic account of our fight. "Senator triumphs over frail little woman," was the headline. There was a detailed account of the whole thing, giving the vote of the senators, and a dramatic story of the disappearance of the roll. But there had not been any "glisten of tears" in my eyes. I want that understood. I smiled again as I thought of the ultimate effect of this defeat upon the housing movement throughout the state. Sympathy was strong for us, as the paper showed, and I felt that this defeat would give just the touch of sympathy and interest the cause needed.

Our women's clubs, too, I felt sure, would resent it as the press had done. And the state Board of Health would go on with the work, I had reason to believe. And after all we had still our law of 1909 for two cities. Already my light Irish heart was coming to the top. Ah-h! "Beneath the bludgeonings of

fate, my head is bloody but unbowed," I repeated to myself with relish, and a grim smile. But something better than stoicism had been in my mind all the while. It was the thought of the "chariots and horsemen of fire" on all the heights round about me. I was as sure of them as ever.

Before the train pulled out of Indianapolis I had formulated another plan of campaign for 1913, that I felt sure must win.

The miles clicked away. The cab rushed me home. The family was at the door—four little arms were around my neck, and the last of that deepest hurt was gone.

There isn't much that one's friends can say after a defeat.

"But it will come, in the Lord's own time, when He is ready," some said.

"No, His time is when *we* are ready," I told them, perhaps a little impatiently.

Just as I had surmised, the press of the state took up the cause. None were more gallant than our own home papers, and I say it with a deep feeling of gratitude. Interviewers came from magazines, too, scenting a "story," though, as we had been defeated, I felt there was nothing to tell. They wanted to know about the campaign of 1909, but that was all over and done with. I was interested in the articles that followed, for they all helped the cause tremendously, but they always seemed to me like accounts of some other woman, and I read them with an odd, impersonal feeling, wondering what she was like. But the stories agreed on two particulars. She was "frail", and she was "persistent!"

Women's Clubs to the Rescue

And now another force came forward with support—an army with banners, the state Federation of Women's Clubs, and at the head of it, Grace Julian Clarke. We call her that in Indiana, with pride and loving emphasis. Daughter of George W. Julian, the statesman, scholar and orator, she belongs on the pedestal which our state accords her. Lecturer and writer, if she were a book, it would be a classic. This divinity met me several times in the gloomy corridors of the State House and poured ichor into my heart on the days when Saturn warred against the fiery Mars and the two blazing suns of my horoscope. Now she came with more than ichor. The women of the federation were incensed at my defeat. The whole federation was to know all about it, the leaders had decided, and to resent it properly. It was planned that I should speak before them at district conventions and other meetings throughout the state.

So, then, there was another line to add to the inscription upon the "monument" of my triumph in the House. The

Senate had written upon it "Here lies the tenement bill, slain, 1911." Under this the women of the federation were to write, "Awaiting the resurrection."

It was June when I went to Lake Winona to speak to the women's clubs at a summer session, and there the federation opened its arms to me and took me in. The instant I set foot inside their circle I realized something unusual in the atmosphere. It was the "federation spirit"—a reality, not a name—the spirit of unselfish love and interest in each other, and it radiated and kindled all about me. I could never tell them all their cordial welcome meant to me, but I felt like one who had been struggling up a steep mountain path, battling with a heavy snow-storm, and who came, cold and weary, to a place where there was warmth, food, shelter and friends.

"Federation"

True, I had warm friends and helpers here and there all over the state; but our forces were scattered, some too far to help. Here was a united body, perfectly organized. "Federation"—there is strength in the very name.

I had never had time to be a club woman, and this first close view was a revelation. Where were the club women I had read about, whose programs skipped from appliqué to Xingu?

Here were practical women, telling what their clubs had done that year in the way of study and civic work. Here were farmer's wives, women of wealth, women who worked for a living; college women, and women who had come into the clubs for the very purpose of getting educational advantages that they had been denied. Each one could teach the others out of her own experience, and their range was deep and wide.

Sitting near the front, at the first session, I turned to a quiet little woman beside me, asking, "Tell me who all these women are, and what they have done." She began with pride to tell of all those who were prominent in the National Federation. There was Grace Julian Clarke, president of the Indiana federation. The lady presiding, Mrs. Edwin Knapp, was one of the leading spirits in our federation. There was Mrs. Melville Johnson, a member of the Art Committee of the National Federation; Mrs. Kinsey, one of our pioneer club women.

But who was this, just come to the platform? A bright, eager little woman whose voice rang clear and strong and whose presence radiated energy? Every one roused. It seemed as if suddenly more windows had been let into the room, and a fresh western breeze was blowing through. "That is Mrs. Olaf Guldlin," I was told. At that time she was chairman of the Home Economics Committee of the National Federation,

and was known all over the United States for the important work she had done in putting home economics into schools as well as clubs.

Well, truly, I thought, Indiana has a good share in the national work. We are something more than a political pivot and a center of population.

As one by one of the different clubs contributed their part to the discussion, it seemed to me as if chord after chord had been struck upon a great harp, whose strings were all attuned. It was a clear, high strain of noble harmonies.

And then I spoke, and twanged a harsh, deep chord that gave a new note they had never heard before. Although the federation had studied social and industrial conditions, as allied to child labor and the work of women, and had gone conscientiously into these movements, they had not yet turned their gaze upon the hovels and tenements where so many of these working women and children live.

Carrying the Message

I told them "A Tale of the Tenements," a true and simple story of life in the slums of our Indiana towns, and made it just as bare and sordid and miserable as I found it, in plain speech, for there was no need for eloquence. They could see, those clear-eyed women, that not education, not culture, not music or art, not even Home Economics, could ever penetrate to those darkened places, where cleanliness was difficult, and sanitation impossible, where decency was often barred, and life too often bestial.

They grasped at once the lesson in "race solidarity," the danger to their own children in the schools, the neutralizing of the best endeavors of their clubs in civic work by the demoralizing influence of those classes to whom their culture could never "filter down." They had gone to great lengths and ample breadths of endeavor; now they were ready to go to the depths, in their massive effort for humanity.

I had noticed that the home and the child were the two great themes about which most of their thought centered. The contrast of their homes and their children with the unsanctified "homes" of the slums and the children of the poor was more than their mother hearts could bear, and they sat for a moment hushed when I closed. I remember then with what quiet dignity Mrs. Knapp arose, and with skillful touch swept the harp so that it seemed as if one great chord—now with its lowest note vibrating—shook the room, as the women rose and pledged support to the housing movement.

Yet another experience was waiting for me among those hills that demands its place in this story.

The State Bar Association was in session at Winona at the same time, and my good friends in that association

planned that I should address their convention on the housing law. Of course, nothing could have been more opportune, and I was happy to do it, for I felt it would mean much to the cause. But to think of making an extemporaneous address to such a body, and on law!

It gave me confidence to be escorted to the platform and introduced by my dear friend, Judge Timothy E. Howard, who is one of our ex-judges of the Supreme Court and revered throughout the state. But I must confess that as I stood upon the platform and looked down into the grave and expectant faces of our supreme judges, ex-attorney generals and others of our brilliant and distinguished members of the state bar, for a moment my breath deserted me, and only the presence of my friend and his confidence in my ability gave me courage to proceed.

During the summer and early fall I spoke to a number of the federated clubs. The leaders of the federation opened the way for me to bring the matter of housing reform to all the women of the state, and plans were made, also, for special lectures, along the line of my travel, in churches, to charities circles, etc.

Club Achievements

In October the federation convened for its annual session in Indianapolis and I had a chance to see it in its full glory. If I had needed any proof that the club women of the romancers was either a myth, or long ago extinct, I should have had it in the reports that showed what each club had done through the year. I sat and listened with deep interest as the thirteen districts gave their statements, and these are some of the things they reported:

- a "swat-the-fly" campaign
- red cross stamp sales
- social centers established
- rest rooms opened for working girls
- school gardens
- fight for pure water supply
- clean-up days
- special course of home economics lectures
- establishment of parent-teachers' clubs
- home gardens

One district reported a civic department which had a municipal committee appointed to serve three months and attend meetings of the council. The same department had also an ordinance committee whose duty it was to formulate and push the passage of needed ordinances. The committee had been looking after public sanitation, the beautifying of the river bank, and the care of the city garbage.

After these reports came others telling of the progress of child-labor work, which had engrossed the federation that year. Then a committee on forestry and waterways reported.

[Continued on page 382.]

The St. Louis Pageant and Masque¹

Commemorating the 150th
Anniversary of the
Founding of the City

BY CHARLOTTE RUMBOLD
SECRETARY PUBLIC
RECREATION COMMITTEE

TO readers of THE SURVEY, the significance of the Pageant and Masque of St. Louis is that a group of citizens tried a daring experiment and succeeded. Citizens first and artists secondarily, they, are not the type to stage "Big Shows" just for the show's sake. They tried to arouse a city of 800,000 people to a sense of its solidarity, to a sense of the possibility of infinite achievement by a community under the spell of a unifying idealism.

And they succeeded. They proved that though democracy may never have been tried, it is not an academic abstraction but a workable hypothesis, and they proved it through the age-long appeal to Art.

I am not going to explain that the stage was eight hundred or more feet long and two hundred wide. I shall omit the number of board feet in the sound-ing-screen and the acreage of the dress-ing-tents. These things will all be printed in the official book which the St. Louis Pageant Drama Association will issue. And beyond the statement that the pageant was written and produced by Thomas Wood Stevens, with the music written by E. R. Kroeger and Noel Poeping, that the book of the masque was written by Percy MacKaye, the music by Frederick Converse and the masque produced by Joseph Lindon Smith, I shall not say anything of the dramatic or musical side of the great production.

The pageant was a fairly accurate reproduction of certain incidents of the history of St. Louis. The masque was a symbolic interpretation of that history

¹The request for this article for THE SURVEY was an additional task transferred to the writer on very short notice, and in consequence apologies are offered for the rather unconnected style of narrative. The more poetical parts, which are obviously not the writer's, are taken bodily from some of the local papers, notably from Reedy's *Mirror*.—C. R.

closing with the city's aspiration for the future.

Last summer, a handful of people decided that the city was ripe for a new expression of its pride in past achievements and its hope for a solution of its present problem. Strong in the faith that if people play together, they will work together, and in the knowledge that a beautiful expression of an ideal increases many-fold the power of that ideal, they determined to put to the touch their faith in the city's inherent capacity for united action.

The mayor of the city gave enthusiastic assent to the plans of the committee which waited on him, and the first meeting of the organizations called upon to participate was held in his office in the city hall. A call had been sent to every business, political, social, artistic, national, and religious organization in the city, explaining the purpose of the meeting and asking the appointment of delegates. The response was so unexpectedly large as to give assurance of the democracy of the undertaking from the very first.

The organization of committees was taken in hand at once. Among them, of course, the committees on finance, on production, organization and publicity, were the most important. On these committees and the others later appointed were persons, not only of every nationality, profession, trade, religion and social status, but from every ward and precinct of the city. With the idea of democracy continually in mind the executive organization took especial care that no section of the city, no group of people should be omitted from the ad-

ministrative committees, from the cast or from the financial campaign. In a democracy one pays for what one gets, and knows when one pays.

The productions committee was organized into sub-committees on book, music, cast, costumes, properties, dancing, lighting and wiring, stage management, stage setting, and auditorium. In every committee, care was exercised that everyone who had some talent to offer should have an opportunity to give of his best for the city. The chorus of 750 voices was gathered from German singing societies, church choirs, public and parochial schools; and any individual who applied, even though belonging to none of these, had his or her voice tested by the chorus director and was assigned to a place in the big chorus.

Cast cards were placed in every public library, in downtown department stores, at all the organization headquarters in public and parochial schools, in universities, in improvement associations and social clubs. These cards asked for the applicant's name, address, age, sex, height, weight, and whether or not, he or she, could ride a horse, swim, dance, sing or paddle a canoe. The cast was selected entirely on the basis of the answers to these questions, not in the least on social standing.

In the case of horsemen, social standing was even less considered, since they were chosen chiefly by the color and height and weight of their horses. As a result of this kind of selection, the Butcher Town Rough Riders secured the coveted honor of impersonating the "war demons."

To secure persons for the principal speaking parts, the cast committee inserted a request in the daily papers that men over six feet in height, having powerful voices, should meet at the City Club library on a certain afternoon. From those who appeared, the chief

actors for the men's parts were chosen.

There were in all nearly 7,500 actors in the Pageant and Masque. All were amateurs, and all animated by two sentiments. One was, of course, having a good time; the second, and the one which kept them to their work in rehearsals and the trying performances for motion pictures with a patience beyond anyone's expectation, was the desire to "do something for the city." The cast evidenced a loyalty and a helpfulness that turned into a pleasure the weary work of costuming 7,500 persons behind the scenes.

Outside the huge tents where they changed their costumes and on either side of the broad lagoon which separated the men's tents from the women's, are double rows of trees. Under the shade of these were the gathering-places of the different units, arranged in the order of their stage appearance. This shady place was called the "green room," and one of the sights never to be forgotten was the mingling of characters and costumes. Mound-builders, Spanish soldiers, priests, war demons, wild nature forces, fairies, elves and bishops, all went up and down, talking to each other in every language of the civilized world and making the acquaintance of peoples and types they had not known were in their city.

A group of Greeks who had not yet learned English appeared in their national costume. A group of Swedes endeared themselves to costume and property committees by their wonderful helpfulness. Daughters of the American Revolution were costumed as ladies attending a ball in honor of Lafayette. The North-Western Improvement Association and the City Club, between them with their wives and children, made the great procession of pioneers that moved across the stage with ox-carts and prairie schooners and dogs and horses in the long, last lights of the sunset.

And all these people know their city now as they never knew it before.

The costumes were made under the direction of the costume committee in an empty floor of one of the downtown office buildings. Into the making of these costumes went the devoted work of hundreds of volunteers. The Mothers' Clubs of the public schools did wonders in completing the enormous task. There were committees from half a dozen other women's clubs who gave an afternoon regularly each week, and all sorts of individual volunteers,—débütantes, matrons, school teachers, school girls and girls from the department store alteration rooms, gave their leisure time for weeks. Many of the properties were made in the manual training departments of the public schools.

A very important committee was, of course, the publicity committee. Publicity for social work is apparently a very difficult art. The publicity committee of the Pageant and Masque was composed of some of the ablest advertising and publicity agents in the city. They understood and cordially agreed with the idea of the executive committee that the purpose of the great production and not the production itself, was the important thing, the thing that must be brought home to the community. The Pageant and Masque was not given to advertise St. Louis but to bring the people of St. Louis to an understanding of their city's possibilities. What the publicity committee had to present, therefore, was an ideal,—which is much more difficult to work into advertising matter than a new breakfast food.

The committee feared, at first, that the symbolism was not going "to get

across," as they expressed it, and they took the rather reserved statements of artists and various sub-committees of the production committee and "hippodromed" them—successfully, to judge the pudding by the eating.

One of the branches of the publicity department was the lecture bureau. This was very ably conducted by one single woman and it is her pride that though there were often as many as four pageant speakers a night in different parts of the city, not one request for a talk on the pageant was unfilled. Naturally with all these speeches to be made the supply of professional speakers ran short, but volunteers, often from most unexpected quarters, did wonders at this sort of work. City salesmen from the great wholesale dry goods, hardware and other business houses made admirable speeches. In the public schools the larger boys and girls explained the Pageant and Masque to the children in the lower grades.

One thing every lecturer found: organizations expected to be appealed to for money. They were. But also, when they were asked to fill up the cast cards, and "come on in, the water's fine," many a tired business man, remembering that he had at one time been able to paddle a canoe, cheerfully agreed to come to all the rehearsals, wear a costume consisting chiefly of war paint, and do something for his city beside write a cheque.

The children in the public schools sold about one hundred and thirty thousand buttons, and they did it, each one of them, with a pride in doing something for the city.

Beside the lecture bureau, there was a writers' bureau. Everyone in the city who thought he or she could write something about the Pageant and Masque was asked to do it and many of the articles were placed with the newspapers in the small towns through the state.

Mississippi's Canoe Before Cahokia, "father of the mound Builders." Mississippi stands in the prow. The canoe is manned by River Spirits and bears the child—Little Saint Louis

The Mound Builders—"The earth, my children, bring hither the red earth, heap high this mound . . ."

Every one was asked to do something.

This is the sort of publicity that really reached the people outside the restricted districts to which social publicity is usually addressed whether it is an appeal for pure milk, or for the "city beautiful," or the drama league or votes for women.

One marvel of the production was the promptness with which the seven thousand five hundred actors came on the stage exactly on their cues. This means, of course, extraordinarily able stage management; but to one behind the scenes it was entirely evident that no forty or fifty men could have brought those amateur actors, some of them larking, of course, and all excited, into their places in the wings, tensely earnest, determined to do their very best. Nothing could have done this except devotion to the idea—"We can do this for the city."

The auditorium is probably deserving of all the superlatives that St. Louis people bestow upon it. Art Hill, as it is called, is a semi-circular amphitheater, crowned by the city Art Museum, and with a lagoon at its base. Just in front of the museum stands a heroic bronze equestrian statue of Saint Louis. Across the lagoon, the great stage was built, leaving about one hundred and thirty-five feet of water between the front of the stage and the bank behind which the seating began.

Quite unexpected was the discovery of the extraordinary acoustics of the amphitheatre. The voices of even single actors were heard distinctly at the top of the great hill and the chorus of 600 voices and brass band of 100 pieces added to the stupendous effect of the whole. The pageant began just before sunset; the masque ended with the new moon and a single planet swinging low in the sky.

On the sides of the hill 46,000 seats were erected and these occupied something less than a third of the space. Of these seats half were free and half were charged for, and the line between the

free and charged was drawn exactly down the middle of the hill from top to bottom. On one side of this aisle, the seats cost \$1.50 apiece, on the other side they were taken by the first comer. Whole family parties and neighborhood groups brought baskets and boxes of luncheon and dinner. It is said that after the first performance, the soda-pop factories put on a night force. Around the edges of the hill were the concession tents, mostly occupied by the devoted women who do this kind of chore for the various charities of the city—they sold ham sandwiches and ice cream cones by the hundred thousand.

Perhaps the crown of the whole marvelous performance was the magnificently ordered crowd. Few estimates of attendance at the four performances fall below half a million. Yet during the time there was not an arrest, not a serious accident. The ambulances came out and went home, empty. The police department detailed 235 men, including mounted men, captains, sergeants and drill masters, to handle the whole traffic problem, a problem of 3,000 automobiles, street-car terminals, the space behind the scenes, the concessions and the enormous audience.

In addition to the police there were several hundred boy scouts who acted as ushers and general assistants in information agent to the audience. The boys covered themselves with glory. They were courteous, quick and extremely scrupulous for their uniform's honor. But four times the number of police and boy scouts could not have handled that crowd. That crowd handled itself. St.

The people of Upper Louisiana making an agreement which puts them under the American flag.

Louis crowds are accustomed to self-government, and this was one more instance of what we call in St. Louis, the "democratization of administration of public recreational facilities." We are to talk now of the "efficiency of crowd control."

The Public Recreation Commission has intimate knowledge of this efficiency of a crowd to control itself after its experience at the great public swimming pool last summer. This was "still another manifestation of the community's sense of the beauty in ordered and restrained and discriminative and responsible freedom." There were in all four performances. It is perhaps typical of the smoothness and promptness of the whole control that the performance advertised to begin Thursday at 6:30 p. m. began at 6:29 p. m. After the great crowd slowly and reluctantly left the hillside on Thursday night, the success of the pageant was assured. If anything was needed to prove it, it was the rain on Friday night. What would have discouraged any other performance was a triumph here. The audience sat, at least 30,000 of them, through two hard showers and waited, soaked through and dripping, for the performance to begin.

When the actors behind the scenes saw what "good sports" their fellow citizens on the hill were, they insisted on going on and proving their own sporting blood. The bond of fellowship was almost tangible. One seventeen year old actor with his costume of paint streaked from shoulder to heel by the rain, grinned out from the wings at the au-

dience who looked "like a lot of trained and happy seals," and said, "Ain't the old town great!" Two scenes were given, each side determined to prove to the other their good faith. Then considerations of health compelled the management to send actors and audience home.

As for the final effect of these wonderful performances on this wonderful audience, I cannot do better than quote from William Marion Reedy's report in the *Mirror*:

"There were thousands of actors on the stage and amid beautiful scenic ef-

fects. And in the silver-washed dusk, companioned by a brilliant star, the crescent moon like a lantern hung and moving slowly down the purpling night disappeared with the final scene.

"There was a sense of beauty in power and power in beauty through it all. All the city was there. It was a great demonstration of democracy's idealism, of its passion for art that it could understand, of its love for its home town, its past, its future. Here was civic art in colossal splendor. Poetry, music, sculpture, acting, combined their effects and fused into an incalculably effective expression of fraternalism and solidarity of aspiration and purpose. . . .

"And there passed from the stage to the assemblage on the hill a vibration as of the awe in joy that comes when we apprehended the beautiful sublime in any form.

"The city pulsates yet with the passion the performance evoked. The Pageant and Masque influenced the great assemblage on four evenings—100,000 people at a time . . . and the enthusiasm still burns in the casual conversation of groups of people everywhere.

"There is a St. Louis spirit, and a fine one, evident on every hand. It is as something of the pride that must come to people who have won a great victory, and the joy is omnipresent that the city did grandly and beautifully a grand and beautiful thing."

The New Health¹

By Edward T. Devine

WHY new? The new Nationalism of Roosevelt we understand, for political ideals are created by the irresistible sweep of economic and political events. The new Freedom of Woodrow Wilson we grant, for freedom is not negative or absolute, but is conquered affirmatively piece by piece in every generation. To the new History of James Harvey Robinson we take no exception, for that signifies a deeper insight into relevant and useful facts which illustrate important historical truth, instead of a bare chronicle of irrelevant facts.

The next or new Religion of Zangwill need not seriously offend us even though the Lord Chamberlain forbid its production in England and we ourselves politely ask for title deeds, for we remember the prophecy of Lessing's Wise Man, as he interpreted to Saladin the legend of the magic ring, symbol of religion, that after a thousand thousand years, our children's children's children may stand before a juster judge with evidences that the ring's power to make men love us has some objective meaning, and is not all used up in the process of making us duly appreciate our insignificant selves.

But, again, why the new Health? One answer might be that some of the dangers to which the public health is subjected are of our own and our fathers' making, such as industrial accidents and diseases; that some of the resources by which these dangers are to be met, such as accident compensation and safeguard against disease, are not yet fully utilized; and that in these ways, even though our individualistic philosophy remained unchanged, our health problem might be conceived as new.

But there is a deeper sense in which we are justified in speaking of the new Health. There is a corner for us to turn just now sharply for a new view in striking contrast with that which has been the current point of view. The new Health at this moment awaits the adequate formulation and the general acceptance of a health ideal.

The ancient Jews had such an ideal; consonant with their religion and economic order: a health ideal to be attained by the observance of minute sanitary regulations, by abstinence from unclean foods, by purifications and atonements, and by racial integrity. He who was negligent in observing the health regulations was an "abomination unto

the Lord"—and he is so still.

The ancient Greeks also had a sharply defined and universally accepted though a different ideal: to be sought through gymnastic and music, through harmony of life, through moderation and measure, through sanity of mind and discipline of body; a health ideal demanding self-denial and lofty intelligence and freedom from manual toil: an ideal fit for a non-commercial, non-industrial society of thinkers, poets, athletes, slave-owners and philosophers, not, perhaps, for industrial workers or housewives.

Plato taught that a gentleman should be ashamed to go away from home either for his physic, or for his law-abidingness. Save for a frost bite or a sunstroke or a wound, no man who understood and practiced personal hygiene should need to seek the advice of a physician any more than a self-respecting citizen would ordinarily need the advice of a lawyer. To call in a doctor merely because, through self-indulgence or neglect of the plain rules of health, one has become a premature valetudinarian, is nothing less than an insult to the noble sons of Asclepius.

Now we are the heirs of Jew and Greek. Both Leviticus and the Republic lie open before us: the one read constantly in church and synagogue, the other taught in every college class in literature and in politics. But health ideals of the ancient times, like their ethical and political ideals, no longer suffice. No attempt of Puritan or classicist or of any type of medical insurgent will make them live again as dominant ideals, however devoutly or sincerely we may pay them intellectual tribute. They do not express our feelings. They do not match our instincts. They do not meet our corporate needs.

Have we then a health ideal of our own, corresponding to our needs, instincts and feelings? If not, and it is in the making, how shall we recognize it when it comes? What are the earmarks of any ideal which is to make effective appeal to prosperous western twentieth century communities?

I fear that we must as yet answer our first question negatively. What comes into our minds—as yet—when we speak of health campaigns is not the beauty of perfect health, scarcely anything comparable to the harmony of the Greeks or the cleanliness of the Jew.

What is it that we think of when we hear the magic words—a health campaign? Nothing in the world surely, but of such things as the swatting of flies; the injunction that spitting is a filthy

habit and may lead to fine and imprisonment; the inspection and condemnation of dirty or adulterated milk, of tainted meat and rotten fruit and contaminated water; the replacement of privy vaults and cesspools by sewers; the application of silver nitrate to newly opened baby eyes; the exposure and prosecution of medical quacks; the careful measuring, to the fraction of an inch, of tenement flats, to find out whether they are so small, so dark, so insecure, so unfit for human habitation that the law officially sanctions the filling of a technical "violation." These are all excellent things. We are in favor of them. We have helped before now to create committees to educate the public as to their necessity. But add them all together and extend the series to include milk stations, and medical inspection, and tuberculosis dispensaries, and compulsory notification of diseases, and model tenements, playgrounds, summer outings, Bulgarian tablets for the souring of milk and a eugenic marriage law, and you have not yet so much as laid the foundations for the new Health; for these foundations must be laid upon the solid basis of morals and ideals.

If these varied institutions and activities and discoveries are genuine expressions of a social ideal, an ideal of healthy life, of vital health, they are cause for congratulation. If they are accidental, imported notions, popular whims, superficial fads, foolishly held as panaceas, they may be no better than any other quackeries.

We are still without a clear health philosophy however ready we are to listen to health arguments. Reformers still assume that we are most easily influenced by disease bogies. We are still naïvely conscious of our new vital statistics. We are not far removed from the pathological monstrosities by which the schools were at first made to try to inculcate temperance principles. They are gone or going, and we are now deluging the public with somewhat more artistic but still hair-raising exhibitions, including moving pictures, in which the warning note, the inspiring of alarm, the invidious comparison, persist respectively, as the prevailing note, inspiration and comparison.

Such arguments and appeals have their place, but they are indeed a poor and scant expression, an inadequate expression of the modern social spirit. They arouse our individual fears, our instincts for self-preservation and for the safety of our next of kin. What they do not express is our enthusiasm

¹An address given before the twelfth biennial of the General Federation of Women's Clubs at Chicago, June 15.

for a society of healthy, vigorous, self-reliant and yet mutually interdependent fellow citizens.

Our corporate feeling that the public health concerns us is a simple, indivisible direct sentiment. If Sing Sing prison breeds tuberculosis so that a sentence to states prison is in effect—and is known to be—a sentence to tuberculosis, we get angry about it by a very simple and direct reaction. If children are delinquent because of neglected physical defects it arouses our indignation. If families cannot be re-established because of the lack of some essential medical agency, we insist that this is incompatible with the civilization of such a community as ours.

We are coming to care about the death-rate, about the average vigor, effective length of the working life, the content of the community life expressed in pleasure, in material well-being and in standards of living, not because we are making some sort of elaborate calculation as to how these things will inure to our individual personal benefit, but because there is a satisfaction in the very fact of having been born in a community in which there is health, in living to contribute to its increase, and dying in the knowledge that later generations will enter into a richer heritage of health than fell to ourselves. To attempt to translate this passion for the public health into some form of personal advantage is to miss its character.

Calvin's reputed willingness to be damned for the glory of God has its frequent analogy in the sacrifice of personal health for the advancement of the common welfare. Physicians and nurses, sanitarians, and inspectors do work themselves literally to death in order that epidemics may be controlled and necessary health measures brought into effect. There is no paradox here, except from an obsolete individualistic point of view.

The liberty for which socially minded men and women care most is precisely the liberty to serve to the utmost, with no careful measurement of reward, no certainty of livelihood, no personal immunity even from the very evils which they would exterminate from among men. In this spirit men have fought valiantly for religion, for education, for political liberty, for democracy, for many a great cause which they have instinctively, directly, and unqualifiedly identified with the common welfare.

The new Health, as a social ideal, signifies that in our day, because of our new knowledge, our new science of sanitation, our new conscience, our new spirit of brotherhood, our new democracy, our new social intimacy of understanding, we are coming to feel about the public health as our fathers have felt about religion, education, liberty, and nationality. We are to feel

that health is fundamental and inalienable, that it imposes sacred obligations, calls us to willing service, becomes the object of our constant concern, makes us ashamed of inefficiency, stupidity, and graft, because they mean disease, raises us to a new level of brotherhood, of citizenship, of sonship to a common Father, and of joint parental responsibility to the heritors of a racial stock whose full inheritance consists, not merely of the germ plasm of a fortuitous set of parents, but of all that we jointly bestow upon their generation.

The emphasis then will be not upon disease, but upon health; not upon pathology, but upon hygiene; not upon germs or germicides, but upon life and vigor; not upon the shady side, but upon the sunny side; not upon weaknesses and abnormalities, but upon work and play, healthy activities and pleasurable functions. Thus the new health will represent a positive way of looking at life, not a series of subtractions of pains and terrors. We shall think of ourselves as conquering new territory in order that we may go up and enjoy it; not as entrenching ourselves to ward off formidable and unconquerable foes.

FOR the realization of the conception of the new health, certain preliminary revolutionary developments were essential. It was necessary to escape from the ever constant menace of poverty, of economic deficit, with which the ancient Jew in spite of Solomon's magnificence—perhaps in part the cause of it—was ever familiar, of which the Athenian, as well as his kinsmen in Sparta was ever conscious in spite of his poetry and philosophy as we well know from both.

It was necessary for capital to accumulate, for invention to invade the mechanical arts, for labor to become efficient, for transportation facilities to become facile and to enmesh the globe, magically transforming commerce, industry and agriculture. It was necessary that in such ways society should come to a conception of a social surplus, come to a conception of it by seeing its evidences plainly in warehouses, on the rails and at sea, in the fertile fields, in the vaults of banks, in the stores and shops, in university and museum and library and park, but most of all in every home, on the tables of the people, in bath-room and lighting system, in every convenience and comfort which lightens toil or strain and adds to the span of human life.

It was necessary for society thus to pass from an age of deficit into an age of surplus, from what Professor Patten in his famous praise calls a "pain economy," to a pleasure economy. Because of the enormous progress of the nineteenth century it is quite possible for the twentieth century in our modern western communities at any rate to main-

tain for the first time in the history of the race, not merely in a favored class but in all classes, a standard of living consistent with a decent respect for the opinions—the enlightened opinions of mankind.

This is the corner-stone of our new health policy; a higher standard of living through more efficient industry and more fruitful commerce.

But greater wealth of material things is not enough. There was essential, in the second place, political democracy, a utilitarian doctrine that each must count for one and that the happiness of all men was of equal importance. A military despotism might have its achievements in public health. I do not forget Cuba under military occupation or the Panama Canal zone; and I have seen great things accomplished by similar means in emergencies in San Francisco, and in Dayton. But the new Health of a national ideal can never be achieved or held by despotism, however benevolent. It rests upon public education and common consent. The individual who endangers others must indeed be controlled and the expert must be trusted; but always upon a democratic basis, subject to recall, tested by reasonable tests, justifying himself before a critical and informed public opinion.

One thing more was essential besides economic progress and democratic equality. There was essential a sense of social solidarity, of mutual responsibility, of the reality that society is one, that men are brethren, that we are members one of another, that squalor, misery, crime, injustice, ignorance and disease are literally and actually matters of common concern. I have fallen into the old manner of speech. Let us say rather that prosperity, justice, health, material and spiritual well-being, are matters of common concern.

There is some danger of misinterpreting this doctrine to the destruction of self-reliance, and the exaltation of petty and unnecessary interference with the affairs of our neighbors. I believe in the doctrine of personal responsibility and in that of social responsibility and I hold that they are not incompatible.

It has been held in the past that the first factor in the conservation of health was the practice of the family physician. Perhaps the time may come when by the removal of social and industrial obstacles to good health this can yet be held to be sound doctrine. I have no sympathy with medical insurgency, though I must admit that medical standpointism is even more obnoxious. There is no other leadership which the layman may safely accept than that of public-spirited medical men.

Candor compels us, as things are, however, on very different grounds to question the degree of the responsibility of the physician; to recognize that it

is unreasonable to hold medical practice responsible for a death-rate due to the strain of an industry, to the defects of a dwelling, to the neglect of a government, to the ignorance of mothers, to an unsocialized school system, or to any other conditions which can be changed only by the concerted action of many forces outside the medical profession, although not without their co-operation.

THE new Health demands at least these seventeen things, none of which are exclusively medical—most of them not medical at all:

1. The total abolition of child labor, for pay. One expeditious way of contributing to this end is by the passage of the Palmer-Owen bill now pending in Congress, which will put the stamp of the nation's disapproval upon the least excusable of the destructive forces menacing the health, morals and education of the rising generation.

2. The abolition of night work for women and the abolition—or the reform—of all occupations physically injurious to women.

3. The adaptation to the physiological needs of women of those industries in which women and girls are engaged.

4. A mitigation of the muscular and nervous strain of speeding and overwork for children, women and men.

5. A lessening of the no less serious, although very different strain of anxiety and distress due to unemployment, uncertainty and irregularity of employment, and underpaid employment.

6. The prevention of congestion of population in various ways—among others by the taxation of unearned increment, accompanied by the strict regulation of the height of buildings, open spaces and room over-crowding.

7. The prevention of alcoholism, by means analogous to those now so effective in the prevention of tuberculosis.

8. The segregation of the feeble-minded and the adequate treatment and care of the abnormal and helplessly subnormal in the population.

9. The more vigorous control of food, milk, and water infections by federal and local health authorities, who however shall be asked to say just as little about the anatomical and biological details of their operations as is consistent with the necessary public co-operation. This involves, of course, a strict enforcement of the federal food and drugs act, and it may well be supplemented by popular education in the principles of dietetics.

10. The development of the system of physical inspection of school children to become a rational program for developing soundness of body and that soundness of mind which only bodily health can insure. Gulick and Ayres inform us that the sudden recognition of the imperative necessity of safe-guarding the physical welfare of school children grew

out of the discovery that compulsory education under modern city conditions meant compulsory disease. The farther away we can get from the particular policies founded upon this discovery, and the nearer we can get to the idea that medical inspection, open air schools, special classes for handicapped children, school sanitation and sanitary architecture are all integral features of a rational educational system the more we shall approximate to the ideal of the new health as it affects school children.

11. A great increase in public recreational facilities, in rural communities as well as in cities.

12. A more accurate and complete registration of births and deaths; persistent extension of the registration area looking eventually to a complete, continuously corrected registration of the whole population.

13. A hastening of the too gradual process by which the marine hospital service has been transformed in part and is yet to be transformed completely into a federal public health service.

14. The development of a vigorous health service in the several states, such as the past years have witnessed in my own state of New York.

15. A more generous recognition and protection and control of the practice of midwifery and the teaching of midwives.

16. A more careful supervision of marriage, if not immediately by legal compulsion, at least by voluntary submission of health certificates and the creation of a public opinion as to the baseness of corrupting the marriage relation by making it the channel of communicating vile disease to innocent husbands, wives or children.

17. The instruction of mothers in the care of infants before and after birth, securing for this purpose the co-operation of the whole body of physicians, midwives and nurses, not despising grandmothers, mothers-in-law and neighbors when they have experience and practical common-sense, which they are willing to subordinate to professional instruction and when necessary to authoritative control.

Every organized social movement has its health aspects even if not directly aimed at disease. The tuberculosis movement is of all these most widely extended, the most vigorously pressed, the most rationally related to government, most clearly exhibiting the possibilities of co-operation between physicians of every school and social workers of every sort. Similar if less extensive campaigns are in progress against insanity, feeble-mindedness, epilepsy, infant mortality and the venereal diseases.

These health movements have also their moral, economic, sanitary and civic features, which amply justify the participation of others than doctors. The housing movement, the town-planning movement, the child labor movement, the

playground movement, the recreation movement, the minimum wage movement, the movement for the exclusion of physically unfit immigrants, the country life movement, organized charity, prison reform, probation and juvenile protection, the protection of women in industry and above all the labor movement and the movement for the emancipation of women, in all their multitudinous forms, are not, it is true, primarily health movements, yet every one gains a large part of its appeal from the recognition of its bearing on the public health; and nearly every one loses a part of the appeal which it might make by failing to appreciate that relation.

THE prime characteristic of the new Health is that it is social, not self-centered; to be won all together by corporate effort; to be enjoyed contemporaneously by brain workers, and capital workers and manual workers; to be built up by positive additions from patient science, from mutual co-operation; from many a happy accident, intelligently appropriated; from rational eugenic policies; from equally rational social work directed towards environmental reforms; from wise decisions by learned courts; from laws enacted in the public interest; from rising standards in the practice of medicine and rising standards of living of the people; from social insurance against sickness; from increased prosperity, higher incomes, the more equitable distribution and the more rational use of wealth.

The new Health is thus an index of our civilization, a composite result of all our well-being and a tremendous asset for the advancement of that well-being.

Health is economic. Sound men cannot be exploited; and for that reason, if for no other, I greet with enthusiasm the advent of the new Health.

Health is moral. Sound men will not be unjust and for that reason I salute the era of the new Health.

Health is civic. Sound men will eliminate poverty and that of itself should make us all sanitarians. Sound men will learn to do without jails, recognizing that so-called criminals are properly speaking candidates either for educational reformatory or for a custodial hospital, and therefore again I turn gladly towards the dawn of the new Health. Sound men, speaking generically of course, male and female, will rise at last above the tragedies of the sex relation—the age long sin and shame of it, the misunderstanding and abuse of it—will learn that friendship, companionship, comradeship are incompatible with lust.

And on this high ground, for this greatest of all its victories—the victory over vice in every repulsive or seductive form—I multiply hosannas to the great cause—the cause of the new Health—the Health in which there is no shadow of turning.

JACOB Riis wrote wonderful letters—full of gaiety and humor and the philosophy of life. And he never spared himself in writing. Often because of the drain on his strength, he was urged not to handle them all, but he used to clear his desk every day. In recent years Mrs. Riis answered many for him, but what remained made up a heavy mail.

Courage, practical suggestion, enthusiasm—whether to a group of college boys, or a civic league in some out-of-the-way village, or a railroad president with a social outlook—these were the things he sent unfailingly.

At a memorial service in Plymouth Church last month, Mr. Riis's son told of a young immigrant who had written asking for funds with which to get to the Middle West. He was stranded at the seaboard. Mr. Riis put it up to him to walk; it was summer and he was young. The lad wrote back in anger, saying he saw what stuff philanthropists are made of, only to get an inimitable letter from Mr. Riis telling of his own experiences when he himself was an American in the making.

He did not give offense; he did not take it. He entered into the boy's scheme of life, and let the youth enter—wide—into that of his own. Whether the young man walked or not is no matter; he got west, working his way and carrying with him a new vision. Two years later a letter came from him to Richmond Hill telling of his success in one of the prairie states, and thanking his fellow Dane for the biggest help that ever man gave to man.

One of the men present at this Brooklyn meeting was an editor of standing who had been stirred by *The Making of an American* when he was living in one of the cheap lodging-houses of Paris.

AMONG readers of *THE SURVEY* there must be scores who know unwritten stories of the man Riis. There must be scores who cherish letters that breathe his spirit, like that precious package which Mrs. Bacon tells of in "Beauty for Ashes" and which—the household well understood—was to be saved next after the babies should the house catch fire. An effort is to be made to collect such letters and to draw out such fragmentary evidences of Mr. Riis's social evangelism as may be fitted by friendly hands into the mosaic of a book. Will readers of *THE SURVEY* join in sending letters and experiences to Mrs. Riis, Pine Brook Farm, Barre, Mass.?

In a message to a friend recently Mrs. Riis spoke of the glow Mr. Riis left around the heart

of everyone who knew him; and she added:

"Surely the candle he lighted must burn always, until it lights the darkness in uncounted lives to come. There was something so shining about him. He was good, but he was more than good,—radiantly, gloriously good, and so adorably human always. He used to laugh at me when I told him what he was, but I am so glad now I did tell him, and that his nearness did not blind me to his soul."

AN Act has passed Congress which provides a means for extending medical and surgical relief at sea to American deep-sea fishermen. The urgent need for such provisions was pointed out in an article in *THE SURVEY*, November, 1911, and a description was given of the relief to deep-sea fishermen provided by countries which take more thought of the sea-faring man than we do.

Congress was urged to provide a hospital schooner under the United States Public Health Service, and bills for this purpose were introduced in the House of Representatives by Hon. A. P. Gardner, and in the Senate by Hon. Henry Cabot Lodge. The committee on merchant marine and fisheries, composed largely of congressmen from inland states, did not report Mr. Gardner's bill, however, and it seemed best to make a demonstration of the need for such work and the practicability of the plan suggested by having a revenue cutter detailed for this purpose, with surgeons and nurses of the Public Health Service in charge of the work of relief.

The act which has just been passed provides that "any revenue cutter now or hereafter in commission may be used to extend medical and surgical aid to the crews of American vessels engaged in the deep-sea fisheries under such regulations as the Secretary of the Treasury may prescribe.

The captain and surgeon assigned to this duty have an excellent opportunity of showing that the resources of modern medicine and surgery can be successfully taken to sea, and that lives can be saved and permanent disability prevented.

The Public Health Service, under the name of the Marine Hospital Service, by which it was known for more than a century, has been the traditional friend of the American seaman. The duties of this service have been so widely extended that it has become in effect a national board of health; but the uniforms and stationery of the service still bear the fouled anchor—symbol of the sailor in distress.

THE BILL OF RIGHTS

GEORGE W. ALGER

Author of *The Old Law and the New Order*

THE Commission on Industrial Relations is acting wisely in making careful inquiries as it goes along in the examination of recent industrial disturbances, to see to what extent, if any, the law is being violated by executive and police officers and by the courts, in denying to strikers the fundamental protection of the Bill of Rights.

Our constitutions, both state and national, of course, guarantee to everyone freedom of speech, the right of assembly, the right to the writ of habeas corpus, freedom of the press, and the like, all of which are ancient liberties of the English people, considered by our forefathers absolutely essential to an American democracy. In all the recent industrial disturbances, including those in Lawrence, in West Virginia, in Paterson, in Colorado, things have been done which, as given in the press at the time, would indicate that the Bill of Rights, which includes all these constitutional liberties to which I have referred, was not considered "practical." No conservative public opinion has as yet been aroused, since these violations (if they have been such) of the Bill of Rights have applied only to discontented poor people in the course of industrial disturbances. Most of the court decisions by which these constitutional rights seem to have been denied have been made by judges in petty courts, whose judicial opinions as such are quite negligible from the standpoint of the law but far from negligible from the standpoint of the working people affected by them.

Take, for example, the Paterson decision by the local magistrate in the Scott case. If it had been affirmed in the Supreme Court of New Jersey, the liberty of the press would have been a dead letter in New Jersey. Similar decisions have been made by the police courts in Massachusetts and in New York state on other branches of the Bill of Rights.

These decisions and the action of local executive and police officers, through which these decisions arise, all seem to come from an idea that the Bill of Rights is not practical, in its application at least, to this large class of foreigners who form the striking masses in a majority of these industrial disputes. Colorado has apparently decided in a number of cases that the Bill of Rights is not practical, and outrages upon those rights have been so frequent, if one may judge by recent magazine articles, as to arouse the question whether, so far as the working class is concerned, a republican form of government exists in that state. West Virginia, through its governor, established a military tribunal in defiance of a constitution which clearly declares that no such tribunal should ever be established in the state, and this tribunal denies the writ of habeas corpus in defiance of a constitution which expressly forbids that it should ever be denied. The practical executive saw that action was necessary to re-establish order, and, having reached that conclusion, he concluded that it was advis-

able to suspend the constitution so far as the striking miners were concerned, and the highest court of West Virginia sustained him in what he did.

As conservative an authority as ex-Chief Justice Cullen, of our Court of Appeals, has characterized these decisions in language which a judge rarely uses concerning decisions of the highest court of another state. He declared in an address before the New York State Bar Association in January of this year:

"These decisions exalt the military power beyond any height hitherto known in this country. They assert the power of the military at the uncontrolled discretion of a single man to dispose of the life and liberty of any person within the state, not by way of detention till the termination of an insurrection nor where life is taken in the actual clash of arms, but purely as a punishment for acts which may not be offenses at all by the law, or, if offenses, subject to slight penalties."

If the Commission on Industrial Relations can so far assist us by getting us the actual facts, so that we may judge whether in its fundamentals the Bill of Rights is being disregarded in its application to strikers in industrial disputes, it will aid a conservative body of opinion to crystallize itself and make its influence felt.

It is a true conservatism to regard the Bill of Rights as something fundamental, as belonging to all of us, which cannot exist at all if it is denied to one class and preserved only to a more prosperous class which economically needs it least. There are many of us who have no sympathy whatever with the class of agitators who are today shouting for free speech, believing them to be insincere and lawless in their purposes. The mere fact that we do not sympathize with them is no reason why we should permit any of the fundamental guarantees of citizenship in America to be undermined or destroyed.

The Bill of Rights cost a great deal of blood; it was a thing which our forefathers fought for; it cannot become out of date and impractical unless we agree to its destruction by indirect attack. All the questions which relate to the Bill of Rights in recent times have, of course, arisen in connection with one class only,—working people, mostly foreigners, suffering from economic pressure and distress on American soil. Unless we are agreed that it is possible to Mexicanize America by having a constitution which is a name rather than a reality to a peon class, we must take sides in favor of the Bill of Rights when its protection is denied to any class under any conditions.

It is to be hoped that the Commission on Industrial Relations will throughout its investigations bear the Bill of Rights clearly in mind and will be able to report to us as a people the extent, if any, to which that charter of liberties has been nullified or overruled or cast aside during the industrial disputes of recent years. No part of its work can be of any greater value, as I see it, than this. It is to be hoped that that work will be done thoroughly and impartially.

WHEN THE SHIP GOES DOWN

[Continued from page 363.]

dress in death cases. Under our present federal law the old common law rule that an action dies with the person, still obtains, and it is only by applying the state or foreign law that our admiralty courts can take jurisdiction of an action for damages for death at sea.

3. An amendment of the Harter act decreasing the owner's exemption from liability for cargo loss.

4. The extension of the federal employers' liability laws or future interstate railroad workmen's compensation laws to seamen on vessels in foreign, lake, coastwise and inland river trade.

These extensions of the owner's liability besides doing justice to passengers, shippers and crew, would in all probability have an important indirect effect in preventing accidents at sea. Until a short time ago we were taught to believe that transportation on the water was comparatively safe compared with transportation on land. Lately a large number of serious accidents involving great loss of life, have impressed upon us that there is much to be done to increase safety at sea.

Considerable attention has been devoted to the problem of increasing safety by governmental regulations respecting the construction, equipment and operation of vessels. Senator La Follette's bill, directed particularly to improving the condition and efficiency of seamen, has been passed by the Senate and is pending in the House. The London Conference has prepared a code of rules which are recommended to maritime countries for adoption. The House committee on Merchant Marine has introduced a bill based on this code.

No consideration seems to have been given, however, to the possibility of contributing to this safety movement by increasing the owner's financial responsibility for accidents when they occur.

The movement for prevention has been tremendously advanced by the employer's realization of the economic advantage to him of prevention and the economic cost of accidents. It is not probable that increased liability on the part of the ship-owners will result in increased efforts on their part to devise ways and means of preventing losses? However effective governmental regulation may be, it cannot be so successful as the concerted efforts of the owners to conserve their own property.

No one accuses the owners of deliberate carelessness in exposing the traveling public to unnecessary danger, but there is good reason to believe that the owner's active and positive attention to the safety of his passengers will increase in proportion to increases of his financial liability for the damages suffered by them in case of accident.

The Telephone Emergency

THE stoutest telephone line cannot stand against such a storm as that which swept the Middle Atlantic coast early in the year. Poles were broken off like wooden toothpicks, and wires were left useless in a tangled skein.

It cost the telephone company over a million dollars to repair that damage, an item to be remembered when we talk about how cheaply telephone service may be given.

More than half of the wire mileage of the Bell System is underground out of the way of storms. The expense of underground conduits and cables is warranted for the important trunk lines with numerous wires and for the lines in the congested districts which serve a large number of people.

But for the suburban and rural lines reaching a scattered population and doing a small business in a large area, it is impracticable to dig trenches, build conduits and lay cables in order that each individual wire may be underground.

More important is the problem of service. Overhead wires are necessary for talking a very long distance. It is impossible to talk more than a limited distance underground, although Bell engineers are making a world's record for underground communication.

Parallel to the underground there must also be overhead wires for the long haul, in order that the Bell System may give service universally between distant parts of the country.

"BEAUTY FOR ASHES"

[Continued from page 371.]

Those stories about the impractical club women must have been started years ago, in the first callow beginnings of women's clubs, I thought, and said as much to a neighbor. She was an Indianapolis woman, and for answer she handed me a register of the Indianapolis Woman's Club beginning with 1875.

Glancing through it with curious interest I found that the first topic on its first program was: "In order to be good housekeepers, is it necessary to devote one's entire time to the work?" Its second program took up Woman's Relation to Man. By '76 they were studying banking systems, and had a lecture from Mary Livermore on Superfluous Women. Their programs went on, taking up history, philosophy, literature, religion and architecture, till '79 brought them to the consideration of Legislation on Public Order and Municipal Government and The Kindergarten Theory. Free Trade and The Charities of Today followed. In 1889 Service came into the club thought with Boshop Faber's words, "The great fact is, that life is a service; the only question is, whom will we serve."

In '92 Out-Door Relief and The Children of Our State were considered. I closed the book with deep thoughts of those women of an earlier day. And now my neighbor, seeing the impression made upon me by this review, pressed upon me a fat volume of the history of the General Federation of Women's Clubs. It was overwhelming. It is a big thought, that of the 16,000 in our Indiana federation. But to think of one million club women, doing, thinking, working out all the things their programs designate! It is stupendous. I looked again, with new interest, at our leaders on the platform, who were prominent in this giant organization and wondered about all the grist its great wheels were turning to grind. Then my thoughts came back to our own organization.

Enlisting the Federation

Any one who strayed into that convention hall would have had to listen attentively to discover whether it was a child labor meeting, a conservation conference, or a congress of mothers. In fact, it was the vital forces of all these interests federated. It seemed therefore perfectly fitting to me and to them that, after I had told them the story of the defeat of the tenement law that year, I should propose as their slogan "the homes of Indiana," and that they should accept it and pledge the whole federation to housing reform. I asked it of them, "because whatever is a menace to the poorest home is a menace to our own; for the sake of all who live in mansions, cottages, farm houses, tene-

We Believe—

- THAT home-making should be regarded as a profession.
- THAT right living should be the fourth "R" in education.
- THAT health is the business of the individual, illness of the physician.
- THAT the spending of money is as important as the earning of the money.
- THAT the upbringing of children demands more study than the raising of chickens.
- THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics

If you agree, send for the 100-page illustrated handbook, "The Profession of Home-Making," giving details of home-study, domestic science courses, etc. It's FREE. Address postal or note, —A. S. H. E., 519 W. 69th St., Chicago, Ill.

ments, or hovels; that all the 'homes of Indiana' may be safeguarded."

Not only did the federation take up housing reform as a whole body, but it created a housing committee and made me its chairman. It became my part, thereafter, to explain the need and nature of housing reform to the clubs of the state; and so up and down, from the Ohio to the Great Lakes I went, and back and forth across our state, telling the story of "the homes of Indiana." They needed no urging, these women of the federation, to make them take up the cause of those other women who had no voice, who were too weak and ignorant to plead for themselves, or to know how to better their conditions.

Before I started off on a tour I went again to the homes of the poor, to burn within my mind a more vivid image of their wretchedness, to get the figures of their enormous rentals, and to rouse afresh the anger that blazed within me, that I might kindle it in others.

On many of my trips I had the company of the president of the federation, as her duties called her to many of the meetings. First, this was Mrs. Clarke, and later, Mrs. Felix T. McWhirter, wife of an Indianapolis banker and one of the noblest christian women in our state. Both entered heartily into my work, and gave it emphasis before the federation in every possible way.

In such company I soon saw what it meant to be president of our federation, and enjoyed their honors with them. I must say that the care taken of us has spoiled me for the ordinary lecture field, with its uncertainties. In the larger cities a limousine was waiting for us at the station, and the club woman who had the most palatial home took the duties of our hostess. There were club luncheons and dinners, the mere memory of which will refresh any famishing desert that life may hold for me. At the smaller towns we were met by an auto or, in some places, a sleek country horse and carriage, that conveyed us to the softest bed, the most bountiful fare, and the warmest hearts that could be found. From club to club we went, from home to home.

Sympathetic Response

It was most interesting to study the different groups of women, and to see what their club life meant to them. It meant occupation and new interests to the women of leisure. It meant rest and refreshing of energy to the busy women. The most noticeable result of all was in the spirit of the women—a spirit of optimism and achievement, of ever renewed and vigorous purpose, which I believe does more to counteract age and illness than any force of the age, except religion. But the greatest thing was not the spirit, nor the work. "It is the women themselves, after all," as Mrs. Clarke said.

WILSON'S OUTSIDE VENETIANS

For Windows and Piazzas

Artistic Combination of Blind and Awning for town and country houses. More durable and slightly than fabric awnings. Very easily operated; slats open and close to admit air yet exclude sun rays; can be pulled up out of sight if desired; provides much summer comfort. Adds architectural distinction to the house.

For illustrated booklet specify "Venetian A-4"

WILSON'S ROLLING PARTITIONS

Made to Roll Overhead or from Side.

Most effective method for dividing large rooms in Churches and Buildings into small rooms, and vice versa; made from various kinds of wood; sound proof and air tight; easily operated and lasting. MAIL ORDERS GIVEN
PROMPT ATTENTION

It was inspiring to see how instantly they took up the thought I was trying to bring to them. And if they had been organized only for the purposes of self-improvement, they would not have felt their responsibility so keenly.

It was a sad business, though, to go about the state, thrusting thorns into tender hearts. "No one looks at me without thinking of slums," I told them, "and I almost feel as if my name were Bill, from the constant references to it." I envied the lecturers who could talk all the time about pretty things. I hated the reek and ruin of the slums more than ever. But the truth had to be told. And what a harvest I was reaping! And here was such an opportunity. I might never see this audience again. They *must* know and care.

There is something weird about the effect of turning over to one's subconscious mind the responsibility for a speech, and hearing one's own voice (sounding strangely far off) go on and on, saying things that both entertain and surprise one. And, at the close, to have a friend say "That's the best speech you ever made," gives food for thought.

When I had to pinch my arms to keep alert and had a strong desire to lay my head on the pulpit pillow (when I spoke in churches) I knew the danger line was near. In one city where I stopped at a hotel, after meetings, discussions, conferences, luncheons, callers, and reporters, I went to the hotel desk to give my key to the clerk. His amazed smile made me aware that I had given him my watch, which was in my other hand.

At the end of one tour an invitation was brought to me from the Chamber of Commerce of South Bend to come over next day and speak. Miss Rein, who had charge of the charities there, met me and went with me to the Oliver. Waiting in the parlors with her for the committee of men who were to receive me, I remember trying in vain to write a few notes for my talk, and controlling an almost overwhelming desire to stretch out upon the green velvet davenport for a little nap. But I roused to speak to the committee, and later the snow in my face set my blood a-tingle. A good audience of civic and charity workers awaited me, as well as many members of the Chamber of Commerce. And there was my friend, Judge Howard, president of the Chamber of Commerce, ready to help and encourage. That meeting was worth the whole trip, for, as a result, the board of directors of the Chamber pledged the body to the state housing movement.

And the Legislature was coming nearer and nearer.

I looked across the year, that stretched like a great circle of a race track before me, to January, 1913, and dreaded it.

THE SURVEY

THE SAFE FOURTH

Early returns indicate that the Safe and Sane Fourth has gained this year its best records. Later returns always show more deaths, when all the figures for local jaw are in. But for July 5 in each year, the figures are:

	Deaths	Injuries
1914	10	867
1913	25	1032
1912	25	1043
1911	39	1358
1910	44	2485
1905	59	3169
1900	59	2767

Last year 394 cities celebrated sanely. The figures for this year are not yet in. The Chicago Tribune, pioneer of the movement, finds the gun still the most deadly weapon and "the only remnant of insanity."

INTRODUCE YOUR FRIEND TO THE SURVEY

Haven't you a friend who *ought*, as the saying goes, to be a reader of *THE SURVEY*, one who would really appreciate the issues if he but knew the magazine *well*?

Why don't you introduce him to us at least, if you do not wish to pay for an extra subscription?

Here is our suggestion in the form of a special offer:

A Renewal and a Trial Subscription of 8 months for a Friend, \$4 00

Mail us \$4.00, and we will not only renew your own subscription but will also send *THE SURVEY* to any address in the United States for *eight months*.

If you have more than one friend to introduce to us, send us fifty cents for each and we will mail them issues for thirteen weeks.

The GIST of IT—

THE Salem fire, working like a surgeon, spared historical and beauty spots and excised the dangerous wooden tenement district. The Red Cross is in charge of relief. Page 387.

THE New York state labor law, assembled on the general plan of a centipede, will be recodified following the recent hearings. Page 386.

STATE charitable institutions fared ill at the hands of the economy program of the New York state administration. Page 385.

PHILADELPHIA children's agencies have surveyed their work and charted a co-operative program. Page 395.

EVEN mere men are to have Saturday nights off in a Buffalo clothing store. Page 385.

WOMEN prisoners at Sherborn gave The Pirates of Penzance, and music is accounted one of the big items in making the reformatory actually reform. Page 393.

MOYAMENSING, even in the cold terms of a half-hearted investigation report, sounds tragically like Sing Sing. Page 386.

MORE than 2,000 descendants of the five Juke sisters are now on record. Curiously enough some of them, through marriage to normal outsiders, show normal characteristics. Page 385.

COOK COUNTY'S infirmary comes out from an investigation with colors flying. It was attacked by the same political forces that tried to wreck the Chicago Juvenile Court two years ago. Page 387.

DR. CABOT'S suggestion that play amid beautiful surroundings is a necessity for social workers led Julius Rosenwald to give the social workers of Chicago a country club. Page 395.

PROHIBITION will probably carry in Texas next fall, so interest centers on the other big issue of the campaign—the land question. Texas is becoming a state of tenant farmers and is seeking a plan to stop it. Page 394.

CANADIAN officials, present in large numbers, gave new flavor to the National Conference on City Planning and challenged the American constitution for protecting individual privilege against community right. Page 390.

HECKLING by both workers and employers characterized the Philadelphia hearings of the Industrial Relations Commission, but some substantial and interesting suggestions were put into the record. Page 397.

NEW YORK'S report on limiting the heights of buildings does not apply directly to smaller and less congested communities, but it lays down principles which are of service to city planners everywhere. Page 389.

THE SURVEY

COMMON WELFARE

STUNTING NEW YORK STATE INSTITUTIONS

GOVERNOR GLYNN's final action on legislative appropriations affords practically no relief to the unprecedented pressure on nearly all state institutions in New York. The only grant of any importance to receive his sanction was that of \$150,000 to the Rome State Custodial Asylum for feeble-minded. This will be used to erect a hospital in which, it is declared, 300 patients will be accommodated.

That more money was not forthcoming is attributed to the administration's policy of economy by which, the governor declares, he has avoided the necessity of a direct tax this year.

Meanwhile, waiting lists grow all along the line. A published statement of the State Charities Aid Association declares that in May there were 5,584 more patients in the fourteen hospitals for the insane than those institutions could decently care for. No relief to this situation can come for another year.

Similar pressure is declared to exist with regard to the feeble-minded. Out of an estimated total feeble-minded population in the state of 32,000, only 5,000 are cared for in institutions designed for them. Four thousand five hundred are believed to be in prisons, reformatories and almshouses and the rest are at large.

A unique campaign was carried on to bring to the Legislature a sense of the needs of institutions for this class of defectives. A directory of 1,000 diagnosed cases of feeble-minded persons living at large in New York city and needing custodial care was put on the desk of each legislator by the Association for Improving the Condition of the Poor, and a similar list of persons outside New York city was furnished by the State Charities Aid Association. A minimum appropriation of \$500,000 was urged as necessary merely to keep the state from slipping back this year, as it did last when no appropriation was made.

Not even Letchworth Village was enabled to proceed with construction. The four dormitories now under way there will accommodate 280 feeble-minded

persons. Over \$200,000 appropriated in 1912 lapsed in April, 1914, because building plans were not completed by the state architect's office, and when this money was reappropriated the governor cut out every item but that for the laundry.

THE GREENWICH VILLAGE COUNTY FAIR

When historic Greenwich Village, New York city, was treated to an old-fashioned county fair recently, one of the most interesting "side-shows" was a marionette performance given by Italian boys. These youths, members of the Seringhaus Dramatic Club of Richmond Hill House, impersonated puppets in the fashion of their ancestors 600 years ago. Like the real marionette of today they enacted an incident of the crusades.

AN EMPLOYER'S REASONS FOR CLOSING EVENINGS

ALTHOUGH in New York, Chicago and Philadelphia some retail stores employing only men close at 6 p. m. on Saturday—at 1 o'clock in summer—an early closing movement for men is practically unknown in smaller cities. In fact, many of them have still to achieve a free Saturday evening for women.

In Buffalo, however, with an alert Consumers' League and an active union of retail clerks, the Saturday half holiday for women has been achieved. And now C. A. Weed & Company, men's clothiers employing only men, have begun closing at 6 o'clock on Saturday. Their reasons for it, as given in display advertisements in the Buffalo newspapers, make interesting reading. "No man has a right to climb to success over his brother's bones," they say.

"The heads of this firm, who engage in no strenuous labor but merely oversee the work of others, are themselves weary and mentally tired at 6 o'clock. What, then, must be the condition of the men who do the work? Personal observation has proved to us that they are close to the point of exhaustion, and when that point is passed, the work of the doctor begins.

"Employers, therefore, are in large measure responsible for many of the physical ills and resultant misfortunes of their employes. Human nature can stand just so much. When it is pushed to the extreme, it balks. And as a rule when employes get sick, they not only lose their salaries but use up their surplus in medicines.

"The actual responsibility of the employer may cease with the payment of salaries, but his moral obligations to those who help him succeed include not only sanitary working conditions but such working hours as the human system can stand comfortably.

"It is almost impossible to estimate the amount of good that would come from a general 6 o'clock closing movement. We ourselves feel so keenly on the subject and we are so confident we are doing right that nothing on earth can pry open our doors after 6 o'clock Saturday night, no matter if every other retail clothing establishment in Buffalo keeps open till midnight and does a land-office business."

THE METROPOLITAN LIFE SANATORIUM

On the southern slope of Mt. McGregor, among the foothills of the Adirondacks, more than a thousand feet above sea level, the new sanatorium erected by the Metropolitan Life Insurance Company for any of its employes who suffer from tuberculosis was dedicated recently.

When completed, all the main buildings will be joined by covered open-air passages. Graded walks allow wheeled chairs or food carts to pass easily to and from the buildings.

The sanatorium will have provision for 229 patients. Its equipment is of the most modern and scientific type, and a laboratory for research work is among the plans soon to be carried out. Two miles distant is the farm, of more than one hundred tillable acres and a wooded stream.

A PLACID VIEW OF A CROWDED PRISON

THE REPORT of the Board of Judges on the conditions in Moyamensing Prison (city prison of Philadelphia) leaves some readers in the frame of mind of the man who whacked the spot where the flea had been.

The investigation followed criticisms as to overcrowding, classification of prisoners and sanitation, in the presentment of the Grand Jury in December, 1913, which was referred by the Board of Judges to the Committee on Criminal Business for investigation and report.

Regarding overcrowding, the Board of Judges calmly states that "this fact has been recognized for the past ten years at least." The report does not state how much overcrowding there is. The facts are that from one to four prisoners occupy cells constructed to accommodate one prisoner. New prisoners are placed in any cell with space enough to receive them, so that young first offenders may be put in cells with one or more old offenders.

In mild language the report comments on this point: "We do not deem it wise that a prisoner serving a first term should be confined in a cell with an old offender. . . . The segregation of prisoners according to crime and age, especially of those under twenty-one years of age, is desirable."

The report also admits that the conditions under which untried prisoners and witnesses are held are much worse than those under which convicted prisoners are kept, but the conclusion is that "the

Board of Prison Inspectors is not responsible for the length of time that untried prisoners and witnesses are confined, nor do the present conditions permit such prisoners and witnesses to be treated in a manner different from that of those whose guilt has been established."

The report also states that "the lack of opportunity for exercise of the prisoners in Moyamensing cannot be remedied with the present insufficiency of space for the purpose," but it does not herald from the housetops the fact that many prisoners crowded in these small cells have not had the slightest opportunity for exercise from the day of admission to the day of discharge.

Commenting on the plumbing system, the report says: "While undoubtedly the present system of water-closets, particularly at Moyamensing prison, is obsolete, and should be changed, your committee is of the opinion that much of the criticism of the present system, particularly concerning its unhealthiness, is unwarranted and not borne out by the facts."

MUNICIPAL GOVERNMENT IN NEW YORK STATE

HAVING SECURED the enactment of two-thirds of its municipal home rule program and paved the way for the adoption of the remaining third, the Conference of Mayors and Other City Officials of the State of New York at its fifth annual session held at Auburn early in June took its next progressive step by advocating the enactment of an

optional law under which cities of the state may secure non-partisan municipal elections.

The chief undertaking of the conference during the coming year will be the organization of a national conference of mayors, to be held under the auspices of the New York organization at San Francisco in 1915. The suggestion was made by Mayor Mitchel of New York, and he was made chairman of the Committee on Arrangements.

To strengthen the influence of the conference a committee was appointed to confer with the Organization of Village Presidents of the state to promote a plan of co-operation between the two organizations. The state-wide campaign of municipal welfare begun last year will be continued and a plan for the codification of local laws and ordinances of the state will be formulated.

R. S. Binkerd, secretary of the City Club of New York, discussed the conference's municipal home rule campaign. In the subsequent discussion it was brought out forcibly that the municipal empowering act, passed by the Legislature two years ago at the suggestion of the conference and the Municipal Government Association, had produced the desired results, and that local city legislation last year was materially reduced.

An entire session of the conference was devoted to city planning and a discussion of the city planning survey which the conference is now conducting. Charles Downing Lay, former landscape architect of New York city, presented a program of development for parks and playgrounds, and Prof. James S. Pray of Harvard University discussed the subject of making the survey for a city plan.

Municipal health was the general subject discussed at the last session. State Health Commissioner Biggs presented an efficient municipal health program and told how the state is willing to help. Dr. Donald B. Armstrong, director of the Social Welfare Department of the New York A. I. C. P., discussed public health values and presented a few modern fallacies. It was decided to undertake the coming year a health survey of the cities of the state. State Health Commissioner Biggs, Charles C. Duryee of Schenectady, Dr. John S. Wilson of Poughkeepsie, Dr. G. W. Goler, health officer of Rochester, and Mayor Louis Van Hoesen of Hudson will prepare the questionnaire and direct this health study.

The following officers were elected: President, Mayor Rosslyn M. Cox of Middletown; vice-president, Mayor Louis Will of Syracuse; treasurer, Mayor George A. Brock of Lockport; secretary, William P. Capes of New York city. The next conference will be held in Troy.

Purging Salem's Tenements With Fire

AN EXPLOSION in a leather factory, a brisk wind and a city dry as a tinderbox from a long drought, have combined to give Salem, Mass., such a cleansing and such an opportunity as have come to few cities.

The House of the Seven Gables, Hawthorne's birthplace, and in fact much of the better residence part of the city and its historic landmarks were spared. The French-Canadian tenement section, said to be the most congested spot in any New England city, was swept away. Plans are making for adopting a better city plan, with wider streets and real homes to replace the three-, four- and five-story tenements which were burned.

Loss of property was heavy, but the Naumkeag Cotton Mills, employing 6,000 hands, are typical of the town's buoyant spirit in their announcement that they will rebuild. Loss of life was slight as the fire came in the afternoon, with ample warning. There were but three deaths, one of them from heart failure. Some 14,000 people are homeless, but the Red Cross was promptly on the spot.

The net result to Salem may well be good. It has lost the modern buildings, atrocious in style, sanitation and safety, which have grown about its Colonial center as homes for the working people of this century. And the loss has come in a generation that knows better ways of home-making than piling up rickety wooden tenements.

Relief work was prompt. Governor Walsh immediately called a conference. In twenty minutes Boston business men had subscribed \$70,000. In Salem \$36,000 was raised. At the time of writing, \$250,000 was in hand and funds were still pouring in. Chelsea, Mass., and Dayton, Ohio, remembering one its fire and the other its flood, sent generous checks. A plan has been put in operation by which holders of insurance policies can secure credit on them while awaiting adjustment of their claims.

Mabel T. Boardman and Ernest P. Bicknell, of the American National Red Cross, reached the scene almost as quickly as the social workers representing all the large social and civic organizations of Boston. These were led by Fred R. Johnson, secretary of the Boston Associated Charities, which is the New

England institutional member of the Red Cross. Relief work is in charge of a state Red Cross committee, co-operating

with a local committee, and doing its actual work through a small group headed by John F. Moors, of Boston, who was a volunteer at San Francisco in 1906 and at the Chelsea fire.

The state militia took charge of the city the night of the fire, organized the refugees into three camps in the parks, put up tents, dispensed relief and in general proved themselves efficient social police. The Boy Scouts worked with them.

Perhaps the loss fell most heavily on the people of St. Joseph's French Canadian church. The whole parish of 7,000 souls was burned out, and with it the handsome church building erected at great sacrifice in 1911.

LEWIS E. PALMER of Boston, who took these photographs the day after the fire, writes: "You might imagine that some immense crew of building wreckers had completed a year's contract, done a good job in record time, packed up their tools and left."

At the right, a Polish woman with her children and her meager salvage, a Red Cross visitor and a Boy Scout.

Below, the ruins of St. Joseph's Church, which the French Canadians built in 1911. The whole parish was burned out.

THE TREND OF THE SCIENCE OF EUGENICS

THE MOST Pressing Topics for Research in Eugenics, discussed as a symposium at the recent second annual meeting of the Eugenics Research Association, afforded a glimpse ahead in the development of the science.

The symposium brought out as the most urgent needs of the present in the field of eugenics:

That more emphasis must be placed on the study of the mental traits of the individual;

That the psychologist is not willing to grant the proof of the existence of unit characters or traits now used in describing the mental activities of man;

That tests for intelligence need closer standardization;

That a better definition of feeble-mindedness, or, as Dr. C. B. Davenport suggested, "feeble-mindedness," must be made.

Certain comparative studies of the inmates of Bedford Reformatory, groups of working girls, and of some school children in the West, showed that psychological tests in general do not give a clear idea of a person's power of learning and adaptability.

"The necessity of determining the line of demarcation between normality and mental defect will be felt," said R. W. Hill of the State Board of Charities at Albany, "in the new method of commitment of the feeble-minded in New York state." This provides that a person may be committed for feeble-mindedness by a judge on the request of relatives with the certificate of two physicians. It was brought out that there might be great injustice in this method if persons were put away on the word of two practicing physicians, when experts on feeble-mindedness are at sea as

to the determination of the higher grades of mental defect.

The reading of technical papers occupied an entire session of the conference. The inheritance of eroticism, periodic bad temper, wanderlust, and alcoholism, was strikingly demonstrated in a series of charts shown by Dr. Davenport, president of the association.

DEFENDING COOK COUNTY AGAINST FACTION—BY GRAHAM TAYLOR

THE PARTISAN FACTION in the Cook County Board of Commissioners at Chicago, continues its fight, to the last ditch, for the control and perversion of the public agencies and institutions of the county. Although its nefarious attack upon the probation officials of the juvenile court was defeated and discredited, both in the courts and in the report of the thorough investigation conducted by Prof. Willard E. Hotchkiss [see THE SURVEY for March 30, 1912], this same faction has had the hardihood to try the same tactics against the management of the county infirmary at Oak Forest.

As soon as charges, based upon an alleged investigation by one of the commissioners, appeared in the press, President Alexander A. McCormick of the county board, who with the honest and capable minority has valiantly withstood continuous attack, appointed a citizens' committee "to make a thorough and rigid examination and to inform the public of the real situation." On this committee were Miss Addams, Miss McDowell, Miss Low, Miss Breckinridge, Allen B. Pcond, president of the City Club, and representatives of five nationalities.

Their report covers the two points at issue, first, concluding that "there is not the slightest evidence of brutality or of

One of the most interesting features of the conference was a short account of the result of the work he has done on "the Jukes" during the past two and a half years, given by A. H. Estabrook of the Eugenics Record Office. Including those studied by Dugdale, 2,100 individuals have been found descended from the five original Juke sisters. It is a noteworthy fact that certain branches of the Juke family now show normal characteristics. This improvement has been produced mainly by out-marriages into better stock. Others, by far the greater portion, and including some who have sought better environment, show the same traits attributed to their ancestors and described by Dugdale in 1877.

Dr. Howard A. Knox, assistant surgeon at Ellis Island, talked on the present methods of detection of mental defectives among the immigrants.

Miss I. V. Kendig of the Monson, Mass., State Hospital told of an intensive study of a degenerate family of old American stock, which in an isolated community had multiplied until the town became a by-word for alcoholism, immorality and feeble-mindedness.

At the regular field-workers' conference Dr. Gertrude Hall of Albany announced that the State Board of Charities is taking a census of the feeble-minded in New York state.

unkindness on the part of any employe, but unanimous testimony to the high general level of kindness shown to inmates by employes;" second, that "the standard of food served is higher than at any earlier period" and that "there has been more skillful and intelligent attention given to the planning of the meals than ever before." Bacteriological examination of the causes of the sudden illness suffered by some of the inmates is reported to be in progress.

The committee asked permission to extend its investigation in order to determine whether, within the appropriation granted, further improvements and safeguards are possible and in order to suggest "a program of progressively improved care of the aged, sick and infirm poor in the care of Cook county."

This report, which was signed by all the committee, although accepted by the public, was of course treated with disrespect by the factional majority of the county board and its adoption was voted down, with contemptuous reference to the committee as consisting of "more or less radical adherents of President McCormick." Both they and Supt. James Mullenbach, whose efficient and progressive administration is endorsed, are well assured of the verdict of the jury of public opinion.

CIVICS

REGULATING HEIGHTS OF BUILDINGS—BY CHARLES MULFORD ROBINSON

THE RECENTLY PUBLISHED report of the Heights of Buildings Commission of New York city is a most thorough and valuable discussion of a limitation of the height, size and arrangement of buildings, and of the division of cities into districts. The thoroughness and value of this report lies even more in its supplementing of wide investigation by sane interpretation than it does in the concrete suggestions. This is because New York city, for which the suggestions of the commission are made, presents exceptional conditions of structural congestion to such degree that regulations there must be more liberal than is necessary in most smaller cities.

To model the regulation of building heights generally on the recommendations of this commission for New York would be to repeat the too familiar error of accepting the New York tenement code as a model housing regulation for smaller cities. It is well to emphasize this danger, for it may prove very real. Yet so clear and enlightening is the commission's discussion of principles that there is not the least necessity for such a mistake. Not simply New Yorkers, but careful students everywhere, of the subject under discussion, are indebted to the Heights of Buildings Commission.

The commission, which was appointed to be advisory to a committee of the Board of Estimate and Apportionment, was composed of twenty well-known men. Fully to indicate the scope of the investigation, one must turn to the chairman's letter of transmittal:

"Many organizations took a great interest in our work, appointed conference committees and in some cases had counsel prepare careful briefs for our consideration. All of the title companies and many of the large lenders on real estate securities freely gave us the benefit of facts, figures and opinions. Owners and managers of buildings, both large and small, developers of vacant land, builders, engineers, architects, insurance men, fire fighters and fire protection experts, housing and factory specialists, lawyers and physicians, city officials having to do with streets, building construction and tenement houses, manufacturers and transportation men attended our conferences and gave us an opportunity to check up from every angle the work of our committees and the staff.

"Special investigations were carried on in a number of large cities of our country, Canada and Europe. Furthermore, our staff has corresponded with officials of almost every large city of the world that has taken up the subject of building regulation. Statutes and ordinances were collected and a record of

the experience of other cities obtained, so far as possible at first hand.

We carried on our work with much diversity of opinion. . . . Continued study of the facts and conditions brought us to a harmonious and united opinion."

With regard to the report's definite recommendations, these contain necessarily an amount of detail that renders them somewhat complicated. Since they should be modified before adoption elsewhere, it is enough to say here that pending the adoption of a districting plan, to make possible the acceptance of different regulations for different parts of the city, the commission recommended a proportioning of building height to street width, with the fixing of a maximum limit. After reaching this limit, it is proposed that buildings may be carried higher by setting the street walls above such limit back one foot for each four feet of increased height. In order that the proposed height regulations may be effective in securing a maximum of light in the streets, it is recommended that no cornice project over more than 5 per cent of the street width.

Advocating legislation, which has now been secured, that will permit the division of the city into districts having different building regulations, the commission tentatively suggests that there be in New York eight classes of districts.

The proposed regulations are given for each of these, and the portions of the greater city which would be included in the different districts are roughly indicated.

Cities outside of New York have, therefore, only to determine which portion, from lower Manhattan to Richmond and parts of the Bronx, they most resemble or wish to resemble in order to ascertain the nature of the restrictions they should adopt.

On one important point, which will suggest itself to readers of THE SURVEY, the commission says: "While we know of no immediate practicable remedy for the existing congestion of population on the lower East Side, we believe that appropriate restrictions, varying with the district, can prevent the repetition of these conditions in other parts of the city."

The commission adds: "It is clear that any system of building control would be defective unless in addition to regulation of height, yards and courts, regulations be imposed on the location of industries and of buildings designed for certain uses."

The chairman of the Heights of Buildings Commission was Edward M. Bassett, and the staff included George B. Ford, secretary and director of investigations; Robert H. Whitten, editor of the report and special investigator; Herbert S. Swan, statistician and special investigator, and Frank B. Williams, writer on districting methods in Europe.

CITIZENS OF TOMORROW

Civic work by children has grown apace and the youngsters have taken effective part in many a "swat the fly" campaign or "clean-up" day. The American Civic Association has recently organized a Department of Junior Civic Leagues under the chairmanship of Maude Van Buren. It aims to develop good citizenship by emphasizing the spirit of civic service and familiarizing the children with the simple municipal ordinances which affect the child's every-day life. Home gardening is promoted by the department. The picture above is published by courtesy of the People's Gardens Association of Washington, D. C.

A RECREATION PARK WITH PROVISION FOR ONLOOKERS

A people's park and recreation center has been established in East St. Louis, Ill. In addition to the usual provision of playground, swimming pool, tennis courts, ball field, wading pool, sand piles and rest house, there is recognition of the enjoyment which spectators may have. Very few playgrounds and recreation centers make provision for them, but Jones Park, East St. Louis, opened June 12, has a concrete grand-stand seating 1,000 people and costing \$10,000. It faces the ball ground and athletic field and underneath it are lockers and shower baths for athletes of both sexes.

WITH THE CITY PLANNERS AT TORONTO—BY FLAVEL SHURTLEFF

SECRETARY, NATIONAL CONFERENCE ON CITY PLANNING

IT WAS a wonderfully good thing for the National Conference on City Planning to hold its sixth annual meeting in Canada. With a keen desire for material results in the cities of Canada, the Commission of Conservation for six weeks previous to the conference sent a very persuasive herald to the larger Canadian cities from Winnipeg to Halifax and St. John, to invite the city governments to send the right kind of men to participate in the conference at Toronto. The registration roll reads like pages from a Canadian municipal year book, mayors, city engineers, members of city plan commissions, the men who must be convinced if city planning is to be an every-day practice.

The provincial governments of Canada, ever alert for legislative measures of material benefit, sent their representatives to join in the discussion of a proposed Canadian town planning act which had been drafted for the conference by a committee of the Commission of Conservation: from British Columbia the minister of lands, Hon. W. R. Ross; from Saskatchewan the minister of municipal affairs, Hon. George Langley; from Ontario the provincial secretary, Hon. W. J. Hanna, and from Quebec the provincial treasurer, Hon. P. S. G. MacKenzie.

The delegates from the United States were equally representative of official municipal life and particularly of the

new administrative agency in American cities, the city plan commission.

Previous meetings of the conference have stuck closely to set papers; discussions have been somewhat lifeless. The Toronto meeting was a conference of rapid-fire questions, of short pointed discussions, of statements challenged and explained. The Toronto harbor commissioner, Robert Gourlay, was on his feet two hours before he had satisfied inquiries into the plan for the development of Toronto's waterfront. Whatever the subject discussed, whether transportation in general, or the advantages of the auto bus, both subjects in which Toronto is interested, the sessions were ended only by luncheon, by dinner, or the approach of midnight.

Great inspiration came from the broad social vision, the strong emphasis on community rights, which dominated the sessions from the opening words of the Duke of Connaught. It was an inspiration to the American delegates to breathe the pure air of Canadian freedom, without the restraint of the federal constitution. It was evident in the discussion of Mr. Veiller's paper, *Protecting Residential Districts*.

While the American lawyers who discussed the paper were struggling with the constitutional difficulties which prevent regulating the use of land in the interest of the community, the impatience of the Canadians grew until finally it

was expressed in no uncertain terms in a challenge of the right of the United States to boast of its democracy when individual privilege was protected by the federal constitution at the expense of community right. There was evidence also of this Canadian freedom in the draft of the Canadian town planning act, where city planning was frankly interpreted as a measure of community protection, a health measure as Dr. Hodgetts put it, and as such, its mandatory features which had met with much adverse criticism in the discussions were to be justified.

It was an inspiration to have one of Canada's ablest administrators bring home the grave responsibilities of those who guide the policies of the conference.

"We have many theories for the redress of social evils. Government ownership of public utilities, socialism, and single tax are illustrations. The advocates of each claim that their particular theory will set everything right. Yet when we divest ourselves of the enthusiasm which people are apt to acquire when they take up one particular idea, it takes very little serious consideration to lead one to the conclusion that while perhaps each one of the remedies suggested has some merit and may under certain circumstances accomplish some good, yet that no one of them would radically alter the law that has heretofore obtained with inexorable regularity, namely, that the growth of poverty, misery and crime accompany industrial and commercial expansion on a large scale on the march of what we call modern progress.

"I put it to you that the real problem that is up to the intellect of this twentieth century is whether we have brain and capacity enough to free ourselves from the prejudices and the shibboleths with which our minds are encumbered and to grapple with these problems so that society shall control its own destinies and avoid the evils which have dogged the foot-steps of progress in the past. . . . It is a composite problem, and it requires a composite answer. But a part and the more important part, of the answer is to be found in a rational system of town planning, a rational system of providing conditions in which the people in our great cities shall live."

The impression of Mr. Sifton's address was very evident when the Executive Committee met on the morning after the close of the conference and a formal vote was recorded to endeavor to meet the responsibilities of guiding the city planning movement in proper channels, by making a study of the fundamental questions involved in city planning. For this year there will be conducted two lines of study: first, into the administrative machinery needed to facilitate city planning; second, into the proper methods of land subdivision to produce the greatest community benefit.

The Executive Committee remains the same, except for the addition of Dr. Charles A. Hodgetts, medical adviser of the Canadian Commission of Conservation. The officers of the conference were re-elected: Frederick L. Olmsted, president; Nelson P. Lewis, vice-president; Flavel Shurtleff, secretary.

EASTER SUNRISE SERVICE ON MT. RUBIDOUX

This service, suggested by Jacob A. Rus when visiting in Riverside, Cal., some years ago, has been held on Easter morn for six consecutive years. 5,000 people were in attendance this year when the photograph was taken. The year before, Henry Van Dyke read his God of the Open Air.

AROUSING A CITY TO SAFETY—BY WILLIAM A. SEARLE SECRETARY, ROME (N. Y.) CHAMBER OF COMMERCE

WHEN THE Chamber of Commerce of Rome, N. Y., was confronted with the problem as to how to arouse the city to a realization of individual responsibility in accident prevention, the effort was made to do so in a spectacular way, which would compel attention.

A careful survey was made of conditions, and the population was roughly divided into the following classes to be reached: Employers and employes, children, and the home dwellers and women. Before the campaign started the newspapers gave out just enough information to pique curiosity.

Without warning one morning shortly before the campaign week opened, citizens were greeted with "safety first" signs painted on the ornamental electric light poles of the city. In the course of the following night on the sidewalks a few feet from each crossing huge signs in green (the safety color) were painted cautioning "safety first." Then the people began to wonder what was going to happen next. The following day all the street cars bore illustrated half sheet posters calling attention to careless practices.

Then the campaign began, and the

people were ready for it. Local speakers assisted by a safety engineer from out of town gave noonday talks in factories. Where there was a sufficient number of foreigners a speaker talked to them in their own tongue.

A week before the regular campaign talks were given in the public and parochial schools of the city by the writer. These were really chalk talks, suited as the case might be to kindergarten or high school pupils. About three-fourths of these children promised that for the next two weeks each morning as their father went to work they would ask him: "Father, will you remember 'safety first' today?"

Each evening of the week pictures and charts on accidents were thrown on a screen in one of the public parks, a lecturer explaining the pictures and giving a brief talk on safety. The evening's program concluded with one or more safety films.

Touching the people as widely as possible in these three general ways in factories, schools and evening lectures, it was yet realized that many would not be reached. The idea of an imitation accident insurance policy was evolved, giving

in an attractive and popular way many safety suggestions—from avoiding rusty nails to the way to pull a fire alarm box.

On Thursday of Safety Week members of the Junior Chamber of Commerce, boys of high school age, in a whirlwind campaign, placed one of these policies in every dwelling in Rome. Each team was known as a flying squadron, and was assigned to a ward. The first team reported back, its work completed in eighteen and one-half minutes. Automobiles were used, and the public, prepared by newspaper stories, in many cases met the boys at the door to receive the policy.

MUNICIPAL ICE: SOME SUCCESSFUL EXPERIMENTS

MUNICIPAL ICE is the very seasonable subject discussed in a report submitted to the president of the Borough of Manhattan a few months ago and recently published. At his direction an investigation was undertaken last summer by Jeanie Wells Wentworth. It was pointed out that a few years ago agitation became general throughout the United States for the establishment of municipal ice plants. The increasingly high prices charged by ice dealers led to the feeling that municipalities could not only supply ice for their

own institutions, but also provide it at cost to citizens.

The report presents data concerning the municipal plants successfully operated by the city of Weatherford, Okla., the first and only city to undertake the manufacture of ice on a commercial basis. It describes fully the ice plants operated by the federal government for the federal buildings in Washington, and the profitable ones at Panama and the Philippines. Municipal and governmental plants in England, Germany and northern Italy, all operated at profit, are also covered.

More than a dozen states have either home rule legislation enabling them to own and operate municipal ice plants or have secured enabling acts in regard to specific cities. The efforts of various cities to secure ice for their citizens at lower cost and of some of them to engage in the manufacture of ice, are presented in letters from mayors and directors of public works.

The use of exhaust steam from power plants in the manufacturing of ice is shown to be an important factor in reducing the cost of making ice. Figures are given covering retail prices and the costs at the various plants described.

New York city, it is shown, uses about forty tons of ice per day during the summer, paying prices which vary from 16 to 65 cents per hundred pounds. The report comments vigorously on the fact that "the city of New York, consuming such enormous wholesale quantities of ice, should be obliged to pay the highest retail prices, especially when it has been shown that other municipalities and government stations can manufacture ice at the low figures given in their official reports. The city of New York has in operation a number of power plants where the exhaust steam could be utilized for the manufacture of ice at a nominal price in sufficient quantities to serve the needs of the various departments. Any surplus ice might well be sold at actual cost to the poor people of the tenement house districts."

TWELVE MONTH'S RECREATION RECORD

THE SPREAD of organized and supervised recreation is shown in the list of cities, which during the past year have had the assistance of field secretaries of the Playground and Recreation Association of America. There are eleven of them: Tampa, Fla.; Birmingham, Ala.; Red Bank, N. J.; Wheeling, W. Va.; Dayton, O.; Montreal, Canada; Scranton, Pa.; Lynchburg, Va.; Kansas City, Mo.; Sioux City, Ia., and Ishpeming, Mich.

The association is now aiding campaigns for all-the-year recreation in twenty cities, with the probable result that secretaries will be appointed and organized recreation systems established ere long.

Every city to which field secretaries go to organize forces for recreation presents its own peculiar problems. The situation at Birmingham, Ala., was not unusual. A year ago Birmingham had never spent a cent for playgrounds, and while the city was prosperous the city

government was restricted by an arbitrary tax limit and was running behind \$500 a day. Although the tax limit remains unchanged, a city appropriation of \$7,000 and a fund of from \$5,000 to \$10,000 raised by private subscription, has been secured and a permanent department of recreation legalized. This has made possible the employment of a trained superintendent of recreation, with twenty assistants, and the opening of sixteen playgrounds during the past year.

A similar situation was met at Scranton, where a change in the city's fiscal year complicated things so that the city faced 1914 with a \$20,000 deficit. The adoption of an ordinance creating a Bureau of Public Recreation was the first reward of the plans, proofs and facts amassed by the playground people. Then came the announcement of an appropriation of \$6,000, conditional upon the raising of an additional \$4,000.

In some cities it is not possible to secure a city appropriation when the help of a field secretary is enlisted. This was the case in Tampa, Fla. Through the Board of Public Works, sufficient funds were secured to operate a model recreation center, and to pay the salary of a trained secretary. This enabled a certain amount of recreation to be provided at once, which was most desirable, as a large foreign and industrial element makes Tampa's recreation problem a pressing one. The city is planning to take over on its own budget this summer the support of the larger and more adequate system mapped out.

In Wheeling, W. Va., and Red Bank, N. J., popular campaigns were carried on to raise money to establish recreation systems which should demonstrate the necessity of municipal support as soon as such a step is possible. In the former city, as in many others, a vital problem is the lack of available land. This may be either through topographical peculiarities or through lack of foresight in city planning, and it means more money to acquire facilities.

Many cities in Michigan might well profit by the example set by Ishpeming, a city of about 13,000 people. The state law now in operation requires the Board of Education to employ a physical training director for the schools. The plan, introduced by the association's field secretary, includes the employment of a permanent worker to handle the physical training work in the schools and also take charge of the recreational activities of the community. As the system is developed, a full-time worker will undoubtedly be required, but the present plan is working out successfully for the first year of the recreation program.

NEIGHBORHOOD CENTER COMPETITION

A COMPETITION for plans for a neighborhood center is announced by the City Club of Chicago. The success which attended the club's competition held in connection with its Housing Exhibition last year for plans for the laying out of a typical quarter section of land in the outskirts of Chicago, has led to the arrangement of the present effort along

similar lines [See THE SURVEY for June 7, 1913, p. 343].

The object is "to bring before the public, in graphic form, the practical possibilities of enhancing neighborhood life in our cities by better, and especially better grouped, buildings and grounds for neighborhood activities. The drawings submitted in the competition will be shown as the special feature of an exhibition and a series of conferences on neighborhood centers, to be opened at the City Club, February 9, 1915.

The competition has been prepared with the co-operation of the Illinois chapter of the American Institute of Architects. One of the past presidents of the City Club has offered \$600 to be divided equally among the authors of eight drawings selected by the Jury of Awards, as covering in part the expense of preparing the drawings.

The problem before contestants is to "produce plans for a neighborhood center suitable for an actual or an assumed neighborhood in Chicago or, in case a competitor so elects, in some other community." This will involve decision as to the sorts of institutions to be included in such a center, and especially whether commercial as well as social; the size of the neighborhood to be served, which would perhaps vary with the density of population; the sizes of the institutions to be included; the most efficient interrelation among these institutions; the adjustment of the composition to the general frame-work of the city—street system and means of communication; and the landscape and architectural treatment of the center in its various parts and as a whole.

The club has issued a pamphlet giving the program and conditions of the competition. It also presents a discussion of the problem designed to be of suggestive value to the competitors. A map of a typical foreign community is shown with the location of neighborhood institutions indicated and with pictures of some of them.

The multiplicity of the various social institutions in Chicago—from branch postoffices and libraries to moving-picture "palaces"—is pointed out and the conditions of neighborhood life are briefly described.

The preliminary competition closes November 9, 1914. Eight plans will then be selected whose authors will be asked to make additional drawings. The final competition closes January 25, 1915, and the exhibition and conferences will open on February 9, 1915.

A MUNICIPAL SCRUBBER

With soap and water, broom and mop, a strong armed Negro woman is visiting the tenements which house Louisville's colored population. She was engaged by the Department of Public Safety on recommendation of the Department of Health.

In enforcing the tenement house laws it was often found impossible to get the cleanliness necessary to health merely by inspection and the giving of orders, so it was decided to put a municipal scrubber to work in the worst tenements.

The appointment of the scrubber was largely due to the efforts of Marie Durning of the Health Department, under whose supervision she will work.

SOCIAL AGENCIES

INMATES OF A MASSACHUSETTS PRISON GIVING GILBERT AND SULLIVAN'S PIRATES OF PENZANCE

“PIRATES” AND PRISONERS: MUSIC AS A REFORMING INFLUENCE—BY MARY CAROLINE CRAWFORD

SECRETARY FORD HALL MEETINGS, BOSTON

WE HEAR a good deal, all over the country today, about prison reform, but at Sherborn, in Massachusetts, it can be seen at work. Since Jessie D. Hodder took charge of this institution over two years ago, a veritable revolution has been effected in the daily life of the inmates and in the attitude of the officers toward them. Formerly the women were not allowed even so much of God's out of doors as could be seen through a window; ground glass and bars prevented this. Now they work out of doors whenever the weather is favorable, play out of doors on holidays, and stroll out of doors, under proper supervision, every evening in summer.

All these things Mrs. Hodder accomplished before she had been long at Sherborn. But it took her some time to discover just the person needed to develop these women inmates by means of that most potent of all powers "to soothe the savage breast,"—music.

"Can't you help me to find someone who will just flood this place with music?" she asked the writer about two years ago. "I shall not feel as if I had done all that I might for these women until I have exposed them to the constant influence of good music. I believe music will do for them what nothing else can, and I shall not rest until I have given this conviction of mine a full and fair test."

The very person to carry this experi-

ment to a successful issue was recently found in Mrs. Perle Wilkinson, a good musician who had already proved at Randall's Island the influences of music on women under restraint. On a recent June Saturday, the women of Sherborn, under Mrs. Wilkinson's direction, gave Gilbert and Sullivan's opera, *The Pirates of Penzance*, with such poetic feeling, musicianly power and dramatic skill as I have seldom seen equalled in an amateur performance.

There were sixty women in the cast, including the choruses. All were absolutely raw material when rehearsals started, six months previously. Yet some of the solos were sung with real beauty, the quick and often difficult choruses were attacked with fine precision and there was poetry throughout in the business of the play.

The scenery was designed and executed within the institution, the women made their own costumes and in no essential particular did the performance differ from those given constantly by girl-students at our leading colleges for women.

"How did Mrs. Wilkinson accomplish her difficult task?" will be asked. "And what has been the effect of this musical training upon the women themselves?"

The answer to the first question is exceedingly interesting. Mrs. Wilkinson is an enthusiastic farmer as well as an accomplished musician. She owns a

farm, had worked it herself and so found the out-of-door work at Sherborn extremely congenial. She got on intimate terms with her opera singers, working with them in the fields. When she had become friendly with the women, it was easy to interest them in her plans.

As to the effect of the project upon the women themselves—since the rehearsals began not one woman out of the 300 inmates of the institution has been started on a period of punishment, so constantly has the thought of the place been focussed on intelligent activity and the desire to co-operate in the opera. The reform possibilities of such a social interest as the production of this opera have been found to be almost unlimited.

For even the women who had no part in the play had a share in the pleasant preparations for the big event. In the evenings, while rehearsals were going on, the women inmates brought their sewing and acted as an audience. At the dress-rehearsal they, with an invited company of probation officers, saw the opera in all its glory.

As for these probation officers,—men, mark you, who had already decided that the women now acting before them were not fit to be put on probation one more time—they leaped to their feet at the end of the final chorus, and cheered the actresses to the echo. One man, more emotional than the rest, shouted at the top of his voice, "Let's put them all on parole!"

In the audience of 200 invited guests who saw the final performance there were many social workers, all of whom

congratulated Mrs. Hodder on what she had accomplished. The Massachusetts Prison Commission was represented by Chairman Randall and Mrs. James M. Carret; the bench by Judge McManus; the Lyman School by Mrs. Glendower Evans, and leading institutions for the feeble-minded by their most socially alert physicians.

The Police Department of Boston had showed itself most interested. It will be remembered that a chorus of policemen is an important part of the "Pirates"; and though these Sherborn women are very clever at making things, they could not make policemen's helmets. Accordingly, Mrs. Hodder threw herself for this detail of properties on the generosity of Commissioner O'Meara with the result that the Sherborn "policemen" were equipped with imposing headpieces which formerly crowned the charms of Boston's "finest."

For the dress rehearsal all the invalids

at the institution were taken off their beds and all the people who were being disciplined for various offences were taken out of punishment. "We broke every rule of the place," said Mrs. Hodder joyfully. And then she told me an incident which shows how shut in, even at best, are the lives of women in prison.

"Do you know," she said, "we had got as far as the dress rehearsal without realizing that the major general in the opera had no sword, and should have one. But the woman who was to take this part saved the situation. She reminded me that, two years before, a man who was preaching here on patriotism had spoken of the emotions which were always stirred in him by the sight of his father's sword hanging over the mantelpiece in his library. 'Don't you think he would lend us that sword?' she queried. I got busy with this last detail. That was the sword you saw her wearing."

aged to get out of debt. The farmer puts his cotton in a bonded warehouse and then borrows money with the warehouse receipt as collateral. He has mortgaged his property on the chance that the price will rise, and has not now the same control of it as formerly. At the same time he must be paying for storage. He had better provide his own storage facilities.

As for the tenants, the old-fashioned doctrine of temperance and thrift is by no means ignored by those who are discussing the question. The part played by indifference, lack of energy, and thriftlessness is recognized. Some tenants are by no means eager to own land. Many of them once did so. The desire to acquire, own, and keep a home must be created in them. Rural education and compulsory attendance (at present we have no compulsory school attendance law in Texas) would accomplish much. The question is a moral one. Honest, industrious, and sober farmers, self-respecting men who have been impoverished by misfortune, may get a home before long by their own unaided effort. But while conditions are not altogether due to lack of opportunity, it is possible to open the door of opportunity a little wider by legislation.

One of the prominent candidates for the Democratic nomination for governor, James E. Ferguson, farmer, and banker of Temple, came forward early with a bold proposal in behalf of the 225,000 tenant farmers of Texas. He proposes to make it usurious and unlawful for an owner of land to receive or collect a rent of more than one-third of the value of all grain crops and more than one-fourth of the value of all cotton crops. "For fifty years the good old rule of cropping on the third and fourth and on the halves has been the custom in Texas." "Take away today the abuses of the present rent system and the Socialist would not have a leg to stand on." "It is the immediate relief which a restriction of rentals will bring about that the farmer needs. This will not only prevent oppression, but will destroy the incentive to own lands except for home occupation."

The first cry to be raised in protest was that the proposal was Socialistic, but this scarecrow is fast losing its efficacy. Then it was pronounced illegal—an infringement of the right of private contract. But the underlying principle of legal interest and legal rents is the same. The rate of interest which a man may charge for the loan of his money is fixed by law; so also the rate charged for fire insurance, for transporting passengers and property, etc. The sale of drugs, liquors, and pistols is regulated by law, regardless of private contracts between the parties. The only question involved is one of policy. On that score it is said that to charge a third and a fourth would be too much in some instances and too little in others, and that the law would not be enforceable, as shown by the notorious failure of the usury laws.

The program of the other leading candidate for governor Thomas H.

THE LAND PROBLEM IN TEXAS AND THE REMEDIES PROPOSED—BY JOHN C. GRANBERY

PROFESSOR OF SOCIOLOGY AND ECONOMICS, SOUTHWESTERN UNIVERSITY

THE TWO LEADING issues in the campaign now being conducted for state offices in Texas are prohibition and the land question. The questions involved in the former issue are not new and are well understood, though the introduction of the question of federal prohibition by constitutional amendment has confused the situation somewhat. However, it seems to be generally recognized that the days of the saloon in Texas are numbered, and the people are turning to other issues.

Papers and candidates are giving more attention possibly to the land problem than to any other single subject discussed in the campaign. Yet there is an impression that all the factors involved in this question are not fully understood.

It is agreed, however, that there is a land problem. Some years ago most of the farmers owned their homes and the ground they tilled, while today the tenants outnumber the owners. Some states are apparently in a worse condition in this respect than Texas, as may be seen by the following comparison, showing the percentage of farm tenants:

	1880	1890	1900	1910
United States.....	25.6	28.4	35.3	37.0
Mississippi	43.8	52.8	62.4	66.1
Louisiana	35.2	44.4	58.0	55.3
Texas	37.6	41.9	49.7	52.6

Texas ranks seventh in the percentage of tenant farms. This decline in farm ownership is accompanied by an increase in the number of farms mortgaged.

Our people feel that we are strong, prosperous, and happy in proportion as we occupy homes of our own. Many things we may do without, but we cannot dispense with the use of the land, air, water, and light. One candidate for

In Texas, as in many of the southern states, the only real contest is in the Democratic primaries and not in the November elections. The date of the coming primary in Texas is July 25.

the Democratic nomination for governor declares that this is "the biggest question in Texas," while the other says: "Texas should enter upon a fixed and definite land policy which will discourage land monopoly, encourage the breaking up of large holdings, and the acquisition by our good people of homes and small farms."

In his *Principles of Economics*, page 526, Prof. Henry R. Seager says: "It follows that the suitability of the present system of private property in land to present conditions hinges largely upon the question whether absentee landlordism both in town and country is coming to be the rule or whether this condition is still exceptional." Many of our tenant farmers are discontented and shiftless, moving from place to place to better their condition, their children growing up in ignorance.

The first of the leading suggestions made has reference not directly to the tenant farmers but to the matter of marketing agricultural products. The establishment of a system of bonded warehouses with power to issue negotiable receipts, all under the sanction and supervision of the state, is advocated by both candidates. At present the cotton crop, valued at over \$200,000,000 a year, is exposed to the weather, the yearly loss running into millions, and is forced on the market at prices below normal. The farmers are at the mercy of those who would buy their cotton at low prices; they should be enabled to store and hold the cotton until the right time comes to sell, and should be provided with authentic information so as to know what is the right time.

It is objected that this public warehouse system would make 90 per cent of the farmers gamblers. The spinners also would know how much cotton is withheld and be able to dominate the situation. The practice of holding cotton or other farm products on credit is dangerous. Farmers should be encour-

Ball, a lawyer of Houston, designed to make it less difficult for the average farmer to become a home owner, is too elaborate to admit of description here. He appears to have an open mind toward the whole subject, and much that he says he offers only by way of suggestion. He would exempt improvements on farm land from taxation, on the principle of the single tax, tending to induce land owners to sell surplus holdings. He would have the state lend to the farmer on easy terms, the sources of such funds being indicated in ways that cannot be here detailed.

There are now millions of acres of land in Texas that can be secured at reasonable prices. The University of Texas has about 2,000,000 acres of land, much of it suitable for homestead purposes, which the state might buy, giving bonds therefor, and cut it up into small farms. In East Texas there are millions of acres of fertile timbered land that might be made available. Farm building and loan associations might be authorized to buy, subdivide, and sell lands to home-buyers.

The trouble does not seem to be that there is not land enough, but that there is not rich black land enough for all who prefer to farm where farming is easy. But the price of such land puts it beyond the reach of most tenant farmers. Owners of lands in the Trinity Valley are now offering a million acres to 200,000 tenant farmers "without payment for one year, and allowing forty years thereafter in which to make payment." Details have not yet been furnished.

The Dallas News has probably made as large a contribution to the discussion of this subject as any other agency. For example, it applies to Texas the proposal of Lloyd-George that not the use made of the land but its possible use be regarded the criterion of its value and of the tax to be imposed. We tax idle land less than land in use, putting a premium on holding land in idleness for speculation, and penalizing the enterprise and labor of the man who uses his land to help clothe and feed the country. We discriminate in favor of the man who, instead of making his land serve society, makes society serve his land.

The chief significance of it all is that the people realize that there is a condition demanding a remedy. Many proposals are, of course, more radical than any of those just mentioned. But conservatives keen to catch the scent of Socialistic innovations, individualists jealous of any extension of the exercise of governmental authority, under the exigencies of a political campaign find themselves warmly advocating just such radical schemes of social control. They are coming to see that although a man may hold a title to his land, the control of it is conditioned and limited by considerations of social welfare; that while land may afford a legitimate opportunity for investment, it does not for speculation; and that the co-existence of the landless man and the manless land is intolerable.

COUNTRY CLUB GIVEN TO CHICAGO SOCIAL WORKERS BY JULIUS ROSENWALD

CHICAGO'S COUNTRY CLUB FOR SOCIAL WORKERS

JUNE 20 was "recognition day" to the social workers of Chicago and in the annals of the city's public and volunteer social work. Then it was that they received the first and very substantial recognition of appreciation for their work and of their personal need of friendly consideration. They had long since gotten together in their Social Service Club—now numbering more than 500—to give and take comfort and aid to each other in its good fellowship. Good as this has been, something still better, in the form of a country club house at Riverside on the Desplaines River, had been planned and was now presented by their friend and fellow worker, Julius Rosenwald.

In accepting the gift on behalf of the trustees, Jane Addams said it would be entrusted gladly to the care of the Social Service Club so long as it really represented all the social workers of Chicago without discrimination against any. By adding two dollars to its one dollar membership fee, all the privileges of the Country Club for Social Workers can be secured.

The house which, with its 14 acres of rolling wooded land, cost \$50,000, is situated on a beautiful bend of the river. A large living-room with a great open hearth and a hospitable dining-room occupy most of the first floor. The second floor has 24 dormitory rooms. The basement is well equipped with bathing and locker facilities. As many as 200 day visitors can be accommodated. The house is to be kept open the year round, with Mr. and Mrs. James Minnick as house father and mother.

CO-OPERATION IN CHILDREN'S WORK IN PHILADELPHIA

PHILADELPHIA HAS MADE much progress toward co-operation among its 75 institutions and agencies caring for more than 10,000 children at an annual cost of nearly two million dollars. Two round table conferences organized by the Children's Bureau, one for colored institutions and one for white, have developed into permanent conferences. The one is known as the Round Table Conference for Work Among Colored

People, and the other as the Conference of Institutions for the Care and Training of Children.

Four years ago the colored institutions reorganized their age and sex requirements for admission, so that all overlapping is avoided.

During this past winter the Conference of Institutions for the Care and Training of Children made a study of their work. This disclosed that nearly all of the institutions, caring for Protestant children, restrict their admission ages to from four to nine years. This means that instead of placing children in family homes at the age when they are most placeable, they are taken into institutions and kept there until older, and, therefore, more difficult to place. It also means that when older children must be removed from their homes they have to be placed in family homes, when in many instances they should go to institutions for industrial training. It was also disclosed that no institution is giving high grade industrial training.

Based on these facts, the conference adopted the following recommendations, and appointed a committee to endeavor to carry them out:

1. That no normal child under eight (or ten) years of age, should be placed in an institution except for temporary care, or unless family placement would necessitate separating children of the same family.
2. Each institution should employ a trained investigator, or have its investigations made through a central agency.
3. Each institution should have a systematic record system which will give the family history and necessary information concerning each child.
4. More aggressive efforts toward family placement should be made either by the institutions themselves or through a central agency.
5. One institution should discontinue its present work and give temporary care (one month to three months) to children, pending permanent disposition.
6. Another institution should discontinue its present work and become a working-boys' home.
7. Two other institutions should equip themselves to give trade training to older children, one to boys and one to girls.

FOR REST AND RECREATION, HOME OF MOBILE BUSINESS WOMEN'S CLUB, FAIRHOPE, ALA.

RECREATION AND A SOUTHERN BUSINESS WOMEN'S CLUB

ORGANIZED BY working women for working women, the Mobile Business Women's Club is an interesting instance of what may be accomplished by a group of energetic women in solving their recreation needs. Truly self-reliant and independent, these women made no effort to get large gifts for the club, but determined to swing the project absolutely on their own resources.

With the object "to provide and maintain a place where the self-supporting women and girls of Mobile can rest and recuperate during their summer vacations and when recovering from illnesses at a price within reach of their purses," the club must first of all have a home. The story of how a stretch of three acres of land at Magnolia Beach, on the eastern shore of Mobile Bay, eighteen miles by water from Mobile, was acquired, a spacious club house which accommodates 200 guests was built in about eighteen months' time is a story of real business efficiency.

The land was scarcely paid for, the club members, all working women, could not give large amounts, and there was the club principle against soliciting outside financial help, but to have a club house these business women were determined.

They decided that the club should issue bonds secured by deed of trust on the land and improvements to be made thereon. These bonds were to sell at \$10 and bear 6 per cent interest. When the bonds did not sell as well as expected a floating debt was assumed and a building costing \$8,000, was erected.

The comforts of this country house are given to members for \$4 a week. Club dues are \$6 a year, payable 50 cents a month. And there is a bit of philanthropy practiced. The club hopes to be able to provide rest and comfort to a number of self-supporting women who, because of limited earnings or heavy responsibilities, cannot afford membership. Such women, in increasing numbers as the club debt is decreased, will be entertained as guests of the club.

In the conduct of the club affairs the same efficiency is shown as marked the efforts to get a clubhouse. A governing committee, composed of president, vice-

president, secretary, treasurer and eleven directors, handles the club's business. The club's secretary is a stenographer and the treasurer is a bookkeeper and neither they nor any of the club officials are paid. Not even the housekeeper receives a salary. She and her husband, in return for living quarters and the use of the ground for garden and chickens, care for the house and furnish meals for the profit they make on them. Average current expenses of the club are not over \$10 a month.

The Mobile Business Women's Club has attracted members from the professions, trades and business—lawyers, physicians, saleswomen, stenographers, dressmakers, nurses, teachers and bookkeepers. They work, or rather play, together in the club in most friendly relationships, apparently recognizing that their work in life is but a matter of different education and that all work is useful to society no matter how humble.

FIVE YEARS OF JUVENILE COURT WORK IN ST. LOUIS

The St. Louis Juvenile Court has just issued a report of the court's work, covering the five year period from 1908 to 1913. The report was prepared by Hugh M. Fullerton, chief probation officer.

The number of cases, the proportion of boys to girls, of colored to white, the percentage of children put on probation and committed to institutions have varied but little during the five years, though the judges in the court have changed frequently. One striking fact is the decrease of the number of cases brought by the attendance officers of the Board of Education, due to the fact that the public schools have made extensive provision for dealing with truants and exceptional children in the schools. During the last two years the court's jurisdiction was increased to include children sixteen years of age, which naturally resulted in a large increase in the number of cases brought before the court.

The statistical tables were prepared through the assistance of the St. Louis School of Social Economy. The report furnishes extremely valuable information for students. It is not being generally distributed but will be sent to interested persons upon payment of four cents postage.

CHICAGO SCHOOL OF CIVICS AND PHILANTHROPY

FIFTY-FIVE STUDENTS received the certificate for having completed the full year's course at the Chicago School of Civics and Philanthropy in the eighth regular class to be graduated. Of 139 who registered for the regular course, 64 per cent had previously taken college training. The 137 who registered in extension courses were almost exclusively on the paid staffs of public or private agencies.

The 276 students thus far enrolled, with the registrations of the summer session, will mark the present academic year as far in advance of any other, both in the number of students taking credit courses and in the exactions required of them.

The demand of the field for those trained in the full course is such that almost all the graduating class had positions offered them before the completion of their year's work. The class of 1914 contributed to the school a students' loan fund, which promises to grow by similar gifts from other classes. Judge Julian W. Mack's address to the graduating class was on The Social Worker in Relation to the Immigration Problem.

The announcements for 1914-15 include a second year course, to which students having pre-professional college courses will be admitted on entering the school. Those not thus specially prepared but whose capacity has been tested by practical experience, are eligible to the first year's course, for which a certificate will be given. All who have not had academic discipline or who in college have not been trained in economics and related subjects are urged to take two years of training in the school.

Eight research studentships and two research scholarships have been awarded for 1914-15. The honorary senior research studentship was received by Helen R. Wright, Smith College, 1912, Chicago School of Civics and Philanthropy, 1913.

The new feature for the coming year is the elaborated course for playground workers, who will receive much of the regular first-year training and will take their technical work in the public playgrounds and field-houses, at the Hull House gymnasium and at Chicago Commons and other settlements.

EASIER NATURALIZATION

There are 3,500,000 unnaturalized men in this country. Usually a county's clerk office is open only during the hours when these men are working, so that they are met by an obstacle at the very outset of the naturalization process.

Newark and Cleveland have sought to remove this obstacle by opening the clerk's office one evening a week. A petition asking for such an arrangement in New York, where the clerk's office is open only from 9 to 4 five days a week and from 9 to 1 on Saturday, has been sent to the clerk's office under the auspices of the Citizenship Bureau of the South Harlem Neighborhood Association.

INDUSTRY

COLLECTIVE BARGAINING AND INDUSTRIAL UNREST —BY JOHN A. FITCH

FEELING RAN HIGH at the hearings before the Federal Commission on Industrial Relations at Philadelphia last week. There were times when if shillalahs could have been used, instead of mere language, there might have been scenes reminiscent of an old-fashioned Donnybrook Fair.

Sharp differences of opinion between witnesses were frequent. The situation grew tensest when John M. Tobin, vice-president of the Blacksmith's Union, was permitted to heckle and cross-examine Alba Johnson, president of the Baldwin Locomotive Works, and when on another occasion a representative of the Pennsylvania Rapid Transit Company was given the same chance at William B. Fitzgerald, an official of the Amalgamated Association of Street and Electric Railway Employees, when the latter had gone on the stand to criticize the Philadelphia street railway management.

Evidence of industrial unrest cropped up frequently and more than at any preceding session the commissioners asked witnesses to give their opinion as to its cause.

John Wanamaker gave it as his opinion that it is due to misunderstanding which could be done away with if employers and employees would get together and develop mutual sympathy.

W. P. Barda, general manager of the Midvale Steel Company, blamed it on the newspapers. He said that if the papers did not emphasize so much the differences of opinion that exist, employers and employees would cease to draw up in opposing camps as they are now. They must learn that the interests of capital and labor are absolutely identical. When they learn that, they will work together harmoniously and there will be no more unrest.

Prof. Scott Nearing of the University of Pennsylvania intimated that there were too many people living without working. If a man happens to have had a grandfather who owned some real estate in the center of a large city and who passed it on at his death, the grandson never will have to work. He will live on the efforts of other men who work and pay him rent.

As a result of inequitable methods of taxation especially, great luxury and great poverty appear side by side. The division between the rich and the poor is accelerated also by labor-saving machinery which tends to decrease the number of skilled men at high wages and increase the number of unskilled who receive low wages. Therefore the tendency is constantly to increase the proportion of the profits that goes to capital and to decrease the proportion that goes to labor.

Probing the Causes of Unrest

VIII

The eighth of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

Alba Johnson, president of the Baldwin Locomotive Works, had a categorical denial for Nearing's charges against the existing social order.

"The principal cause of unrest," said Johnson, "is the universal craze to get rich quick. Too many people are living beyond their means." Things would be very much better, he said, "if we could inculcate in the minds of the youths, the idea that opportunities for advancement are greater now than ever before in the history of the world." He denied also that labor-saving machinery is bringing down the rate of wages.

"The more complex the machinery," he said, "the better the man required to operate the machine." Then with improved machinery production is cheapened; demand therefore increases and opportunities for employment increase.

James H. Maurer, president of the Pennsylvania Federation of Labor, who was referred to by Commissioner Weinstock as the "highest and finest type of the intelligent labor leader," dissented most vigorously from the statements of Johnson and Barda.

"We do everything up-side-down in Pennsylvania," he said. "We go after the effect, but we very seldom attack the cause. We have learned better with regard to contagious disease. We try to prevent disease instead of curing a man after he gets sick. But we haven't learned that about other things.

"The state spends millions of dollars to run down and punish criminals—many of them fifty-year-old men with six-year-old brains. In the same spirit we make raid after raid on the red-light districts. We want to drive out these wicked people, harass them, persecute them, but all the while we are doing nothing that will affect the cause of crime. All the while we are pursuing

criminals we are making more criminals. We spend so much money attacking the effect that there is nothing left with which to find the cause of crime."

The entire problem of social unrest, he said, is due to fundamental economic changes resulting from the development of steam, which has made it possible for a few men to amass enormous fortunes while vast numbers of men are always on the border line of starvation. "This is true," he said, "in spite of the fact that our production is now the greatest ever known in the history of the world. The only remedy I can suggest is the government ownership of all the machinery for producing the actual necessities of life."

"Isn't that Socialism, pure and simple?" asked Mr. Weinstock.

"Pure, but not simple," answered Maurer, while the audience applauded.

The labor of women and children, minimum wage legislation and vocational training came in for a good deal of discussion.

John P. Wood, vice-president of the Pennsylvania Manufacturers' Association, spoke in bitter opposition to the minimum wage idea. He said that it would throw out of employment thousands of people who are not capable now of earning the minimum that might be established but who can earn something. It would be a terrible injustice to these people, he felt. As to restricting the labor of women and children, he favored it with regard to certain industries. Indeed, there are some industries from which he would exclude them altogether on account of their hazards or on account of the lack of adaptability of women and children to the work. Aside from that, he said, if he were a woman he would resent having his liberty so entrenched upon.

The chief differences that arose between union men and the employers had to do with the question of discrimination. The union men alleged that this exists very widely, especially in the Baldwin Locomotive Works where, they declared, men had been discharged for belonging to a union. The same charge was made regarding the Philadelphia Rapid Transit Company. These charges were denied by representatives of the companies.

Out of the maze of conflict there were three important lines of constructive testimony. One had to do with eight-hour legislation; the second with the administration of laws regarding child welfare; and the third was a new kind of working agreement between capital and labor.

It was an employer in an industry that has gained a wider notoriety than any other for its long hours of labor who proposed an eight-hour law. W. P. Barda, general manager of the Midvale

Steel Company of Philadelphia, was asked whether he favored a universal eight-hour law.

"Absolutely, yes," replied Mr. Barda. He went on to explain that his company does a certain amount of work on government contracts. In these they are obliged to maintain the eight-hour day. Experience in the eight-hour day in this line of work has demonstrated, he said, that in jobs where strength or skill are necessary there has been an improvement in the amount of work done. On other jobs, such as in a machine shop where the work necessarily involves a great deal of waiting, no improvement has been noted. However, it is inconvenient to have one-sixth of the force working eight hours and the other five-sixths working a longer time.

Costs in general would be higher, he said, if they put all their employes on the eight-hour basis, but it could be done if their competitors did the same. He could see no way of accomplishing this end except by law and, therefore, would favor having the government establish by statute an eight-hour day in the industry. When questioned further, Mr. Barda said that while this would equalize competition in the United States, it would severally handicap American manufacturers in foreign markets. As to local markets, however, there would be no difficulty. Costs would increase somewhat but the burden would be passed on to the consumer.

The problems of the child who leaves school to enter industry between the ages of fourteen and sixteen were discussed from several angles. The child's problem of securing the right kind of a job and society's responsibility in assisting him were made clearly apparent. It was made apparent, also, that there is much duplication and wasted effort.

James S. Hiatt, formerly secretary of the Public Education Association of Philadelphia, testified that there are no less than five public agencies dealing with children during this period. First, there is a Compulsory Attendance Board having jurisdiction over all children,—the sick and the well and the delinquent. Then there is a medical bureau dealing with the sick; a probation board dealing with the delinquent; a vocation bureau having responsibility for the children who wish to go to work; and finally the State Bureau of Labor and Industries which has jurisdiction over all. These agencies are working independently without very much regard for each other.

Mr. Hiatt recommended that there should be a department of child relations, and in this single department should be centered all the authority having to do with the welfare of children. The authority for issuing working certificates should rest there also; and he suggested further, that instead of issuing a certificate to the child, who then could work or not as he saw fit until the compulsory attendance officer happened to catch him, the certificate should be issued to the employer and granted to him only when he is ready to offer a job to the child. Then if the child quits or is discharged the employer should immediately return the certificate to the

issuing authority which should immediately communicate with the child.

This would make it possible to keep a constant check upon the children who leave school. It would assist in placing them in the industries for which they are fitted and it would make it absolutely certain that the child would be either at work or in school. This centralization of authority has been tried out successfully in Cincinnati.

A unique method of adjusting relations between employer and employe was revealed in the so-called co-operative plan of the Philadelphia Rapid Transit Company. T. E. Mitten, chairman of the Executive Committee of the company, went on the stand and explained the system in detail. He reminded the commission that there had been serious and disorderly strikes of the Philadelphia street car system in 1909 and again in 1910. Not only was there conflict between the employers and the employes, but there was conflict between rival labor organizations—two of them at first and before the trouble came to an end, three.

Mr. Mitten was at that time connected with the Chicago Street Railway Company and had had some experience in handling labor troubles. The Philadelphia management asked him to come and see if he could work out a solution. After helping to solve the financial troubles of the company, Mr. Mitten said that he began to examine the labor situation and found that the wages that the men had been receiving amounted to 21.8 per cent of the gross passenger revenue of the company. This included besides wages certain benefits that were paid by the company.

Mr. Mitten said that he felt that with the co-operation of the men, an improvement in service could be secured that would increase revenues. Therefore, he worked out a plan for putting 22 per cent of the gross receipts into a fund from which wages would be paid, and for a co-operative committee, consisting of the men and superintendents to adjust whatever difficulties might arise. No attempt was made to enforce the plan from above. Instead the men were asked to decide by vote whether they would deal with the company collectively through a union or whether they would accept the co-operative plan, which would do away with unions but would give the men representation on the co-operative committee. The company stated further that a two-thirds majority would be required to carry either proposition. The co-operative plan was adopted by the men by a vote of almost exactly two-thirds.

Accordingly, the plan went into effect early in 1912. Several changes have been made since then in the method of selecting the co-operative committee. At first they were appointed by the superintendents. In April, 1912, it was decided that the men should vote for representatives, two to be selected from each of fourteen depots. At first 80 per cent of the men voted, but in the last ballot 98 per cent of them did so. At first the ballot was not secret, but by the use of a machine it is claimed

that a secret ballot is now had.

The success of the plan, Mr. Mitten declares, is demonstrated by its results. The men have a keen interest in making the 22 per cent fund as large as possible. Therefore, motormen are not inclined to run by a group of people waiting on a corner and conductors are on the alert to secure each fare. The men try in every way, he said, to improve the service. Smoking and spitting on the cars has been practically eliminated. There are 80 per cent fewer complaints from passengers than used to be the case. There has been a 25 per cent decrease in all accidents and a 35 per cent decrease in fatal accidents and at the same time there has been a 25 per cent increase in the number of passengers.

On the side of the men wages have increased from the maximum in 1911 of 23 cents an hour to a maximum in 1914 of 30 cents an hour. The average of 1911 was 22 cents and a fraction; it is now 28 cents, and 47 per cent of the employed are receiving the maximum wage, since there is a sliding scale dependent upon length of service. This tends to show that the men are remaining in the service of the company. The number of men dismissed has dropped from 1,635 in 1911 to 536 in 1913 and 334 so far in 1914. The number of men voluntarily resigning has been cut from 1,390 in 1911 to 956 in 1913 and 337 to date in 1914.

In addition to improving the service, the company contributes to benefit funds for the men and has made an arrangement whereby about one hundred stores in Philadelphia allow a reduction of 8 per cent in prices to employes of the company.

Two employes of the company, one of them a member of the Co-operative Committee, went on the stand and endorsed the plan highly.

Representatives of the union and leaders of the 1910 strike, however, denounced it and claimed that under unionism wages would have advanced just as much, while certain grievances which now exist would have been adjusted.

William B. Fitzgerald, member of the Executive Board of the Street Car Men's Union, charged that material abuses have grown up and that the so-called Co-operative Committee has no power whatever to deal with them. It can only act in an advisory capacity. This charge was practically admitted by Mr. Mitten when he told the commission that in the last analysis he acted as a supreme court to pass upon the decisions of the Co-operative Committee.

It was charged by Mr. Fitzgerald that the ballot employed in electing members of the Co-operative Committee is not secret. While this point was combatted by representatives of the company, the matter seemed to be left in some doubt. The plan, however, seems to have possibilities. Stripped of its defects, real or imaginary, there seems to be no reason why it could not be worked out effectively in many industries.

The inquiry into conditions prevailing in the garment trades revealed the bitterest kind of feeling. When Morris

Bernstein, president of the Women's Garment Manufacturers' Association of Philadelphia, told the commission that last year's garment strike was caused solely by imported labor leaders and that 85 per cent of the workers went out unwillingly, jeers came from every part of the room. And sarcastic laughter, taunts, and "boos" from the workers greeted his statement that in Philadelphia higher wages were paid than in any other American city. He asserted that the average was \$20 a week and that women piece workers made from \$18 to \$30 a week.

"They're so avaricious that they'd give up their sleep to do it. If we didn't close up our shops and turn off the light and power, we'd have some of them working all night."

If the testimony of Max Amidur, president of the Joint Board of the Cloak and Suit Makers' Union, was to be believed, avarice might not prove to be the only factor. According to him, conditions had been so much worse since last year's strike of twenty-six weeks that it would "take very little to ignite one of the worst industrial explosions in the history of Philadelphia." Wages had been reduced 20 per cent and only 10 per cent of the workers were earning a living wage. The home-work system prevailed largely and living condi-

tions were especially bad, he declared.

"Mr. Bernstein charges that this was a manufactured strike and that the workers had no grievances," said Amidur. "I tell you that men and women do not stay out on a strike for twenty-six weeks if they have no grievances."

Asked to propose a remedy for the industrial unrest, he said:

"Laws should be enacted which would make employers fear strikes. There should be a law which would make it an offense for either employers or unions to violate their agreements."

Most of the textile manufacturers' representatives who testified placed themselves on record as favoring a workmen's compensation law. None of them was in favor of collective bargaining.

Arthur Spencer, managing director of the Dobson mills, was ready to admit that if an agreement could be formulated between employers to pay higher wages and remove competitive bidding for labor, it might result in better conditions. He doubted the possibility, however, of making such an agreement. He was upheld by W. P. Moore, manager of the Brown Knitting Mills Company. But Mr. Moore confessed that he has as little confidence in the ability of manufacturers to keep faith among themselves.

lating to fire prevention in mercantile establishments was emphasized by Anna Phillips, who investigated the fire hazard in eighty department stores throughout the state for the commission. She found that in 50 per cent of the stores the elevator shafts, and in 75 per cent the stairways, were unprotected by fire-resisting material. She called particular attention to the risks in the basements of department stores.

Of the twenty or more laws passed last year at the instigation of the State Factory Investigating Commission, several came in for criticism, especially by manufacturers who found themselves hampered by the new measures. Joseph Rowen, representing the artificial ice manufacturers, thought that the law requiring one day's rest in seven should exclude ice manufacturers as well as ice gatherers. Hugh Frayne of the American Federation of Labor contended that there was no reason why the request of Mr. Rowen should be granted if he paid sufficient wages to command more men, and he further urged the extension of the one-day-of-rest-in-seven law to telephone girls, cashiers, telegraph operators, waitresses, girls in offices and ticket agents on elevated and subway lines.

The new law prohibiting the work of women in factories between 10 p. m. and 6 a. m. also had its opponents. Judge Amend, attorney for the Charles Schweinler Company, which is now testing this law in the courts, appeared with four women employed in the printing trade. They declared that they preferred night work and that they could make as much money working three nights as they could working a whole week by day. Again, the American Federation of Labor rose in protest and Rose Schneiderman, vice president of the Women's Trade Union League, retorted

HEARINGS ON THE RECODIFICATION OF THE NEW YORK STATE LABOR LAW

CLOSE ON the heels of the hearings before the Federal Commission on Industrial Relations has come a similar group of public hearings in New York city before the State Factory Investigating Commission. While lacking the interest of a forum where employe and employer confronted each other with their grievances, the hearings before the Factory Commission were of definite value since each bit of testimony focused on the proposed recodification of the New York state labor law.

For nearly a year the commission has been trying to remodel the present cumbersome law into an orderly code.

The most insistent criticism of the code was the duplication of inspections and the issuance of conflicting orders by city and state authorities. Like L. B. Prahar, a Brooklyn iron manufacturer who was ordered to build a ladder to the roof of his factory by the Fire Department and told to remove it by the Labor Department, many of the witnesses were "all muddled up." The remedies suggested for Mr. Prahar's dilemma ranged from that of James Lynch, commissioner of labor, who would give the Department of Labor complete jurisdiction over factories and eliminate other inspections, to that of Rudolph Miller, superintendent of buildings in Manhattan, who would create a new department of public safety consolidating the present departments of labor, tenement house inspection, health, fire and the bureau of buildings.

To many, the Industrial Board of the Department of Labor presented a means of solving the complexities and injustices of the labor law. "The statutes should

lay down general principles," said Maurice Wertheim, a member of the board, "and the Industrial Board should work out details and make individual application of the law. The board should, however, be given power to modify as well as amplify the statutes."

The need for more stringent laws re-

FLORA AND CANARY BIRDS PART OF THIS FACTORY'S EQUIPMENT.

Flowers and birds serve a very useful purpose in the workshop, H. F. Porter of Chicago, tells us. It has been proved that where these do not flourish and thrive, conditions are not what they should be for human beings.

Flowers are a test of the humidity; if the air is too dry, as is frequently the case in steam heated interiors, plants will wither and wilt.

Bird life, on the other hand, like human life, needs oxygen; and if there is a deficiency of oxygen, the fact is speedily evident in drooping spirits, lessened activity and stilled song notes.

that it seemed absurd to repeal a law benefitting thousands of women workers for the sake of about one hundred and fifty women employed at night in the printing trade.

Another Factory Commission measure criticized, not its stringency, but for its leniency, was the law restricting home work on certain articles of food and clothing and prohibiting the work of children in tenement manufactures. Lillian D. Wald of the Nurses' Settlement, George Hall of the New York Child Labor Committee, and Elizabeth Watson all testified that the only way of regulating home work was by total prohibition.

Miss Watson exhibited a newspaper of May 15 wherein 185 firms advertised for home workers, seventeen of which advertised for workers on prohibited articles. She also told of visiting a girls' reform home where the matron said 70 per cent of the girls had venereal disease, and finding the inmates at work on infants' boots and sacks.

The enactment of new laws for the protection of women workers was recommended by several witnesses. Nell Swartz, of the Consumers' League, and Elizabeth Dutcher, of the Retail Clerks' Union, urged the abolition of the Christmas exemption in department stores, the posting of state regulations of working hours in department stores and the increase of mercantile inspectors. Miss Dutcher also recommended a law prohibiting blacklisting, such as already exists in twenty-three states.

Frederick Cunningham, chief counsel of the Department of Labor, James Gernon, chief of the Mercantile Bureau, and Marie Orenstein, special investigator for the commission, all emphasized the long hours and hard work of women employed in hotel laundries and in restaurants over which the Labor Department has no jurisdiction. Mr. Gernon pointed out the incongruity of a law that prevented women working more than fifty-four hours in the finest mercantile establishment and allowed her to drudge seventy-two hours in the poorest hotel beside it. He did not agree with Frank Bolen, attorney for the Hotel Association, who asserted that, while hotel owners were ready to comply in every way with the labor law regarding machinery, they themselves could decide "reasonable hours" for their women employees.

Marie Orenstein produced statistics showing that in thirty-five restaurants which she investigated fifteen women worked from sixty to seventy hours; fifty-five worked from seventy-one to eighty hours; four from eighty-one to ninety hours; and two worked ninety-eight hours, being employed seven days in the week from seven a. m. to nine p. m.

"Women who work in canning factories," said Mrs. Orenstein, "are now subject to state supervision, yet the woman who opens the cans and gets them ready for table service is not protected by law."

Members of the State Factory Investigating Commission who conducted the hearings are Robert Wagner, lieutenant governor, chairman; Alfred Smith, Charles Hamilton, Edward Jack-

son, Cyrus Phillips, Robert Dowling, Simon Brentano, Samuel Gompers, Mary E. Dreier, and Abram Elkus and Bernard Shientag, counsel.

EMPLOYMENT AGENCIES IN PORTLAND—By Edwin Anders Instructor Washington High School, Portland

In Portland, Ore., workmen may get employment through labor agencies run for commercial gain or through a municipal free labor bureau. The city free labor bureau furnishes, for the most part, odd jobs of a few hours or of a day or two,—not of much service to laborers but a convenience to people who want work done.

The private business agencies furnish employment to workmen with contractors, in and out of the city, for street paving, railroad building, logging and other kinds of work where more than a few hours of work is needed. These agencies furnish most of the jobs to the workmen, and in some cases, are the only mediums of information between the workmen and employers.

To get jobs, workmen walk from one agency to another, reading the bulletins written in crayon upon black painted walls and traveling back and forth until they find a job they want, or which they think they can get. Upon a blackboard is written: "Wanted—25 Tunnel men—soft dirt—\$3.50." Men gather and discuss the sign. "Soft dirt" may mean that they will have to work in mud and water. A few workmen are urged to come into the office for information. The clerk says the fee is \$2.50 in advance, to be remitted if the job is misrepresented. A description of the work is given, but before the place is made known \$2.50 must be paid. Then the workmen are asked to be at the office at some stated time, a few minutes before train time, and as they get on the train they read on their tickets their destination.

Each man must have a "slip," so called, a receipt from the employment agency showing that he has paid his fee and obtained his information from a certain agency. The agencies and the employers seem to work together. A "split fee" system is said to be practiced. The employer gets part of the

fee charged the workmen at the employment agency.

One owner of an employment agency told the writer that he has lost several chances of placing large groups of workmen because he refuses to "split fees." He stated, further, that contractors employing hundreds of men make money by discharging small groups of men, from time to time, and collecting "split fees" from new recruits or perhaps the same men who return to the same job through the agency. Municipal ordinances are in effect to prevent this practice, but through inability to get sufficient proof, the practice is apparently continued. Laborers are loud in their condemnation of the present employment system, but employers and agencies deny that any crooked work is being done.

Workmen, in Portland, may go to the city free employment bureau, get odd jobs and so gradually sink from the dignity of regular workmen to casual laborers. If they desire permanent employment, they must risk their chances with the fee-charging agencies, be employed, dropped, re-employed, work long hours on day or night shifts during the busy season, and be dropped again during the dull season. The workmen are treated as brutes. Their time and services are bought and sold by the men in control. Under present conditions, with about ten men for every job, it is not easy to find work. The agencies are not organized to co-operate with each other for the convenience of workmen. The only co-operation is that between the agency and the employer.

BOOKBINDING FOR WOMEN IN PHILADELPHIA

To supply data for a program of vocational education and guidance, the Consumers' League of Eastern Pennsylvania is publishing a series of pamphlets, *Occupations for Philadelphia Girls*, the third of which describes women's work in the bookbinding trade in Philadelphia.

The facts were secured through interviews with 108 employers, 158 workers, and a pay roll study in six binderies. Nearly half the workers studied were members of the trade union, although not more than a quarter of the women in the trade are union members. A comparison of the wages received by union and non-union workers shows higher earnings for the union girls, and it may be doubted, therefore, whether in view of this undue proportion of union members in the group interviewed, it is fair to regard as typical the surprisingly long tenure of service and regularity of employment among them.

The author of the pamphlet does not compare conditions in Philadelphia with those revealed in a recent investigation in New York, but in form of tables and schedules used the data are comparable with the facts presented in the Russell Sage Foundation study of this industry. On the basis of such a comparison wage rates appear to be higher in New York but employment less steady.

LABOR PROBLEMS vs. BRIDGE BUILDING

I believe that it is more important for a senior to gain a good comprehension of present-day labor problems than to spend six or eight hours per week in detailing a plate-girder bridge; and, as an academic means to equip an engineering graduate for intelligent citizenship, it would be more profitable for him to consider the fact that between 10,000,000 and 20,000,000 people in our prosperous America are near the poverty line and design measures of relief for them than to design a gas engine.—W. H. Raynor, Instructor in Civil Engineering, University of Illinois.

Communications

The latch-string of the Communications Department is out to all readers of THE SURVEY. Lively debate and good cheer are to be had within. But the space available for the department makes necessary the following house rules:

1. Communications of 250 words or less, criticising, protesting against, or developing something published in THE SURVEY, will be published, so far as possible, in the first issue after receipt.
2. All other accepted communications will be published in the order received, if space remains *after* the letters described in paragraph 1 have been used.
3. The maximum length of communications is 500 words, except in cases where the writer convinces the Editor that more is needed. The extreme limit is 1,000 words.
4. Contributing Editors and authors of signed articles will be given an opportunity for rejoinder in the same issue in which letters of criticism are published.
5. In discussions back and forth between readers, each succeeding letter is limited to half the length of the previous one from the same contributor.
6. The Editor reserves the right to reject letters which he regards as libelous, letters of spite, letters on subjects outside the field of THE SURVEY; and for other good and sufficient reasons which he would be prepared to defend.

GEORGE

TO THE EDITOR: I fail to see in the decision of the boards of directors of the George Junior Republic, and the board of judges, vindication of Mr. George that is claimed in your editorial of May 16. Does not the responsible position of Mr. George as a leader of young men and women justify the demand that his moral character should measure up to the most exacting standards?

ERIC L. ALLING.

Princeton, N. J.

HYMNS

TO THE EDITOR: You were good enough to forward, at the request of Rev. T. Albert Moore, a sample copy of THE SURVEY to me. It so happened that a committee preparing a new hymn book for the Methodist Church in Canada was in session at the time, and, finding so many excellent hymns referring to labor and social conditions in the issue you sent me, I handed it over to a member of the committee. I am very glad to say that quite a number of the hymns will be placed in the new hymn book, and be sung by about a million and a half people.

S. D. CHOWN.

Vancouver, B. C.

SEGREGATION

TO THE EDITOR: May I call your attention to a criss-cross of usage that has often occurred to me, but which was conspicuous in your recent report of the

social hygiene section of the National Conference of Charities and Correction? Namely, the use of the word "segregation" to indicate first, an exploded theory of dealing with the social evil, and second, the most up-to-date and humane way of handling the recalcitrant or weak victims of that evil. I suggest for general usage, or at least in articles in which both are mentioned, the use of the word "colonization" or "isolation" or "rustication," to indicate the second meaning of the word.

THOMAS D. ELIOT.

[Pacific Coast Secretary American Social Hygiene Assn.]
San Francisco.

OLD AGE

TO THE EDITOR: I notice that recently you have been giving considerable space to a discussion of old-age pensions and I thought the following excerpt from More's Utopia would be interesting. He is referring to the treatment accorded by society to the aged poor.

"But after it hath abused the labors of their lusty and flourishing age, at the last when they are oppressed with old age and sickness, being needy, poor and indigent of all things, then forgetting their many painful watchings, not remembering their many and so great benefices, recompenseth and acquitteth them most unkindly with miserable death."

This was written over 400 years ago and yet appears to fit into a description of things existing at present. In fact, there are a good many suggestions in More's Utopia, that might well be taken

advantage of by reformers of the present age.

WILLIAM O'CONNOR.

[Inspector, Neglected and Dependent Children.]
Toronto.

ABOLISH THE SLUMS

TO THE EDITOR: The universal use of the word "slums" is unfortunate. It has an unsavory meaning to most people. But who can define it? Does it apply more to things than people or more to people than things? One may say it applies to both things and people. People make "slums."

There are many good and intelligent people who live in those districts commonly called "slums." And yet these people are stigmatized by this term which connotes so much and may mean so little. It is not a democratic word. If it is a reproach to any one, those who do not live in the slums may be quite as reproached by contributing directly or indirectly to their existence as those who live in them.

A great packing house with all its noxious odors is a place where many good people earn their daily bread, and many of them live in the vicinity of the abattoir. There are those who refer to such a locality as "slums." This is wrong. I think we should limit the use of this term, make it apply specifically to certain conditions or drop it altogether. Indeed, there may be a term which would serve our purpose better.

EPISTLE TO IRISHMEN

TO THE EDITOR: Yesterday I had a letter from a man who has been in my employ for many years, and who has during those years found great enjoyment in reading every issue of THE SURVEY. Last year he fell ill, and the doctor advised a visit to his home in Ireland, for some months. So he went last October, and as he is an American citizen he hopes to return later. He has found much enjoyment in THE SURVEY, and I will quote from his letter, written in a tiny Irish village, May 18:

"I find many changes here in 20 years—that is, my old friends have all gone from here—but I wonder how the young people live without one bit of enjoyment—nothing but work, all the time. There isn't a place within six or seven miles where they can get together for even a dance or party."

"A bright lad just out of school, a neighbor, comes here evenings and reads THE SURVEY from beginning to end; and in the issue of November 22 was an article Redeeming Rural Recreation in a Big Red Barn. We couldn't find a barn, but we got a site for nothing, and a gentleman who owns a large estate started our subscription paper with five pounds."

"The fund has been growing all winter and now it amounts to about one hundred pounds, and we are going to

build a village hall. The work will start next week—and the whole idea came from THE SURVEY."

This seems to me a splendid result, and especially so to come from a man who is at present physically disabled, yet whose mind has been filled with inspiration from your paper.

M. W. F.

Lexington, Mass.

COMMUNAL FACTORIES

TO THE EDITOR: In view of the conditions under which some clothing particularly, and often food products, are manufactured in the tenements of New York and other great cities it should be a law that no clothing or food should be manufactured anywhere without thorough inspection and the articles so branded that purchasers will know the conditions are satisfactory.

Our government does not permit tobacco to be worked or sold without government license and something like this should be adopted for clothing and food, for if the manufacturers were not permitted to send out such goods except with a government label it would greatly help conditions. This might work hardship temporarily for tenement workers, but out of such a law there will come the following plan to remedy the tenement working conditions.

A great many enterprising municipalities have buildings in which small manufacturers can rent floor space under most favorable conditions. Why should not our own municipalities put up, in proper localities, sanitary factories for the very poor who make clothing and flowers and prepare nuts and other foods, the city government collecting a very small rent?

Surely some multi-millionaire might well perpetuate his memory in the gratitude of hundreds of thousands of people by erecting such buildings, the difference between the rent and cost of operating being borne by a fund for the erection of such buildings.

The ability to do more and better work will always leave some reasonable sum for the rent of the machine upon which the work is done.

Such a plan will cause a great mental and moral uplift of tenement conditions and might well revolutionize them.

S. W. HAMILTON.

St. Paul, Minn.

HALVING THE TAX RATE

TO THE EDITOR: In your issue of April 18, Prof. E. R. A. Seligman states: "There is not a single economist of note who approves, or who has ever approved, of the single tax. We may have our sins, but that heinous charge, at all events, cannot be laid at our doors."

We are not discussing the single tax nor anything approaching it, as Professor Seligman is aware. Measured by Professor Seligman's eminence in the economic world, economists who favor untaxing buildings, or halving the tax rate on buildings, may not be "of note," but among them are: Profs. Irving Fisher, of Yale; T. N. Carver, of Har-

vard; Walter E. Clark, of City College of New York; E. A. Ross, and John R. Commons of Wisconsin; E. T. Devine of Columbia; C. Linn Seiler of the University of Pennsylvania; Franklin L. McVey of the University of North Dakota; Royal Meeker of Princeton University. We have their written statements in our office.

A number favor entirely exempting buildings from taxation. Professor Commons, for instance, says: "I have long been strongly convinced that a gradual reduction of the tax rate on buildings, leading finally to exemption of all improvements, will be one of the most important gains that could be accomplished in our system of taxation. This is peculiarly true as a city grows in size, and, of course, my judgment would apply to New York more than any other place in the country."

Professor Seligman must realize that there is a middle ground between taxing every object, in and out of sight, and the single tax. That middle ground, heavier taxation of land values, the people of this city have reached. This fact is appreciated by land speculators. Hence their frantic efforts to prevent a referendum on this question.

F. C. LEUBUSCHER.

[President, Society to Lower Rents and Reduce Taxes on Homes.]

SKILLED LABOR?

TO THE EDITOR: I must differ somewhat with Mr. Fitch in his opinion that the hearings of the Industrial Relations Commission on department stores were entirely contradictory and inconclusive. After attending all these hearings as an outsider, unfamiliar with the details of store conditions, I formed several well-defined opinions.

First, that store managers and members of the union were looking at the situation from such different viewpoints that the objections of the latter were seldom met or understood by the former. The sore points were apparently not low wages, but rather compulsory benefits, the firing system and discharge without notice, and usually without information as to the cause of dismissal. These were none of them satisfactorily explained by store managers.

Questioning by the commission brought out the fact that managers recognize no good reason for having employees represented on a "grievance committee" or similar body in which questions at issue might be discussed impartially and to which complaints might be brought. Separation between the government and the governed could not be more complete, yet the management, often benevolent in its intentions, seems to rest in sublime ignorance of the bitterness now evident as the result of this separation. Employees can always appeal "higher up." No notice has been taken of the fact that they almost never do appeal from the decision of their immediate superiors.

Although the other testimony was conflicting at times, the side-lights were most illuminating. If department store

work is a skilled occupation, as claimed by the union, it has a low average wage. If unskilled, the wage compares favorably with that of other kinds of work in the same class. Its specialized functions may demand skill, but the ease with which positions are filled and the lack of any control on the part of employees of the conditions of employment bring it into the class of the unskilled. No standards are discoverable whatever and in spite of the higher average intelligence of its members, department store work approaches very nearly that much maligned occupation, domestic service.

E.

A FEW QUESTIONS

TO THE EDITOR: In your issue of April 11, Bertha Bradley Warbasse, answering critics of minimum wage legislation, makes this statement: "Either it is desirable that all who work be given enough of the wealth they produce to live on, or it is not."

This suggests to me a few questions that I wish Mrs. Warbasse or some reader of THE SURVEY would answer.

Mrs. Warbasse evidently assumes that the workers produce all wealth which is correct, because if not, then some of the wealth must be produced by those who do not work, which is absurd.

Therefore, granted that the workers do produce all wealth, and, also, that "he who labors is entitled to the full product of his labor," why is it that the workers are dependent upon others for enough to live on, and are unable to take care of themselves?

If all who work are given enough to live on by others, the others must be non-workers. These others being non-workers, the wealth they have to give is not a product of their labor, and as Mrs. Warbasse correctly states, it is the product of those who work. But how, then, do the non-workers come to possess it?

Producing no wealth themselves what do they give the workers in exchange for the wealth they receive? Or, do the workers freely and joyfully give away to the non-workers the most of what they produce, retaining for themselves so little that the non-workers are moved to return to them enough to enable them to live?

If the wealth possessed by the non-workers is not their own product, is not theirs by exchange of service for service, and is not theirs by gift, how do they get it, and by what right is it theirs? Like the Japanese school-boy, "I ask to know."

As to whether it is, or is not, desirable that the workers be given enough to live on, I would say that it is not. Would it not be more desirable to allow every worker to retain directly the full product of his labor? Taking nothing from him, there would be no need of giving anything back to him.

I think this could be accomplished, not by strikes, employers' agreements, or by government regulation, but by the public appropriation of ground rent.

JAMES B. ELLERY,

Erie, Pa.

SAFETY AT SEA

TO THE EDITOR: The London *Graphic* of June 6 says: "Everything that modern science has invented for the safety of life at sea, every appliance by which the greatest risks might be eliminated, had been given to her [the *Empress of Ireland*]."

Yet the picture of the *Empress*, published in the same *Graphic*, shows equipment of obsolete type: roundbar davits and open wooden life-boats along the deck on both sides. One change, hardly an improvement, was a number of collapsible canvas boats, the value of which has not been demonstrated at sea.

I agree with the New York *Evening Post* that it would be unreasonable to expect shipowners to rebuild or reconstruct all their old ships because it is still an open question whether ships constructed in accordance with the latest recommendations—the so-called unsinkable ships—will prove unsinkable. Since practically the same authorities vouch for the unsinkableness of the new construction as claimed that the *Titanic* was unsinkable, there is reason for doubt. It will scarcely be practicable to build merchantmen as unsinkable as men-of-war, yet even these sink occasionally.

It seems, therefore, that safety appliances should be taken more seriously than heretofore. Because marine insurance companies give better premiums and rates on ships properly equipped, there is a monetary inducement to ship-owners to install wireless and submarine signals or other instruments for protecting the ship and cargo. But the human cargo is not insured by the shipping companies.

Life-boats are white elephants which do not pay dividends on capital, but are carried as fire-escapes are placed on buildings—to meet the requirements of the law. Governments must, therefore, go very far in their requirements for life-boat equipment to force ship-owners to try out the best appliances, in a businesslike way, on the high seas.

The regulations proposed at the International Conference on Safety at Sea were principally based on recommendations of the Departmental Committee of the British Board of Trade, who submitted their report after conferences in offices and experiments in harbors and swimming pools in England. But at no time did they go out to sea and actually try out any equipment. Instead, the Departmental Committee left loopholes in their articles for equipment to be later invented. They ignored reports submitted to them of experiments and tests conducted by the United States government. They paid no heed to the lessons taught by the *Volturno* disaster, immediately before the conference. They gave preference to old-fashioned wooden and collapsible canvas boats, notwithstanding that it had been so recently shown how little these can withstand the waves when being launched. ALICE MATTULLATH.

New York City.

TO THE EDITOR: Kindly allow me space in which to reply to the letter in your issue by J. W. Walton, the ship

chandler, of Cleveland, regarding the LaFollette bill. The statistics he offers are misleading, to say the least.

It is true that during the past five years there has been comparatively small loss of life among passengers on the Great Lakes. But I am sure Mr. Walton will not deny that several passenger vessels have been involved in serious disasters during that period, and that loss of life was avoided by only a narrow margin.

There was the *Iowa*, sunk in a collision with the *Sheboygan* at the mouth of the Chicago harbor last July. Both were passenger steamers, but fortunately, the *Iowa* had no passengers on board at the time. The *Pere Marquette* foundered on Lake Michigan in September, 1910, drowning 27 of her crew, just four days after the vessel had been taken off the excursion run in which she had been carrying as many as 2,000 people daily. Several vessels have been destroyed by fire, among them the very best on the Great Lakes.

Let one of these disasters take place with a full passenger list on board, and the catastrophe will overshadow any sea horror that ever occurred, because the passenger steamers on the Great Lakes carry larger crowds per ship than is permitted anywhere else in the world, except, perhaps, in China.

The number of these vessels is small but the toll they will gather in human life, if permitted to continue their present methods, will be tremendous. It is inescapable so long as vessels of that type are permitted to jam as many as 4,000 human beings on their decks. The LaFollette bill, by requiring life-boats for all, will compel them to reduce the number of passengers to reasonable safety limits.

The Great Lakes are not regarded as particularly safe waters even by ship-owners. Mr. Walton does not tell the story of the twelve ships, ten of which were steamers, that foundered during a gale on the lakes last November, about 240 seamen losing their lives within half a day. During the past nine years twenty-eight vessels have foundered with all hands on the lakes, and in most instances they were steamers. Only a few weeks ago the *Benjamin Noble*, a comparatively new steel steamer, foundered on Lake Superior drowning her entire crew of nineteen men.

Most of these steamers were better fitted to encounter bad weather than is the average passenger vessel on the lakes. Mr. Walton is certainly familiar enough with marine affairs to know all this. He should have told you about it so that you could get a clear view of the situation.

The steamer route between Sandusky and Cedar Point, with which Mr. Walton is much concerned, is not affected by the LaFollette bill. The route is entirely within the harbor known as Sandusky Bay, and the bill excludes harbors.

The claim that the bill will require a certain vessel to have a "crew of 450 and to carry 183 life-boats" was evidently not intended to reach the eyes of practical seamen familiar with the Great Lakes. Mr. Walton fails to give the name of the vessel he refers to. Let me

supply it. It is the excursion steamer *Put-in-Bay*, running between Detroit and Sandusky. Her regular passenger allowance is about 1,000 persons, which however, is extended to 3,200 on an excursion permit. She has life-boats for just 120 persons.

If Mr. Walton wants that condition to continue he should say so frankly, without juggling figures. Under the LaFollette bill that steamer would be limited to her regular allowance of about 1,000 persons, and 17 life-boats of 60 persons capacity each would accommodate that number, and the number of able seamen combined with men of higher rating required for the boats would total 34.

I have sailed the Great Lakes most of my life. I know those waters, their ships, their sailors, and even their ship-owners. Mr. Walton knows that I do.

V. A. OLANDER.

[Secy., Lake Seamen's Union.]

DR. SPINGARN

TO THE EDITOR: The brief account in *THE SURVEY* for May 30 of the meeting held by the National Association for the Advancement of Colored People in Avery Chapel in Memphis during the sessions of the National Conference of Charities and Correction, is so incomplete that it makes it possible to misunderstand entirely the real spirit of that meeting and the motive of at least one of its speakers, our chairman, Dr. Spingarn.

Dr. Spingarn did not say at Memphis what he has been quoted as saying. At his request an account of the meeting was written in our New York office and released to the press. Since Dr. Spingarn had not prepared a speech, and sent with his request from Memphis no notion of what he would say, some impressions of conversation with him were incorporated in the article by its author.

Dr. Spingarn did not go to Memphis to raise the red flag. It was far from his purpose and from that of our other representatives there to attack any individuals or organizations. They went, as they printed in the announcement of their meeting, to speak out "to all who love the truth and dare to hear it." Their object was neither to offend nor conciliate but to arouse and to encourage,—more especially to arouse and to encourage the radical South, white and black, in the same spirit so eloquently expressed by Mr. Villard in his widely quoted address at our recent conference in Baltimore, when in commenting on our choice of a southern city, he characterized such reactionaries as Blease and Vardaman as traitors to the South and said that the bearers of its new message, the message of the "Human Way," would never have opportunity to come to their fullest expression if an organization like ours was afraid to preach its propaganda where it was most needed.

In justice to Dr. Spingarn and to our association, I should appreciate your printing this letter.

MAY CHILDS NERNEY.

[Secretary National Association for the Advancement of Colored People.]
New York.

JOTTINGS

Labor Sunday has been set for September 6. Labor Day falls on September 7.

Judge Robert J. Wilkin of the Brooklyn Children's Court announces that children's cases are no longer tried in open court but in a private room. None but those directly interested in each case is admitted.

Dr. Arthur Lankester, a British army officer, has been appointed by the government of India to study the tuberculosis situation preparatory to widespread measures of prevention to be set on foot throughout the country.

The Philadelphia Bureau of Occupations for Trained Women, which has helped college women to find employment, primarily in social work, has extended its work to include volunteers who can spare only a limited portion of their time.

The New York Charity Organization Society announces that on October 1 it will open a new district—the Lowell District. This is made possible by an appropriation of \$5,000 for one year given by the Junior League, a group of society women interested in social service.

Three Orientals, soliciting for a fictitious orphanage in Judea, have been arrested and deported as a result of action by the Associated Charities of Sioux City, Iowa. They bore credentials from Mar Sergius, of Hakari, Asia, and the Rev. A. K. Duff of New York city.

A serviceable reference book for immigrants, *The Immigrant's Guide*, has just been published by the Immigration Bureau of the Department of Public Welfare of Cleveland. The book is printed in eight languages: English, Italian, German, Hungarian, Polish, Bohemian, Russian and Yiddish.

In the annual report of the Board of City Magistrates of New York city, Judge McAdoo calls attention to the increased use of finger printing. Prejudice against it is passing away. Finger-prints are now being taken of all cases of intoxication, vagrancy, "jostling" (professional pickpockets), "mashers" and rowdies.

Representatives from practically every hospital in Philadelphia met recently to plan greater co-operation among hospitals and greater efficiency in their management. A committee of the County Medical Society has been developing methods which will increase co-operation, limit the establishment of new hospitals to proper locations, and seek to secure greater efficiency.

The National Housing Conference will travel farthest west when it goes to Minneapolis, October 21-23. Until a year ago Minneapolis believed it had no bad housing conditions. Since then it has investigated, and as a result the Civic and Commerce Association has four committees working on the problems discovered.

The Committee on Buildings and Grounds of the Board of Education of Chicago has passed a resolution recommending that a new school be named for the late Jacob A. Riis. The school site is in a location largely populated by immigrants, and so to name it for the man who earned the title of "the finest immigrant that ever came to this country" seems particularly fitting.

The National Child Welfare Press Service has organized and elected Bert Hall of Milwaukee, president; Edwin D. Solenberger of Philadelphia, vice-president; H. Wirt Steele of Baltimore, secretary; John A. McCormack, treasurer; James L. Clark of Chicago, director. The object is to furnish to newspapers articles on various aspects of child welfare. An annual budget of \$25,000 is proposed.

Authority has been granted to the Bureau of Municipal Research of Chattanooga to establish a council of social agencies to supervise charitable organizations of the city. It is proposed that the council be made up of two delegates from each organization, and its duties will consist in passing on the work of affiliated members and preventing duplication of effort.

In a company over 1,500 strong the American Nurses Association, the National League of Nursing Education and the National Organization for Public Health Nursing, assembled in annual convention in St. Louis. Among the topics discussed were: standardizing of nursing and nurses' training schools, preparing of students for public health work, uniform laws for the registration of nurses.

Twenty members of the Structural Iron Workers' Association, convicted in the "dynamite conspiracy" cases resulting from the McNamara confessions, began their terms in Fort Leavenworth Penitentiary on June 26, their appeals for pardon having been denied by President Wilson. Four were set free, as having only a minor part in the conspiracy. Action was deferred in the cases of two others.

The Conference on Unemployment Among Women, New York city, has protested against the action of the State Civil Service Commission in excluding women from positions in the new State Bureau of Employment. The protest points out that fully one-third of the wage-earners of the state are women, that women suffer peculiarly from unemployment and that dealing with it has traditionally been considered as a work open to women.

DO YOUR XMAS PLANNING EARLY

THE SURVEY desires to know as many cases as possible in which Christmas gifts have taken the practical form of pensions through the year. Also, wherever plans last year were based upon community interest and developed into new ways of observing the Christmas season.

Will anyone who has such results to report, or plans to suggest for extending the "Community Christmas" idea, write as soon as possible to the Christmas editor, THE SURVEY?

RECREATION IN CLEVELAND

No better use of the extra hour of daylight, which up-and-coming Cleveland gains with the adoption of Eastern time instead of Central, could be made than to devote it to summer enjoyment.

With two thousand acres of park lands; two public bathing beaches on Lake Erie; tennis courts and playgrounds in twenty parks; golf links in one park; canoeing on two park lakes, municipal three-cent dance halls at two parks; nine municipal three-cent refreshment stands in parks; band concerts in parks afternoons and in congested neighborhoods evenings; and twenty playgrounds—what more could the city do to lure its 700,000 people to out of doors recreation?

The New York School of Philanthropy

UNITED CHARITIES BUILDING
105 EAST 22d ST.
EDWARD T. DEVINE, DIRECTOR

**A PROFESSIONAL TRAINING
SCHOOL, OF GRADUATE RANK, FOR
SOCIAL AND CIVIC WORK**

ANNOUNCEMENT FOR 1914-15
WILL BE SENT ON APPLICATION

CHRISTOPHER EASTON

Executive Secretary for five years of the Minnesota Association for the Prevention and Relief of Tuberculosis, and
**LECTURER ON VARIOUS ASPECTS OF
THE PUBLIC HEALTH QUESTION**
announces that he will enter into arrangement for his services as a lecturer with committees of teachers, civic and commercial organizations.

SUBJECTS—"Our Biggest Tax, Preventable Disease," "Vital Statistics; or the Bookkeeping of Public Health," "Some Rural Sanitary Problems," "Efficient Public Health Administration, What it is and How to Get It," "The Place of the Public Institution in the Life of a Community," and "The Administrative Control of Tuberculosis."

For terms, dates, etc., apply to General Extension Division, University of Minnesota, Minneapolis, Minn.

VACATION

Your own is about to begin isn't it? Congratulations!

But before you give yourself up too completely to jubilation, **let us know where you are going.** Don't leave it until the last suit case is packed.

To prevent delay or break in the receipt of issues, we must know the week before you wish the change to be made.

"The National Training School prepares for executive positions in Young Women's Christian Associations. Address Secretarial Department, 600 Lexington Avenue, New York City."

ENTERED AT THE POST OFFICE, NEW YORK, AS SECOND CLASS MATTER

INTRODUCE YOUR FRIEND TO THE SURVEY

Haven't you a friend who *ought*, as the saying goes, to be a reader of **THE SURVEY**, one who would really appreciate the issues if he but knew the magazine *well*?

Why don't you introduce him to us at least, if you do not wish to pay for an extra subscription?

Here is our suggestion in the form of a special offer:

A Renewal and a Trial Subscription of 8 months for a Friend, \$4.00

Mail us \$4.00, and we will not only renew your own subscription but will also send **THE SURVEY** to any address in the United States for *eight months*.

If you have more than one friend to introduce to us, send us fifty cents for each and we will mail them issues for thirteen weeks.

The GIST of IT—

CLEVELAND can go the Gold Dust Twins one better. It not only scours and polishes but tears down unsanitary houses as a part of its clean-up campaign. Page 406.

MISSOURI'S Supreme Court, in holding the state juvenile court law unconstitutional, seems to swing back to the old theory of juvenile crime. The law was based on the theory that a child is the ward of the state, to be protected rather than punished. Page 406.

MASSACHUSETTS has diagnosed its immigration problem, found it pretty bad in every respect and prescribed some remedies. A review of the state commission's report. Page 409.

ST. LOUIS social activities are grouped in a department of public welfare in the progressive new city charter. Page 405.

PITTSBURGH has abolished its public outdoor relief, consisting chiefly of a fortnightly basket of food, and the private charities are handling the situation. Page 405.

THE survey of the University of Wisconsin will turn a modern high-power light on the bookworms, if there be any a year. Page 416.

CALIFORNIA collegiate alumnae show their state as nigher than any Yankee commonwealth when it comes to spending money for schools. Page 417.

PRESIDENT WILSON'S Commission on Vocational Education, reporting ahead of schedule and with one-third its appropriation unspent, has drafted a plan for extending the help of the federal government to the states in providing vocational education for 25,000,000 workers in agriculture and industry. The ultimate cost will run up to \$7,000,000 a year. Page 416.

ONTARIO province has set an example for all North America in including industrial diseases along with accidents in a compensation law. Progressive European countries did it long ago. Page 413.

IF you buy glass from Pennsylvania, coal from West Virginia or preserved fruits from Delaware—not to explore further South—you are an accomplice in the employment of child labor, no matter how good the law of your own state. Only a federal law can save you. Page 411.

THE Good Samaritan was good enough in his time, but his daughter, the visiting nurse, must be not only nurse but social worker, too, able to diagnose a family as a doctor does diseases. Page 414.

THE SURVEY

COMMON WELFARE

PITTSBURGH'S BASKET OF FOOD FOR WIDOWS

ALTHOUGH two months have passed since the Pittsburgh Department of Charities ceased supplying outdoor relief, representative private charities report that their burden has not been increased because of it.

Pittsburgh's efforts to discontinue outdoor relief date back to the last months of 1913 when a number of surveys were made of the city departments. These showed that the Department of Charities spent approximately \$24,000 a year in relief and that to administer this sum six inspectors were required.

It had become a kind of unwritten law in the department that, in addition to coal and shoes, the maximum amount of relief to be furnished in the way of staple commodities was \$1.35 worth every two weeks. It made no difference whether a family consisted of two persons or ten, the amount was the same.

The case of a deserted woman and six children is given as an illustration of the method. Ordinarily the woman and two daughters worked, but when one daughter fell ill the mother was obliged to give up her work. At this time the only income of the family was \$3.50 a week, earned by the second daughter. The Department of Charities allowed the family a basket of groceries every two weeks.

The efficiency company which investigated the Department of Charities recommended that instead of appropriating money for relief to the department, the city should appropriate directly to the Associated Charities. The Associated Charities, however, refused to accept what would practically have amounted to a subsidy. It offered, instead, to make all the investigations of applicants for city outdoor relief and to make requisition upon a fund appropriated by the City Council to the Department of Charities for food, rent and other relief.

Toward the close of December the City Council practically decided to discontinue the administration of outdoor relief by the Department of Charities and to allow the Associated Charities to undertake the work. A new administra-

tion came into office in January, however, and nothing was done. The Council delayed the general appropriation bill for the city until the end of January. Then the exceedingly cold weather was utilized, whether for humanitarian or political purposes, and a public clamor was aroused to demand that the city help its poor. Immediately \$10,000 was voted for this purpose with the provision that all of it be spent in three months.

The Department of Charities announced in the newspapers that it was ready to supply relief. It was at once thronged with applicants and in the succeeding three months more than twice as many persons were aided as during the same period of the previous year. It was felt by many social workers that relief had been given indiscriminately and carelessly. At any rate, all of the \$10,000 appropriation was used.

When the question of a further appropriation for outdoor relief was brought before Council, hearings upon the subject were held. Visitors from the Associated Charities testified as to the inefficiency of the work of the Department of Charities and the Council made no further appropriation for relief.

COMMITTEE ON WHITE LIST FOR INVESTORS

The work of drawing up a "white list" of securities will be undertaken by a committee recently appointed by the Episcopal Social Service Commission, collaborating with a committee of the Consumers' League. The Episcopal committee consists of Bishop Lawrence of Massachusetts, Robert Hay Woods of Boston, and Vida D. Scudder of Wellesley College. Labor conditions in corporations offering securities for public sale will be investigated, and it is hoped through this action to make clear the ethical obligation of purchasers and holders of stocks, especially among church members.

The appointment of this committee was suggested by Mary E. Clarkson of Germantown, Pa. In an article, *The Responsibility of the Small Investor*, Miss Clarkson first put the idea forward in *THE SURVEY* of July 26, 1913.

SOCIAL FEATURES OF THE NEW ST. LOUIS CHARTER

ON JUNE 30 the voters of St. Louis adopted a new city charter drawn along the most modern and democratic lines. It is a popular-government-municipal-ownership-efficiency charter. It displaces a thirty-eight-year-old instrument drawn on the theory of checks and balances, under which St. Louis has had her share of boodle, corruption, inefficiency and spoils politics.

The social features of the new charter are conspicuous. A thorough-going civil service system is provided and the administrative departments are greatly simplified.

A new Department of Public Welfare is created with a commissioner at a salary of \$8,000 a year. Under him are the departments of parks and recreation, health, hospitals, and correction, each in charge of a commissioner appointed by him.

Permission is also given to establish divisions for research and publicity concerning the causes of poverty, crime and disease; free legal aid, a municipal lodging house and a free employment bureau.

Two administrative boards are retained outside the Department of Public Welfare, chiefly because these boards have large discretion in granting public funds to individuals. These are the Board of Children's Guardians, which has jurisdiction over the Industrial School and the placing-out of destitute children in family homes, including mothers' pensions; and the Mullanphy Board, which administers a million dollar trust fund for the benefit of travelers and immigrants. The Mullanphy Board has been reduced in number from an unwieldy membership of thirteen to three.

The new charter puts St. Louis in the front rank of American cities in substituting scientific and stable government for the haphazard and inefficient government of "spoilsmen and the interests." It is hailed by social workers as opening the way to them for public service in many directions and as creating the greatest opportunity the city has ever had for attacking the problems of poverty, disease and crime.

TORN DOWN IN THE CLEAN-UP

Under the viaduct, three stories of it below street grade, this tenement was one of the worst in Cleveland

CLEVELAND CLEANING UP WITH A WRECKING CREW

CLEVELAND'S "clean-up week" went far beyond the usual furbishing of vacant lots and sweetening of garbage cans.

The actual work lasted two weeks at the end of April and the beginning of May when the city Bureau of Sanitation, re-enforced by the city Fire Department and the state fire marshal's men, made a visit through the city's worst housing sections.

The results are now showing in great gaps where ramshackle houses and tenements once stood. For the orders issued as a result of the clean-up fortnight have meant the razing of over 200 dwellings housing 500 families and of 150 sheds and barns, and the repairing of 137 other dwellings.

Parts of Cleveland look almost like Salem after its fire. The Haymarket district, once called "the worst square mile of housing in America," and Franklin Hill, up which rickety dwellings climbed in dishevelled order, suffered most severely, but with most clear justice to principles of right living. Thirty days of grace allowed by law have now elapsed. Franklin Hill is decimated of buildings, and great gaps are being torn in the Haymarket district. The work is proceeding as rapidly as official action can force it.

Meanwhile social agencies are housing the 500 dispossessed families with less difficulty than had been anticipated. Mildred Chadsey, chief of the Bureau of Sanitation, says:

"This housing clean-up will, I am sure, stimulate building enterprise. Builders couldn't and wouldn't compete with the old structures. Many of the families which formerly were content to live un-

der bad conditions now are finding a higher earning capacity which makes better quarters easily available. And, for that matter, it is cheaper for the community to care for these folks than to allow them to live under such conditions as we have eliminated. Moreover, any difficulty we have along this line will prove a means of drawing attention to the scarcity of sanitary, inexpensive homes for workers."

The actual change of living conditions which these evicted families undergo is being made the subject of study by Miss Chadsey. Records taken before the family moved will be compared with records of the same facts to be made a year later. Items to be considered are number in family, adults, minors, boarders, number of wage-earners, income per month, occupations, regularity of work, standards of living and health. Miss Chadsey expects the investigation, when completed, to bring out significant material on the relationship of living conditions to earning capacity.

COUNTY JAILS CLASSED WITH SING SING

SPECIFIC SUGGESTIONS for improving each of the county jails of New York, and urgent recommendations that fourteen of them be abandoned and new ones erected in their places, are the results of inspections made throughout the state by the Prison Association of New York during the past year.

Nearly everything that can render a place unsuitable for habitation was found over and over again by the association's inspectors. Many jails were found to be firetraps, many were found to mingle indiscriminately young and old, first offenders and "repeaters," those convicted and those awaiting trial. Food was often discovered to be of poor

quality or inadequate in amount. Bad ventilation, insanitary sewage, idleness, and inadequate supervision were found in many jails.

Definite recommendations for the improvement of each of these conditions are presented in the report of the inspections. The association declares its belief that the county jail, "in its present form and management, should be abolished." It calls it "the worst institution, generally speaking, in our correctional system," and says that it is "in most instances inevitably a school of crime."

The association has but one recommendation to make with regard to Sing Sing prison: "Abandon it and substitute therefor a modern farm industrial prison." Erected in 1821, this prison was built, says the report,

"at a time when dungeons were used for cells and when the health of the inmate received practically no consideration. . . . The close proximity of the cell house to the river, its slight elevation above the tide water mark, its lack of air space, its heavy mass of stone construction, both interior and exterior of cell blocks, together with the worthless system of ventilation, convert them into vast refrigerators which condense the warm and humid air, causing moisture to be deposited on the cell walls, rendering them damp and watery."

MISSOURI JUVENILE COURT LAW UNCONSTITUTIONAL

THE MISSOURI juvenile court law, applying to every county in the state except the six largest, was held invalid by the State Supreme Court by a unanimous decision rendered in May.

The law, passed by the Legislature in 1913, was modeled on the so-called Rochester law and other recent enactments based on the chancery or equity procedure. It was not a criminal statute. It vested probate courts throughout the state with sole power to act in the cases of all neglected and delinquent children.

The Supreme Court held the law invalid on two grounds: first, because it conflicted with a provision of the constitution which requires that the duties of probate courts shall be uniform throughout the state; and second, because the act, while applying to children who committed crimes, failed to follow the criminal procedure set forth in the constitution.

On the first ground there is very little difference of opinion, although many lawyers think the law might have been held constitutional even as to that.

On the second ground, however, great surprise and chagrin are expressed that the Supreme Court should have held to the antiquated notion that a child is a criminal in the eyes of the law, and that he should be prosecuted under juvenile court procedure in the same way that adults are prosecuted. The court said in substance that although children were

Letting Light into Dark Places

THE picture above shows "before-and-after" rooms in the Child Federation's Baby-saving Show in the courtyard of the Philadelphia City Hall. One room is in model sanitary condition; the other far from it.

D R. W. W. TRINKLE, chairman of the committee on health of the Common Councils, has called upon the mayor to remove this "filthy room" on the ground that it reflects on the good name of the city.

SOCIAL workers, on the other hand, protest against its removal. Philadelphia has many such rooms, they say, a menace to health and to childhood, and it is sound policy that the public should know about it.

dealt with in the Juvenile Court for the commission of misdemeanors and felonies, yet the act denied the right of prosecuting officials to file informations or grand juries to find indictments, and denied the right of trial by jury. The court stated that the act although laudable in purpose, could not be sustained because it would be subversive of "our entire system of criminal jurisprudence."

This decision is entirely out of line with the view that the delinquent child is a ward of the state, not to be punished but to be protected and guided along the road to good citizenship.

Social workers are planning to write a new juvenile court act applying to every county in the state, based even more flatly on the chancery or equity procedure.

The juvenile court law which applies to the six largest counties in the state was not before the Supreme Court, but the court went out of its way to indicate that if it were, it would be sustained, for it permits prosecuting officials to file informations and permits trials by jury.

WOMEN ELIGIBLE FOR EMPLOYMENT BUREAU

The attention of the women in all parts of New York state is called to the examination for the ten offices in the new state Bureau of Employment, to be held on July 25.

An examination for the positions in the new bureau was held on June 27. But by the ruling of the State Civil Service Commission, acting under the direction of Commissioner of Labor

Lynch, the offices in the bureau were declared open to men only. 350 men took the examination.

The exclusion of women from the first examination was challenged as especially reactionary in view of women's recognized ability in the sort of work the new bureau requires, because of the peculiar suitability of women for certain divisions of the new bureau's work, notably that concerning juvenile employment and because it contradicted traditions already established in the State Department of Labor, for the head of another bureau, Industries and Immigration, has always been a woman.

As a result of protests from all over the state and from the Conference on Unemployment Among Women in New York city, Commissioner Lynch has arranged with the State Civil Service Commission for a parallel examination open to women only.

The many women in the state whose ability, experience and interest fit them for these ten positions are urged to take the examination on July 25.

Applications must be received in the office of the commission in Albany on or before July 21. No application blanks will be sent out by mail after July 18.

One director at a yearly salary of \$4,000, and nine superintendents at \$2,000 each will be appointed. The superintendents are to take charge of branch offices in various cities.

The law establishing the bureau provides that the director "shall have recognized executive and managerial ability, technical and scientific knowledge upon the subject of unemployment and

administration of public employment offices and recognized capacity to direct investigations of unemployment and public and private agencies for remedying the same."

Each candidate for the directorship must file with the State Civil Service Commission on or before July 25 a detailed plan for the organization and administration of a state employment office. This paper must be typewritten on paper about 8½ x 13 inches, be of not fewer than 1,500 or more than 4,000 words, and must be accompanied by an affidavit that it is the original, unaided composition of the author.

For the office of superintendent, the requirements are not specifically given. The assumption is that they approximate the requirements for the director, excepting that the nine superintendents do not submit a plan of organization.

The Conference on Unemployment Among Women, 95 Madison Avenue, New York city, offers to suggest material for study and to furnish copies of the bill providing for the new bureau to women who will take the examination.

A HOUSE - PARTY CONFERENCE ON THE FEEBLE-MINDED

THE ASSOCIATION for the Study of the Feeble-minded, which used to be called the Association of Medical Officers of Institutions for the Feeble-minded, held its annual session at Columbus, Ohio, last month.

There is something very charming and homelike about these annual conferences. The meetings are held at the institutions, and for the two or three days, the mem-

bers, their wives and invited guests are entertained in the house.

This means doubling up of the usual number of occupants of bed rooms, and sometimes setting a lot of the men off by themselves in a temporarily vacated dormitory, in which case the grave and reverend seniors sometimes revert to the gaiety and even the pranks of their college days, so that it is a "time of refreshing."

The formal papers and discussions are the least valuable part of these sessions. The members see the new features of the institution and confer about lots of plans and methods.

At Columbus, one of the oldest and largest institutions of the kind in the country, the special point of interest was the splendid new colony farm, reached by a twelve mile auto trip, where 300 moron and imbecile boys are practically earning their own living.

Next in eliciting admiration and praise among attendants at the conference were the fine performances of the orchestra of feeble-minded boys and girls.

Among the topics discussed the two that attracted most attention were those on Classes for Backward Children in the Public Schools by Miss Walsh of New York, and Extension Departments for Feeble-minded by E. R. Johnstone of Vineland, N. J.

A lively discussion followed this latter paper. The extension method proposed and already in practice to some extent was explained by Alexander Johnson who also reported on the details and results of an extension campaign in Virginia late last fall.

The association voted to appoint a committee to consider the extension method and to report on co-operation with the Vineland work. The committee appointed consisted of the following members: Dr. Fernald, Massachusetts, Dr. Rogers, Minnesota, and Dr. Morigridge, Iowa.

RURAL THEATRICALS: EXPERIMENT OF A WESTERN AGRICULTURAL COLLEGE

E. G. ARVOLD

Founder of the Little Country Theater

The little theater idea, for better drama, is not new as a city venture. Privately owned little theaters, in various large cities of our own country as well as abroad, are serving a worthy purpose. The first attempt at carrying the idea into a rural community has been made by the North Dakota Agricultural College at Fargo. This Little Country Theater, however, besides stimulating intelligent appreciation of the drama, purposes to become a center of activity for the people of the countryside which will make city attractions less alluring and induce the people to stay on the farms.

Apparently working on the theory that it is small use to teach farming unless life on the farm is made attractive, A. G. Arvold, founder of the Little Country Theater, has adopted the policy of making the theater a "sociological

experiment station." In the State Agricultural College there are several hundred students, and it is the plan to have them all during the school year do some work in the theater, either as actors, playwrights, stage hands, producers or members of choruses. By this actual participation in things theatrical the students are fitted to go out from the college and establish similar theaters in their own rural home setting.

With what practical foresight this result has been planned is shown in the simple nature of all the physical details of the theater. A room on the second floor of the college administration building, about the size of the average town hall, seating capacity 200, has been fitted up as a model theater for the open country or small village. Everything on and off the stage is reduced to the simplest form possible so that the setting up of such a little theater in a rural community may be accomplished without expert assistance.

The object of the Little Country Theatre is to produce such plays as can be easily staged in the country school, the village hall, or any place where country people assemble for social activity. Emphasis will be laid on the one act play and scenes taken from dramas depicting foreign life.

Since North Dakota has a large population of foreign people, nationality programs—plays, folk dances, and music—will be given frequently. Young people are encouraged to write plays, to be staged by Little Country Theater casts, choosing for their themes subjects dealing with country life and community problems.

An admission fee of from five to fifteen cents is charged for all programs, the money being used for scenery, costumes and promotion work.

AUDIENCE AT THE LITTLE COUNTRY THEATER, WITNESSING PERFORMANCE OF A ONE-ACT COMEDY, CHERRY TREE FARM. NINETY PER CENT OF THEM ARE FROM THE RURAL DISTRICTS OF NORTH DAKOTA

THE PROBLEM OF IMMIGRATION IN MASSACHUSETTS—BY KATE HOLLADAY CLAGHORN

IT IS ENCOURAGING to see some of the interest devoted to foreign immigration turning from the question of exclusion or admission to the question of what to do with the immigrants once they are here. For while we are disputing about the desirability or undesirability of admitting them, in they are coming, year after year, thousand upon thousand, steadily adding to the weight of the "immigration problem"—such as it is.

The care of immigrants after arrival would seem to be particularly a function of the states. They can have nothing to say about the admission of immigrants but must take the consequences of their presence. The federal government, on the other hand, which can admit or exclude, has no powers or facilities for continued supervision.

Yet the states have been slow to take this matter up. Many of them have so-called "bureaus of immigration," but these are primarily for the purpose of attracting settlers of a selected kind, whether native or foreign. Only two states, New York and California, have bureaus of immigration in active operation which have for their object the care of the foreign immigrant. Two more states, New Jersey and Massachusetts, have laid the foundations for such care by creating—New Jersey in 1911 and Massachusetts in 1913—commissions on immigration to investigate and make recommendations.

The Massachusetts report, which has lately appeared, is a thorough and admirable piece of work, and should prove instructive and stimulating to other states which ought to be taking hold of the same problem. For the conditions shown by the careful original investigations of the commission are those that characterize communities generally where immigrants are found.

There are, naturally, characteristic lo-

cal differences. It appears, for instance, that methods of dealing with immigrants at the port of Boston are far behind the methods followed in New York. Inspection is carried on not at a central station where facilities could be made adequate but at the different docks where steamers arrive; the detention quarters are "disgracefully inadequate," and passed immigrants are discharged into a common waiting room immediately after inspection without further care or guidance to fall an easy prey to the various species of vultures which infest such places.

Exploitation by unscrupulous employment agencies seems to be particularly flagrant in Massachusetts. The law affecting these agencies is said by the commission to "lack all the safeguards of a good law" and is poorly enforced.

Housing conditions in which the immigrants are found are generally poor. Dark rooms, overcrowding and bad sanitation are characteristic features. There is no state housing legislation in Massachusetts, except the acts of 1911 and 1912 establishing standard requirements for towns and cities, which take effect only when adopted by a locality. Only fifteen towns and no cities have as yet accepted them as law.

With its educational traditions we should expect from Massachusetts a more adequate recognition of the educational needs of immigrants than is shown by the report. In only a few localities and to a very limited extent is special provision made for immigrant children, who, simply from ignorance of language, are often found in classes with subnormal children—a dreadful state of things. The needs of adult immigrants are most imperfectly met. In 1910-11 there were 224,000 non-English-speaking persons in Massachusetts, and it is estimated that at the very least 200,000 of these persons did not receive the

benefit of any educational means.

These are but a few of the vital topics touched in the report. It is a wonder that so much valuable material could be got together in so short a space of time. For the commission was required by the act constituting it to "make a full investigation" of the general condition of immigrants, "including their way of living, distribution, occupation, educational opportunities and business opportunities and facilities and also their relation to the industrial, social and economic condition of all the people in the commonwealth," and to report their findings and recommendations within seven months of their appointment!

A large order. And that it was filled so successfully was due in large part to the fact that the commission was fortunate in securing as executive secretary, and director of the investigation, Grace Abbott, director of the Immigrants' Protective League of Chicago, to whose "comprehensive grasp, sympathetic understanding, energetic zeal and loyal co-operation" the commission pays especial tribute in its letter of transmittal. It should not be forgotten also that one member of the commission was Prof. Emily G. Balch, whose authoritative studies of immigrant life peculiarly fitted her for this task.

The recommendations of the commission are most comprehensive, touching all aspects of the immigration problem, and range from informal suggestions for the more effective operation of existing agencies to recommendations for further legislation.

The legislative program was not expected to go through at this year's session, as the report was not presented until April, and the financial burdens of the state were particularly heavy. The most important recommendation, however, for establishing a state board of immigration to care for immigrants in various ways, has already been reported on favorably in committee and may be expected to pass at an early date.

FAILURE

Julian Walter Brandeis

I HAIL the man who toiled his days in vain,
Who waged a valiant strife that came to nought,
Who left but hope unblossomed where he fought
Nor reared a single shaft to mark a gain.
His mission such as that of sweet spring rain
That softly falling to the earth is caught
By every yearning living thing, and wrought
In all the splendor coming in its train.
No thunderbolt from him that shook the world;
And yet a flash of light that lit the way
For those who struggled bravely to the crest
Where Victory's banner rested still unfurled.
And if he had a cheering word to say
That spurred them on—what matters all the rest!

INDUSTRY

THE NATIONAL LEAGUE OF WOMEN WORKERS—BY BEULAH E. KENNARD

BIG NEW YORK scarcely knew that 400 girl delegates were being entertained by her a few weeks ago, but it was a memorable occasion to the girls; for the National League of Women Workers was holding its ninth biennial convention, and they were its representatives. This organization is composed of working-girls' clubs in nine eastern states, with seven state associations and a membership of over 14,000. Mrs. Henry Ollesheimer is president, and Jean Hamilton national secretary, with headquarters in New York.

When asked "What is the difference between this league of girls' clubs and other organizations for girls?" I have answered only, "It is democratic. The girls run it."

The earlier organizations for working women consisted of church clubs, Young Women's Christian Associations and Girls' Friendly Societies. The first two included doctrinal religious teaching; the third gave primary emphasis to personal purity by a policy of rigid exclusion. These organizations are still doing fine work, but fail to meet entirely the need of the modern girl for right self-development and for a realization of her share of personal responsibility.

Their influence is limited, because many faiths are represented in any large store or factory. An association having a sectarian character will fail to reach the staunch adherents of widely differing sects. The league, being non-sectarian, does not require religious professions, which it feels belongs rather to the home and church. This freedom has not made club members irreligious, but has developed an understanding and tolerance as fine as it is unusual.

Only last winter in Pittsburgh, the council (representatives from each club who govern the association activities) with a large majority of Roman Catholics, voted unanimously to postpone the ball which had been planned to raise money for running expenses, because the Billy Sunday revival was appealing to almost every Protestant club member, making it inconsistent for them to dance or urge others to in a week of devotions. And these girls, in turn, recognized the equal responsibilities of their Catholic friends during Lent. And so through a spontaneous mutual respect for differing religious obligations, the ball was postponed months—to the detriment of association finances, possibly, but with a splendid gain in spirit.

But sectarianism, though it limits a club's influence, need not withhold the essentials of freedom and self-government which girls earning their own living have a right to expect. The serious defect in these other organizations is

that their leadership is too maternal. Even when a group has a form of constitution and power to choose its own officers, the girls have nothing to say about its larger interests and no part at all in the governing board which decides all questions of policy. If there be any value in democracy, the girls do not get it under these benevolent despotisms. In the League of Women Workers, the National Board with its officers is elected by the club membership.

In all these forms of organization, the girls' lack of responsibility is most clearly shown in the attitude of both girls and leaders toward the question of finances. Though small dues are often paid, there is no expectation that they will meet expenses. Important expenditures are decided by the mysterious "board" in which the girls have no part.

Even the youngest and the weakest of the league clubs are bearing what they can of their own expenses. This gives them a freedom of action and a sense of responsibility for the club which is not found under any other conditions. The power of the purse is the very foundation of independence and democracy.

The value of the ideal of self-dependence was shown in a club in New England, whose original furnishings, large club rental and the constant deficit from an ill-advised restaurant, were met by one wealthy member. The salary of an executive secretary and of class teachers and the expenses of the social activities were the contribution of the remainder of the club members, and in themselves constituted as heavy a burden as the club could shoulder; but through a sense of obligation they sanctioned the plans of their well intentioned benefactress. A sudden change of fortune on her part not only made future contributions impossible, but disclosed an unexpected debt of about \$1,300.

There were 110 club members at the time, an unincorporated body which could have repudiated their debt by disbanding. But the ideal of personal responsibility had underlain all their club life. With few exceptions they signed the constitution again to signify their assumption of this burden. Businesslike arrangements were made to pay all creditors equitably. The expensive quarters were immediately abandoned for one large room up many stairs; and the handsome furnishings sold, realizing nearly \$600.

Classes and social life had to be maintained in some degree to hold the membership together, and this was done. But the chief energy went into money-making—so successfully that two years and five months from the reorganization, the last penny was paid.

The club has lost about one-fourth of its members in the two and a half years, almost all for necessary reasons, and no effort has been made to gain other members; as it was thought unjust to ask new girls to work so hard to repair mistakes not theirs. A membership campaign is now to be undertaken, and the results, with such material, cannot be doubted.

If the league clubs differ from the other groups organized through private initiative, they differ just as widely from the more recent social opportunities provided by municipalities and boards of education. In many cities, public recreation centers are now open where girls and boys may find amusement. These centers have either a sort of school supervision, or such absence of supervision that the young people are not even restrained by ordinary community standards and abuses become flagrant.

In the supervised centers (which predominate) teachers and directors are apt to be those whose experience has been entirely with children, and they treat the members of their classes as pupils only. Because of this, the interest often flags before the end of the course. The classes are not self-supporting and the groups are so shifting that they cannot develop common ties. The self-organized groups soon fall to pieces for lack of definite aim. In either case, the majority of those who use these municipal centers, are taking advantage of benefits for which they make no return.

The fault in all these plans is that they fail to develop self-dependence and initiative; the powers of natural leaders remain undeveloped; benefits easily obtained are lightly appreciated, and the prevailing irresponsibility of our time is fostered rather than controlled. There is too wide a gulf between those who are trying to teach or entertain, and those who receive such help.

The mission of the League of Women Workers is to sound the note of democracy. We would emphasize our freedom and substantial equality to those who may be unconsciously aristocratic in their spirit, and call attention to our duties, where privilege without service has resulted in social pauperization.

If our municipalities are to provide recreation for the people, the social spirit must have its roots in the community instead of being bestowed by a paternal government or school system. This spirit can only exist where the people have some form of efficient social organization and for such the self-governing, self-supporting, non-sectarian club forms the natural basis. Democracy is not merely a theory, it is an achievement. In a self-governing club, moral qualities are tested and spiritual values discovered. It is a school of character, and character is the foundation upon which democracy must finally rest.

INDUSTRIAL WELFARE WORK IN FLINT, MICH.—BY FRANKLIN V. V. SWAN

SECRETARY, MANUFACTURERS' ASSOCIATION OF FLINT

SO FAR AS it has been possible to ascertain, Flint has a system of industrial welfare work maintained by the Manufacturers' Association which is unique, so far as this country is concerned, in that the benefits offered to employees are not available unless the employees first protect themselves by carrying industrial, sick and accident insurance in their own mutual company and draw benefits therefrom for a period of thirteen weeks.

The first united local work along welfare lines resulted in the organization, September 24, 1901, of the Flint Vehicle Factories Mutual Benefit Association by the combined efforts of the management and the employees of the Associated Factories. These employees were much above the average in intelligence, and quick to appreciate the advantages of a mutual insurance wherein they could change their place of employment from the factory of one associate to that of another without invalidating their insurance, so long as the premiums were duly paid.

Briefly stated, the Flint Vehicle Factories Mutual Benefit Association is managed by a board of trustees, elected annually. Each trustee must be an employe of the factory he represents and also a member of this association. The organization is managed exclusively by the employees and is not dominated in any way by the factory management.

At the first meeting of the trustees following the annual meeting, they elect the officers for one year. The president, vice-president and treasurer must be trustees, but this is not necessary in the case of the secretary.

Every man who enters the employ of any of the Associated Factories is furnished with both an employment application which he fills out and signs and an application for insurance and membership in the Mutual Benefit Association, which he must sign in one of two places, either making application for benefit insurance or giving his reasons for not wanting it. If he does not want the insurance and gives no real reason, the plan is explained to him, but he is never unduly urged.

In case he signs the application for insurance, which 74 per cent of the employes do, he thereby authorizes the time-keeper to deduct his dues from his pay and states that he is in good health. A medical examination is not required, the man's simple statement of good health being accepted.

There are three classes of membership with dues and benefits as follows:

Class	Requirements	Dues	Benefits
AA	Average weekly wage must be \$12 or more	15c.	\$0 \$75
A	Average weekly wage must be \$7 or more	10c.	\$0 \$50
B	Average weekly wage must be less than \$7	5c.	\$0 \$25

An employe with an average weekly wage of over \$12 may take out insurance in either Class AA or Class A.

A member is not eligible to receive benefits until he has been a member for

twenty-one days. He is allowed to draw benefits for thirteen consecutive weeks, and, in case of another sickness within the twelve months, he is entitled to draw an additional five weeks' benefits.

In the thirteen years since organization up to January 1, 1914, there has been paid out a total of \$119,553.93 in sick, accident and funeral benefits.

For the calendar year 1913 the following claims were paid:

Accident	AA	Class	100		
Accident	AA	Class	103	263	\$5,681.85
Sickness	A	Class	151		
Sickness	AA	Class	371	522	14,122.54
Funeral					
Benefits	A	Class	4		
Funeral					
Benefits	AA	Class	11	17	1,025.00
• \$20,829.39					

There were seventeen in Class A and twenty-nine in Class AA who drew the limit of thirteen weeks' benefits, a total of forty-six.

At the present time several plans are being considered whereby the workmen will receive even greater returns from the premiums paid, the intention being to return in the form of benefits as much as the income from the premiums will safely permit.

In 1908, the factory management reorganized as the Manufacturers' Association of Flint. Officers were elected and plans matured for more active work in the interest of the members, a system of employes' records has been developed, a free employment bureau maintained and all advertising for labor has been handled through the office of the association.

The most notable achievement of the Manufacturers' Association of Flint was the action taken March 27, 1912, adopting the supplementary compensation plan and pledging themselves to give it a fair trial and to continue it if found to be feasible. This plan is entirely independent of and different from the Michigan workmen's compensation act, in that our fund is for the aid of the workmen who become dependent as the result of sickness while the state law provides aid for workmen who have been the victims of accidents.

For several years the manufacturers, who are all deeply interested in the development of the Mutual Benefit Association, the employees' organization, have known that after an employe had been sick for thirteen weeks, the limit during which benefits under their policy are paid, his finances were, in the majority of cases, at very low ebb and if he were still incapacitated, there was an urgent need that some means be supplied to furnish aid. In case of the workman's death the death benefit received from the Mutual Benefit Association was needed to defray the funeral expenses, and the family had nothing left for their support during the period of adjustment to the new conditions imposed by the loss of the head of the family.

The plan as worked out, is to pay to the sick workman, while totally incapacitated

from labor, or to the dependents of such workman in case of the workman's death, a certain sum of money each week for a period not to exceed in any case 104 weeks; or for partial disability from sickness, a sum governed entirely by the merits of each individual case and always under the control of the Executive Committee of the Manufacturers' Association of Flint.

On the obverse side of the insurance application is a statement of the rates and benefits, and on the reverse side a circular letter from the Manufacturers' Association of Flint stating clearly just what they propose to do in the matter of financial aid, making it very clear by a paragraph, which states that "maximum compensation both as regards amount paid and time limit of payment will be paid in exceptional cases only, as our intention is simply to relieve suffering and distress temporarily, not to provide support for two years or any part thereof." It is considered as emergency help only, and the desire is to have the beneficiaries become self-supporting as soon as possible.

The workman to avail himself of the benefits of the supplementary compensation plan must fulfill the following conditions:

1. Must be an employe in the factory of one of the members of the Manufacturers' Association of Flint at the time his sickness began.

2. Must be a member in good standing (that is with all dues paid) of the Flint Vehicle Factories Mutual Benefit Association at the time his sickness began.

3. Must have been unable to work for a period exceeding thirteen weeks during which time he shall have drawn all benefits to which he is entitled from the Mutual Benefit Association; or in case of the workman's death at any time, the dependents of such workman are immediately eligible to draw benefits provided their dependence is established to the satisfaction of the executive committee.

4. Must make formal application for compensation to the Manufacturers' Association of Flint and satisfy the executive committee thereof of the justice of his case; or in the event of the death of the workman the dependence of the petitioner must be established.

For the purposes of this plan, workmen receiving compensation thereunder are classified under three heads, viz.:

Class 1. Single man (or woman) or married man (or woman) with no dependent children.

Under this class the dependents are wife (or husband) parents, brothers and sisters, as the case may be.

Class 2. Married man (or woman) with one dependent child under fifteen years of age (or over fifteen years of age if physically or mentally incapacitated from earning).

Under this class the dependents include the dependent child in addition to those enumerated under Class 1.

Class 3. Married man (or woman) with two or more dependent children under fifteen years of age (or over fifteen years of age if physically or mentally incapacitated from earning).

Under this class the dependents include the dependent children in addition to those enumerated under Class 1.

The maximum amount of compensation to be paid each class is as follows:

For death or for total disability from sickness from causes covered by certificate of the Flint Vehicle Factories Mutual Benefit Association: Class 1, \$7; Class 2, \$8, and Class 3, \$9 per week.

For partial disability from sickness from causes covered by certificate of the Flint Vehicle Factories Mutual Benefit Association, such payment will be made as seems fair in each individual case.

The maintenance of the supplementary compensation fund is provided by assessing the members of the manufacturers' Association of Flint whenever the funds in the treasury become low.

As the plan was entirely novel at the time it was put in operation, and for this reason no data was available to ascertain in advance just what the expense might be, the Manufacturers' Association of Flint reserved the right to discontinue its operation at any time it became too burdensome, but in view of the conservative way the fund is being administered by the executive committee, there seems to be no reason why any change should be necessary.

For the twelve months ending December 31, 1913, the cost to the Manufacturers' Association of Flint amounted to approximately \$1.20 per capita for the average number of employees during that time.

The executive committee gives a great deal of time to the careful investigation of each case and handles it in the best way to accomplish the desired results.

The administration of any benefit fund gives an exceptional opportunity to study human nature, and at times severely taxes the patience—as for instance when someone, after receiving all necessary aid, attempts to get additional benefits to avoid going to work. Fortunately these cases are rare. The relief work is being made more practical all the time. For example, we handle correspondence for anyone who is being harassed by credit houses and are often able to make fair settlements of accounts which could not have been accomplished by the debtor himself. We secure for our beneficiaries, when they are ready for work, the sort of employment for which they are fitted; we advise them as to the use of the money they receive from us, if they have debts to pay a word from us often secures leniency from their creditors; in fact our activities are governed entirely by the needs as they are brought to our attention.

As time goes on and the number of beneficiaries increases (up to January 1, 1914, we have served fifty-two and now are paying out benefits to twenty-three each week) it is hoped that the spirit of confidence between employer and employee will make for stronger co-operation.

THE CONSUMER AND THE FEDERAL CHILD LABOR LAW—ANNA ROCHESTER, NATIONAL CHILD LABOR COMMITTEE

ALREADY 87,000,000 Americans have registered their belief that fourteen years is the lowest age at which children ought to enter factories. Of the 78,000,000 who live in mining states, 41,000,000 have forbidden their children under sixteen to work in mines. 45,000,000 have on their statute books an eight-hour day for children, and 58,000,000 a night work prohibition for all under sixteen years.

On the fact that the Palmer-Owen bill embodies principles already recognized by a majority of the states, certain advocates of child labor reform have based their opposition to a federal child labor law. They have overlooked, however, two vital considerations: Their conscience as consumers seems to be buried under a monument of state's rights on which is inscribed their own state's righteousness; and they have forgotten that the consumer of child-made products is the ultimate employer of the child and bears a share in the responsibility for evils involved. They may have begun to prevent child labor in their own states, but so long as they buy glass from Pennsylvania, cotton goods from Georgia, canned fish from Mississippi, coal from West Virginia, preserved fruits from Delaware, or any one of a score of other common commodities from any state whose child labor law falls below standard in any one respect they are accomplices in the abuse of childhood.

Among those who have stood for a fair standard in their own states there are many—and their number is growing day by day—who do not wish to buy child labor products, but whom the intertangling of the states leaves with only these alternatives: They may buy the products of child labor and compromise their deepest sense of justice and compassion; or they may demand the enactment of a federal law to exclude from interstate commerce the products made under conditions from which their souls revolt. The children who ripped the bastings from my coat or mined the coal that keeps me warm are nearer to me than the child who lives next door, though they happen to live in another state. I cannot set aside as a foolish and irrelevant whim the impulse to demand that I be not compelled to employ them.

Not merely for interstate consumers but also for citizens who believe that the children of their own state should be protected, the state powers are insufficient. Without federal interference there is no way to meet that interstate commerce in children, by which the children of one state are subjected in another to conditions which the first state would not tolerate.

The most glaring example, of course, is the traffic in families—men, women and children taken from cities having a fairly high standard of protection to work in the canneries of states having no effective restriction of ages and hours. From Baltimore alone hundreds of workers, including very young chil-

dren, are taken for the winter season to pick shrimp and shuck oysters in the coast canneries of Alabama, Mississippi and Louisiana. They return each spring to Baltimore. The children will be citizens of Maryland, exploited, stunted, debased by their work in other states. Not that Maryland's standard for canneries is higher than the letter of the law in these three states; but she is developing an efficient administration of the law unknown there outside of New Orleans.

Less spectacular is the contrast in standards of adjacent states. Ohio has had for several years the eight-hour day and no night work of children under sixteen years, effectually protecting her boys from the worst phases of employment in glass factories. But Ohio boys can, and do, work in the glass factories of West Virginia where no such restrictions exist, and Ohio is powerless to prevent the overwork and moral injury to her sons. Alabama is trying to enforce a twelve-year limit; Georgia feebly protests the employment of children under ten years of age in cotton mills is illegal.

When a state sees its wards slip over the border to work in another state and there suffer from lower standards, what has become of our unity as a nation if that state may not appeal to Congress to set a minimum standard of protection? A federal law, touching only establishments producing goods for interstate commerce, would prevent the most glaring evils—exploitation of young children in canneries and cotton mills, and the night work and the long day of older children in mills and factories of all kinds. The Constitution guarantees to citizens of one state the privileges and immunities of all. This opens a wide field and amply justifies an attempt by the majority of the states to protect their present and their future citizens from the debasement of exploitation and ignorance involved in present conditions.

Twice at least, in the lottery laws and the Mann white slave act, Congress has recognized the moral needs of the consumer or of the public as a call to action. In the matter of child labor the moral appeal is more subtle, but to those whose conscience is aroused it is no less impelling than the business corruption of lotteries or the horrors of the interstate traffic in girls.

Supreme Court decisions on analogous points have opened the way for a discussion of the whole question on its merits without regard to this specter of constitutionality. In *United States vs. Marigold* (9 Howard U. S. 560), Justice Daniel said:

"Such exclusion cannot be limited to particular classes or descriptions of commercial subjects; it may embrace manufactures, bullions, coins, or any other thing. The power once conceded it may operate on any and every subject of commerce to which the legislative discretion may apply it."

Again in *Hoke vs. United States* (227 U. S. 308), Justice McKenna said:

"Our dual form of government has its perplexities, state and nation having different spheres of jurisdiction, as we have said; but it must be kept in mind that we are one people; and the powers reserved to the states and those conferred on the nation are adapted to be exercised, whether independently or concurrently, to promote the general welfare, material and moral. . . . It may be that Congress could not prohibit the manufacture of the article in a state. It may be that Congress could not prohibit in all of its conditions its sale within a state. But Congress may prohibit its transportation between the states, and by that means defeat the motive and evils of its manufacture."

The older decision in the lottery cases (188 U. S. 321, 357) is perhaps even more suggestive, especially if the reader substitutes for "lottery tickets" and "lotteries" the words "products of child labor" and "child labor":

"If the carrying of lottery tickets from one state to another be interstate commerce, and if Congress is of opinion that an effective regulation for the suppression of lotteries, carried on through such commerce, is to make it a criminal offense to cause lottery tickets to be carried from one state to another, we know of no authority in the courts to hold that the means thus devised are not appropriate and necessary to protect the country at large against a species of interstate commerce which, although

in general use and somewhat favored in both national and state legislation in the early history of the country, has grown into disrepute, and has become offensive to the entire people of the nation. It is a kind of traffic which no one can be entitled to pursue as of right."

In none of these cases is the analogy complete, but note these words published in 1908 by so conservative an authority as Frederic Jesup Stimson, professor of comparative legislation at Harvard University:

"It is perhaps obvious that we intend to withhold the right of conducting interstate commerce from any corporation not conforming to a federal standard. Whether we shall go further and deny it to individuals; whether, indeed, Congress has the constitutional right to deny it to individuals; and whether, on the other branch of the definition, we shall extend it from commerce, in the sense of interstate traffic, to manufacturing, mining, or producing goods intended to be sold outside of the state where they are manufactured, mined, or produced; and to the returns, or the profits, or the fortunes, or the disposition of the fortunes derived therefrom; and still more, to the contractual relations, the conditions of labor, etc., of the persons so engaged, are all matters for the future to settle."

The future has arrived. What will the decision be?

IMPRESSIONS OF WOMEN'S WORK ABROAD—BY GEORGE M. PRICE, M. D., JOINT BOARD OF SANITARY CONTROL, NEW YORK

WHEN I FIRST saw women hod-carriers in Paris I was rather shocked, as it was a sight that one is not used to in the States. The Parisians, however, seem to take it as a matter of fact. I have seen women carrying hods, laying bricks, and, in one place on the outskirts of Paris, I saw two women digging trenches. All these women were rather healthy specimens and did not seem in the least to mind the hardships of their work.

In a Paris factory which makes clothing and uniforms for government employes there were about two hundred women working at machines operated by foot power. These women were paid for nine hours' work from 1½ to 3 francs a day.

The sanitary conditions of this factory, as well as most of the other factories which I inspected in France and Belgium, left much to be desired. Wash-room and toilet accommodations are apparently matters which receive scant attention. The toilets were in such miserable condition that they would not be tolerated in any of our factories, even in those on the outskirts of the city, where factory inspectors do not often get around. But the French factory inspector who accompanied me did not seem to notice especially the lack of cleanliness and sanitary accommodations. There was no privacy whatever in the toilets. They were used by both sexes, and their construction would be considered obsolete even in our villages.

In a large cloak and suit factory in Vienna I found fifty to sixty women working, most of them quite young. This factory belonged to the so-called *Kartellierten Firmen*, consisting of sixty-two firms in the cloak, suit and dress industries, which made a sort of protocol agreement as to wages with the labor unions, and over which protocol the industrial inspector of the state has some jurisdiction. According to this protocol the minimum daily wage of a woman worker after passing her apprenticeship period was set at 2 Kronen-10 Hellers (39 cents); after one year's assistanceship, 2 Kronen-40 Hellers (about 46 cents); after two years' assistanceship, 2 Kronen-70 Hellers (about 52 cents); after three years, 3 Kronen-10 Hellers (59 cents); after four years, 3 Kronen-40 Hellers (65 cents); after five years, 3 Kronen-70 Hellers (71 cents); after six years, 4 Kronen (about 76 cents). No payment is made for holidays. A control commission, consisting of five workers and five employes has charge of the workings of this protocol. This commission acts also as a grievance board. In case of failure to agree the industrial inspector acts as chairman and has the deciding vote. The protocol was made for five years and its term expires March 1, 1916.

In most of the factories abroad an hour and a half is given for pauses, and the practice is for women and children to get two additional pauses for a quarter of an hour each at 10 a. m. and 4

p. m. In some places the midday pause is only one hour, the additional half hour being divided between the morning and afternoon pauses. It was interesting to see how eagerly all the workers took advantage of the breaks in the day's monotony to go outside, get a bite and frolic. It seems to me that this practice could advantageously be adopted in this country with profit to workers as well as employers.

In a large clothing factory in London I found five to six hundred women. Many of them seemed very young,—indeed, some of them did not seem more than thirteen or fourteen. I know that the sanitary conditions of this factory, if found in New York, would be rated as in Class D. The toilet accommodations were all on the top floor, necessitating much loss of time to reach them.

I was surprised to find in this factory that the pressing, even on very heavy clothing, was done almost exclusively by women. The pressing irons were heated on gas stoves, with no provision made for carrying off the heat or gas generated. In this factory I also found a new kind of pressing and ironing machine for pressing very large and heavy pieces of cloth, also operated by women. During the pressing a large amount of steam is generated which envelops the operator. The temperature also seemed very high—at least eighty degrees Fahrenheit—at quite a distance from the irons. According to the statement of the owner, the workers in this factory are paid from twelve to thirty-four shillings a week.

In a large shirt and collar factory inspected in Berlin I found nearly a thousand women and girls at work. The women were of all ages—some of them as young as thirteen. A few looked like grandmothers. The safety and sanitary conditions of this plant were excellent, and the management also provided a lunch at cost to the employes. Wages ranged from two to five marks a day.

In a shirt factory in Brussels nearly six hundred women and girls were found at work in very light, well ventilated and scrupulously clean workshops. Model machinery well safeguarded was used in every process. The laundry was one of the best I have ever seen, not surpassed even in this country. Not only was the floor well drained but it was covered with cork mats, and the women employes wore shoes with rubber soles. Because of the splendid ventilating apparatus, there was hardly any steam in the laundry, nor was there excessive humidity. Three pauses, an hour at noon and a quarter of an hour each during the forenoon and afternoon, were given to the employes. Splendid wash-rooms, dressing-rooms and bathing places were provided for the employes, and a large, fully equipped restaurant, where food was sold at cost.

The general conditions in the Berlin and Brussels collar and shirt factories were very favorable in comparison with the conditions in the same kind of factories at Troy, N. Y.

HEALTH

THE DISTRICT NURSE OF YESTERDAY AND OF TODAY—BY OLIVE A. COLTON, TOLEDO, O.

"PUBLIC HEALTH can be bought." The death-rate of any city indicates the intensity of that city's struggle between disease and dollars plus brains.

In the development essential to all things progressive, there has been in the last few years a radical change in the province of district nursing. Formerly nurses were sent forth to alleviate suffering; now they must also promote health by enlightening and protecting the public.

Our original idea of a district nurse was the proverbial angel of mercy who entered the destitute home of the typhoid victim, gave her a refreshing bath, combed her neglected hair, and made the bed with clean linen. She left milk tickets to secure proper nourishment for her patient, told her not to worry about the rent as the Relief Committee would attend to that; and after a kind scolding to Sammy for not being in school, and a few cheery words to rheumatic grandpa behind the stove, she departed with a "God bless you!" ringing in her ears. Thus she continued her rounds, this Good Samaritan. But lo, the poor we still have with us always.

Formerly restorative, our task is now also preventative. The nurse who cares for one sufferer does well; but the real helper of today is she who closes the polluted well, or exposes the untrustworthy milkman, so preventing the rest of the neighborhood from disease.

As an example of the change of method in substituting thoughtful plans for spasmodic relief, take two sisters, one blind, the other crippled and weak-minded. The nurse had visited them three times a week for years. They belonged to no church, nor lodge, and the neighbors for months had denied themselves to feed them. They had refused to go to the Infirmary. Limping Mandy had led her blind sister from door to door selling needles; but now the rent was months overdue, they were aged, cold and hungry.

"Now God help us," they wailed, "we're too beat out to work!"

Surely here was a worthy family for the District Nurse Association. Then a social worker appeared on the scene. In the corner grocery she heard a vague reference to "property." After a whole week's investigation she tracked down a sacred lot which, in spite of all advice, Mandy had refused to sell, obsessed with the idea it was worth more. These two old women had lived on charity for years, instead of helping themselves.

This was evidently a case for the court. A reputable guardian was appointed who sold the lot at the best

possible price and now pays in weekly installments to the poor old creatures the sum placed for them in the bank. The blind committee, the Sunshine Society and a friendly visitor pilot them through the shoals of old age, with a kindly but not monetary interest in their welfare.

Here a necessity presents itself that unfortunately the public is but slowly coming to understand. The district nurse of today should be more than a hospital graduate; she should also have had a course of social training.

Too much stress cannot be laid upon this point. Only first hand knowledge of social conditions can give her the point of view of the poor. The racial tendencies of the immigrant must be known to her. The early traditions bred in the bone in his own land may not protect him against exploiters ready to prey upon his ignorance here; and the quickest way to develop him is to understand what to him is sacred and worthy of honor.

No cure can be found for the ills of our civilization until the basic causes of poverty are mastered, and we learn that the remedy for destitution is not giving to, but considering, the poor. We used to think that penury came from drink and laziness; now we have irrefutable statistics to prove that but 17 per cent of the dire want of our day comes from alcohol, and that non-employment, feeble-mindedness, sickness, occupational diseases, child labor, ignorance, bad housing, family desertion, widowhood

and old age, are contributing and often interlocking causes.

Poets may be born, but a district nurse must be made. Miss Wald says, "We not only need her trained, we need her inspired." The only desirable nurse is *she* who has high ideals and the efficiency to carry them out; who, while her mother heart and soothing hand relieve the patient, can also untangle domestic knots and teach the family the laws of health. The doctor will diagnose the patient's sickness; the nurse must diagnose the household.

None but a nurse equipped with the social knowledge of today will understand how to lift her families to the level of normal living. Family building is the district nurse's particular privilege. A good home life is the greatest factor in race betterment. The nurse must know the housing laws of her city; the health officer is her fellow worker, and the juvenile court, probate judge, and all that represent that authoritative word, Law, must not fill her with awe. She should have sufficient address to command the respect of these men, for co-operation with other civic agencies is her daily duty.

The quickest way to eliminate disease-breeding conditions is to create public opinion on the subject, to quicken the civic conscience. To fulfil her highest purpose the district nurse must testify of the evils of child labor that she sees in the arrested development and darkened future of little workers. She must urge the longing of youth for wholesome pleasures, the need of school laws, of instruction for blind, sick or backward children. Who can bear truer witness to the persistent spread of tuber-

THE MOTHER OF THIS FAMILY, USED TO ECONOMIZING, PRAYED, "MAY THERE BE NURSES ENOUGH TO GO AROUND"

culosis? To the actual peril of white slavery? To the horrifying increase of mental defectiveness? Who sooner than the nurse finds the father of a little family, a spent toiler at fifty? Who realizes more keenly the number of deserting fathers?

Her opinion is valuable on the success or miscarriage of mother's pensions. She knows the results of our lax labor laws and the necessity of humanizing industries. Foreigners are building our great cities above and underground. They are developing our resources and doing the hard work in conquering space and time. Shall our gratitude to the immigrant be to reduce him to a drunken, anarchistic, disease-racked outcast?

In creating public opinion against these and other evils the district nurse's new activities will enlist the strongest champion for reform. Her voice will rouse humanity from its evasion of duty and help the world advance farther than Cain's time, who did not understand that we really must be our brother's keeper, if we, ourselves, hope to make progress.

If then this field of work is so fertile, why do not more women enter it? Because they cannot afford the preliminary courses. Tuition in the Boston, New York, and Chicago Schools of Philanthropy is not prohibitive, but the cost

of living in these large cities must be considered. Few nurses after three years in hospital training without remuneration, can take more time for study before becoming self-supporting.

Endowments and scholarships in these schools, or money to maintain nurses while there, would not only help the nurses and be a blessing to the giver, but would go out in an ever-widening circle of benefit throughout the whole community. People give generously to help the poor. Where is the foresighted philanthropist who will do the double good of helping helpers?

OCCUPATIONAL DISEASE COMPENSATION: SOME RECENT VERDICTS—BY JOHN B. ANDREWS

SECRETARY, AMERICAN ASSOCIATION FOR LABOR LEGISLATION

JUST BEFORE THE legislature of Ontario adjourned recently, it did a new thing in America. It made a law "to provide for compensation to workmen for injuries sustained and industrial diseases contracted in the course of their employment."

The federal government and twenty-three of our states have already covered accidents by legislation more or less inadequate. But "industrial diseases" compensation by special mention, right in the title of the law, is worthy of your respectful attention. It hasn't happened before on the American continent.

This means that in Ontario victims of industrial trade maladies are to be compensated just like sufferers from sudden and obvious accidents. The law mentions by way of introduction half-a-dozen work diseases about which we have been learning lately,—poisoning from lead, phosphorus, mercury and arsenic, as well as anthrax and the miner's ailment, spelled "ankylostomiasis."

Of course, in Europe, progressive countries like England, Germany and Switzerland, long since made definite provision for this sort of thing. But our United States Congress, with a carefully drafted bill before it this long year and more past, and in spite of a favorable recommendation from the House Judiciary Committee, has still failed to provide similar protection even for the government's own employees in shipyard, arsenal and printing office. Belgium, for example, did that years ago.

Readers will remember the technical

decisions of the federal government attorney who refused compensation to victims of lead-poisoning in government navy yards, because lead-poisoning is an occupational disease and "is not an injury" under the law. But now comes Massachusetts with a law that is working well and an industrial accident board that guessed her victims of lead-poisoning should be paid. And the Supreme Court of the great Commonwealth of Massachusetts, upon being asked pointedly upon several separate occasions, has recently said to the board, "You guessed right. Go ahead!"

Thus, Massachusetts compensated Otto Johnson, incapacitated after working as a lead grinder for twenty-two years, and William Hurle, totally blinded after working several years in a power-house where his work required him to breath poisonous gases as he looked for a moment seventy times each day through the peep-holes of a gas-producer installation.

In Michigan, the Industrial Accident Board thought compensation should be paid to the widow of Augustus Adams, who died in June, 1913, from the effects of lead-poisoning contracted during his work at the Detroit plant of the Acme White Lead & Color Works. But a year later the liability company in which the employer had insured, although admitting all of the facts, was still fighting the case and had appealed to the Supreme Court on the ground that Adams didn't die by accident but was killed by industrial disease in the course of his duty. An early decision is expected.

The Ohio law, also, uses the words "personal injury;" but when Louis Plasko, who sandpapered white lead paint in the Cincinnati shop of the American Carriage Company, asked indemnity for lead-poisoning, the Ohio Industrial Commission "read into the act words which were not placed there by the legislature" and announced that their interpretation was that the law meant "personal injuries by accident."

Since then the courts, including the Superior Court in a decision by Judge Robert C. Pugh, successor to William Howard Taft and Judson Harmon in the professorship of constitutional law in the Cincinnati Law School, have held that in law the term "personal injury" is used to differentiate injury to the human body from injury to property, and have reversed the interpretation of the Industrial Commission, made up of a labor leader, a lawyer, and a professional economist. To quote the words of the *Lancet-Clinic*, they have rendered "a decision which interprets the law literally, in accordance with the intent of those who wrote and passed the law, and in consonance with the dictates of common sense."

Can it be that the economists and representatives of labor are becoming more conservative than the judges?

Probably some of the existing laws must be amended, and undoubtedly new legislation in unmistakable terms must be passed before victims of occupational disease will be treated sanely and justly. But surely the time is soon coming when advocates of compensation for industrial accidents must realize that a logical consideration of the facts leads likewise to compensation for industrial diseases.

NEW LIGHT ON THE PROBLEM OF PELLAGRA

A NEW REPORT on the causation of this puzzling disease has just been published by the Thompson-McFadden Commission of the New York Post-Graduate Medical School, and though the problem has not by any means been solved, it is brought somewhat nearer solution by the studies of this commission. Briefly stated, the following are their conclusions:

Pellagra is probably a communicable disease, conveyed from person to person by some means, perhaps by the biting fly, perhaps by the contamination of food with the excretions of those suffering from the disease. No food in itself, either fresh corn or decayed or blighted corn, could be found to have any connection with the occurrence of pellagra.

It seems rather a house disease. It was impossible to find that any cases of pellagra had originated in two villages having a complete water-carriage sewerage system, and the disease was found to be most prevalent in houses provided with primitive open privies. It was also found that new cases spread from old ones and develop in houses formerly inhabited by pellagrous cases.

All this points to a communicable infectious disease, a disease of probably microbic origin. The thing to work for now is the discovery of the germ.

SANITARY CONDITIONS AMONG THE ESKIMOS

TWO HEALTH SURVEYS have recently been made in Alaska. One, by our government, included the Eskimo villages along the coast, where some 2,000 natives live.

Dr. Krulish, who writes this report, was especially interested in tuberculosis, the most important disease among the people, and in the factors which favor its spread, and he therefore describes in detail the houses in these villages.

Extreme cold and scanty fuel make them construct houses as nearly air tight as possible. These "igloos" are made of logs covered thickly with sod. They may be lighted by windows or by a skylight, the intestine of the big seal being used for glass. There are two rooms, one used as a store-room and the other, connected with it by a low narrow tunnel, is the living-room, about twelve or fifteen feet square. The door may open into the store-room, which serves to keep the cold from getting into the living-room, or there may be only a trap door into the roof of the store-room. This arrangement keeps out dogs and prevents the entrance from getting blocked with snow.

All the activities of the household are carried on in this one room; and during the long dark months of the Arctic winter the family is packed into this overheated, ill-ventilated space. The Eskimos are very sociable and once a week during the winter in every village they meet for an all-night dance in one of the larger igloos, where some sixty persons crowd into a room not more than sixteen feet square. Fortunately during the two or three months of summer they leave their houses and live in tents on the shore.

These natives are, according to Dr. Krulish, decidedly above the average of Alaskan natives and of the Eskimos of the Siberian coast. As usual, contact with civilization has resulted in a certain amount of syphilitic infection. Dr. Krulish traces this to the whaling ship crews. Trachoma he did not find,—a matter of surprise, for along the southern coast of Alaska it is common and is responsible for a good deal of blindness. He believes that this is due to the fact that southern Alaska was settled by Russians from Siberia, who brought trachoma.

Diseases due to exposure, rheumatism, bronchitis and pneumonia, were reported and much indigestion, caused by the diet of meat and oil and by poor preparation of food. Many of the children have adenoids.

Dr. Krulish recommends the establishment of hospitals for the treatment of the infected, the improvement of the igloo, the enforcement of sanitary measures in the villages and the education of the people in hygiene. He also hopes that outdoor sports may be encouraged by the teachers and the all-night dances abolished or conducted under better conditions.

The second health survey, of one small Alaskan community, was made by

Courtesy U. S. Public Health Service

A GROUP OF ESKIMOS, THEIR SUMMER HOME AND WINTER RESIDENCE

Dr. Harold N. Craig, a physician in charge of the Presbyterian Hospital at Haines, Alaska, together with Captain Lambe, of the U. S. Army. These doctors examined the 170 Indian inhabitants of this little town, including 49 men, 62 women and 57 children. The report states that the fact that 33 1/3 per cent of the entire population are children is enough to mark the race as a dying one. Among 657 children, no less than 12 cases of tuberculosis were found and 3 of blindness. Only 21 of the 57 children appeared to be in really robust condition.

Mortality in infancy and early childhood must be large, for only 43 per cent

of the children of the younger women had survived and only 22.8 per cent of the children of the women over 40.

Ten of the younger women or 27 per cent have pulmonary tuberculosis, and of the older women 24 per cent, making an average of 26 per cent for the women. There were no less than 10 cases of blindness among the women. Of the 51 men, 15 had tuberculosis. The larger tuberculosis rate in this report is explained by the fact that in this village all the inhabitants were examined, while Dr. Krulish was able to examine only those who presented themselves for medical treatment.

EDUCATION

A PLAN TO STIMULATE VOCATIONAL EDUCATION IN ALL THE STATES—BY WINTHROP D. LANE

WITH UNUSUAL promptness and economy the Commission on Vocational Education appointed early this year by President Wilson completed its work last month. Its bill providing federal aid for vocational education in the states has been introduced into both branches of Congress—into the House by Representative Hughes, of Georgia, and into the Senate by Senator Hoke Smith, of Georgia. In each branch it has been referred to the Committee on Education. This measure is the constructive outcome of the commission's work. If made into law, it will end several years' effort to accomplish the object for which it stands. In a supplementary report of many chapters the commission summarizes the arguments for the bill and points out the need for vocational education in the country at large.

The two large aims of the commission's bill are to extend the help of the federal government to the states in providing vocational education and in training persons to teach it. These are to be attained by grants of money and by the establishment of a Federal Board for Vocational Education to work with state boards. In extending the help of the federal government the desire of the commission is to stimulate rather than to support vocational education in the states.

The appropriations of the bill are as follows:

In 1915-16, \$500,000 for salaries of teachers of agricultural subjects, this sum to be increased at the rate of \$250,000 annually until it reaches \$2,000,000 in 1921-22, and then at the rate of \$500,000 annually until it reaches \$3,000,000 in 1923-24. Three millions are to be appropriated annually thereafter. This money is to be allotted to the states in the proportion which their rural populations bear to the total rural population of the United States.

In 1915-16, \$500,000 for salaries of teachers of trade and industrial subjects, this sum to be increased at the same rate as that for teachers of agricultural subjects. This money is to be allotted to the states in the proportion which their urban populations bear to the total urban population of the United States.

In 1915-16, \$500,000 for training persons to teach agricultural, trade, industrial and home economics subjects; in 1916-17, \$700,000; in 1917-18, \$900,000; in 1918-19, and annually thereafter, \$1,000,000. This is to be allotted to the states in the proportion which their total populations bear to the total population of the United States.

In the interests of the smaller states it is provided that of the two funds for

salaries of teachers no state shall receive less than \$5,000 annually prior to 1922, nor less than \$10,000 annually thereafter, and that of the fund for training teachers no state shall receive less than \$5,000 annually prior to 1918, nor less than \$10,000 annually thereafter.

To administer these funds in the states each legislature is required to designate or create a state board of not fewer than three members. The existing state board of education may be so designated.

To administer the act for the United States the bill creates a permanent Federal Board for Vocational Education, to consist of the postmaster general, the secretary of the interior, the secretary of agriculture, the secretary of commerce and the secretary of labor. This board is to elect one of its own members chairman. The commissioner of education is to be its executive officer.

Co-operation with state boards is to

The two large aims of the commission's bill are to extend the help of the federal government to the states in providing vocational education and in training persons to teach it. It is stimulation by the federal government, not support, that the commission wants.

be, however, only one of the duties of the federal board. It is to act as a central investigative and publicity agent in the field of vocational education. The commission early agreed upon the need for such a body. In the reports of the Bureau of Labor Statistics, the Department of Agriculture, the Department of Commerce and the Bureau of Education there is much material of value to the cause of vocational education. But the activities in this field of these departments necessarily lack plan and are without relation to each other. Moreover, except for the work of the Department of Agriculture, Congress has not supported this service liberally.

Accordingly the new board is to be a clearing house for these departments and bureaus in making studies and publishing data. The board may conduct investigations of its own, but it is directed to work with or through the departments so far as practicable. This phase of its work must include, the bill says, "studies, investigations and reports on agriculture and agricultural processes

and requirements upon agricultural workers; trades, industries, and apprenticeships, trade and industrial requirements upon industrial workers, and classification of industrial processes and pursuits; commerce and commercial pursuits and requirements upon commercial workers; home processes and problems and requirements upon home workers; and problems of administration of vocational schools and of courses of study and instruction in vocational subjects." To pay for investigations and maintain its office, the board is granted \$200,000.

Before it can receive federal money, each state must meet certain "conditions of efficiency." For the most part these are left to be determined by agreement between the federal board and state boards. The bill itself fixes some of them, however.

It is stipulated that the controlling purpose of all education on which federal money is spent must be to "fit for useful employment." It must also be of less than college grade and designed to meet the needs of persons over fourteen years of age who have entered upon, or who are preparing to enter upon, farm work, a trade or other industrial pursuit. This rules out so-called prevocational instruction, the purpose of which is not to fit for specific employment but rather to liven the traditional elementary curriculum with touches of the actual environment of life.

It is required also that at least one-third of the money given to any state for trade and industrial education shall be applied to part-time classes for those who have already entered upon employment. Before money for training teachers can be received, each state must show that such training will be given only to persons who have had "adequate vocational experience or contact in the line of work for which they are preparing themselves," or who are acquiring such experience or contact as a part of their training.

The creation of the commission which framed this bill came as the result of six years' efforts to secure federal aid for vocational education. Under the leadership, first, of Representative Davis, of Minnesota, and later of Senators Dolliver, of Iowa, and Page, of Vermont, the struggle progressed. It met the steady opposition of those who objected to such an extension of federal activity as well as of those who questioned the wisdom of its specific purposes. The Page bill passed the Senate at the last Congress. Meanwhile the Lever bill which granted federal aid to extension work among farmers, passed the House and the two measures died in joint conference.

After the passage of the Lever bill at the present session, and its signing by the

'See THE SURVEY, Jan. 18, 1913.

president, Congress authorized the creation of the commission, appropriating \$15,000 for its work.

The president appointed the members about March first. The commission held its first meeting April 2, two months before the date set by Congress for its final report. Not only did it complete its work in the allotted time, but returned nearly a third of its appropriation unexpended. The five lay members of the commission went to Washington and there gave all of their time for two months to its work.

Two methods of getting information were adopted. One was that of public hearings, at which representatives of national, educational, labor and industrial bodies and organizations of farmers appeared. The other was the use of questionnaires. In this way state superintendents of public instruction, 564 superintendents of cities and towns over 10,000, five county superintendents in each state, 115 national labor organizations and 120 employers representing skilled, semi-skilled and unskilled occupations gave their assistance to the commission.

In its report the commission declares

that of more than 25,000,000 workers in agriculture and industry, less than 1 per cent have had adequate preparation for their jobs. "As a solution of the problem confronting the nation," the report continues, "vocational training is needed to conserve and develop our natural resources, to prevent waste of human labor, to provide a substitute for the old apprenticeship, to increase wage-earning power, and to meet the increasing demand for trained workers."

The commission included four members of Congress and five others, as follows: Senator Hoke Smith, of Georgia, chairman; Senator Carroll S. Page, of Vermont; Representative D. H. Hughes, of Georgia; Representative S. D. Fess, of Ohio; John A. Lapp, director of the Bureau of Legislative Information, Indianapolis, Indiana; Florence M. Marshall principal of the Manhattan Trade School, New York city; Agnes Nestor, president of the International Glove Workers' Union, Chicago; Charles A. Prosser, secretary of the National Society for the Promotion of Industrial Education, New York; Charles A. Winslow, Bureau of Labor, Washington, D. C.

SAN FRANCISCO AS A BARGAINER AT THE EDUCATIONAL COUNTER

IN CALIFORNIA, where women vote, they also help to get the facts necessary to an intelligent exercise of citizenship. A vivid picture of San Francisco bargaining at the educational counter has been drawn by a group of members of the California branch of the Association of Collegiate Alumnae.

Their report, which fills nearly 100 printed pages, and is based on the researches of an experienced investigator, first undertakes to show that San Francisco is a poor "spender" on schools. It is stated that "among 195 cities of over 30,000 population which are listed in the United States Census report on the financial statistics of cities for 1912, there are only five which spend a smaller proportion for schools than San Francisco." This expenditure is in great contrast to the fact that "San Francisco is the richest city, per capita, of the eleven principal cities of the nation", and the fact that during the last six years, while the city's assessed valuation has increased 45.2 per cent and the tax rate for all purposes has increased 55.4 per cent, the increase in the school budget has been only 24.5 per cent.

This small expenditure, it is pointed out, is in part due to the comparatively few children in the population. San Francisco is declared to be a single man's city—no city of the country except Newport, R. I., having so small a proportion of married men. Among all the cities in the United States the percentage of children under 15 years of age is 27.3. In San Francisco it is 18.9.

But that this is not sufficient justification for spending so little on schools is shown by the fact that in her per capita cost for schools San Francisco stands fifth from bottom among the eighteen cities over 300,000. Moreover, while Pittsburgh is spending \$2.65 for supplies for each child attending school, Los An-

geles \$2.44, Minneapolis \$1.44, and so on, San Francisco is spending thirty-one cents.

Actual conditions in the schools are declared to reflect this niggardliness. Sanitation is not up to standard. One wash-basin was found doing duty for 648 boys and girls. Eight stalls and three small troughs provided for one school housing 694 boys. Twenty sanitary fixtures in another met the needs of 1323 children.

The great majority of the school yards are declared to be totally inadequate in size, lacking in play provision and with bad drainage. No decorations for classrooms have been provided by the Board of Education. Everywhere there is stated to be a striking lack of maps, globes, reference books and other teaching materials. One small globe was found meeting the needs of 613 pupils.

The evil of overcrowded classes is flagrant. Of the 985 classes in San Francisco schools, 41 per cent have more than 45 pupils each.

Progressive features in education already firmly entrenched in the public school systems of many cities are unknown in San Francisco, or scarcely begun. Among these are kindergartens, vacation schools, physical training, school gardens, open-air schools, school lunches, special classes for defectives, trade schools, vocational guidance, continuation schools, and social use of school houses.

With due allowance for setbacks incident to earthquake and fire, the facts presented, declares the report, "warrant the assertion that San Francisco has been busy developing herself commercially and industrially, but that while she has been increasing her wealth and her resources, she has been neglecting her schools."

Among many specific recommendations for remedying discovered defects, one is the establishment of an Efficiency and Publicity Bureau in the school department, "whose duty it shall be to collect scientific and adequate school data, for the guidance of school authorities and the proper information of the public." If this be done, it is urged, such another accumulation of bad things will be impossible. Ills will be discovered as soon as they exist.

UNIVERSITY OF WISCONSIN UNDER MICROSCOPE

WHEN THE Wisconsin State Board of Public Affairs was continued by the last legislature it was directed to extend its investigations to include the state university. This is in a measure subjecting the university to the same treatment which it has advocated for other institutions, having even released many of its own faculty for investigation of departments of government in Wisconsin and elsewhere.

The university survey is now going on and it is expected that the report of its findings will be published late this year. Its recommendations are required to be in bill form. The directors of the survey are A. W. Sanborn, chairman, William H. Allen, who has been granted a leave of absence for the purpose by the New York Bureau of Municipal Research, and E. C. Branson.

One of the first steps of the board was to submit to the people of the state through the newspapers a list of questions to be answered by the survey, with a request for criticisms and additions. Some of the newspapers have established departments called "university forums" in which the questions submitted by their readers are printed.

Each member of the university faculty has received a long list of questions about his own work which he is expected to answer. Many of these bear on the technical aspects of pedagogy but the wider scope of the inquiry is indicated by such questions as the following: "Please list typical or most gratifying products or results which you wish recorded among your services to productive scholarship, learning, or business or social progress that the people of Wisconsin ought to understand and remember."

Another question is: "State in what respects, if at all, each of your courses is different from what it would be if given in an eastern privately supported institution, that is, in what respects it is modified as a result of your analysis of Wisconsin's social, industrial and educational conditions and needs or your study of the students who are in your classes."

MAKING THE MOVIES EDUCATE

Visual instruction, carried on by the University of Wisconsin extension division for several years in embryonic form, has become so important as to warrant the creation of a special bureau for the promotion of this work. William H. Dudley, formerly of the department of biology in the State Normal School at Plattsville, Wis., heads the bureau.

Under Mr. Dudley's charge will be the formation of various kinds of exhibits of an educational nature running all the way from ornithology to social center development.

"This department," states Mr. Dudley, "has been established for two purposes: to make a thorough and systematic study of all the various materials that may legitimately be employed in illustrative teaching, or in instruction through the medium of the eye; and to devise and organize plans for placing such illustrative material within easy and constant reach of all the schools and other social organizations of the state."

The division emphasizes particularly the vast educational possibilities of the motion picture. It believes that this should be brought into regular use in all departments of school work from the grades to the university.

To that end immediate steps will be taken to provide a library of educational films to lend to schools and social centers throughout the state wherever provision in the way of machines, etc., is made for the profitable use of them.

THE SOCIAL CENTER IN ST. LOUIS

A three years' movement to secure the free use of public school buildings outside of school hours in St. Louis has just been won and the social center will soon be a reality.

In the past no association could use a school-room outside of school hours without the payment of a fee. Under the new rules of the Board of Education school-rooms may be used for all civic, recreation and educational purposes at any time of the year without any charge whatever. Fees will be charged only for use of school-rooms or auditoriums for amusements, entertainment or "social recreation," which means dancing. The school-yards, shower-baths and play-rooms may also be used free.

Plans are now being made for the complete organization of this new use of the schools by neighborhood groups. It is expected that the Board of Education will employ a supervisor to study the different types of use needed in different parts of the city and to stimulate neighborhood organizations to take advantage of the new rules.

PROGRESS IN COMPULSORY EDUCATION

Although six states—South Carolina, Georgia, Florida, Alabama, Mississippi and Texas—are still without compulsory school attendance laws, and four others—Maryland, Virginia, Arkansas and Louisiana—have county local option in the matter, there has been progress during the past decade. Since 1905 eight states have adopted such laws.

Meanwhile the old arguments against this "encroachment upon individual liberty" go merrily on. A knight errant of one of the still "black" states, who signs himself B. F. Harris, writes these sentences among others to the *Dallas Morning News*:

"I am opposed to any form of compulsory school law, for I believe I have the God-given right to enjoy the privacy and sacredness of my home and select the books, teachers and schools for my children, and so strong is my belief that I have this right that I sold

FUTURE CITIZENS OF LACKAWANNA, N. Y.

Eight adjoining houses, furnished by the Lackawanna Steel plant and provided with heat and a caretaker by the Board of Education, serve the citizens of this community of 16,000 as a social center. Dancing and cooking teachers and club leaders are furnished also by the steel plant. Mothers' meetings are held in the rooms at night.

a little home back in the sunny hills of Tennessee and became an exile for liberty's sake, and I thank God and the signers of the Declaration of Independence that I have found here what I want, and I am enjoying it immensely.

"If a compulsory school law were passed in Texas what would the majority of the tenants do when cotton-chopping time and the picking season arrived? . . . They would have to pay out a good portion of the crop to get it picked, when the children ought to be at home where they would be worth so much to the home. . . .

"I am educating my children at home. I know their wants and needs better than any state or individual. They are advancing in their studies as rapidly as many children are in the free schools. I know how to teach them and I am going to have my own way and theirs about it. I love liberty."

MEDICAL INSPECTION

Of 1,300 school superintendents in cities between 2,500 and 30,000 population, replying to a questionnaire submitted by the United States Bureau of Education, only 516 report medical inspection. Of these, only 86 employ a school nurse.

ADULT ILLITERACY

Nothing less than the elimination of adult illiteracy in the United States is the object of a bill now before the federal House of Representatives. The measure, which is only twenty-five lines long, calls upon the commissioner of education to "investigate the methods that have been and are now used in any part of the United States and in foreign countries in teaching illiterate men and women to read and write."

It further calls upon him to "devise efficient and economic methods for teaching adult illiterates and men and women of meager education, both native and foreign," and to "promote plans for the elimination of illiteracy and the extension of education among the adult population, and co-operate with state, county, district and municipal education

officers and others in putting these plans into operation."

Amounts from \$15,000 to \$22,500 are to be appropriated annually till 1925 to carry out the provisions of the bill.

SOCIAL WORK EXPLAINED TO TEACHERS

Arrangements have been made by Martin G. Brumbaugh, superintendent of schools in Philadelphia, to give social workers of that city an opportunity to present their problems to present and prospective teachers. On June 8 and 9 the graduating class of the Girls' Normal School was addressed by Mildred H. Lane, acting secretary of the Consumers' League; Henry J. Gideon, chief of the Bureau of Compulsory Education; Bernard J. Newman, secretary of the Housing Commission and Paul N. Furman, secretary of the Pennsylvania Child Labor Association.

Efforts are being made to have a similar series of talks before the School of Pedagogy, where young men are studying to be teachers. The talks, it is expected, will be continued next fall, and will be extended to include public school teachers.

SCHOOL CHILDREN IN BOSTON

The number of Boston children, between fourteen and sixteen years of age, attending school is at least 20 per cent greater than has been heretofore estimated, according to a study recently made by Supt. F. B. Dyer of that city. On January 1, 1914, there were in Boston public schools 13,509 children of that age; in Catholic and all other parochial schools, 1,705; in other schools, 1,278. This made a total of 16,492, or 70.4 per cent of the estimated total number in the city.

Superintendent Dyer's study indicates also that the new child labor law did not augment the number of children on the street as much as has been declared. A canvass of employers showed that the law threw out of employment 890 children. At the same time there has been an abnormal increase in school attendance this year of 801 children between fourteen and sixteen years.

Ideals of Life and Living

By a Little Italian Girl
and an Immigrant Greek

"What kind of a home I would like to have," was the text set for compositions in one of the classes in English at Hull House. Among the papers turned in were these given below.

By an IMMIGRANT GREEK

IF I had money enough (a few thousand dollars would be sufficient) I would go to a farm somewhere in the United States and I would stay there for a year to learn farming. Then I would go directly to my native country.

When I should go there I would make some repairs on my old house in order to make it more comfortable, then I would buy more land, connect it with that I have already and make a big farm. Then I would have some people work at it, and I would teach them to treat the land like American people do.

Early in the morning I would mount my best horse and accompanied by my two favorite dogs I would go to the farm, wish good morning to the people, give advice if needed, say something about this or that, and I would go and have a look at the cattle. After that I would go to the nearest town on business, on route I would shoot a few hares or rabbits if by chance they would be discovered by my dogs.

On Sundays and holidays in winter time after church I would invite some other people to my house, I would ask them to sit down around my ready table. At that time the little lambs would be pulled off from the oven and everybody would start to eat and drink. After we would start to sing and dance, while we could see the large flakes of falling snow through the windows and hear the merry sound of the burning woods.

In spring and summer time I would once in a while go on the mountains, then I would

climb on the top of a landscape [mountain peak]. There I would stay for hours looking at the splendid panoram which would lay before my eyes, smell the delicious odors of the gay flowers and breathe deeply the pure breeze of the mountains. After I would come down again and if I was tired I would sit down under the shade of an old tree at the edge of the little river, and while my horse would peck here and there some mouthfuls of fresh grass, and my dogs would lay down looking at me, I would enjoy the joyful and happy singing of the birds. This is only part of my ideal home and ideal life and that is what I am always dreaming. May God let the dream be a reality.

By CARMELLA GUSTAFERRE

I SHOULD like to have a nice looking house with a garden like I had it at my old home in Italy. I would like to have a nice educated house and I like to have all the things that I have not got in my house. I would like to have a piano, a parlor and a room full of flowers. I would like to have a empty room in my house so that I could fix it into a stage so that my friends and I could have acting. We have made customs all ready, we played once and all our friends came to see it so that we made fifty cents and we were happy after that. I would like to have a back yard with a swing in it and a sink, and a large tree with branches that I would seat on the bench and read in the summer.

Personals

IT is the social work done in the larger cities that has in the past chiefly attracted attention; but more and more it has come to be realized that not only New York, Chicago, and San Francisco have their social problems, but that the smaller cities and communities of the country present a field no less important.

It has come to be recognized, too, that the best social workers, as well as the best lawyers, not infrequently come from the smaller communities.

The twentieth anniversary of Whittier House in Jersey City calls attention to the fact that not only is Jersey City the home of one of the most important of the settlement houses, but Whittier House is also one of the oldest.

When Cornelia F. Bradford began her work in the First Ward of Jersey City she was better equipped in training and in spirit than in material goods for the work which she was to do. The material equipment consisted of a guarantee of a year's rent, three articles of furniture, and a ten dollar bill. Today Whittier House has two large buildings, well equipped for their work and free from debt.

Although Jersey City was an entirely new field, Miss Bradford had prepared herself for social work by living in the East End of London, and by some months spent at Hull House; but, chiefly, her equipment consisted of a dauntless spirit, common sense, sympathy, and an insight into the needs and the latent powers of the people about her.

Her work has been chiefly in two directions, the one creating organizations or working with those already in existence that were necessary as part of the social machinery. Miss Bradford has been always a co-operator; a member of various state boards; an influential factor in preparing and passing needed legislation; and for several years the only woman member of the Jersey City Board of Education.

A huge map at the rear of the room on the occasion of the testimonial dinner given recently to Miss Bradford showed the now flourishing organizations which had grown out of the little work that had begun twenty years before; and perhaps the most important result of the work at Whittier House, although it can never lend itself to measurement or calculation, is the power which its headworker has to a great degree—that power which every social worker must have to some degree in order to achieve the finest results. It is a kind of clairvoyancy which makes the possessor see through the rags and dirt, just as through the frippery and fashion, and get a glimpse of the fine life that the rags or fashion hides.

There is real democracy at Whittier House; and there is, too, real efficient service. One of the young men who

CORNELIA F. BRADFORD
Founder and for 20 years headworker
of Whittier House, Jersey City

spoke of. Whittier House called it his Alma Mater; and those who heard him recognized that he had not only graduated into a successful business life but he had been helped into a real social relationship to the people of his city.

It would be impossible for settlements to have graduations. Perhaps no one ever succeeds in achieving a perfect social relationship; but it is work towards a better relationship that is distinctly the settlement's function, for it must regard the people of its neighborhood not only as the objects of philanthropy and social service, but also as a source from which fine social and civic work can come.

ALLEN T. BURNS
Who is to be director of the Cleveland
social survey

The duty of changing and improving a neighborhood belongs to those living in it more than it belongs to anyone else, and the best and finest way to change a neighborhood is to set the people who compose it working towards that end.

But the neighborhood is not only a charge upon the citizens who compose it, but also on the entire community; and this lesson Miss Bradford, too, has taught. Jersey City used to be ashamed of its First Ward without recognizing that the bad sewerage and the bad houses were the result of bad citizenship throughout the entire city; and if Jersey City has not learned this lesson in all its completeness, like all the other cities of the United States, it is beginning to realize it; and it is such social workers as Miss Bradford who have brought to light the situation and helped to find the remedies. It is no wonder that her city and her state are proud of her.

The great dinner given to Miss Bradford on the twentieth anniversary was therefore an occasion of real importance. The governor of the state, the mayor of the city, and other officials were present; and it was possible to note the effect which social work had had on political life.

The atmosphere of a testimonial dinner is often much like that of a funeral, but on this occasion the sense of a good work done was secondary to the sense of the fine things that were yet to be accomplished.

A fund has been created, to be known as the Cornelia F. Bradford Endowment; and Miss Bradford's girls and boys, and the city in which she works, have been so deeply touched by the power of her purposes, that there was during the evening chiefly a sense of the fine things yet to be.

JOHN L. ELLIOTT.

ALLEN T. BURNS, for five years secretary of the Pittsburgh Civic Commission, is to be the director of the Cleveland social survey. Made under the auspices of a committee of five representative citizens, financed by the Cleveland Foundation and planned as a five-year job, the Cleveland survey promises to be the most ambitious and thorough social stock-taking yet attempted.

Mr. Burns will begin his work in the fall, making first a brief preliminary study of general conditions with a view to deciding the main lines of investigation to be followed later.

When in 1909 Mr. Burns went to Pittsburgh as secretary of the Civic Commission, he carried with him experience in industrial Y. M. C. A. work in Chicago and as assistant warden of Chicago Commons. In five years he has made his influence felt in a score of fields of social, civic and political activity in western Pennsylvania.

The commission early laid the elements of a city plan before Pittsburgh in a comprehensive report of thoroughfares by Frederick Law Olmsted; and enlisted the city administration in commissioning Bion J. Arnold in making an intensive study of traction develop-

ment. It has co-operated in movements for revolutionizing the tax system, for a new charter, for budgetary and administrative efficiency in the municipal departments, for adequate housing laws and health code.

During the past year, as secretary of the Progressive Club, Mr. Burns has been active in directing political movements toward bringing these new agencies of government into the hands of the people. Through the Hungry Club, and other centers of acquaintance and discussion, he has been among the foremost of the younger men who have made the open discussion of public affairs a quickening leaven in Pittsburgh's municipal life.

BESSIE A. McCLENAHAN has resigned as assistant secretary of the Associated Charities of Des Moines, Iowa, to accept a place with the State University at Iowa City. She is to be connected with the social service work of the Extension Division.

Miss McClenahan, who is a graduate of Drake University and the New York School of Philanthropy, has been with the Des Moines Associated Charities for about five years following one year with the Cleveland Associated Charities. She was called to Grinnell in 1912 to make the survey of social conditions which resulted in the establishment of the Social Service League, one of the few charity organization societies organically linked with public relief work. In 1913 she was one of the Red Cross workers at Dayton.

DR. THOMAS SPEES CARRINGTON, for five years assistant secretary of the National Association for the Study and Prevention of Tuberculosis, has resigned. Dr. Carrington's contributions to the tuberculosis campaign were largely in the field of hospital and sanatorium construction, where his work has done much to standardize the types of buildings being used in such institutions. He is the author of *Tuberculosis Hospital and Sanatorium Construction*, and *Fresh Air and How to Use It*. During this summer he will be in Alaska with a sanitary expedition in the interest of the United States Department of Education.

ON July 1, Dr. C. Irving Fisher, for twenty-three years superintendent of the Presbyterian Hospital, New York city, retired from active service.

Dr. Fisher is a graduate of Harvard Medical School, of the class of '70. He was connected with the quarantine department of the city of Boston as assistant and as port physician until 1875. Eight years of private practice followed; then eight years as superintendent of the State Infirmary at Tewksbury.

Dr. Fisher has remained loyal to his New England affiliations, being a member of the Massachusetts Medical Society since 1872, and a counselor of the same society since 1891. He has written on hospital administration.

His successor is Dr. C. H. Young, former assistant superintendent at the Presbyterian Hospital.

THE LADY UMPIRE OF CHARITY BASEBALL

JESSAMINE S. WHITNEY, field secretary of the tuberculosis forces in Georgia, was official umpire in the ball games played at Memphis during the National Conference of Charities and Correction. The Philadelphia "Morons," mostly executives of social agencies, beat both the All-Southerners and the Memphis Giants, including Jimmy Kranz and two of his socialized policemen. The large figure in the foreground is Pat Witherbee, captain and pitcher of the Morons. Photo by Flanagan, M.D., of the Virginia Board of Health.

THE New Jersey Housing Association has engaged W. Lane Shannon to become its executive secretary beginning August 1. Mr. Shannon is a graduate of the University of Pennsylvania and of the Philadelphia Training School for Social Work.

W. LANE SHANNON
Executive secretary New Jersey Housing Association

He entered social work in 1912 as an inspector, later became chief inspector and assistant secretary, of the Philadelphia Housing Commission. His work as executive secretary of the New Jersey Housing Association follows a year's service on its board of directors. The association plans an energetic campaign through surveys of conditions, illustrated lectures and the organization of local committees.

ALEXANDER FLEISCHER, formerly assistant secretary of the Public Charities Association of Pennsylvania, has resigned that position to accept one with Lee K. Frankel in the Metropolitan Life Insurance Company in New York city. His work will be in the department of public health.

Mr. Fleischer was associated with the Public Charities Association from its inception in 1912, and did effective work as its representative at the last session of the Pennsylvania state legislature in aid of progressive social legislation. Some of the more important accomplishments of the session were the appropriations for establishing the State Village for Feeble-minded Women of Child-Bearing Age, the Woman's Reformatory, and the Inebriate Colony.

ON June 1, John R. Howard, Jr., assumed the duties of superintendent of the New York Orthopaedic Dispensary and Hospital at White Plains. Mr. Howard entered social work as headworker of Welcome Hall Settlement in Buffalo after leaving Harvard in 1904. While in Buffalo he was conspicuous in many community movements, one of the growing list of social workers who have carried into their own careers the spirit and influence of Frederic Almy.

In 1909, Mr. Howard became general secretary of the Starr Center in Philadelphia, leaving in 1910 to become the general secretary of the Thomas Thompson Trust in Boston. In this capacity he had a wide experience, particularly with the problems of the small community. During this time the Thomas Thompson Trust has made some significant contributions to social work especially in the field of sickness. Mr. Howard conducted the standard of living study in Buffalo in 1907-8, the results of which were later incorporated in Chapin's volume on *Standard of Living*, published by the Russell Sage Foundation.

ROBERT C. POWELL has been appointed executive secretary of the Maryland Association for the Prevention and Relief of Tuberculosis, succeeding H. Wirt Steele. Mr. Powell is a newcomer in social work. After his graduation from Amherst, he was engaged for several years in the advertising business. Last fall he entered the tuberculosis field, working with the New York City Committee on the Prevention of Tuberculosis in the management of their Red Cross seal sale.

JOTTINGS

JOHN'S WIFE

At the last New York City Conference of Charities, Bolton Hall told a story to illustrate a single-taxer's idea of how charity workers find work for the unemployed—by taking a job away from one man and giving it to another.

The story was of a boy, a little wild, whose father said to him:

"John, it is time you were settling down and taking a wife."

"Why so it is, father," answered John. "Whose wife shall I take?"

EXHIBITIONS

INTERNATIONAL

CIVIC EXHIBITION, Linenhall Buildings, Dublin, Ireland, July-August, 1914.

GERMAN ARTISANS' EXPOSITION. Cologne, May-October, 1914.

HYGIENE, Exposition of. Stuttgart, Germany. Middle of May to end of October, 1914.

PANAMA-PACIFIC EXPOSITION. San Francisco, Cal., February 20-December 4, 1915. Social Economy Department—Alvin E. Pope, San Francisco, Cal.

PANAMA-CALIFORNIA EXPOSITION, San Diego, Cal., January 1-December 31, 1915. Director of Exhibits, E. L. Hewett, San Diego, Cal.

URBAN EXPOSITION, International. Lyons, France, May 1-November 1, 1914. General Director, Dr. Jules Courmont, Hotel de Ville, Lyons, France.

NATIONAL

SOUTHERN HEALTH EXHIBITION, with American Public Health Association convention, Jacksonville, Fla., November 30 to December 5.

STATE AND LOCAL

COMMERCIAL AND INDUSTRIAL EXPOSITION, Grand Central Palace, New York city. September 5-26. Information may be secured by addressing F. J. Oppenheimer, 500 Fifth Avenue, New York.

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. *Always enclose postage for reply.*

Children

CHILD LABOR—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

CHILD HELPING—Department of Child-Helping, Russell Sage Foundation, 130 East 22d St., New York. Correspondence, printed matter and counsel relative to institutions for children, child placing, infant mortality care of crippled children, Juvenile Courts, etc.

CHILD WELFARE EXHIBITS—National Child Welfare Exhibition Committee, 200 Fifth ave., New York. Charles F. Powlson, Gen. Sec'y, Anna Louise Strong, Director of Exhibits. Bulletins covering Results, Organization, Cost, Construction, etc., of Child Welfare Exhibits. Will assist cities in organization and direction. Exhibit material to loan.

CONSERVATION OF INFANT LIFE—American Assoc. for Study and Prevention of Infant Mortality. 1211 Cathedral St., Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request. Traveling Exhibit. Urges prenatal instruction; adequate obstetrical care; birth registration; maternal nursing; infant welfare consultations.

Health

SCHOOL HYGIENE—American School Hygiene Association. Pres., Dr. Henry M. Bracken, Chairman State Board of Health, St. Paul, Minn. Sec'y, Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

MENTAL HYGIENE—National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of insane, social service in mental hygiene, State Societies for Mental Hygiene.

PUBLIC HEALTH—American Public Health Association. Pres., Wm. C. Woodward, Washington; Sec'y, S. M. Gunn, Boston. Founded for the purpose of advancing the cause of public health and prevention of disease. Five sections: Laboratory, Vital Statistics, Municipal Health Officers, Sanitary Engineering and Sociological. Official organ American Journal of Public Health, \$3.00 a year, published monthly. 3 months' subscription, 50 cents. Address 755 Boylston St., Boston, Mass.

SEX HYGIENE—Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies. Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

NATIONAL ORGANIZATION FOR PUBLIC HEALTH NURSING—Object: to stimulate the extension of public health nursing; to develop standards of technique; to maintain a central bureau of information. Publications: Pub. Health Nursing Quarterly, \$1.00 per year, and bulletins. Address Ella Phillips Crandall, R. N. Exec. Sec., 54 East 34th St., New York City.

LIFE EXTENSION INSTITUTE, Inc., E. E. Rittenhouse, Pres. Gives life extension service to subscribers. Service No. 1 \$3.00 a year; Service No. 2 \$5.00 a year. Consists of periodic health examinations, inspection service, and health bulletins on disease prevention. Head office 25 West 45th St., New York City. Phone—Bryant 1907—1908.

NATIONAL HEALTH—Committee of One Hundred on National Health. E. F. Robbins, Exec. Sec., Room 51, 105 East 22d St., New York. To unite all government health agencies into a National Department of Health to inform the people how to prevent disease.

TUBERCULOSIS—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M.D., Exec. Sec'y. Reports, pamphlets, etc., sent upon request. Annual transactions and other publications free to members.

SOCIAL HYGIENE—The American Social Hygiene Association (Inc.), 105 W. 40th St., New York. Division Offices: Chicago, 1632 McCormick Building; San Francisco, Examiner Building. Full information on request. Individual and society membership. The Association is organized to promote sound sex education, the reduction of venereal diseases and the suppression of commercialized vice. Executives, James B. Reynolds, Counsel: William F. Snow, M.D., General Secretary.

CANCER—American Society for the Control of Cancer, 289 Fourth Ave., New York City. Curtis E. Lakeman, Exec. Sec'y. To disseminate knowledge concerning symptoms, diagnosis, treatment and prevention. Publications free on request. Annual membership dues \$5.

Employment Exchange

SOCIAL WORKERS' EMPLOYMENT EXCHANGE—The Department for Social Workers of the Intercollegiate Bureau of Occupations registers properly qualified men and women for positions in social, religious and civic work. The needs of organizations seeking workers are given careful and prompt attention. Emma P. Hirth, Manager, 130 East 22d Street, New York City.

Libraries

AMERICAN LIBRARY ASSOCIATION—Furnishes information about organizing libraries, planning library buildings, training librarians, cataloging libraries, etc. *A. L. A. Booklist*, a monthly annotated magazine on book selection, is a valuable guide to the best new books. List of publications on request. George B. Utley, Executive Secretary, 78 E. Washington St., Chicago.

Aid for Travelers

AID FOR TRAVELERS—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y, 238 East 48th Street, New York City.

Remedial Loans

REMEDIAL LOANS—National Federation of Remedial Loan Associations, 130 E. 22nd St., N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Recreation

SOURCES OF INFORMATION ON RECREATION—A classified list of significant publications on recreation giving publisher, price, and printed description. Cities issuing reports on recreation administration are also included. Price 10 cents. Department of Recreation, Russell Sage Foundation, 130 East 22nd Street, New York City.

RECREATION—Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y. Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

ANTIDOTE FOR STRIKES

Based on an interview with

MR. JUSTICE HIGGINS

President of the Commonwealth Court of Conciliation and Arbitration

Several social agencies in New York are having reprints made for propaganda
use. Orders will be filled at the following prices if received by August 8

10 to 250 copies	5 cents each
300 or more copies	4 cents each
500 or more copies	3 cents each
1,000 or more copies	2 cents each

The GIST of IT—

CONGRESS has given the Industrial Relations Commission its full \$200,000, but not without a fight in the Senate. Page 425.

PHILADELPHIA has routed 358 beggars from its streets, most of them old offenders. Two had been arrested 100 times. Page 426.

MARSHALSEA, Pittsburgh's almshouse and insane hospital, has had a spring cleaning to rid it of methods that were out of date in the days of Queen Bess. Page 426.

OHIO'S Industrial Commission has reported on the wages of women in mercantile lines. Half of them get less than \$8.00 a week—women, not young girls. Page 427.

WINNIPEG, in a private report, shows an average of about \$9.00 a week. Women workers here shift even faster than in the East. Those who don't go in for matrimony, go on further West. Page 428.

HUERTA'S flight last week, should it mean the end of fighting on the Texas border, will relieve the Red Cross of the hospital service it has steadily rendered on the side lines. Page 429.

SEWAGE so infects the waters around Manhattan Island that the river baths are now filled with fresh water and salted to taste for the million and half bathers who use them. Page 427.

KING ALFONSO of Spain is, by his own jocular confession, risking a jail term through his high-financing of workingmen's homes. There's ample need, for Madrid is one of the most densely crowded capitals of Europe and has earned the name of "the city of death." Page 431.

SIX thousand men with banners, music and calls, marched through the streets of Chicago in a Sunday school rally. Delegates present represented seventeen million Sunday school pupils and teachers. Page 433.

THEOLOGICAL seminaries have been more loyal to history than to prophecy, but the bonds they are entering into with secular colleges promise a development of the humanities along with the divinities. Page 434.

SOCIAL service to the whole community was the keynote at the conference of New England union churches. Page 435.

SOME public service interests and the tenderloin have been in cahoots to head off anti-vice legislation in California. A long fight, in which the decent elements of the state have surely won ground, comes to a pitched battle next election in a referendum invoked to knock out the red light abatement law and keep the town "open" for the world's fair. Page 430.

THE SURVEY

COMMON WELFARE

\$200,000 FOR INDUSTRIAL RELATIONS WORK

THE FATE of the Federal Commission on Industrial Relations hung by a slender thread for several hours on July 7, while the Senate debated as to whether it would pass the House appropriation of an additional \$200,000 to continue the commission's work.

This commission, SURVEY readers will remember, was created by Congress in August, 1912, through the efforts of social workers and "third parties" interested in the conditions disclosed by the McNamara confessions, to inquire into the causes of industrial unrest and report its conclusions thereon. \$300,000 was to be provided for this work of which the commission has used \$100,000.

The Committee on Appropriations, headed by Senator Martin of Virginia, proposed to cut the remaining appropriation from \$200,000 to \$50,000 which, in view of the wide scope of the commission's program, would have meant practically strangling its activities.

After a lively all day session the original appropriation was passed by a vote of 46 to 18—not, however, before the discussion had provoked some senatorial remarks straight from the shoulder. All in all, the discussion proved a very healthy thing for the commission, and brought out some strong endorsements of its work. Incidentally child labor came in for an airing.

After Senator Kern had pointed it out as remarkable that the only decrease recommended in the sundry civil appropriation bill was the appropriation for the work of this commission, which was dealing "in a very effective way with the labor problem," Senator Borah took a fling at the "spasm of economy" which seized the legislative body whenever it was proposed to investigate "certain conditions in the industrial world and the relationship between labor and capital." He said:

"I know how sensitive some of us are as to the investigation of the conditions of child labor and of the sweatshops and death traps and hell holes in which the lives of the young people of our country are being ground out of existence. I know how thoroughly it stirs the blood

of economy when we begin to 'lift the lid' off of that hole into which we are pouring the young lives of this country year by year."

And to Senator Hoke Smith of Georgia, who strongly favored cutting the appropriation on the ground that the commission's work was unnecessary and a duplication of other investigations, Senator Borah retorted that while he did not wish to indulge in personalities, he nevertheless did not hesitate to say that "for years there has been a powerful influence asserting itself one way and another against the right treatment of the child labor problem in this country, and no one ought to know it better than the senator from Georgia."

In supporting the work of the commission, Senator Kenyon said:

"It is through a spiritual growth and development of the human being that this question will finally be worked out. But at the same time the facts brought before us will enable us, possibly in a philosophy of legislation, to devise some means to help settle this great question that is staring us in the face in this country; that is, of keeping the few from becoming excessively rich while the many are becoming excessively poor."

The Leaden Eyed

[FROM RHYMES TO BE TRADED FOR
BREAD BY NICHOLAS VACHEL
LINDSAY]

LET not young souls be smothered out before
They do quaint deeds and fully flaunt their pride.
It is the world's one crime its babes grow dull,
Its poor are ox-like, limp and leaden eyed.
Not that they starve, but starve so dreamlessly,
Not that they sow, but that they seldom reap,
Not that they serve, but have no Gods to serve,
Not that they die, but that they die like sheep.

FORD'S PLAN OF SMALL FARMS NEAR DETROIT

HENRY FORD, the Detroit automobile manufacturer, having established his \$10,000,000 profit-sharing plan and signed contracts for the Detroit General Hospital to cost \$3,000,000, is now at work on a plan of dividing into small farms to be worked by tenants a large tract of land near his home city.

While in Washington to keep an appointment with President Wilson Mr. Ford gave a representative of THE SURVEY an interview in which he talked of the new hospital which he will not only build but maintain and outlined his farm scheme.

Of the farming project he said:

"In a few words, this is what will be done. I have about 3,000 acres of land near Detroit, 2,000 of which includes good farming land now under cultivation. This will be divided into small farms of fifteen acres. On each farm a family will be established and to the head of the family who runs the farm I shall pay \$1,000 a year and his food supplies which will be raised on the land.

"Besides the food for this family, it is planned to grow on the fifteen acres enough more food for the market to make the whole project pay for itself, \$1,000 salary to the farmer and all. This means, of course, intensive farming under the most approved methods and careful planning all the way."

If Henry Ford can make a success of this problem, agricultural experts who have been taken into his confidence say that he will have taken a long step toward settling the problem of providing an adequate food supply for a rapidly growing population and at the same time giving the food-producers a living income.

Mr. Ford is planning his newest project as carefully as he planned the building of his \$35,000,000 motor car business, with more than 13,000 employes. He is already a good farmer as well as a master machinist. He is not ready to announce all the details of the plan, but that they are practical all who have reason to know his genius for organization are convinced.

DRIVING THE BEGGARS OUT OF PHILADELPHIA

THE PHILADELPHIA Society for Organizing Charity, in close co-operation with the Department of Safety, has been waging war for the past six months on street beggars. For at least thirty-five years Philadelphia has had the unenviable reputation of being a Mecca for beggars, and of having her streets decorated with all kinds of begging cripples.

As a result of this campaign there has been a marked decrease in the number of panhandlers. 358 arrests have been made by the mendicancy squad, and 170 by special district officers and officers from the United States Immigration Department—a total of 528.

Of this number, 273 able-bodied panhandlers, mostly young men, were committed to the House of Correction for terms of from three to six months. Twenty crippled and handicapped beggars were sent to the House of Correction for a similar term. 43 street beggars were sent to the county prison, and 43 others, most of whom were in bad physical condition, were sent to the Philadelphia Hospital and Almshouse.

A great majority of those committed proved to be old-timers and repeaters, with from two to 113 former commitments against them. One had been committed 113 times, one 100 times, one 54 times, one 48 times, and so on down the line.

Twenty-four of the beggars, young men between the ages of 19 and 29 years, proved to be drug fiends. 90 per cent of all blamed their downfall on drink. Many of them have good home connections and friends from whom they have been estranged. The amount of money in their possession varied from 50 cents to \$6, and their average daily income from begging, according to their own statements, was approximately \$1.50 a day.

One man, the "Rev." R. Henry Clayton, a fake collector for the Manasses Industrial School, Virginia, whose book showed that he had received over \$2,000, was sentenced to prison for four years and six months. Twenty-four Assyrians, who were carrying out an extensive begging campaign, were arrested and deported.

One man sent to the House of Correction is an architectural draughtsman of exceptional ability, and was offered a check for \$5,000 and a permanent position at \$100 a week if he would abstain from drink. Another was a salesman, formerly capable of earning \$5,000 a year. Another was a saloonkeeper, who had wasted a fortune of \$56,000 in a few years.

Prior to this campaign if a beggar was sent to the House of Correction he was usually released within a day or two and would be found begging at his

old stand. At present detainers are being placed on the men thus committed, and they are not released without serving their entire time unless the Society for Organizing Charity recommends clemency and has some plan to propose for the man's support.

THE PEACEMAKER

William Templeton Johnson

A FOUR-year-old American boy lived on the top floor of a high-shouldered Paris apartment house.

It was at the time of the last great railroad strike in France. Sabotage was the cry from Bordeaux to Brittany. London trains had ceased to leave the Gare du Nord, for the strikers were in almost complete control, and troops were pouring into Paris to protect the railroad properties.

T—'s father and mother had gone to England for a short time. The child was left with his grandmother who took him out with her to make a visit. They saw soldiers marching through the streets. The old nunnery of St. Sulpice, closed several years ago by the government, was being converted into barracks, beds and supplies carried in, troops arriving and guards mounted at the gates.

To the friend's house a young man came in to call who described how the strike was spreading, how the soldiers were now called upon to move the trains, how the St. Lazare station had been rushed by strikers throwing stones and coal.

T— had been much impressed by what he had seen in the streets, and now sat still taking in every word. That night he was excited, and talked with his nurse about the naughty strikers. Their actions followed him into his dreams. The next day, just after lunch, T— was missed. His nurse and grandmother were frightened, for the door had a spring lock too high for him to reach, and if he had opened a window and fallen from the balcony, it meant death on the pavement below.

JUST then the door bell rang, and there stood T— with trembling lips and tears in his eyes. He had put on his hat and coat, climbed upon a chair to open the door, and dragged his rocking horse, heavier than himself, down a whole flight of curving stone stairs. He had broken the bridle of his horse, and so came back for help. But he was hurrying on his way to do what he could to keep men from throwing stones at each other!

MOVING MARSHALSEA OUT OF THE MIDDLE AGES

THE MOVEMENT to improve the methods of care and treatment of the insane in Pennsylvania, directed by the Committee on Mental Hygiene of the Public Charities Association, has recently expressed itself in a substantial way by bringing about a complete change of management at Marshalsea, the Pittsburgh city almshouse and hospital for the insane.

An investigation of this institution by the Public Charities Association revealed that the medical service was inadequate and inefficient; that two young physicians each receiving \$900 a year were in charge of 702 insane patients; that no attempt was made to keep any sort of case records of the patients, there being sick patients in the hospital department the nature of whose illness no one had any knowledge; that there was no laboratory or department of hydrotherapy; and that absolute authority in all medical matters was placed in the hands of a former Pittsburgh policeman appointed superintendent as a reward for political services.

It was also reported by the agents of the Public Charities Association that the food provided for the inmates was meager and unsatisfactory, both morning and evening meal consisting regularly of a piece of bread, a ladle of molasses, and a cup of coffee; that there was but little provision either for recreation or for profitable employment; that the ancient idea of punishment for the insane prevailed among the employes and an astonishing number of the patients were kept constantly in restraint by the use of hand-muffs, straight-jackets, chains, and other physical devices.

These conditions were called to the attention of the City Council and the mayor of Pittsburgh by James H. Gray, vice-president of the Public Charities Association, Stanley H. Howe, educational secretary, and Rabbi Rudolph I. Coffee, chairman of the sub-committee on the insane.

Resolutions were adopted by the Allegheny county branch of the association consisting of sixty prominent local citizens urging the passage of an ordinance by the City Council providing for an adequate appropriation to secure the services of a qualified alienist as superintendent at Marshalsea. The official visiting alienists to Marshalsea joined in urging the passage of such an ordinance. On June 9 an ordinance establishing a position of medical superintendent at Marshalsea was passed by the Council.

For the new position, the visiting alienists to Marshalsea recommended Dr. C. R. McKinniss, chief physician of the department for men at the State Hospital for the Insane at Norristown, Pa. Dr. McKinniss will take charge early in August.

PUTTING A STOP TO BATHING IN SEWAGE

IN MANY quarters the stand against New York city's encouragement of bathing in polluted river waters has been crystallizing. The last of March an order was issued by Commissioner Goldwater, of the Health Department, forbidding the use of the floating baths within a danger zone bounded by the Narrows, the waters of the Hudson and Harlem, and East River below the Bronx Kills.

Immediately the owners of private river baths, entrenched behind city permits and leases, raised a hue and cry. In deference to their protests a hearing was held by the Health Department.

Following this, the order of the Health Department was somewhat modified. An amendment to the sanitary code granted permission to continue river bathing, public and private, provided that the hitherto more or less complete enclosures of river or harbor waters be made entirely water tight; that no river or harbor water be used unless purified; that persons suffering from communicable diseases be excluded and that all bathers be required to use a shower bath before entering a pool.

In order that the million and a half bathers who enjoyed river bathing in the floating baths last summer may not be deprived, the Bureau of Public Buildings and Offices of the Department of Public Works, at the request of the borough president, has arranged to remodel six of the public floating baths so that they will be water-tight. Into these Croton water will be introduced. Salt may be added.

One hundred and twenty-seven sewers empty into the Harlem and East Rivers, and sixty-two empty into the

Jars of water taken in April by the Bureau of Public Health and Hygiene of the A. I. C. P. from the rivers around Manhattan Island, near floating baths. The ease with which the black band can be seen shows the clearness of the water. The water in numbers one, two and three contains 1,500,000 bacteria per pint and 500,000 intestinal types per pint. That in number four, which has been treated, contains 5,000 bacteria per pint and no intestinal types.

Hudson from Manhattan alone. Chemical and bacteriological examinations have repeatedly shown the water to be highly polluted. The 500,000,000 gallons of sewage daily discharged into the waters surrounding Manhattan face the further unhappy prospect of some 150,000,000 gallons of the Passaic Valley sewage from New Jersey soon to be added daily to the waters of New York.

WAGES OF WOMEN CLERKS IN OHIO

OHIO is squarely confronted with a problem in industrial ethics. It is this. Are her women at work in mercantile establishments paid a living wage? Yesterday the problem was vague, theoretical. Today, it is personal, concrete. Yesterday the sums these women received were a matter of conjecture. Today the facts are before the whole state.

Ohio knows, for instance, that out of every twenty women in mercantile occupations, sixteen get not more than \$10 a week; fourteen less than \$10; twelve not more than \$8; ten less than \$8; seven not more than \$6; and four less than \$6.

Can a woman live on less than \$8 a week? The question is open to debate, a debate nevertheless, that is worth waging to the finish when the welfare of half the women in this service to the public is at stake. Can she live on \$6? Or less than \$6? The grounds for debate are dwindling; but the welfare of a fifth of the workers, all of them over eighteen years of age, is still at stake.

This is the problem arising from facts gleaned by the Industrial Commission of Ohio. This commission was created by an act of the last Legislature which felt the desirability of knowing the wages paid female employees prior to consider-

FLOATING BATH (WOMEN'S) BATTERY PARK

The condition of this water is precisely similar to that shown in jar number two.

ing any minimum wage legislation, authority for the enactment of which was granted by one of the late constitutional amendments. A total of 1,086 establishments, employing 15,744 women and girls, submitted answers to the commission's questionnaire seeking the wages and hours of employment of women.

The study covers only weekly wages, not earnings. Some employers pay in addition to the wage a bonus which may be based upon the character of goods sold, or only on the portion of the sales exceeding a stated amount. In some stores, heads of departments receive the premiums and in others the saleswomen. These were not taken into account in the commission's study as a statistical statement could not adapt itself to the rather indefinite variations, and because it was thought that the wage statistics furnished a better clue to the situation of the employe.

Several interesting situations are revealed by the inquiry. One is a remarkable concentration on certain rates of pay measured for adults in even dollars, and in half dollars for those below the age of eighteen. Seventy per cent of the older women fall into eight rates, beginning with \$4 which is paid to 3.6 per cent of the total, and ranging upward a dollar a rate to \$12, received by 5.4 per cent. Eighty-one per cent of those under eighteen fall into seven rates, the lowest being \$2.50, the wage of 7 per cent, and going up fifty cents a rate to \$6 received by 6.9 per cent.

The variations in wages paid in different cities and towns of the state are not prominent. Ten dollars a week appearing as one of the four leading rates in Cincinnati, Cleveland, and Columbus, and not appearing in the other cities and groups of towns, hints that the higher cost of living in large cities may have some influence on wages. Likewise, the absence of the \$5 rate as one of the four leaders in the three cities named and its universal presence elsewhere indicate that the smaller cities and towns have lower schedules.

Generally speaking, however, the commission finds there is no apparent connection between the size of city and its wage scale. Lower percentages held in the low wage groups in Dayton, the fifth city in size, than in its larger competitors, Cincinnati, Columbus, and Toledo.

A third situation of interest appears in the fact that the very low wage groups are found in only a portion of the establishments in each city or group of cities. Approximately, only one-half of the firms indulge in the practice of paying women over eighteen less than \$6; and only 10 per cent pay less than \$4 to girls under eighteen.

It is impossible to show exactly the prevailing rate of wages because of the rather even distribution of employes through a large number of wage groups.

The commission decides, however, "that of the 14,635 employes eighteen years of age or over, 40.7 per cent received weekly wages ranging from \$6 to \$8, inclusive. Of the 1,109 employes under eighteen years of age, 75.5, or 68.1 per cent received wages ranging from \$3 to \$5, inclusive. The prevailing rate of wages for women in Ohio mercantile establishments may therefore be said to be from \$6 to \$8 per week, while for girls under 18 years of age the prevailing rates are from \$3 to \$5 per week."

Having collected no data tending to show the actual needs of female employes in mercantile occupations in Ohio, and the cost of those needs (which would have been a dangerous task for a commission of mere men) the commission refrains from suggesting whether or not this prevailing rate is sufficient, or what should be a minimum wage for those occupations. That is left for the Legislature.

It is not impertinent, however, for those interested in the problem to ask a question. If there be truth in the recent findings of the brushmakers' wage board in Massachusetts that \$8.71 is the bottom-most amount "without which no girl worker can supply the necessary cost of living and maintain herself in health"—if that is true, where do these women of Ohio "get off"? Their prevailing wage is from \$6 to \$8, and half of them get less than \$8.

WOMEN BEHIND WINNIPEG'S COUNTERS

DEPARTMENT store investigation has spread to Canada. The last report to be published on the subject is one by the Civic Committee of the University Women's Club, Winnipeg, dealing with the conditions of women's work in four large department stores in that city.

Since the investigation was undertaken by inexperienced volunteer workers it is less detailed and perhaps less reliable than similar studies elsewhere. Furthermore the report claims that in Winnipeg the expansion of trade within the last ten years has been so rapid that conditions change almost from month to month, and accurate observation is therefore more difficult than in older cities. This is particularly true of the employes who, in this western country, form a rapidly shifting element in the industrial world, the women even more so than the men. There are two reasons for it—first, early marriage, and second, the tendency to move further west.

Many points made in the report are, however, interesting by way of comparison with mercantile work in other cities.

When it is realized that the only prohibition on the hours of labor contained in the shops regulation act of Manitoba is that a young person, a boy under 14 or a girl under 16, shall not work more than 74 hours in any one week, it is

greatly to the credit of the employers of labor in the stores of Winnipeg that the working hours compare favorably with those in cities of the United States. Only one of the four stores remains open Saturday evenings or evenings during the Christmas season, and even in this small store extra help is engaged to relieve the regular staff on long days. In three of the stores the day runs from 8.20 a. m. to 6 p. m., and in one store from 8.20 a. m. to 5.30 p. m. The hours are shortened in summer by the Saturday half holiday. Each store requires one night's work at stocktaking and without pay.

Neither is there any prohibition as to the employment of children in stores. Yet, according to the report, none of the stores, except perhaps one at Christmas time, takes advantage of this law. All stores require that girls between 14 and 18 live at home or with friends who will be responsible for them.

The wage figures were obtained in every instance from the store management, but the report contends "we believe these figures to be correct, first from the manner in which they were given, and second from the fact that we have been unable to find contradictory evidence."

The data thus secured shows that saleswomen of average efficiency in Winnipeg are earning at least \$9 a week. The beginning point of the wage paid to women and girls working a full day in Winnipeg is \$5 a week.

No store in Winnipeg, states the report, "exact any direct fine." But it goes on to say that "the penalty for lateness without good excuse is half a day's absence with consequent loss of pay." As in American stores the general rule is that dismissal is given without notice.

The report gives considerable emphasis to store construction. In criticising the lack of good ventilation, it remarks that "natural ventilation in a large building fully occupied is admittedly insufficient, and all the stores but one in Winnipeg depend upon natural ventilation." No store in Winnipeg uses its basement, however, for sale purposes. Fire protection seems to be as scarce as in the stores of our own cities. Only one store investigated had an enclosed stairway leading to the street.

Welfare work is not carried on as generally as in American stores. Only one store—the largest—had any organized service. This, however, has as a unique feature on this continent, the pension system. To any woman employe who has been in its service fifteen consecutive years and who has reached the age of forty, this firm will give a retiring pension commensurate with the term of service and the amount of salary. The pension ranges from \$4 to \$8 weekly, and will be paid for life, so long as the pensioner does not marry, does not enter employment similar to the company's, and leads a moral life.

The Red Cross on the Mexican Border

EVER since Mexican revolutionists captured the city of Juarez in 1911 and Madero issued the first of repeated appeals to the United States to care for the sick and wounded, the American Red Cross has been in frequent service in Mexico and along the border line. Like a doctor at a football game, it has waited on the side-lines or rushed to a point opposite where fighting was thickest, to give expert surgical and nursing care to those brought from the field.

This service has been of three sorts—caring for the sick and wounded, affording transportation and necessities of life to American citizens leaving Mexico, and extending the same help to Mexican refugees, whether soldiers or not. Into Southern California, Arizona, New Mexico and Texas have come thousands of fugitives whose lives and property have been endangered by the fighting of contending armies and by the depredations of marauding bands of outlaws who have taken advantage of disturbed conditions.

During the first few months of 1914 the chief activities of the Red Cross grew out of active military operations in and around the Mexican cities of Juarez, New Laredo and Ojinaga—border towns prized by both armies as gateways for supplies. It was at the evacuation of Ojinaga that the events pictured in the accompanying photographs took place.

Learning that the Constitutionalists had sent a large body of men against this town and that the attack on the Federal garrison there would be made in a few days, a representative of the Red Cross hastened to Presidio, Texas, just across the Rio Grande from Ojinaga, and converted a school house into a hospital. Fighting began next day. For ten days wounded soldiers from Ojinaga kept up a steady passage across the river to receive Red Cross treatment. Families of women and children camped on the American side.

Driven finally from their outposts by an attack led by Villa himself, the entire garrison and population of Ojinaga evacuated on a beautiful moon-lit night. Wading the shallow Rio Grande, a disorderly and ragged stream of

The wounded in army wagons on the march across the desert to Marfa. Wheels up to their hubs in a dust cloud.

foot-soldiers, horsemen, women, children and wagons, crossed to the American side for hours. As they came out of the river they were disarmed by United States soldiers.

But though they had escaped their Mexican enemies, they were now threatened with starvation. Presidio is a village of one hundred population. For miles around the country produces only enough to feed the normal population and for weeks it had been drained to

the very last ounce of its scant supply.

There was nothing to do but to move the visiting host on to some land of plenty. Accordingly 3,500 soldiers, 1,100 women and 500 children were formed into a caravan and escorted on a four days' march, across desert and through mountains, to Marfa, the nearest railway station, sixty-seven miles away. There they took train to El Paso, being finally placed under guard in a camp at Fort Bliss.

CALIFORNIA'S CAMPAIGN AGAINST ENTRENCHED VICE—BY FRANKLIN HICHBORN, SAN FRANCISCO

THE CALIFORNIA Legislature in 1913 passed, and the governor signed, a red-light abatement act. The measure has, however, been held up under the referendum provisions of the California state constitution.

The invoking of the referendum against the California measure makes the social evil a sharp issue in that state. The social evil, however, is but part of California's larger vice problem, while the vice problem in its entirety is but part of the state's great political problem, which Californians have set themselves resolutely to solve.

California's political problem has its foundation in enormous investments of outside capital in the state's public utilities. In the three principal groups of utilities—railroads, gas and electric plants, telegraph and telephone companies—the California State Board of Equalization employing the stock and bond method of valuation, finds an investment of \$840,000,000. The properties are largely in the hands of resident officials representing eastern and European capital. We find them "in politics" controlling largely Legislature, executives and even courts.

Another important group of exploiters in California has also taken keen interest in public affairs—the tenderloin group. This group divides into three classes, the exploiters of gambling, liquor-selling and prostitution.

The interests of this group are enormous. The lowest estimate placed on the volume of betting at what was, up to three years ago, California's principal gambling center—the Emeryville Race Course—was, for the last great season, 1907-8, covering a period of 180 days, \$36,000,000. At the trial of former Mayor Eugene E. Schmitz for extortion from French restaurant assignation house keepers, it was shown that one of these establishments represented an investment of \$400,000.

The business and political ramifications of these vice interests are most far-reaching. Up to the legislative session of 1911, for example, the race-track gamblers dominated the Public Morals Committee of the state Senate, and in that committee arbitrarily held

up all legislation aimed at gambling interests. When the San Francisco Board of Supervisors attempted to pass an ordinance to outlaw nickel-in-the-slot machines, eight of the most important banks of San Francisco joined in a petition to the supervisors, praying that the ordinance be not enacted.

A report published by the San Francisco Board of Supervisors in 1910 on the causes of political corruption in San Francisco, sets forth that one of San Francisco's most notorious assignation places, having four stories devoted to private supper bedrooms, had been constructed according to plans satisfactory to a well-known assignation house keeper, "by one of the largest, if not the largest, trust company in the West." "And," the report continues, "the officer of the trust company which made the lease of that particular house situated in the shopping district, was appointed a regent of the state university."

Thus in California there are two special-privilege-seeking groups: the public service corporation exploiting group, and the vice exploiting group. We find them working together in politics, uniting in common cause. And these have constituted the so-called California machine. Under their unholy alliance, public service corporations have long been able to fix rates on the basis of all the traffic will bear and to secure for little or nothing franchises worth a king's ransom, while legislatures have been slow to meet the public demand for enforceable laws against vice and district attorneys, and petit courts and peace officers have failed to secure the enforcement of such laws as have been enacted.

The reaction against machine domination in California began in 1908. That year many new men were elected to the Legislature. They succeeded in passing one important moral reform measure, however, a bill, based on the New York law, to outlaw race-track gambling.

This was the "machine's" first important defeat. But under "interpretations" by the state supreme court, the law was practically nullified.

The revolt against "machine" methods was to culminate in 1910 in the elec-

tion of Hiram Johnson, governor, with a thoroughly anti-machine Legislature at his back. That year, another anti-gambling law was enacted.

No attempt was made to "interpret" this 1911 law. But at the 1912 election, the gamblers, through the initiative, attempted to undo the Legislature's work. The gamblers' measure was on its face as drastic as that which the Legislature had enacted. But in the last paragraphs a few words had been inserted under which the gamblers would have been able to resume operations. The trick was exposed, however, and at the 1912 elections California settled the racetrack gambling question by piling up a majority of 203,000 against the gamblers' bill.

The 1911 Legislature struck two other important blows at vice exploitation, by outlawing the nickel-in-the-slot machines and passing a local option law.

This local option law gives communities power to decide by popular vote whether the sale of intoxicants shall be licensed. Under it upwards of 1,000 saloons and road houses have been closed in three years.

The 1913 Legislature continued the steadily advanced campaign against vice exploitation by the passage of the red-light abatement law. The measure is by no means as drastic as similar acts in force in other states, but under its provisions property employed for purposes of prostitution is rendered insecure. With the law on the statute books, it would gain exploiters of the social evil nothing to "go into politics" to protect their illegal enterprises, for every citizen would be furnished the machinery to proceed against them. This particular group of exploiters had counted upon exceptional gains during the period of the Panama-Pacific Exposition, which makes the enactment of the abatement measure particularly objectionable to them at this time. They proceeded to invoke the referendum against it.

It is now known that the petition under which the referendum was invoked contains hundreds of forged signatures. After the most casual investigation, the San Francisco authorities rejected as forgeries 1,280 names on the San Francisco petitions. Theodore Kytka, the handwriting expert, who has since examined the petitions, states that in his judgment were all the forged names to be eliminated there would not be valid signatures enough left on the petition to invoke the referendum.

The tenderloin interests, with literally millions of unclean profits at stake, are making a state-wide campaign against the bill. The measure's proponents are making as determined a campaign for the measure's ratification. The proponents of the bill confidently expect to see the measure ratified.

INDUSTRY

HOW SPAIN PROVIDES FOR THE HOUSING OF HER WAGE-EARNERS—BY KATHARINE COMAN

EARLY IN THE reign of Isabella II of unhappy memory, there was issued in the Queen's name, and apparently with her personal approval, a royal decree proposing the betterment of living conditions for the Spanish people "whose slender means and miserable wage" did not enable them to pay for suitable dwellings. The queen promised to aid every legal effort to improve the sanitation of the poorer districts of the industrial cities where working class quarters were declared to be a menace to health. She also agreed to further any plans to build in the outskirts of such cities one or more dwellings "in which comfort and adequate space shall be combined with low rents and accommodations suited to the habits of this portion of the population."

There is no evidence that the aspirations of Isabella bore fruit. The provision of living quarters for Spanish workmen was abandoned to business enterprise. The rapidly increasing demand that followed the opening of factories and the gathering of the rural population to the cities, characteristic of the past sixty years, has been met by cheaply built and overcrowded tenement houses which yield 30 per cent on the money invested.

According to the report issued by the Royal Council of Sanitation in 1901, the rate of mortality varies directly with housing conditions. In Madrid, one of the most densely populated capitals of Europe, the death rate runs the gamut from 19.6 in the business center to 37.9 in the factory district, keeping pace with the density of population. The influence of overcrowding, with the inevitable concomitants of filth, bad air and insufficient light and water, is evident in the prevalence of contagious diseases, such as measles, smallpox, tuberculosis and typhoid.

Of the 500,000 people in Madrid, 52,000 live in tenement houses with an average of 3.4 persons to a room. In one of these "tragic" tenement-house streets, the death rate rose to 93.89 per thousand in 1900, in another even more infamous, the ratio was 151.38 per thousand. Madrid has earned the sinister name "the city of death," not only because the winds from the nearby Guadarramas are bitter, because the drainage system is defective and the water supply inadequate, but because the houses of the poor are the breeding places of disease.

One of the reforming impulses characteristic of the period of the Republic found expression in the organization of *La Constructora Benéfica*, a building society authorized to open public subscrip-

TENEMENTS BUILT AROUND A "CORRAL", SEVILLE, SPAIN

tions and receive legacies for the purpose of providing low-cost dwellings for wage-earners. A tract of land was purchased near the railway station and adjoining the factory district, and there the initial group of four houses, accommodating six families each, was put up in 1874. The standard set in the initial years—"one family to a house and to every house a garden"—was not realized until 1907, when a group of workmen's cottages was built on the Calle Cartagena. These modest establishments are rented at rates ranging from \$5 to \$10 a month, according to size, situation and length of time contracted for purchase. Here the society hopes to realize another of its early ideals, opportunity for the renter to become full proprietor of his dwelling through a series of monthly payments extending over ten, twelve or fifteen years.

El Montepío General Obrero de España, or workingmen's loan association, uses a part of its capital in building houses for rent or sale to its members. The rentals are calculated on a basis of 6 per cent of the money invested. If the occupant contracts to buy, half the rental is accredited to him as payment on the capital.

La Sociedad Benéfica Española de Casas Higiénicas enjoys a more distinguished patronage. Organized in 1906 to erect a group of workingmen's houses in honor of the king's marriage, it received a gift of \$14,000 from the Grandees of Spain. The first cottage completed was assigned to the family of a victim of the bomb explosion in-

tended to destroy the royal pair.

Alphonso XIII has taken personal interest in the improvement of the habitations of the poor. He has devoted the gift of \$40,000 from a Spaniard who had gathered a fortune in South America to the construction of a group of forty workingmen's cottages in Seville on a plot of land offered by the town council. They are unusually commodious, for the king has announced his intention of assigning these houses to the applicants who bring the largest number of children.

In a recent interview, Don Alfonso announced to the reporters a reckless policy of expansion. "My plan is very simple. First I build these houses in Seville, I mortgage them and with the loan I build others in Madrid. Then I mortgage these and with this money I shall build another group of houses, also in Madrid. And so with mortgage after mortgage, I go on building . . . until I land in jail. When this happens," jokingly added the king, "I shall be in a very difficult situation, because, being in jail, I cannot sign my own pardon."

The propaganda for improvement of workmen's dwellings is fast becoming fashionable. In 1904, the Seville Chamber of Commerce, Industry and Navigation built six cottages in honor of the king's visit to the Alcazar. These admirably built houses were awarded to the most faithful wage-earners as recommended by the employers of the city: one dock-laborer, one male and one female operative, one employee of the tobacco factory, etc. The fortunate winners are life tenants, and their heirs will come into full possession of the property. The town council appropriates \$1,000 a year for the construction of workmen's cottages which are rented, at 4 per cent on the cost, to wage-earners who can prove the longest period of service with any one employer. After twenty years of occupation, no further rental is required, and if a man dies before completing the score, his widow and minor children may continue to live in the house, rent free.

One of the first undertakings of the workingmen's delegates to the Institute of Social Reforms was a presentation of the needs of better dwellings for wage-earners. As a result, the institute began its propaganda in behalf of improved tenements which finally crystallized in the law of June 27, 1911. This enactment provides for the organization of local *juntas* for the improvement of workmen's dwellings. (The institute has organized thirty-one local *juntas de Fomento y mejora de las habitaciones baratas*.) Of the nine members in each *junta*, one must be an architect or contractor, one a physician and one a member of the town council.

All are nominated by the *alcalde* and appointed by the civil governor of the province in which the town is situated. Two members are elected by the fifty principal subscribers to the building funds and two by the workmen's societies represented on the *junta* of social reforms. Two must be men preeminently concerned in social betterment.

Building societies approved by the local *junta* and legally registered may receive legacies, donations and subventions accorded by state, province or municipality. All property destined for the construction of workmen's dwellings is exempted from direct taxation, which ranges from 17.5 to 22 per cent of the net profit, on real estate, as well as from inheritance, taxes, transfer dues, and stamp duties. Municipal lands may be appropriated to the uses of these societies. The law further directs that private building sites desirable for cheap houses and not utilized for this purpose within three years after the promulgation of the law, may be expropriated in the interest of public welfare. This extension of the right of eminent domain is regarded as entirely logical, for the need of adequate housing may be quite as urgent as that of transportation facilities.

Finally, when tenements are condemned as unsanitary, and the owner refuses to make necessary reforms, the city may proceed to forcible expropriation, paying only the value of the land and utilizing the proceeds from the sale of wreckage or of superfluous land in the building of new houses on the site. Abuse of these extraordinary powers is guarded against by the proviso that in every such project an official representing the Institute of Social Reforms hears the protests made by the injured parties. Thereafter the case is referred to the secretary of state who must submit it to the Council of State and to the Royal Council of Sanitation before the final decision is given. The effectiveness of this provision of the law is not yet determined for no *ayuntamiento* has thus far taken advantage of its powers.

The city government or a co-operative building society may issue bonds for the purpose of constructing workmen's dwellings and mortgage its property on this account. The last-named organizations are especially favored as the state guarantees the payment of interest on their loans, somewhat as the United States government guaranteed interest on the Pacific railway bonds. An annual grant of \$100,000 is promised, half of which is set aside as a sinking fund against arrears of unpaid interest (not exceeding 5 per cent) due to savings banks, *montes de piedad* and other credit institutions recognized by the law. Societies which pay more than a 4 per cent dividend to their members may not be accorded this aid in meeting their obligations. The remainder of the annual grant is devoted to direct loans to the most needy and deserving enterprises, the loan never exceeding 25 per cent of the capital stock.

The building regulations imposed upon organizations which undertake workmen's dwellings are sufficiently

IMPROVED DWELLINGS BUILT BY CHAMBER OF COMMERCE, SEVILLE, SPAIN

exacting. The site must be free from humidity due to springs, rivers or ponds. It must be clear of poisonous gases and remote from standing water, dung-hills, unsavory factories, etc. Attention should be given to the orientation of the houses so as to secure air, light and sunshine. The dimensions of the *patio*, or central court, that indispensable element of good building in Spain, must be adequate to give air and light to all the tenements.

The size and height of living rooms is stipulated, and the location of ventilating shafts. The cellars may not be used for sleeping quarters and only in case of necessity as kitchens, baths, etc. No tenement house should be built to accommodate more than forty families. Single dwellings, if two stories high, should cover no more than one-half or two-thirds of the lot, leaving room for *patios* and gardens.

Workmen's dwellings built in accordance with the law are exempted from taxation for twenty years, provided they are not diverted from their original purpose. Such houses may be sold to the tenants for cash or on deferred payment. In the latter case they are exempt from taxation until the purchase is completed. The building society may secure its interests by a mortgage on the property or by the Belgian form of life guarantee, whereby the purchaser adds a percentage equivalent to a life insurance premium to his annual payments. If he dies before the contract is fulfilled his heirs receive the property free from encumbrance.

In 1913, the first year in which the subvention was available, twenty-three building societies qualified under the law relative to the construction of low-priced dwellings. Several of these had been organized previous to the enactment of the law and were well established. The society for the construction of workmen's dwellings in Valen-

cia could boast a capital of \$36,000, 85 houses built, and 585 occupants; that of Bilbao showed a capital of \$136,100, 33 tenement houses and 1,000 occupants; that of Burgos, \$35,000 capital and 26 cottages sheltering as many families; while one of the building societies of Barcelona reported a capital of \$1,000,000, with 30 houses under construction and more projected. Other applicants for state aid were so newly organized that they could show no capital, no houses, not even the building sites usually granted by the municipality.

Under the first adjudication, the Institute of Social Reforms determined that none of the applicants was entitled to a guarantee of interest on bonds under the terms of the law; but the \$50,000 available for subventions was distributed under the following classification: to co-operative societies with contributed funds less than \$3,000, and to societies proposing no payment of dividends or having a profit of less than 3 per cent a subsidy of 20 per cent on the capital stock; to co-operative societies, whose funds amounted to more than \$3,000, a subsidy of 15 per cent on the capital; to building societies, co-operative or not, whose annual profit ranges from 3 to 4 per cent, a subsidy of 10 per cent of capital represented.

An old Moorish city like Seville affords but poor and expensive living quarters to workmen. Tenement houses built round a "corral" with rooms opening on the gallery are reasonably sanitary, but there is usually no water in the kitchens and the plumbing is defective. Many families live in cave-like habitations at or below street level, with inner rooms where no sunlight can penetrate. Rents are even higher than in Madrid, and wages average less by 20 per cent.

It was to be expected then that in Seville the law offering special privileges to co-operative building societies

[Continued on page 445.]

CHURCH and COMMUNITY

Edited by GRAHAM TAYLOR

FOURTEENTH INTERNATIONAL SUNDAY SCHOOL RALLY AT CHICAGO

No EVENT of the year in America has involved more men, women and children, both in the church and the community, than the fourteenth international Sunday school convention held in Chicago, June 23-30. No other convention requires such a large constituency for each delegate—45,000 enrolled members for each. And yet 2,200 delegates were assigned seats, but as Chicago's big Medinah Temple had room for as many more, the alternates of the delegates were authorized to act as delegates.

A constituency of 173,459 Sunday schools, with a membership of about 17,000,000 scholars, teachers and officers, in practically all Protestant denominations, scattered through every city, town and hamlet in the country were thus represented. There was room for only about 500 people other than delegates, so that until nearly the end of the conference the attendance was restricted to those with official connection, except at the many section conferences held in widely scattered churches and districts where the public was admitted. There were 364 participants in the programs listed.

In meeting at Chicago the convention came back home. The local committee welcomed it "where the work of the organized Sunday school has been emphasized in a unique degree, a center of leadership in Sunday school work of such practical sense and broad vision as warrants honest pride." In responding, the president said, "Chicago has a Sunday-school atmosphere we ought to breathe, a history we must know if we would be just to our predecessors. It has been the mount from which imperial visions have been gained by men whom Chicago and its suburbs have produced—B. F. Jacobs, to whom the uniform lesson system and interdenominational work owe more than to any other man, Bishop John H. Vincent, Dwight L. Moody, Edward Eggleston, Henry Clay Trumbull, C. R. Blackall and M. C. Hazard."

Marion Lawrance, general secretary of the association, who also became a citizen of Chicago when the headquarters of the international committee removed there, emphasized Chicago's influence upon the Sunday school movement in the words given prominence on this page.

On motion of an alderman who is also chairman of the Red Cross committee of the International Sunday School Association, the City Council of Chicago voted "to recognize the presence of these guests of the city, extend its greetings and express the hope that provisions for their comfort during their stay in the city would in every way be satisfactory."

Most of the time and attention at the

convention and its conferences were absorbed by discussions of educational administration and methods, in which the modern psychology and pedagogy involved in religious experience and teaching were more emphasized and with less criticism than in any previous convention. The new principle that we know best the things that we do is finding larger acceptance than ever in the Sunday schools. Religion is being regarded less as a speculative theological theory than as an experience and a service. The slogan was heard on all sides that Sunday school scholars must do what they are taught. The one real divisive point was administrative, but it had been safeguarded at the last convention and was harmonized at this one by giving proportionate representation on

WHAT CHICAGO HAS DONE FOR THE SUNDAY SCHOOL

Here started the first campaign to organize every county in a state, every county in Illinois having been organized for over forty years.

The first organized teacher training was undertaken here and the first Sunday School institute was held here.

The first uniform lesson system in North America was issued by the Chicago Sunday School Union and out of it grew the uniform lesson system which has been in use over forty years.

The first Sunday School journal was published here under the same auspices in 1866.

The first full account of a state Sunday School convention was published by the Chicago Advance.

The first festival of religious and patriotic songs was held and has been continued here, with the largest chorus of women's voices in the world.

The adult Bible class movement was here adopted as a department of organized Sunday School work.

And the first Bible class athletic association in connection with the organized Sunday School work had its birth in this city, with the largest amateur baseball organization in the world, having eleven leagues of six teams each and one thousand members who are eligible only upon regular Sunday School attendance, certified by the written statement of the pastor or superintendent.

the international committee to differing groups which might otherwise have organized separately.

If there was one feature of the work predominantly emphasized, it was the movement to include adults, especially men's Bible classes, in the regular Sunday school. To "feature it" strenuous efforts were made to marshal a parade of men's Bible classes that would impress the public with the fact that at least 2,500,000 men are enrolled in their membership.

By official count 6,514 of them lined up with bands and banners in impressive array, which would have been more so had it not been for the exaggerated claim that many more thousands would march, as many as 30,000 having registered their intention to march. Men of all ages, many nationalities and different station in life were in line.

Almost every detachment bore a banner with a cross encircled with the words, "By this sign conquer." Open Bibles were borne in frames on the shoulders of men. Legends galore fluttered from pennants, such as, "Men of Missouri in line for Christ"; "Michigan for Service"; "Alberta for Christ"; "Train up a child in the way he should go and go that way yourself"; "Physically strong, mentally awake, morally straight"; "Bible study builds character"; "Where men go boys will follow"; "The prison seldom reforms, but often deforms"; "Nebraska the land of corn and Bryan"; "Kansas, twenty-five years of prohibition, empty jails, 66 per cent of taxes spent on education"; "We will bury booze in Wisconsin"; "Oklahoma born sober"; "The bier that will make Milwaukee famous"—which was the legend over a beer barrel borne on a bier. State calls, like "O-HI-O", rang out, in the intervals between the marching music of the bands, all of which played Onward, Christian Soldiers.

The social significance of the men's Bible class movement, as well as that of the women, has found such expression as the use of social studies prepared by the American Institute of Social Service and denominational social service commissions. These Bible classes have social committees, hold socials for men, cooperate with each other in community surveys, in fighting drink and the social evil and in planning playgrounds, getting the Saturday half-holiday and in furnishing volunteer workers for "big brothers," probation officers and many other lines of public welfare work.

The emphasis upon the importance of these adult classes was carried so far by one of the most influential members of the international committee as to include the insistence that all young people's societies should be merged into a department of the church, called the depart-

ment of religious education. He argued this point by the claim that these societies in calling for testimony rather than for education are psychologically wrong and lack educational vision.

Others emphasized the same lack in the church by saying: "We have too much preaching and too little teaching, too much exhortation and too little definite instruction, too much mere culture and too little conversion"; "Our education is losing its religious significance and pure religion is losing its educational ideal."

At the closing session the note up to which the utterances of the whole convention were keyed most highly was the social note. It was voiced in clarion tones by two speakers. Dr. J. A. Macdonald, editor of the *Toronto Globe*, significantly said:

"I care not how venerable or how puissant an institution may be, woe to the institution against which a vital, pregnant idea comes. Its day is doomed! And a new idea has been released in the states and provinces of North America against the old iniquities and established oppressions. It is the social message, the social program, the social motive—the message of one man and another, not the message of the individual, I tell you, but the message of one man and another."

Margaret Slattery of Boston said:

"Jane Addams saw a star in the smoky sky—a great star—and she has given her life to the working out of the mes-

sage of the star. Go back to your boys and girls and give them the insignia, not of brute force but the tokens of service and of peace. Give them the message of the star Jane Addams saw. Teach them the message of the star so that nothing shall ever extenuate in their eyes the awful contrast of useless wealth and causeless poverty in a rich land. Teach them those things so that they shall never extenuate what we have come to extenuate, because we will not give heed, because we have not tried to understand. Develop the conscience of your community."

While the greatest enthusiasm was shown over the speaking and action against the liquor habit and traffic and the use of the cigarette and tobacco, yet among the resolutions unanimously passed were those favoring a federal law for the regulation of marriage and divorce, a single standard of purity for both sexes, laws for the suppression of commercialized vice, lotteries and gambling, and for the censoring of moving pictures, the prohibition of child labor, Sabbath rest and observance and the advancement of international peace.

The association adjourned to meet in New York city four years hence for its first quadrennial session. The next world's convention meets in Tokio, Japan, in 1916, at the invitation of the premier, Count Okuma, who sent a personal representative to Zurich, Switzerland, to urge its acceptance at the last convention held there in 1913.

STIR AT THE CENTERS OF THEOLOGICAL EDUCATION

THE WAY the church schools for the training of the ministry are responsively reacting to the tendencies of the times is proving that many of them are not as reactionary as all of them are supposed to be.

The church has been the great conservator of civilization. Its initiative has also led much of the advance in human progress. What it has conserved, however, has been worth as much to mankind as what it has advanced. Its institutions, therefore, cannot be expected to change as quickly or radically as some others.

Its training schools for the ministry have the difficult task of keeping in adjustment with the long past and with the opening future. Most of them, indeed, seem to have been more loyal to history than to prophecy. The past appears secure to them. In comparison, the present and the immediate future seem like the temporary in contrast with the eternal, like the steadfast in contrast with the evanescent.

Never more than in the swiftly changing tendencies of our own times have men needed the continuity for which the church stands, to connect the present with the past, the future with some background.

While, therefore, theological seminaries are not expected to change their policies and methods without due cause and deliberation, and should not be criticized too severely on that account, yet

when they do change, they are likely to register the deeper tendencies of the times—the set of the tide.

Seminaries Moving to Universities

The tendency to co-operate and thereby to economize resource and at the same time increase efficiency of equipment and effort, is emphasized by the seminaries which are removing their

base of operation close to universities. This movement, which has long since demonstrated its value at Oxford and other universities abroad, is setting in strongly on this continent.

At McGill University, Montreal, the divinity schools of several denominations have been led organically to unite. At Toronto the church schools are closely affiliated with the university. Old Andover Seminary moved to Cambridge to be near Harvard. The young Pacific Seminary removed to Berkeley to share the advantages of the University of California.

And now the unanimous decision of the directors and faculty of the Chicago Theological Seminary to move within co-operating distance of the University of Chicago is announced.

Without compromise of distinctive tenet, or sacrifice of unique heritage, or loss of institutional independence, or change of charter, or alienation of funds, or weakening denominational fellowship, the reciprocity thus made possible will furnish a working demonstration of the larger loyalty to more fundamental principles, to the higher ideals of the greater common cause.

The co-operative relation of divinity schools thus made possible by their affiliation with the same university has great possibilities both to the church and the community. It may do much to shade off the too sharp line between the sacred and the secular, as religion and all the relationships of life are studied together, as students in many departments of study meet and mingle. The unity of all life may thus be impressed. The identification of religion with everything common to man will be more apparent. The application of the common faith to the social conditions of the common life can be brought to bear more effectively, both in theory and practice, through the combined resources of hitherto competing institutions.

Such a move may be the beginning of the end of much waste, duplication, competition, misunderstanding, between denominations and denominational institutions, which have far more in common than to divide them. It may be followed by the grouping, not only of other seminaries, but of other church agencies, in something more like "the holy catholic church, the communion of saints."

Meadville's Readjustment

The Theological School of Meadville, Pa., also announces a fundamental change in its method of procedure. It was proposed by Anna Garlin Spencer, acting professor of sociology and ethics, and was adopted by the board of trustees in May.

This includes an all-year-round academic year of four terms; the required course for college graduates covering two calendar years; a sub-junior course offered, by special arrangement with other institutions, to students without college training, who will thus prepare to enter the theological course; graduation in the early autumn instead of the spring, to facilitate prompt placement in parish work; summer work provided for seniors at Meadville in co-operation with the departments of religious education

Bowers in Newark, N. J. News

IN SUMMER—THE CLOSED DOOR AND THE OPEN DOOR.

and social service of the American Unitarian Association, and for juniors and those taking preparatory courses the privilege of attending the summer session of the University of Chicago at the expense of the Meadville School.

This is said to be the first training school for the ministry to combine the advantages of such intensive work as can be done in a smaller school with the stimulating and many-sided advantages of a great university located in a large city and in another part of the country. A Meadville professor will be in charge of the students thus sent to the University of Chicago.

A special course of one year including four terms is also offered those seeking training for parish assistants, church settlements, directors of moral and religious education, and organizers of volunteer social service in institutional churches.

Professor Spencer accompanies the announcement of these unique and significant changes with this interpretation:

"It marks one of the steps from the exclusive devotion to the 'divinities' of the old type of theological school toward the 'humanities' that form the center of gravity in modern religious training. The old studies are of course retained, but relatively shortened and balanced by an increasing attention to sociology and its application to social reforms, social amelioration and constructive social service. Nothing is more significant of the pressure inward to the church from all departments of the social movement than this stir at the centers of theological education."

COMMUNITY SERVICE AND NEW ENGLAND CHURCHES

By William Horton Foster

COMMUNITY SERVICE was the keynote of the third annual conference of the Union Churches of New England held at Hopedale, Mass., June 9. Scores of such churches are scattered through New England and many of them were represented at this gathering.

The speakers all lauded the Union Church as the conservator of religious energy and activity but accepted with equal unanimity the responsibility for community service resting upon such churches. The opinion of the conference may be taken from the following quotation from H. J. Burgstahler's address on The United Protestantism of America.

"The church used to say, social welfare, the group interest, politics, industry, social relationships viewed from the group standpoint are of no concern to us. Let us keep out. Today, we realize that unless the interest of the church is cosmopolitan, unless it reaches out into every department of life to infuse into society the dynamic of Jesus Christ, our social fabric will rot of social disease, and the church will confront another decadent civilization, as did the early church in the earlier centuries.

"The task of the church is to regenerate society, to transform our civilization, to help solve our stupendous problems by applying the old summons 'Re-

pent ye,' and through a constructive program of Christ's gospel.

"This alone is a stupendous task, it involves such huge problems as recreation, fraternalism in industry, co-operation, child welfare, education, the housing problem, poverty, the American saloon, the white slave traffic, and numerous other problems."

RURAL CHURCH SUNDAY PROCLAIMED

THE FIRST proclamation in behalf of the country church and the rural Sunday was issued by Governor Henry D. Hatfield to the people of West Virginia. It is a noteworthy document in the annals of both church and state.

Newspaper reports and personal letters from almost all parts of the state show that the day was very generally observed and the idea seems to have struck a popular chord. This was in part due to an effectively printed and circulated appeal for the observance of Rural Church Day, not so much as a "go-to-church Sunday," as a day on which the usefulness and work of the country church should receive special emphasis and stimulation.

To that end this circular suggested such lines of work for the country church as a survey of its field; encouragement to education by lecture courses,

libraries and co-operation with the schools, as well as through farmers' clubs, of both men and women, and the granges; the promotion of agriculture and the common interests of agricultural people; sanitary and hygienic work and the provision of plans, facilities and occasions for healthful recreation.

A list of annual events to be celebrated, a suggestive program for Sunday school observance of Rural Church Sunday and a prayer for Rural Church Day were also included.

This new idea worked so well in West Virginia that the suggestion comes from that state through THE SURVEY to the Home Missionary Boards affiliated with the Federal Council to initiate, inspire, standardize and practically promote the observance of Rural Church Day among the churches of their respective fellowships.

THE GOSPEL FOR SOCIETY

The Sunday evening at the Northern Baptist Convention in Boston, which was devoted to The Gospel for Society attracted the largest attendance which any session attained.

The Rev. C. W. Gilkey of Chicago put the theme home to the hearts and consciences of all in these fresh and vigorous terms:

"The old phrase 'full salvation' includes what might be called the horizontal aspect of life—all men—and the vertical as well, every range and interest of human nature. God's redemptive power must be released into every compartment of human life. Salvation is a present possession. God is Lord of earth as well as of heaven. The world is not a shipwrecked craft, if God be its creator, however battered the hull. If religion is to be in the craft at all, it must be all over it. Our water-tight compartments are being ripped out by the modern social conscience.

"On us as Christians lies the responsibility when matters like the Lawrence or Colorado strikes confront us. Just as football, a few years ago, had to be changed or banished from college, so must Christianity change the rules of the game. Customs, habits, all relations, must be Christianized. The rules must be changed as to the relation between men and things. Only as we democratize our industry in terms of essential social justice, are we seeking first God's kingdom."

CHRISTIAN SOCIAL SERVICE UNION

One of the farthest reaching of the many results achieved by the Men and Religion Forward Movement is registered at Pittsburgh in the organization of the Christian Social Service Union, in which 400 churches of the city and suburbs are allied.

Rev. Charles Reed Zahniser has become its general secretary, for which service he is said to be exceptionally equipped by his academic training and personal experience in social work. A speakers' bureau places at the service of brotherhoods, Bible classes, churches and other organizations, a number of the strongest and best informed social and religious leaders in the city.

A PROCLAMATION—TO THE PEOPLE OF THE STATE OF WEST VIRGINIA: GREETING

AS THE GREATEST FORCE FOR INSPIRING BETTER COUNTRY LIFE AND DEVELOPMENT OF THE RURAL COMMUNITY, THE COUNTRY CHURCH OFFERS THE GREATEST OPPORTUNITY AND IS THE MOST POTENTIAL AGENCY. IN THE PRESENT WIDE INTEREST BEING MANIFESTED IN BETTER AGRICULTURAL DEVELOPMENT, BETTER COUNTRY SCHOOLS AND HIGHER STANDARDS AND IDEALS OF LIFE IN GENERAL, IT HAS BECOME APPARENT THAT ONLY THROUGH THE LEADERSHIP OF THE CHURCH, WHICH CAN AROUSE THE RELIGIOUS MOTIVE, CAN THIS MOVEMENT BE PLACED ON SECURE FOUNDATION AND PERMANENT SUCCESS ASSURED.

UPON THE ACTIVITIES OF THE COUNTRY MINISTER IN THE COUNTRY CHURCH AND THE CO-OPERATION OF HIS PEOPLE DEPENDS LARGELY THE WHOLESOME LIFE OF THE RESPECTIVE COMMUNITIES, AND THESE EFFORTS IN ELEVATING THE STANDARDS OF THE RELIGIOUS, MORAL AND CIVIC LIFE SHOULD NOT BE CONFINED TO ONE DAY, BUT SHOULD BE THE PURPOSE OF EVERY DAY CONCERN.

WITH THE DESIRE TO ACT IN ACCORD WITH THOSE WHO HAVE INAUGURATED A MOVEMENT FOR THE INCREASED USEFULNESS AND INFLUENCE FOR GOOD OF THE COUNTRY CHURCHES OF WEST VIRGINIA, I HEREBY DESIGNATE SUNDAY, THE THIRD DAY OF MAY, NEXT, AS RURAL CHURCH SUNDAY, AND URGE THAT ON THE DAY THUS NAMED, THE PEOPLE IN THE RURAL COMMUNITIES OF WEST VIRGINIA, SHALL JOIN TOGETHER HEARTILY IN RELIGIOUS WORSHIP, AND WITH PARTICULAR AIM TO PROMOTE PERSONAL DEVOTION AND ATTENDANCE AND THE REVERED CHURCH-GOING CUSTOM OF OLDEN DAYS.

BOOK REVIEWS

THE BACKWARD CHILD

By Barbara Spofford Morgan. G. P. Putnam's Sons. 263 pp. Price \$1.25; by mail of THE SURVEY \$1.35.

This book is devoted to the proposition that the backward child, who is not feeble-minded, can be, and therefore should be, trained and developed so that he may be able to acquire an ordinary education. He must be brought up to the mark, otherwise he

will grow to maturity as an incompetent, or as a potential criminal.

This must be done not merely, nor chiefly, by discovering his weak points and hammering away upon them, but by finding out in what particulars his mind is strong, and helping him to use these to the best advantage. That may sound like a truism; but is there anything in the ordinary routine of the public schools to suggest that it is so accepted?

No one can read this fascinating book without realizing that the problem of child study is the most important one in education. It makes one see, as never before, that in teaching, as in every other social process, the case method is the only sane one. We are brought face to face with a truth which should have been apparent to everyone the moment we began to divide the backward from the normal and group them in special classes—the truth that the backward differ among themselves quite as much as they, as a class, differ from the normals.

The author has a firm and clear grasp on child psychology. She has worked out its principles into a practical method of great value. We say a child "does not pay attention"; but do we realize that there are several different processes in "paying attention," and do we know in which of these several he fails?

We say "he has a poor memory," but do we know that there are at least three kinds of memory and have we found out how to strengthen the little he has and perhaps how to create the others? Are we trying to cultivate memory by mere dogged repetition, carried on long past the child's fatigue point, without attempting to establish the mental associations upon which it must depend? Do we begin to see the baneful effects of mental fatigue or even recognize that there is such a thing as the fatigue point to force a child beyond which is simple cruelty?

Most of all do we act on the most vital truth of education "the simple principle of making him give out instead of take in"? These and many other queries come crowding one's mind as

he reads this great book; great in its simplicity and clarity as in its depth of content, for it is as profound as it is simple and clear.

The book is a tractate on the science of the education of the backward, but it is much more, it is full of practical methods of testing and of training. These methods are such as the author has used in an experimental clinic in New York city wherein backward children are tested and then trained in the particular deficiency the tests reveal.

Miss Morgan claims that experience has shown, that "backward children can be brought up to a normal average in their lessons by half an hour's daily individual training." She does not say in how short or long a time this can be done but the reader is willing to accept her claim and believe that it *can* be done. He also feels inclined to believe that if the methods this teacher advocates could be applied to all children, as soon as they enter school, or even before, in a very short time we should have no backward children—except those distinctly feeble-minded—and the present torture, retardation, and, often, acquired, life-long incapacity of the so-called—often mis-called—dull children, would cease.

The book is commended to the teachers of backward children. We should like to see its study made obligatory on every teacher, principal, and school superintendent.

ALEXANDER JOHNSON.

THE CRISIS OF MORALS

By Harold Begbie. Fleming H. Revell Company. 159 pp. Price \$.75; by mail of THE SURVEY \$.83.

The author of *Twice Born Men*, who in that first volume proved himself to be a rare storyteller of religious experience, in this last book attempts analysis of social conditions and a program for the church. In an apologetic foreword he prepares the reader to expect the driving force of a single idea, driven home at white heat. The promise is kept, for all evil conditions are less analyzed than characterized and accounted for by the one evil of impurity in thought or deed toward women.

The poles of his highly charged battery, between which play the subtle currents of his strong feeling, and the flashing fire of keen criticism and passionate idealism, are for the negative pole, the purity of normal womanhood and the unnaturalness of impurity—without a

counterpart in nature; and for the positive pole, the necessity of religion to make and keep the will of man and woman pure and to enhance and enrich human life with the Christ-life.

His intensity at both these points, however, broadens out amply enough to emphasize responsibility for the conditions in bad housing, in monotonous and under-paid industry and in the dull conventionality of many homes, which promote, if they do not prompt, impurity. This leads to insistence upon the need to combine science and legislation, social and civic agencies, with religion, in the church's effort to restore the supremacy of purity over the will and in sex relationships. It is done with the art of an impressionist, not with the science of either the moralist or sociologist.

It is to be hoped that those hitherto thrilled by the author's vivid instances of the direct exercise of divine power in transforming human lives, will now be as much inspired by this impassioned appeal to furnish the human medium and means whereby that power may effect the "most urgent and essential reformation of our times."

GRAHAM TAYLOR.

THE SOCIALIZED CONSCIENCE

By Joseph Herschel Coffin. Warwick & York. 247 pp. Price \$1.25; by mail of THE SURVEY \$1.34.

This newest manual of morals is written in untechnical style from the present-day psychological and sociological points of view. Its single purpose is to discern and apply a moral criterion for the guidance and testing of conduct in the moral perplexities of our

ever more complex civilization. That single criterion by which moral standards are to be judged is "the socialized conscience," whereby "the realization of the social self or socialized personality" is to be attained by each one and for others.

In turn this test is applied to conduct in each one of several situations centering about and including family, educational, industrial and civic relationships. Conditions and standards in each of these situations are stated in terms true to the times. At every point the individual and social elements of morality are shown to be inseparable and reciprocal.

"Group morality" is recognized in industry in the right of the group to stand collectively for its common interests, but the ethics growing up within the group, so keenly felt within and so little under-

stood outside organized labor, fails to be described or explained here or elsewhere in the texts of ethics. So also the distinction between social justice and judicial justice is not made clear, although so much dangerous misunderstanding results from confusing them.

The text and the questions following each chapter are well adapted to prompt inquiry, study and discussion in the classroom and in current-topics groups.

GRAHAM TAYLOR.

THE SOCIAL EMERGENCY

Edited by William Trufant Foster, with an Introduction by Charles W. Eliot. Houghton, Mifflin Co. 224 pp. Price \$1.35; by mail of *THE SURVEY* \$1.45.

These studies are as significant in their origin as in their effective form and content. That they were offered by Reed College at Portland as an extension course of study to the teachers and other social workers of Oregon is not only highly creditable to the public spirit of that institution, but also suggestive of the public service that other states and local communities have a right to expect of their colleges.

Upon the president of the college, who is also president of the Pacific Coast Federation of Sex Hygiene, devolved the task of editing, introducing and concluding the volume. In projecting, as in publishing these studies, he has succeeded in his endeavor "to avoid the errors, the exaggerations, the narrowness of view, and the hysteria that characterize some of the current discussions concerning sex and the social evil."

No saner, safer and more sensibly discriminating treatments of the physiological, medical, economic, recreational, educational, moral and religious phases of this delicate subject have appeared in the flood of contemporary writing which it has produced. The several topics were assigned to writers who prove themselves to be specialists in their respective spheres of inquiry. It only states the simple fact to say that each of them is masterful in grasp of the subject and in reducing it to practice, in the balance between technical details and their practical application, in reverent delicacy and straightforward presentation of facts, and above all in discrimination, where it is so difficult not to be extreme.

This discrimination is noteworthy in giving due weight to the physiological and economic factors of the problem, while depending upon moral and spiritual resources for the final control of the sex impulse. The cautious yet firm insistence upon teaching sex hygiene, by every writer, in wisely suggested ways adapted to parents, to children, to boys and to girls, is even more significant, in view of the editor's insistence that the passing of the old order, in which silence failed, and "the invasion of the new order of publicity before we are prepared for it, constitutes the social emergency of the twentieth century."

The situation is what one of the writers affirms it to be:

"We are learning what the evil of sex is and how it arises, and we are beginning to use the forces at hand for its destruction. Conscience is kindling and determination is hardening among our people that this thing shall cease to be. The ape and the tiger shall yet die from our midst and man's spirit shall triumph in his flesh."

Parents and teachers, guardians of children and social workers will find as much information and caution, as much suggestion and warning, as much wisdom in telling them what not to say or do and what to do and teach, as are to be found between any two covers—and besides there is a list of whatever else is worth reading.

GRAHAM TAYLOR.

MARKETS FOR THE PEOPLE

By J. W. Sullivan. The Macmillan Company. 316 pp. Price \$1.25; by mail of *THE SURVEY* \$1.37.

In this interesting and instructive volume, Mr. Sullivan gives the result of five or six years' careful study of marketing conditions in Europe. Those of us in this country who are chiefly aware of our own chaotic condition of food supply and demand are apt to look to the European system of large public markets, regulated by the municipalities, in which they are placed, as affording, if not a solution, at all events a hope that there may be some way of meeting this vexed problem. It is therefore very instructive to observe that Mr. Sullivan's observations do not lead him to favor the public market. He finds that in both Paris and Berlin, where the system has been worked scientifically and with every opportunity for success, these markets are falling behind every year and are becoming less and less a feature in the economic life of the people.

In London, Mr. Sullivan found in the large body of costermongers, answering to our push-cart peddlers, a far cheaper and more satisfactory method of bringing produce and consumers together. In discussing the problem of London, as compared with New York, the difference in its topography is always cited, as showing the disadvantage under which our narrow island position places us. Stress is also laid upon the great congestion of our streets. In this latter regard, however, London is worse off than we, as her street regulations allow the passage of enormous motor trucks, which would not be permitted in any large municipality in the United States. Only the very superior traffic management of the English capital makes their street conditions endurable.

Everyone truly interested in bringing food supplies where they are really needed, and at prices which render them accessible to the poor, would do well to read this book, which offers an oppor-

tunity to make an experiment without expense to the city, and without increase to the burden of the taxpayer.

ALIDA B. HAZARD.

BOY LIFE AND LABOUR

By Arnold Freeman. Preface by Dr. M. E. Sadler. P. S. King and Son. 252 pp. Price \$1.00; by mail of *THE SURVEY* \$1.09.

The investigation on which this work is based was conducted at the request of the town council of Birmingham, England. The author's special purpose was to ascertain the causes of the deterioration in character and in earning capacity which has been observed in a great number of boys who fail to pass at once into the higher grades of labor but escape the special temptations of street trading and casual employment.

What he found in Birmingham has its counterpart elsewhere and the remedies which he suggests are applicable, with the necessary changes, to the needs of districts which, in many of their circumstances, are unlike the city where the inquiry was made.

The work was done in co-operation with the Juvenile Labour Exchange. There is a useful index and an excellent brief bibliography. Students of child labor will find this book suggestive and helpful.

Finger Prints

TEODORO

Florence Cross Kitchelt

FROM the ancient hills of Sicily, from the flower-embroidered fields where Proserpina played and Pluto wooed, they had come to America, the Agnellos—Teodoro and Maria. And in America,—"il Paradiso," they had dreamed of it—this is what befell.

They were erecting a model factory in our town, one of the first. It stands now, as a special sight for visitors. In the midst of a park, its stories of glass windows are barely a partition from the light. Within, the air is kept fresh by an elaborate ventilating system. The men in the dusty basements are paid for their work five dollars a week.

Teodoro was doing his share to help on this beneficent undertaking. With heavy barrows of mortar on his shoulder he scaled ladders, and walked narrow girders to carry to the masons that without which their labor would totter as by an earthquake. Amidst the chasms between the iron beams was a special cleft—an improvised elevator shaft.

If one lost his balance, or stepped too far aside to let another pass—one may read statistics to know the life-cost of labor—well, Teodoro was not dead when they examined him at the foot of the shaft. He breathed.

It was eighteen months before he could rise and walk about. But only a few days after the breaking of his body he was left alone, helpless on his bed, by a loving wife and an inhuman society, left to be the caretaker of four small children.

Not that he could take any care of them—his body in pain and his mind drifting; he knew not whether they cried or ate, nor that the baby each day fell asleep on the sidewalk. But the mother knew that they ate, for she left bread every morning on the table, and she worked from seven until six to get the money to buy it. She helped to can food. Neither the food nor the profits of her industry came to her. The argument goes that four dollars and a half a week was all she was worth, this tall, fine, uncrushed soul. But later, when the model factory was completed, she worked there and was given fifty cents more.

The Royal Insurance Company, with which the contractors for the model factory made business arrangements to care for their injured and dead, sent from their palace in New York an agent to our town. He, dwelling in the se-

curity of a high-storied office, had his agent, too. The sub-agent was a political ward-heeler, regularly maintained in a municipal position that from this vantage point he might usefully control the unknowing foreigner.

In this way the power of the New York palace presented itself at the bedside of Teodoro, about a week after the breaking of his body. The lids lay thin over his sunken eyes. His rosy begrimed little children stood silently, innocently around. It was neither evening, Saturday afternoon, nor Sunday when the mother, the protector, was at home.

Patiently the sub-agent sat and patiently he held Teodoro's hand. He waited quietly when the man's consciousness seemed to ebb away in utter exhaustion. But after half an hour of effort, with the gentlest possible guiding of the pale, gnarled hand, waiting a space between each letter, he caused him to write his name, "Agnello, Teodoro" (which translated means "lamb, the gift of God") at the foot of a piece of paper.

For a pittance Teodoro had signed away his right to sue the contractors for the almost total loss of his body, life, liberty, and the ability to pursue happiness. The money never went further than to pay the doctors' bills. That was some comfort, for among his compatriots to owe a doctor is great dishonor.

So the mother worked, bending her shoulders under the weight of America. And the little unnested children cried. One of them fell sick and died; a new baby came and died. The tall woman grew taller for thinness, and her cheeks pinker, and her eyes blacker for the fire of the soul that burned through them.

Then, there in the model factory, Maria Agnello also fell—fell into another unguarded pit. She had no time to see it in her great haste. A five-dollar-a-week job builds no rail round the pit of over-work and deepening responsibility. Tuberculosis stepped beside and pushed her down. She fought bravely for health. In October they took her to the county hospital. In about two weeks she was dead. The four children were removed by the Children's Aid Society and separated in two orphan asylums.

The maimed man was alone. He could walk now and get around haltingly; he tried to find work. But our industrial system has no place for the lame. No work; no power to work; no children. Two were gone forever,

and the other four were gone to the Sisters who would not let him see and kiss even the baby but once in two weeks. No wife. She came not back from work as she had done these three years. No home. There used to be a place that was his, and not his brother-in-law's. Day after day he sat in the corner of the kitchen with his head on his arm and sobbed. The children and the boarders and the women washing and cooking there grew used to it.

He felt his mind bewildered. A thousand thoughts like a mob beat through his brain. Slowly one emerged and knocked insistently: how did it all happen? He traced back step by step through the gloom to the old sunshine—ah, the fall! But that was by the grace of God. Then the Royal Insurance Company's agent's sub-agent. Had he not heard that from an injury like his the law awarded not hundreds, but thousands of dollars?

If the sub-agent had not held his hand half an hour making him sign a paper, there would have been more money, and not only could the doctors have been paid, but Maria could have stayed at home, and she would still be tall, taller than he, and pink under her dark eyes, and the children would not have died, or have gone to the asylum, and there would be a home, and he would be getting stronger, and someone would give him work.

He grew feverish. O, for some justice to change it all, to make life right! His friends, the laborers in field and factory, were impotent like himself. Justice—a judge—if he could tell his story to a judge! The thought was like a stimulant. To the judge all things are possible. Teodoro tried to straighten his bent body and went out of the house to find a friend.

"No one sees the judge except they who commit crimes," said the friend. "You must get yourself arrested."

"Then will I commit a crime, a little crime," said Teodoro, his eyes alight with inspiration. "I will commit it against the devil."

The sub-agent, being a ward-heeler, could be found on the streets any day, but a policeman might not be at hand. Therefore, Teodoro would go where arrest was certain, to headquarters itself. Besides, the healer spent much of his time there.

It was morning and the middle of summer. The friend and Teodoro started early, for the walk was long and the man with a mission was lame. The brick wrapped in newspaper that he carried grew heavy, but he would not let the friend touch it.

Through the center of the city, across the canal bridge, up an ugly street they trudged until they came to a certain red brick building. Teodoro was tired and breathed heavily, but he mounted the stairs with persistence. It was the hour

of court, and people and policemen were everywhere. Already the elation of success strengthened him—he knew he could not fail—and then would he see the judge—judge—justice—hope—

The heeler, with his sleek face and immovable smile, came down the hallway, and bowed right and left to his superiors.

Teodoro raised the brick and threw it. He had not planned where the brick should strike; he had only planned to throw it. It struck no one, only the wall. But it made a thud, and it aroused carefully cached thoughts in the mind of the sub-agent. Teodoro gained his point—he was arrested. Like one in peace after great trouble he limped away to jail, and the friend went home.

In his cell Teodoro kept repeating to himself in ecstasy, "Judge, good judge, have justice upon me! No misdemeanor I, but an honest man. The fall in the model factory knocked the power out of my body, and the big insurance company's agent held my hand half an hour to make me sign away my maintenance. The babies died, and Maria, my wife—God know how—and the children are closed in the orphanage. Good judge, have justice upon me."

The next morning, Teodoro was arraigned in court a brief moment. When he tried to speak he was told his trial would come later. In answer to the question, "guilty or not guilty" he replied "not guilty." A black wagon called and he was taken to the county hospital to be examined as to his sanity. For the heeler said he thought the man was insane, and did not know what he was talking about. The sub-agent was afraid just a little bit; he frequently was, but it always passed off in a moment, like a bad dream, because the city government was his friend.

So Teodoro waited to see the good judge. As he could speak little English, it tried his patience at the hospital to sit dumb as well as lame all day, but he was full of hope, and he waited trustingly for the judgment.

Suddenly one morning, four or five weeks later, they called him to prepare to leave. He was not insane, said the doctors.

An intensity of hope and longing possessed him. He was oblivious to the officers, the black wagon, the ride. And the officials were oblivious to his rights. No one advised him that he might and should have counsel.

Trembling with the emotion of his great purpose, he was passed into the room of justice. He looked only at the judge.

The heeler was the judge's interpreter. It was he really who had power over life and death. In this case he could not interpret, being also the complainant. The judge peered over his round cheeks, annoyed at this halt in the dis-

bursement of deserts, and spied a young foreigner who was waiting to be tried for assault upon his wife. "Call him over," shouted the judge. So the assailant acted as interpreter.

The judge began, "What is your name?" and the young fellow translated. "Agnello, Teodoro, and, oh, your Honor, I come to you as one good and powerful who can make right great wrongs—"

"Tell him to stop talking," thundered the judge. "Has he got a lawyer?"

"No."

"On the first day of August, about nine in the morning, in police headquarters, did you throw a brick at this gentleman here?"

Teodoro nodded "yes," and the immovable smile of the heeler, the city official, the sub-agent of the Royal Insurance Company, slightly broadened.

"Six months in the penitentiary," shouted the judge.

The prisoner was pushed out. His interview with the all-powerful judge had taken exactly three minutes.

Eight months after leaving prison he died.

The children passed once more through the dingy offices of the Children's Aid Society, Maria-like-her-mother, the older boy, Nando, grown rough from living on the streets, Doro with the yellow curls and the baby, beautiful as Enna's flowers.

The lake in Sicily beside which Proserpina once played is now full of mud, and the brooks from the hill of Enna are dry.

THE JOB DOCTOR

Edna Bonser

"ARE you the job doctor?"

I looked up and faced a pair of the brightest blue eyes I ever saw. They shone with a defiant timidity under a tousled mop of red hair. They were set in a face half of whose freckles were hopelessly obscured by dirt. And eyes, hair, and freckles belonged to the smallest specimen of humanity representing labor, that I have ever seen.

"Yes," I said, "you might call me that. Who calls me the job doctor?"

"Oh, de kids," he answered gaily.

Then his defiance and his gaiety dropped from him as he settled to the business in hand. With a little catch in his voice, he began, "Me name's Mike. I've been workin' for Clancy. I got fired."

Just these few words and the way he said them, told about all I needed to know about Mike. To judge human nature and to know the truth when he hears it is part of the job doctor's work. There was no need to ask Mike why he got fired. I knew Clancy, and I knew all the employers in the community. And again I was face to face with the task that always seemed overwhelming—the responsibility of direct-

ing a life. That, too, is part of a job doctor's work. Yet sometimes I feel like a meddler with sacred things.

"Well, Mike," I said as cheerfully as I could, "if you had your way about it, what would you be?"

Quick as a flash came the answer. "I'd be a boss like Clancy."

He almost took my breath away. Here it was in this mite of male humanity, shining out through the blue eyes, the quick smile, the lifting of the hand, and emphatic sweep of the arm: I'd be a boss, I'd be a power. I'd control things and people. Ambition—how can it be kept alive and at the same time directed, in errand boys, news boys, apprentices?

"Mike," I said, "I'm not going to ask you why you got fired. I'm not going to ask you a lot of questions. And I'm not going to get you a job."

His face fell. I saw it with a little pang of sympathy. I wish I could hand out nice fat jobs to all the boys.

"Getting jobs for boys is not my business," I went on; "but I am going to doctor this job business. I am going to give you some help." The blue eyes were shining again.

"Listen, Mike. Your life, like everybody's, may follow one of two roads. These two roads start out pretty much alike. But they get different as you go on. One road leads to a great light and it gets easier as you go, and the other road leads to a great darkness and it gets harder. The light is success; the darkness is failure."

Mike was listening with every faculty. He understood, too. I could see that. He had expected to be questioned and catalogued and ticketed and asked to come again. This was new and interesting.

"I'm a job doctor, remember, so I'm going to give you some medicine."

Mike looked apprehensive.

"You are to take a big dose of it every day," I went on. "It's called 'constructive ambition.' It will help you to stay on the road with the light at the end."

Mike looked as though he didn't quite understand. However, he had something to think about.

"It's like this, Mike. It's a fine thing to be boss. I want you to remember all the time that you are going to be a boss. That is the ambition. But you can't become a boss unless you keep at work every day. This is the constructive part. Do you see?"

Sure he saw. Mike was quick and smart.

"Being a boss is the light at the end of your road, Mike. What are you going to do about it?"

Now Mike was thinking hard. "They ain't a school for bosses, is they?" he asked.

"There's a fine night school for boys, where you can learn some of the things

you'll need. But the best school for the day time is being on the job with both feet." I was looking quite anxiously at him.

"What are you going to do about it?" I repeated.

"Well," he said slowly rubbing his red head, "I'll go to the night school and learn lots. And I'll work hard. And," more slowly still, "I guess I'll go ast Clancy to take me back. But I wisht—you wouldn't tell me mudder."

It was out at last. That was his fear and shame. But I had proved his grit, too. I reached out and patted his bony little shoulder.

"Good for you, old man. Mum's the word until you make good. And, here, I'll write a line to Clancy."

"WHO IS RESPONSIBLE?"

Mary Gove Smith

THERE is a place down the harbor where people are "put away." Not many know much about it, except those who are sent there to serve their terms. An Italian man of our neighborhood was put away last winter,—sentenced to two years. One night a policeman reported attempted arson. The man carried insurance. Everyone said the man was sober, industrious, attentive to his own business, careful for his home, ambitious for his children,—a law-abiding citizen.

He said that he had refused to sell shoes to a policeman at cut prices, and that the policeman was angry.

The man's all was in his shop. Lawyer's fees were eating into it. He could not hold out. By legal advice he blindly pleaded guilty, under the supposition that by so doing he would be released on probation. But he did not go home again. He knows, and the policeman knows, which one tried to fire the store.

Our man was punished and put away for two years. Perhaps we wonder what he did while he was away to better his citizenship. But that is another story.

And is that the end of it? No, only the beginning.

At home, in one of the many dingy little tenements of a dingy old building, are the wife and two small children—beautiful children. The woman, crazed into dumb stupor, can do little but cry over her whining babies, even while she torpidly tries to keep up the store.

Of course, she fails. Of course, she has to move out of her little home into one horrid, hired room. Of course, the meals are scant, or lacking altogether, and, of course, there is never a day when one or two of the babies is not sick or fretting, and pulling at the dragged out mother, drugged into suffering stupidity by grief and perplexity and bodily want.

You might have been interested in this family before. Now you have to be. Because you are supporting it. Not wittingly, nor adequately, nor reasonably. First, you are paying for the man where he is put away. That is quite expensive. Second, you are giving some coal or some groceries by the Overseers of the Poor. Or perhaps you have helped the little Roman Catholic Church, which gives a stove—the mother improvidently sold hers for bread. Or perhaps you gave to the hospital, which has to take first one child and then another. Or perhaps to the day nursery, which keeps a child or two by the day, that the mother may have more time in which to try to unravel the ever knotting tangle of the mesh at the store.

The family has taken the time of the Associated Charities, too. It has been a rather expensive family, hasn't it? And without a question you have been taxed to keep them going. Through public institutions and private individuals, the punishment of that man has been a high-priced proposition.

Probably you know now why I have outlined this story. Probably you have guessed that the settlement did what it could to counsel and to comfort. The man's landlord was his good friend, too. The governor granted a petition for the

man's pardon, after more than four months of mental torture.

Yet all this combined aid was such a pitiful substitute for the support of the family. They were paupers; and, oh, that is a hard thing. There are so many paupers. That family has suffered perhaps beyond complete restoration. Yet the harrowed, frightened, driven look of the woman is yielding to returning hope and courage. She cleans and cooks and mends for her husband and her babies. She has learned at the settlement some of the old Italian stitches, and it has sold her work, so that with money, too, she helps. Together, with unembittered spirit, they fight back to independence.

The story is a comparatively trivial illustration of how, as a body of people, we are continuing many things and many systems blindly and unreasonably, unquestioningly. In this case, your money gave help in the form of comfort and counsel and friendliness. I think it was well worth while to spend it so, but, ultimately, what can help most will be to question, first, the procedure which brought a verdict of "guilty;" and, second, the wisdom and justice of this form of retribution. Until then, help and comfort will be everlastingly necessary for infinite multiples of this instance. Thought will bring the contribution of mind; and mind, added to heart, will pile upon pile the questioning of things as they are. Then a common mind and heart among the people will give basic and constructive expression to the demands for ways of justice, and of greater common happiness and development.

The contributing of money toward any cause which is heartily and scientifically trying to question, and passionately and sanely trying to answer, is helping toward the goal almost any man desires. But it is the thinking of each contributor, the reading and searching and probing for the fundamental reasons for the need of alleviating funds, which can eliminate the very need.

THE CHIMNEYS

JOSEPH WARREN BEACH.

NOW the dusk settles over river and city,
Dim, rolling vapors rise to meet the crawling,
Heavy breath of the chimneys brown and murky,
And joining forces in the deepening twilight,
They make advance in one dark, ghostly tide.
Already it has filled the river-bottoms,
And steadily rises round the spindling legs
Of the airy bridges, till they are overwhelmed.
Now vanish gable, spire and all that pictures
Our human life and labor along the skies.

The fog has drawn its smutty finger across
The clear gold of the fading sunset. Only,
As lone survivors of the submerged city,
Four slender shafts rise black upon the gold,
Piercing the smother: idle as in a dream,
Four clustered smokestacks. Having clean forgot
Their daily toil, with what serene detachment
They lift their nostrils in the golden air,
As if they had no part nor interest
In the cloudy fortunes of the world below!

Communications

The latch-string of the Communications Department is out to all readers of **THE SURVEY**. Lively debate and good cheer are to be had within. But the space available for the department makes necessary the following house rules:

1. Communications of 250 words or less, criticising, protesting against, or developing something published in **THE SURVEY**, will be published, so far as possible, in the first issue after receipt.
2. All other accepted communications will be published in the order received, if space remains *after* the letters described in paragraph 1 have been used.
3. The maximum length of communications is 500 words, except in cases where the writer convinces the Editor that more is needed. The extreme limit is 1,000 words.
4. Contributing Editors and authors of signed articles will be given an opportunity for rejoinder in the same issue in which letters of criticism are published.
5. In discussions back and forth between readers, each succeeding letter is limited to half the length of the previous one from the same contributor.
6. The Editor reserves the right to reject letters which he regards as libelous, letters of spite, letters on subjects outside the field of **THE SURVEY**; and for other good and sufficient reasons which he would be prepared to defend.

SCHOOL IN SUMMER

TO THE EDITOR: Starting in Newark, N. J., the idea of opening schools in summer has spread all through the state. Newark has 10,000 children enrolled this summer. Jersey City over 8,000.

There is no reason why school should stop in summer. The only reason it started that way was that the children were wanted to work on the farm. That does not apply in cities at all.

It may be a hardship for teachers to work over forty weeks a year, but life is full of hardships, and most of us have to work the year round.

JOSEPH D. HOLMES.

New York.

A CITY PICNIC

TO THE EDITOR: What was called the "first world's community picnic" was held at Fond du Lac, Wis., on July 4. The city has 18,000 inhabitants and there were many visitors from outside towns, so that it was probably the first city community picnic on so large a scale.

It was a "safe and sane" celebration, there being but a stray irrepressible boy or two, who would celebrate in the way the fathers did, when they were boys.

There was a noticeable unity of spirit and a community of interest. Bands playing on the streets made things lively; sports on the streets aided in the amusement; picnic dinners and suppers at the parks brought all sorts and conditions of men, women and children together; parades afforded entertainment, and, as prizes were offered, provoked healthy competition, that was also good-natured; and as a fitting close municipal fire-

works, set off by experts, brought the celebration to a safe and grand termination.

There were only a few minor accidents and the great crowds were handled very skilfully. It was a pronounced success.

POLICE WOMEN

TO THE EDITOR: Some weeks ago I asked through you for information from your readers as to the presence of regularly appointed policewomen in their respective cities.

Through some replies and much correspondence to verify newspaper and other reports, I prepared a list as part of my report on policewomen given before the biennial session of women's clubs in Chicago and the International Association of Chiefs of Police in Grand Rapids. Following these, delegates present added a few names. Thus has been gathered the most complete and accurate list I have been able to make.

This is approximately in order of succession: Los Angeles, 5; Baltimore, 5; Seattle, 5; Fargo, N. D., 1; Bellingham, Wash., 1; Grand Forks, N. D., 1; Topeka, Kan., 2; Toronto, Canada, 2; Omaha, Neb., 1; San Francisco, 3; Rochester, N. Y., 1; Chicago, 20; Ottawa, Canada, 1; Aurora, Ill., 1; San Antonio, Texas, 1; Syracuse, N. Y., 1; Pittsburgh, Pa., 4; Sioux City, Ia., 1; Superior, Wis., 1; Racine, Wis., 1; Salem, Mass., 1; St. Paul, Minn., 3; Minneapolis, 2; Denver, Col., 1, and Colorado Springs, 1.

This is a total of 25 cities and 66 policewomen.

Three cities have Departments of Public Safety for Women and Children: Portland, Ore.; Tacoma, Wash., and Oakland, Cal.

I shall be glad of further facts from your readers now or at any future time. A postal card sent to me when any new city falls into line or increases its number of policewomen would enable me to present to **THE SURVEY** a corrected list from time to time, as well as to supply correct facts to the many other inquirers who are laboring in the interest of this movement.

ALICE STEBBINS WELLS.

[Policewoman.]

Box 1856, Los Angeles, Cal.

RESTITUTION

TO THE EDITOR: In reading the June 20 number of your magazine (which I have followed gratefully from its beginning) I was much interested in A Rejected Letter on page 332. May I refer to a word in it which has perplexed me? That word is "restitution."

The writer holds, if I understand him, that Mr. Rockefeller should make some "restitution." What is not clear to me is, what restitution Mr. Rockefeller should make that many of the rest of us should not make also.

As nearly as I can yet see, multitudes of the rest of us have used, or tried to use, much the same selfish methods for money-getting, that Mr. Rockefeller is accused of using. The chief difference between him and us, as well as I can see, is that he has done business on a vast scale, and has also enjoyed amazing luck. I use the word luck only in a Christian sense. The moral principle, or lack of good principle, has been common to all.

That Mr. Rockefeller may owe a great restitution need not be denied. But if he does, do not I and others (capitalists in the sense that every man is one who has saved something today against the future), who are conscious of having profited however little, and been willing to profit, by methods not free from selfishness?

The "cataclysm" that your honored contributor sees as possibly approaching, others must also see. I see it in the Colorado riots, and those of Lawrence, and of Wakefield; in the Lorimer failure, and the revelations of the New York and New Haven investigations and in scores of other shocking things. Nor do I believe that rich corporations tell the truth when they say they cannot afford to raise lowest wages at all, while they can afford to spend such immense sums in salaries and fees.

Others see this horrible cataclysm as possibly near, and confess that if it come, it will be only the just penalty of widespread sin; and they, too, join your very impressive contributor in his prayer, that a merciful God may spare us, or our children after us, such awful punishment!

But it seems to me possible, that if a multitude of us less conspicuous offenders, measured by the dollars involved, were moved together in penitence to make such restitution as we can find out how to make, we may do al-

most as much to avert the threatened peril, as Mr. Rockefeller alone could do. And I suppose our greatly respected friend could advise us that we generally do better work, in casting out the beam from our neighbor's eye, if we at least recognize the possibility of some mote in our own.

Concord Junction, Mass.

WOMEN'S VOTES IN ILLINOIS

TO THE EDITOR: As an old subscriber to THE SURVEY—my name was on your books when *Charities* was a four-page leaflet—I beg to protest against Graham Taylor's recent article on the Illinois Women at the Polls.

There are different deductions drawn from those elections by people quite as well informed and as conscientious as Mr. Taylor; and it would seem more worthy of the dignified standing of THE SURVEY either to give fair play expression to the opinions on both sides, or else to present a perfectly neutral statement of the bare facts of the case.

MRS. BENJAMIN NICOLL.

New York.

TO THE EDITOR: It is very disappointing to have you state half the case for the Chicago elections as if it were the whole story. I had not expected it from you, although it is very commonly done. You give the number of women voters as 73 per cent of those who registered, and state that the men who voted were but 72 per cent of their registration number, but you omit to give the relative proportion of men and women who registered to vote to those who did not so register. You do not mention that approximately 79 per cent of the men eligible to vote registered themselves as voters, whereas at the most generous estimate only 42 per cent of women signified by registration their intention of voting.

This is a very serious omission, for the result of this first election ever held in Chicago at which women could vote—in which they mustered their forces to the fullest extent possible—indicates very clearly to my mind that only a small minority is trying to force its will on the great majority of women. Counted in this way, which is the only fair way to compute women's desire for the ballot, only 30 per cent of the women who might have voted cared to do so.

In Massachusetts we hear much talk by suffragists about their not wanting chivalry but justice—yet they this year killed the anti-suffragists' bill which asked that a referendum of all school committee voters might be taken on the subject of woman suffrage. They prevented the women's having a voice in deciding the question of their own political status, which would surely have been an act of common justice, because they thought they had a better chance of winning their desires from the chivalry of men. This is not justice nor is it truth, and a cause which stoops to such methods is not one which appeals to the best of women.

MRS. WILLIAM LOWELL PUTNAM.

Boston.

[The article on Women's Voting Significantly Tested in Illinois in THE SURVEY for April 18, to which the above exceptions are taken, understated the official returns which were subsequently reported by the election commissioners, as attested by the following signed statement:

Total men's vote.....	314,863
Total women's vote.....	169,707
Number of men registered.....	455,283
Number of women registered.....	217,614
Men's votes at primary election....	128,867
Women's votes at primary election.	47,674

W. H. STUART,

Chief Clerk Board of Election
Commissioners of the City of Chicago.

The figures of the total number of men and women eligible to register, the absence of which is said to be "a very serious omission," were omitted in the above statement, as in the article, because they do not exist. The election commissioners assure the editor that they have no basis on which to estimate the number of those who by their age, nativity and time of residence are qualified to register and vote. Therefore the "most generous estimate" of one critic that only 42 per cent of Chicago women eligible to vote signified by registration their intention of voting, is unfounded, as is the criticism of another who insists that only 34 per cent of 640,000 women who could have registered did so. This latter critic scaled down the total women's votes to 92,000 when they were actually 169,707.

The assertion that women "mustered their forces to the fullest extent possible" is not justified by the election commissioners' anticipation of a great increase in the votes of women at the next election in the spring.

The simple facts reported in THE SURVEY article and still further emphasized by the subsequent official returns, were, and still are, "conceded by all concerned to be a very favorable showing for the women at their first registration and election." The writer is at a loss to understand how this conclusion states only "half the case for the Chicago election as if it were the whole story," or how "different deductions" could be drawn by others. No other deductions from the authentic facts and figures above stated have been drawn in the editorials of any of Chicago's daily newspapers, or by any public official or influential private citizen there.—G. T.]

THE BLACK MAN'S CASE

TO THE EDITOR: Under the heading, The South Divided on the Black Man's Case, THE SURVEY of June 13 speaks approvingly of Oswald Garrison Villard's address before the recent convention of the National Association for the Advancement of Colored People.

It is undoubtedly true that the South is and always has been "divided on the black man's case," with 99 per cent of the southern white people earnestly desiring his welfare. It is also undoubtedly true that there is a growing feeling among southerners that they need no longer fear to speak out in favor of his racial advancement, to take general and organized action to that end. This is due to the fact that the southern community has become convinced that it has the warm sympathy of a majority of northern people in the solving of the Negro problem along the lines of racial separation, with the political and social dominance of the white man.

If that conviction is destroyed, there

will be a sudden and rapid subsidence of this movement resulting in untold damage to the Negro. Mr. Villard's address, abounding as it does in implications leading to misunderstanding, in quotations segregated from the context and the well-known convictions of the southerners quoted, in unjust inferences, is well calculated to mark the beginning of such a retrogressive movement.

When a southern white woman writes a book urging the improvement of Negro railway accommodations, it may be taken for granted that she is somewhat discouraged at being made to appear in favor of abolishing the separate coach. When southern newspapers of responsibility and conscience, such as the *Houston Post*, the *Atlanta Constitution* and the *Columbia State*, urge their constituents to take a warm interest in the amelioration of certain conditions affecting the Negroes, their hands are not strengthened by having their editorials twisted into an indictment of the southern social system, with an implied *soupcoun* of confession and penitence.

Neither is the zeal of the individual southerner warmed by the injustice of omissions from Mr. Villard's address. The death rate of Negroes in Atlanta is twice as high as the death rate of the whites, but when Mr. Villard cites this as evidence of the total failure of the southern Negro plan, it seems that in justice he should say that the Kansas death rate of Negroes is 32.2 and of whites 10.14, with similar ratios obtaining in every northern state.

To a southerner it seems due cause for resentment that Mr. Villard does not neglect to declare South Carolina a hundred years behind the times because of alleged injustice to the Negro, but says nothing at all of the fact that South Carolinians are paying for the public school education of 25,000 more colored children than white (if editorial news is to be believed) although it is probable that the taxes from South Carolina Negroes do not constitute 6 per cent of the whole. And when he derisively quotes a southern congressman of the fifties as saying that the program of the Abolitionists would make Virginia a desert, it seems to me the proper place for a confession that it did that very thing and that Virginia continued worse than a desert till it was purged of Garrisonian theories.

Mr. Villard's propaganda is bearing fruit. Not long since, I met a Kentuckian who had read a news report of his address. "I gave fifty dollars out of a salary of fifteen hundred to the establishment of a Negro college," he said, "and I gave fifty more to help a Negro boy go to Tuskegee. I will never be such a fool again."

It seems to me that for the good of the Negro, Mr. Blease, Mr. Villard and all others who "have no words too violent" for those who disagree with them should be eliminated as much as possible from the discussion of the Negro problem.

DEETS PICKETT.

SUPERVISOR OF SOCIAL EDUCATION

TO THE EDITOR: Every large school system needs a supervisor of social education because:

The American public school was established primarily to promote mental culture; later physical culture was added; now, social culture is seen to be a necessary corollary. But if a system is to increase by growth rather than by accretion care must be exercised to so correlate each new feature that its addition will strengthen methods directed toward the primary end, the mental culture of the child.

Public opinion is demanding that bodily health be improved in pupils and that a spirit of civic service and community responsibility shall be inculcated. Education is seen to be a continuous process. It is no longer just that the diploma should shut the door of the school against the graduate. Continuation classes and part-time schemes are arising to supply this demand for continued education.

Moreover it is recognized that education must be specific, not general. The hard-of-hearing child, the mental defective, the cripple, the tuberculous child must no longer be neglected. Insistent also is the demand not only for vocational guidance that shall put the worker where he can best work but also for social centers where after working hours he can find healthful recreation.

So the aim in education is no longer individual, that we may produce intelligent persons but social, that we may produce efficient citizens. Yet because true social value rests on the attainments of the individual the public school must retain those features and have that supervision it has hitherto required. It must now, however, acquire other features of social value and provide for them adequate supervision.

Such supervision must imply familiarity with the problems of education and sociology, an intimate understanding of schoolroom conditions, methods, and theories. A knowledge of social conditions in a given community, discretion, and tact are essentials. Some of the details which come under social education may be listed as follows:

Follow-up work for medical inspector and truant officer.

Visiting homes or supervising visiting teachers.

Investigating home environment of defectives.

Special oversight of education of children defective in sight, hearing, or general health.

Establishment of social centers, supervision of recreation activities.

Establishment of co-operation between all the uplift agencies and the Board of Education.

Vocational guidance. Conducted tours through city's industries.

Publicity—supplying material valuable from newspaper standpoint but prepared with wisdom and educational forethought.

The burden of the above details and others of like character now falls upon the superintendent or is divided among

many administrative heads—a burdensome and wasteful arrangement.

Not the least factor in this wastefulness is the loss of unity due to lack of social insight. Unless the officials have a body of common knowledge concerning social needs and remedies and plenty of time to confer and agree confusion and waste are bound to result.

The desirability of dealing with the demands of social education under a separate department is recognized in many quarters. By whatever designation known such an official is needed to assume the burdens now borne by other officials and to systematize and unify the efforts directed toward social education so as to economically meet the ever-increasing demands.

Board of Education.]
Passaic, N. J.

SAFETY-AT-SEA

TO THE EDITOR: I do not want to try to shift the blame upon any one else for what I am represented as saying in my article of June 27. It is my fault that the printer gives "week at sea" in two places where I intended to be interpreted as saying "wreck at sea," and that some of our "boys" are exempted, where I meant "bays." Will you kindly give space to this late interpretation of my puzzling hieroglyphics?

My reference to Mrs. Kelley grew out of a conversation I had with her during a comparatively recent visit to Ottawa, in which I pointed out the absurdity of assigning positions in life-boats. In spite of the fact that the system is in vogue on Japanese steamships I am confident that it would only add to confusion at a time when confusion spells death. It was because Mrs. Kelley gave circulation to the theory in her article, that I associated her name with it in mine.

Following my ungallant denial of a proposition made by one of the opposite sex, I must make again the statement that had the *Volturro* had no life-boats the loss of life would have been less.

In the searching examination of passengers and crew of the ill-fated craft, and of rescuers as well, not a hint was made that seamen, davits or boats were at fault. Having examined the ship before sending members of my own family upon it only a few weeks before it was lost, and having come to know the officers and many of the crew after the awful casualty, I protest against the imputation that under the circumstances, keeping in mind the raging sea which had calmed down when the *Kroonland*, upon which Mrs. Kelley was a passenger, sent out its gallant rescuers, better results might have been obtained.

I am not asking for anything "less than the most perfect provision for safety at sea that ingenuity has devised." I am only asking that men who aim at providing the maximum safety be not hindered by absurd and needless legislation suggested by those who have never commanded a ship nor known by actual

experience the condition under which much of our navigation especially upon inland waters, must be carried on.

As to the suggestion that I wholly missed the point of your editorial, I might perhaps plead guilty "under extenuating circumstances." I want the cry so framed and voiced that all men shall not be thought to be dishonest because a few have been proved to be. Let us emphasize the fact that the bulk of mankind, including steamboatmen, is neither selfish nor heartless, and then unmercifully flay those who are either or both.

C. SEYMOUR BULLOCK.

Ottawa, Canada.

MENTALITY AND PRISON REFORM

TO THE EDITOR: Your issue of April 11, contained an interesting article by the chairman of the Executive Committee of the National Commission on Prison Labor which, though it discusses most of the phases of the prison situation toward which the efforts of reform must be directed, does not at all touch upon one problem in this connection and that one of the most important, namely, the mentality of the convicts.

No one who has watched the prisoners file past the magistrates or the judges of Special and General Sessions, who has observed their answers to questions and their behavior when sentenced can fail to be impressed by the apparent low grade of their average intelligence. Granted that the majority are underfed, below par physically, whatever the contributing causes, it is a well-known fact that a large proportion of the prisoners in our prisons today are below the average mentally.

Of what avail then, will be reforms in dress, reforms in occupation, reforms in sentence, reforms in treatment, if we make no effort to ascertain the applicability of such reforms to the possibilities of the individual convict? A man or woman of low-grade mind cannot appreciate the subtler distinctions between right and wrong made by more sharpened intelligences; cannot do even the same grade of work and must be governed by an entirely different set of rules. Given even the most nearly ideal prison management conceivable, service of sentence will merely punish and not reform unless in such system there is a distinct recognition of the difference in values of specific methods as applied to varying mentalities, and indeed physical equipment, on which alertness, keenness and reasonableness so greatly depend.

At Bedford Reformatory a splendid building for psychological research and investigation attests the approbation of at least one famous expert, Commissioner Davis, to the value of ascertaining the mental calibre of persons under penal sentence as the initial step in procuring their reform. Dr. Schlapp's clinic, connected with the Children's Court in New York city is another instance of effort in this direction. But no similar examinations are being made of the prisoners in Auburn, Clinton, Sing Sing, Dannemora, to mention a few in New York state.

Cannot the National Commission on

Prison Labor, as its most logical initial step, begin a concerted effort to establish in all prisons a laboratory for statistical and psychological research, whose methods and means would be gradually perfected as its material increased, and which alone could balance the value of any reform as a lasting asset to the community against a sincere but misdirected idealism?

DOROTHY STRAUS.

[Attorney.]
New York.

EVE

TO THE EDITOR: The woman question, which in its last analysis is not the woman question but the race question, is being constantly presented to us today by educators, statesmen, philanthropists, physicians and others. Once in a while it is presented by a genius.

Katharine Howard is one of these rare geniuses, and the book in which she has presented the subject is called *Eve*. This wonderful little prose poem is much more than a tract for the times, and although it contains but forty-seven pages, it says more than most writers can say in ten times that space.

The scene opens after the expulsion from Eden, when Eve, the universal mother, has become but the "woe part of man," the drudge and the plaything of Adam, the universal man. The Inscrutable One finds her looking for graves, the graves of her sons, and mourning that although the graves are many, most of her sons are graveless, the sons whom she has borne for the killing.

He reminds her of the days of Eden, and tries to show her that woe has come upon her and her children because she has failed to recognize her power, and now she must get herself knowledge and wisdom, get wisdom and bear her own children! From Eden he promises to bring her some seeds of the fruit of the Tree of Knowledge of Good and Evil "which standeth so close to the Tree of Life that it sticketh."

Digging in the sweat of her brow, she is to plant these seeds not in one place only, but over the face of the earth, that all of her sons and daughters may eat. As she digs the voice of Adam is heard sounding through the ages. Eve speaks to him, and tells him that not until he has made himself fit for fatherhood, will she stay with him in the place of sanctuary, and bear their children. Then if she bears sons she will bear them to the honoring of the daughters, if she bears burdens, she will bear them to a purpose. And Adams replies.

"Eve! thou sayest . . . why didst not say 'it before?'"

And so the ages go on until the Inscrutable One can tell Eve that she has all, that she is all, for the fruit of the Tree of Knowledge which he gave her, has blossomed within; she has climbed the high tower to Herself, has made of Herself the Tree of Life Everlasting. And she is not alone, for Adam followeth with her, so close that her radiance falleth upon him, he climbs by her radiance. And now that her task is done

"She calleth her children, her children who wrangle no more,
For that great understanding hath enwrapped them in Peace,
She calleth her children to rest in her branches,
She calleth to Adam to rest in her shade."

MARY TAYLOR BLAUVELT.

Farmington, Conn.

SAID OF THE SURVEY

TO THE EDITOR: THE SURVEY is so good now-a-days that I am worried because I can't spend more time over each number.

MYRTA L. JONES.

Cleveland.

TO THE EDITOR: I was impressed recently to find more of our students had taken their reports on the National Education Association meeting at Richmond from THE SURVEY than from all other sources.

JOTTINGS

Ellen M. Osborn, secretary of the Salem, Mass., Associated Charities, was the first woman to be appointed a police officer under the new state law.

Courses of training for social workers have been announced by the University of Toronto to begin September 15. Particulars may be had of E. A. Bott at the university.

California state fruit growers at their forty-fourth convention, organized a protective league to oppose two initiative measures coming up at the fall election. One is the universal eight-hour bill, the other a proposed bill establishing a minimum wage of \$2.50 a day.

A general survey of compulsory sickness insurance in Europe will be made this summer by a committee of the National Civic Federation comprising J. W. Sullivan of the Typographical Union, Arthur Williams of the Association of Edison Illuminating Companies, and P. Tecumseh Sherman, attorney-at-law.

RECENT PAMPHLETS

Laws Relating to Mothers' Pensions in the United States, Denmark and New Zealand. Publication No. 7 of the Federal Children's Bureau. 10 cents a copy, of the Superintendent of Public Documents, Government Printing House, Washington, D. C.

A summary of the laws of the several states governing marriage and divorce of the feeble-minded, the epileptic and the insane; asexualization; institutional commitment and discharge of the feeble-minded and the epileptic. By Stevenson Smith, Madge W. Wilkinson and Louisa C. Wagoner. Bulletin No. 82 of the University of Washington, Seattle.

HOUSING IN SPAIN

[Continued from page 432.]

would meet with immediate response among the more enterprising workmen. Co-operation, however, does not readily appeal to the individualistic Spaniard, and the most successful of these enterprises are due to Socialist initiative. Some half-dozen co-operative building associations have been organized; only two were sufficiently advanced to receive a state subvention in December, 1913.

One of these, *La Laboriosa*, is an association of fifty workmen, none of whom earns more than \$600 a year. They have united their "labor and credit" for the purpose of building themselves each a home. They have been fortunate in securing gifts from certain wealthy citizens who are "protecting" members of the association. The initial stock of \$250 was made up of an entrance fee of \$5 from each of the members, and these contribute two pesetas a week until the construction is complete. In view of the meager earnings of these men, averaging about seventy-five cents a day, it is evident how much self-denial is represented in the \$1,040 per year so accumulated. Every member is also expected to give at least one day's labor each month, and all penalties imposed for slack payments, insubordination, etc., take the form of a day's labor for the common good.

The land for building has been given by the city government, and since it lies on the edge of the factory district, connection with the water supply and with the municipal drainage system can be made at slight cost. The land is divided into two lots on each of which twenty-five houses are being constructed at an estimated cost of \$1,300 apiece. Each house will have five rooms as well as basement and *azotea* or roof-garden, and each will possess a bit of land which may be used for flowers or vegetables or goats, according to the fancy of the owner.

It is estimated that the fifty houses together with some rather costly filling and grading work necessitated by the low level of the land, will cost \$75,000. This will be met in part by the weekly membership dues and by the annual subvention from the state; but a considerable loan will be made as soon as the construction progresses to a point that offers security for a mortgage. In connection with the government guarantee of interest, it is possible to negotiate such a loan at 4½ per cent. The proprietor of each house pledges his quota of \$4 a month toward the annual interest payment and the ultimate extinction of the debt.

In the minds of these enthusiastic co-operators, stimulated to their best endeavor by the thrill of a common hope, the workmen's dwellings being erected by the king at the other end of town and later to be assigned to forty families selected according to the royal notions of suitability and with no prospect of ownership, appears, to use their own words, *ridiculous*. It is to be hoped that the *protectores* of *La Laboriosa* will continue to contribute generously so that this rather hazardous financial enterprise may attain success.

The New York School of Philanthropy

UNITED CHARITIES BUILDING, 105 EAST 22d STREET

EDWARD T. DEVINE, Director

A professional training school, of graduate rank, for civic and social work

Requirements for admission: the mental maturity and general education which may be assumed of college graduates, good health, and earnestness of purpose. All students are required to pass an entrance examination. Date of examination: Tuesday, September 8. Fall term opens Tuesday, September 29. Applications for admission in September, 1914, should be filed now.

TWO YEAR COURSES IN

Family Rehabilitation

Child Welfare

Recreation

Medical Social Service

Settlements and Social Centers

Delinquency and Prison Reform

Social Work of Churches

Public Service

CURRICULUM

The course occupies two academic years. All the classroom work of the first year is prescribed, but there is opportunity for choice in Field Work. The work of the second year is vocational and elective. It is so planned as to facilitate the transition from professional study to active service. Training by participation in the actual process of research, administration or case work, is the most conspicuous feature of this half of the curriculum.

At the beginning of the second year, if it has not been done earlier, each student selects his particular department of social work from among the several fields in which expert direction and valuable training are available. Opportunity for practical work in that field is arranged in connection with the appropriate institution or society which best represents it and in which there are favorable conditions for training. The responsibility for supervision of this specialized field work remains with the staff of the school and is entrusted to the particular instructor who is most familiar from practical experience with the kind of work which the student is doing, or, if no member of the staff has such familiarity, then to a competent instructor whose services are secured for the purpose.

THE SURVEY ASSOCIATES, INC., is an adventure in co-operative journalism; incorporated under the laws of the state of New York, November, 1912, as a membership organization without shares or stockholders. Membership is open to readers who become contributors of \$10 or more a year. It is this widespread, convinced backing and personal interest which has made THE SURVEY a living thing.

THE SURVEY is a weekly journal of constructive philanthropy, founded in the 90's by the Century Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged magazine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts.

Price

Single copies of this issue twenty-five cents. Co-operating subscriptions \$10 a year. Regular subscriptions \$3 a year. Foreign postage \$1 extra. Canadian 75 cents. Changes of address should be mailed to us ten days in advance.

 R. E. COSTELLO, Manager

We Believe—

- THAT home-making should be regarded as a profession.
- THAT right living should be the fourth "R" in education.
- THAT health is the business of the individual, illness of the physician.
- THAT the spending of money is as important as the earning of the money.
- THAT the upbringing of children demands more study than the raising of chickens.
- THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics

THE SURVEY

COMMON WELFARE

CHICAGO'S PLAN FOR DISPOSING OF WASTE

CITIZENS OF Chicago are in part compensated for the long delay and acute crisis in the adequate collection and disposal of the city's waste by the appointment and report of the Chicago City Waste Commission. More than to any other citizen this is due to Mary E. McDowell. And she owes the prompting to this public service to her long residence at the University of Chicago Settlement, within smelling distance of Bubbly Creek and the city dumps.

Forth upon her quest on both sides of the sea to ascertain how other cities disposed of their waste, she was thus led, as she was upon her tireless agitation for Chicago's better sanitary policy and equipment. She was one of two women added to nine public officials to constitute the commission.

It employed as consulting engineers John T. Fetherston, who had for years been in charge of New York city's garbage-destroying plant and who is now street cleaning commissioner in New York, and Irwin S. Osborn who designed and operated the municipal garbage reduction works at Columbus, Ohio, and is now in charge of the waste disposal system of Toronto. Both these engineers had just returned from Europe where they investigated waste disposal in the principal cities. Their report gives the results of a scientific investigation of present conditions, of prospective increase in population and waste material and of approved methods and equipment adapted to Chicago's needs.

Calculating the pounds and cubic feet of waste per capita in each ward and for the city at large, they estimated what it might be in 1920, when the city might number 2,900,000, and in 1930, when it would probably reach 3,500,000.

Their table showing the annual amount of garbage per capita in representative cities during 1910 shows that Chicago, with two wards omitted, produces only 96 pounds per capita and New York 157, while Boston is credited with 188 pounds, Cincinnati with 196 and Washington, D. C., with 236 pounds per capita.

The lower rate in the two great cities is said by the engineers to be due to the fact that the foreign populations have less to waste and waste less than the native element.

The most significant of the recommendations which the commission, at the suggestion of these experts, made to the City Council are city ownership and operation of the equipment for collecting and disposing of waste; separation by householders of garbage, ashes and rubbish; city ownership of land brought up to grade by the dumping of ashes in order to gain the profit of the improvement; street car transportation for ashes and street sweepings where more economical than team hauling; reduction of garbage and rubbish separately at central plants, with small incinerators at loading stations for burning the more combustible waste; the continuance of analyses and tests for one year to determine the seasonal variation in the various classes of waste; the employment of a technical staff to develop, install and operate for at least a year the system recommended.

The development of this recommended policy has already begun and will be carried on and out as fast and far as funds allow.

Robinson in New York Tribune

CONTRABAND

Smuggling drugs in to convicts has been shown up lately as one of the worst of prison abuses. Dr. Davis in New York and the new administration at Sing Sing have taken vigorous steps to put a stop to it.

HOW A WOMAN QUELLED A PRISON MUTINY

THAT MANY prisoners' uprisings at present have in large measure a psychological explanation, and that in this respect they are similar in origin to the early strikes and labor disturbances in industry, is the opinion of Katharine Bement Davis, commissioner of correction in New York city, who has just been called upon to settle a strike of prisoners at the city penitentiary on Blackwell's Island.

Commissioner Davis's belief, first expressed to a representative of THE SURVEY, was given after she had restored peace among her prisoners by carrying her grip to Blackwell's Island for the night and announcing that she would stay there until the trouble was over.

"Run your mind over the last few years," she said, "and you will recall many disturbances among prisoners. The widely noted ones in Michigan, Nebraska, Oklahoma and Sing Sing were not all. Each of these had its own immediate cause, no doubt, but underlying them all, and in a measure making them possible, there was, I think, a common state of mind on the part of prisoners. This state of mind was induced by the conflict between old and new theories and methods in the treatment of law-breakers.

"Prisoners read the newspapers. They hear themselves discussed as 'a problem.' They know that the old theory of punishment for revenge is being attacked by those who believe that reformation and cure should be the aim of treatment. They come upon all shades of opinion as to the amount of severity desirable in controlling prisoners, the amount of privilege, of self-government, etc. They know that some people are always ready to attack prison-keepers as brutal and inhuman.

"All this has its effect on them. It gives them an aggravated self-consciousness. But more than that, it makes them ready to turn to their own account this widespread interest in their welfare.

"When the laboring man first emerged as an object of general concern and people began to discuss his condition and agitate reforms in his behalf, the same psychological reaction on his part was seen. Behind many of the early strikes

—G. S.

By Hine

was a desire to use this new weapon, to call attention to himself and to stir up the sentimental and the calm alike to more vigorous efforts for his good.

"It is just so with prisoners today. They are eager to take advantage of the new interest in their welfare and to furnish ammunition, so to speak, for those who, they think, are fighting for them.

"I do not know that anything can be done about it except to understand it. A transition stage is always a difficult stage and certainly the prison reform movement has got to go on.

"One slight thing can be done perhaps. When investigating bodies visit a penal institution, or when an investigation of any sort is carried on, prisoners are sure to be left in an attitude of unrest and suspicion. There may have been no expectation of discovering official misconduct, but it is hard to make the prisoners believe that. If any of them have been called to testify they report their experiences to their fellow-inmates and the institution heads are lucky if they don't have an insurrection to quell.

"The seriousness of such situations could often be lessened if investigating bodies were more cautious and tactful and took pains not to let suspicion against the authorities creep into the heads of inmates."

The immediate cause of the strike on Blackwell's Island grew out of the redoubled efforts of the authorities to keep "contraband" from passing secretly to and from the prisoners. It had been discovered that with the connivance and actual help of some of the keepers drugs were being smuggled in in increasing quantities. Recently a keeper gave a batch of prisoners' letters to the driver of a wagon belonging to the Department of Public Charities and the letters were later found in the nose-bag of the horse. They told how to get drugs in safely. Greater care was ordered in the examination of all outgoing and incoming parcels.

To show their disapproval of the new strictness a number of prisoners "booed" the warden in the dining room one day. It was impossible to detect all the "booers," so the men in two tiers known to contain all the guilty were punished by being kept in their cells.

Sykes in Philadelphia Public-Ledger

The Philadelphia Board of Health has issued a ruling that all milk must be pasteurized except that from farms and herds inspected and passed by the Live Stock Sanitary Board, or the Medical Milk Commission. Violations will result in the revocation of licenses to sell milk.

It may be only a coincidence, but an interesting one, that there was a decrease of 30 per cent in infant mortality during May and June of 1914, as compared with the same months of 1913. During these two months there was an increase of 10 per cent in the amount of pasteurized milk sold and a still greater improvement in the methods of pasteurization.

Frank Tannenbaum, the I. W. W. leader convicted several months ago of participating in a "raid" of the unemployed on a New York church, rose in one of the workshops shortly after and urged his fellow-inmates to strike as a protest against this punishment of the innocent with the guilty. Several other shops laid down their tools also and during one meal heavy soup bowls were thrown at the keepers, three being cut in the head. An ex-inmate of Sing Sing, who had been through an insurrection in that prison, counselled those in his shop that a strike would do them no good and his words prevailed.

The strike ended when the leaders were locked in solitary confinement. A week later one of the city magistrates moved his court for the day over to the warden's office and heard the cases of eight ring-leaders in the strike. Five were held for action by the grand jury on charges of feloniously assaulting their keepers, a sixth was held for later trial on a charge of simple assault, and two were dismissed for lack of evidence.

While Commissioner Davis was on the island, hearing complaints from prisoners and taking a lead in suppressing the strike, she promised the inmates, in a speech, that prison stripes would soon be replaced—on the good prisoners—by a garb of cadet blue with no jail insignia.

She also hinted at the possibility of a convict republic on the island, declaring that self-government would be introduced just as fast as the men showed themselves capable of making it a success. As a first step in this direction the prisoners will be classified on the basis of behavior and a "law and order" group will be gathered in one wing.

The traffic in drugs has been one of the evils which Commissioner Davis's administration has done much to bring

to light. Estimates of the number of prisoners among the 1400 in the penitentiary who secure and use drugs in prison vary from 200 to 700. A few weeks ago Dr. Charles F. Baxter, a physician at the Workhouse, was convicted of selling drugs to a prisoner, and he is now serving sentence in the penitentiary, in the company of some of the very prisoners who bought of him. A second physician has since been convicted, and charges have been preferred against a third.

Contemporaneous with Commissioner Davis's discoveries in city penal institutions, the State Prison Commission has been learning the extent to which drugs are smuggled into state prisons. James M. Clancy, ex-warden of Sing Sing, declared that drugs are smuggled into that prison in "untold quantities" and in ways "almost uncanny." They are sent in, he said, "in pencils, fountain pens, heels of shoes embossed postal cards and in handkerchiefs." Both he and the assistant principal keeper said that the dishonesty of keepers whose low salaries tempt them to the profit of selling drugs to prisoners is responsible for much of the drug smuggling, but neither thought that the traffic can be entirely stopped. By employing more and higher-paid keepers, by segregating drug fiends, and by a closer examination of everything entering the prison, they thought it could be minimized.

The commission expects to investigate conditions in other prisons also.

The Pageant of Narberth

A PAGEANT that won a four-fold success—artistic, financial, social and advertising—must be considered a little out of the ordinary, especially in a suburban borough of Philadelphia with about 2,000 inhabitants.

Truth is, however, that such a success crowned the efforts of the Narberth, Pa., Civic Association. It resulted in a kind of social regeneration within the community. Before the organization of the Civic Association a few months ago, Narberth had been devoid of a well-defined communal consciousness. The interests of the men-folk centered in the big city; of the women-folk in their particular groups. There was no agency to unify these groups in action.

The Civic Association's first task was to introduce Narberth to itself through something big enough to command the co-operation of all the many coteries.

So the fete day and historical pageant was selected. So successful did the plan work out, that Narberth discovered itself and has come to recognize the need of unified effort for civic betterment.

Families who had lived beside each other for a decade with only a nod as they hurried to the train, now are real neighbors and are working hand in hand to make Narberth a better place in which to live. They have called their borough "The Year-round Home Town."

Finally, the pageant put Narberth on the map, favorably. Rarely before had Narberth appeared in the public prints. But the pageant won the immediate co-operation of the press. This publicity pointed out Narberth as an example to other suburban towns. So now it is recognized that they cannot turn back to slumber as before, but must maintain their prestige.

From a painting by Frank H. Taylor

Episode III of the Narberth Pageant was given here at the old William Penn Inn, now the General Wayne Inn. Built in 1704, the inn became a famous wayside gathering place. During the excitement before the war, the Welsh settlers assembled here to talk over the prospects of the times, to read aloud the *Pennsylvania Post*, and to exchange neighborhood gossip.

NOT AN ITALIAN FETE

Five thousand neighbors of the Willow Place Chapel House in Brooklyn ran their own Fourth of July celebration. Boys did most of the work and did it well. Italians, Irish, Syrians, Swedes and Jews competed in the races. The kindergarten ran off a baby parade. At night there were Japanese lanterns, movies and illustrated songs in which everyone joined

with a will. During the whole week of the celebration there was not an arrest, a row, or even a dispute. Newton Ben Knapp, headworker of the Willow Place Chapel House, held that it was "distinctive in that it represented so well that something, infinite in possibility yet evasive, known as the neighborhood spirit."

CHILDREN'S BUREAU POSITIONS TO BE FILLED

FOR THE FIRST time the United States government has recognized social service as a profession in a series of examinations just announced by the civil service commission for sixty-one positions in the Federal Children's Bureau.

The new positions were provided for in the Children's Bureau appropriation bill for the current year which gives the director, Julia C. Lathrop \$165,000.

The examinations for experts will be what the United States Civil Service Commission calls non-assembled—that is, they may be taken at the applicant's home city or wherever he or she may desire, but papers must be sent to Washington not later than August 10. The salaries for the experts who will be employed range from \$2,000 to \$2,800.

A special examination will also be held for special agents and research assistants, with salaries ranging from \$1,200 to \$1,600. This examination must be taken at one of the offices of the Civil Service Commission on August 19 and 20.

The highest paid position for which examinations are to be held is that of medical officer of the bureau, with title of "expert on sanitation," at \$2,800.

The Children's Bureau will be the first branch of the United States government to be authorized to employ a trained sociologist who will have the title of "social service expert." The duties of this officer whose salary is \$2,000 are "the investigation of such subjects as juvenile

courts, desertion, orphanage, and relevant legislation, with studies of the special groups known as the dependent, the delinquent, and the defective, and of public and private provisions for recreation."

Persons to qualify for the examination for social service expert must have an educational training equivalent to that required for a bachelor's degree from a college or university of recognized standing. This training must have included at least two years' special work in sociology or economics and at least three years' professional social work in municipal or state departments dealing with sociological subjects, or in a charity organization society, juvenile court, child-placing society, settlement house, or other similar organization. Applicants must be between twenty-five and forty-five years old.

A third expert for which examination will be held on August 10 is named as "statistical expert," at \$2,000.

Application for special examination form, stating the title of the examination for which the forms are desired, should be made to the United States Civil Service Commission, Washington, D. C.; or to the secretary of the United States Civil Service Board, in the post office at Boston, Philadelphia, Atlanta, Cincinnati, Chicago, St. Paul, Seattle, and San Francisco; or at the customhouse at New York, New Orleans, Honolulu, Hawaii; or at the old customhouse, St. Louis; or to the chairman of the Porto Rican Civil Service Commission, San Juan, P. R.

GOOD READING IN THE CONGRESSIONAL RECORD

REPRESENTATIVE James W. Bryan, of Washington, was so impressed with the article by Thomas L. Parkinson in *THE SURVEY* for July 4, on the liability of vessel owners for losses at sea, that he secured unanimous consent of the House of Representatives to print the entire article in the *Congressional Record* for July 16. He called attention to an error in the Editor's note accompanying the article:

"In referring editorially to the splendid article by Professor Parkinson the Editor of *THE SURVEY* says:

"In all the thousands of bills introduced in Congress since the Titanic disaster none provides for placing on shipowners a substantial liability to answer in damages for losses occurring by accident at sea."

"The Editor of *THE SURVEY*, when he wrote that comment, had not called to his attention House bill 12807, introduced on February 2, 1914, by myself and referred to the Judiciary Committee.

"The present shipowners' liability laws are absolutely unconscionable. They were, in the main, worked through Congress on the day before adjournment in that mass of legislation that is passed without consideration at such a time. . . .

"It is a reproach to Congress that a seaman or an employe or a passenger or a shipper on the water is given any less protection by the law in these matters than is given under like circumstances on the land."

The Black Plague

NEW ORLEANS
SAN FRANCISCO
NORTHERN CHINA

WHEN the bubonic plague—the “black death” of European history—was discovered in San Francisco ten years ago there was terror, delay and evasion on the part of local officials. Here was news to blanch the cheek, yet the San Francisco press was silent; and when finally the existence of the disease became known, “indignation” ran high over this attack on the city’s health. Meanwhile, the country at large became panic-stricken.

A few weeks ago the same plague was discovered in New Orleans. Two cases were found, a post mortem on one confirming the diagnosis. Prompt and de-

cisive action followed. New Orleans had learned from yellow fever that temporizing and denial only give disease more time to develop. Local health officers notified the state health authorities immediately. Before the newspapers even had time to publish the facts, the United States Public Health Service was called on for help. As quickly as it could, the press informed the country.

There was no panic. Thanks to scientific medicine, we know today the cause of this dread disease, its method of transmission and the measures necessary to control it. Surgeon-General Blue and Surgeon Creel, the former

with experience in fighting the plague in Honolulu and San Francisco, and the latter with similar experience in Porto Rico, are now in charge of the situation.

Thus has New Orleans given us evidence of a finer social spirit on the part of trusted officials, and of the beneficent and quieting effects of scientific knowledge.

What can happen when knowledge is not joined with decisive action in fighting this scourge was tragically shown only two years ago when an epidemic of the “black death”, passing over northern China, left 50,000 dead in its trail. Even this was a tremendous improvement over the epidemic of the fourteenth century, when Europe is estimated to have lost 25,000,000 people—one-fourth of her total population.

The Manchurian outbreak in 1912, scenes from which first published in the *World's Work* are here reproduced, presented the first opportunity that modern medical science has had to cope with the disease in any widespread form. Burton J. Hendrick tells in that magazine of the two young American physicians, Richard P. Strong and Oscar Teague, who made fearless entry into the heart of the infested region and risked their lives for months in a study of the plague. They have published a detailed and comprehensive report of their researches.

A characteristic of the plague is that it smoulders unrecognized and suddenly breaks out, apparently from a number of different centers of infection. Hence we can not be sure, says the *Journal of the American Medical Association*, that the few cases discovered are the only persons infected in New Orleans. But we may be sure, it goes on, that the fight will be waged with all the weapons of modern science and that all necessary funds will be provided.

It is only by eternal vigilance, apparently, that we can at present keep this

The doctors' defence against infection. The mask at the left, made of zinc glass, was used in the fourteenth century; the bandages and goggles are used today.

“Contacts” guarded by a sanitary inspector.

Coffins outside a hospital. Despite the prejudice against cremation, thousands of bodies were burned on huge funeral pyres.

visitor from entering our doors. The plague is known to be transmitted by rats, fleas and even squirrels. When it is discovered, one of the most pressing measures is to destroy all of these that can possibly be carrying it. To that end all shipping must be closely watched and even railway lines.

On May 8, this year, the bulletins of the Federal Public Health Service re-

port one plague-infected rat was found at a point on the Pacific coast. Between May 23 and June 6, 954 rats were examined, not one of which showed infection; 401 were examined between June 6 and June 13, with the same result. Yet on June 18, again one rat showed infection. How different might this month's record have been, had the first danger not been discovered!

NEW YORK NIGHTWORK LAW FOR WOMEN UPHeld —BY JOSEPHINE GOLDMARK NATIONAL CONSUMERS' LEAGUE

FACTS HAVE won again. Theory has yielded to a realization of living conditions at our doors. The New York Supreme Court—intermediate between the state's lower courts and its highest, the Court of Appeals—has decided that the employment of women at night in factories, as it has been shown to exist, is detrimental to the women so employed, and, therefore, that it may legitimately be prohibited by the state in the interest of the public health and welfare.

This decision is a clear token of the distance traveled by opinion in general, and by the courts in particular during the past seven years. In 1907 a similar law was declared unconstitutional, in the Williams case, by the same tribunal which now reverses its former position.

Where Judge Gray of the Court of Appeals (who wrote the adverse opinion in 1907) said of the nightwork prohibition that it "arbitrarily deprives citizens of their right to contract with each other," Justice Ingraham now writes: "We have legislation directly enacted for the purpose of procuring as to a large proportion of the people the prevention of physical and moral impairment."

Where Judge Gray could "find nothing in the language of the section which suggests the purpose of promoting health, except as it might be *inferred* that for a woman to work during the forbidden hours of night would be unhealthy," Justice Ingraham in the present Schweinler case can maintain: "With the facts and conditions existing in New York, now before the court, it certainly cannot be said that this legislation is not directly concerned with the moral and physical well-being of women or does not tend to her protection and the welfare and well-being of all the people of the state."

The court has in no way receded from the principle underlying all labor legislation, that a statute must have a "reasonable connection with the public health, welfare and safety" if it is to be within the police power of the state. But today that connection is clear in the nightwork case; seven years ago it was not. The most indifferent reader must note the new language, the new spirit which expresses the judicial mind. "*The facts and conditions existing*", "*the pre-*

vention of physical and moral impairment"—these are the things with which the court is now preoccupied instead of the theoretical "freedom" of which Judge Gray wrote.

For this fundamental difference in opinion the manner of the law's defense is in large part responsible. Because a condition and not a theory was at stake, the conditions and not theories were brought to court. Assistant District Attorney William A. De Ford, who had charge of the case and argued it ably, submitted as part of the people's brief, a 500-page compilation of the "facts of common knowledge" concerning nightwork, prepared by Louis D. Brandeis and the writer of this article.

The "facts of knowledge" consist of the investigations and conclusions of the New York State Factory Investigating Commission of 1913, together with earlier studies of nightwork by scientists of all countries. Their conclusions are unanimous.

Briefly, the nightwork of women is injurious to the health and morals of working girls and women, whether it be the regular night shift or work continued late into the night as overtime after the day's work, and the provision of a regular period of rest at night, for physical recuperation, is a requisite of health. The international treaty, whereby fourteen European nations bound themselves to prohibit the nightwork of women in factories (effective January, 1914) is given in full, together with similar legislation of non-signatory states.

This was no new line of defense in the Schweinler case, nor is the changed attitude of the New York judges a new one. They have fallen into line with other enlightened courts,—the Supreme Court of the United States, and the supreme courts of Oregon, Illinois, Michigan, California, Washington, Ohio and Massachusetts, which, during the past seven years, have sustained labor laws for women precisely in the interest of their health and morals, and for the benefit of the communities which they are to perpetuate.

In 1908, directly after Judge Gray had stated the court's inability to find in the night rest provision any relation to the preservation of health, the now well-known Oregon ten-hour case (the Mul-

ler case) was carried to the Supreme Court of the United States. This involved the validity of the Oregon ten-hour law for women employed in factories and laundries. For the first time in the history of our nation, the highest court had an opportunity to pass upon the constitutionality of such a law.

For the first time, too, a defense was submitted by Mr. Brandeis and the writer showing not the legal but the human facts at issue, the world's experience upon which the legislation providing shorter hours for women is based, and the same defense, successful in every instance, was offered in the subsequent Illinois, Michigan and Ohio cases.

In the present instance, Justice Ingraham points out that the Muller decision has forever superseded an earlier one of the United States Supreme Court (*Lochner v. New York*) upon which the adverse Williams decision of 1907 had "mainly relied." In the *Lochner* case, the United States Supreme Court had decided that the New York ten-hour law for bakers was unconstitutional because the occupation of baker did not seem to them sufficiently dangerous to health to justify the state's intervention. In 1907 this view prevailed strongly enough with the New York court to elicit a similar decision in regard to a totally different form of work for women.

Not in vain did the two hundred Polish women, reported by the New York Factory Investigating Commission, work ten hours each night in a hot and dusty mill and come out at dawn, white and worn, to nurse their babies and care for their households during the daytime. It was they who brought home to the commission, and through them to the public, the true iniquity of nightwork for women.

The best instincts of our common nature revolted against this infraction of Nature's laws. "What we know as men, we cannot profess to be ignorant of as judges," said the Illinois court regarding a different labor law for women, and it is this spirit which animates the New York court in the Schweinler case.

To the objection sometimes urged against the nightwork law, that it may cause hardships to some women, Rose Schneiderman of the Women's Trade Union League, has made sufficient answer. It is true that an inconsiderable number of women employed by newspapers may be adversely affected. But over against these few, thousands are directly and lastingly benefited.

The decision is not unanimous. Justices Clarke and Dowling dissent, being of the opinion that the Court of Appeals alone can reverse its former decision and that the intermediate bench is meanwhile bound thereby. Within a few months it is hoped that the state's highest court may have the opportunity to record its verdict.

TOPEKA: "A city surveyed is a city unafraid"

By Shelby M. Harrison

DIRECTOR OF THE TOPEKA IMPROVEMENT SURVEY

Courtesy Leslie's Weekly

CITY OF TOPEKA, KANSAS TERRITORY

Founded in 1854, Topeka had a school and a church at the time this wood-cut appeared in *Leslie's Weekly* for December 25, 1858. The wooden bridge was the first bridge thrown across the Kansas river. The town was a rendezvous for Free State men who, in 1856, built an earth and sod fort to protect themselves from pro-slavery men.

"WELL, young man, you'll find very little to criticize in Topeka. We have a splendid city here." That was one of the first greetings to the social surveyors in Topeka.

It came from a leading citizen who knew the city about as well as anyone. For more than thirty years he had kept him in contact with many sides of its life. But five days later, after listening to a preliminary report on local conditions—after getting a glimpse of the city through the eyes of the surveyor and outsider—the same man, and some forty others, decided that after all there were things going on in Topeka that needed careful looking into.

Part of his statement, however, was true. Topeka is a splendid city. There is no better proof than the prompt action of this group of leading citizens. Where men and women are found ready to tackle civic and social problems immediately and fearlessly, once convinced that the problems exist, there are the fundamentals of a splendid city.

Like the youth of ancient Athens, these men and women resolved that "we will transmit this city greater, better, and more beautiful than it was transmitted to us." That, and not mere numbers, as Charles Mulford Robinson points out in his city plan report in the Topeka survey series, was what made Athens great. The means adopted for realizing

the resolve in Topeka was the social survey.

Nor was there fear that the city would be unfavorably advertised. The slogan was: "A city surveyed is a city unafraid." People elsewhere could be trusted to recognize in this a sound move for

making the capital city of Kansas a still more splendid city; and, incidentally, other cities might be led to profit by the example.

The Topeka Improvement Survey (the name was chosen deliberately and advisedly) was started last October and the last of the reports will be turned over to the Topeka committee within a few days. It took up public health and sanitation, delinquency and corrections, municipal administration, city planning, industrial conditions, and recreation. But before touching the findings (and they can be only touched here for they make a volume of nearly 300 pages) the methods of this Topeka self-scrutiny seem worth brief recounting.

The survey linked up very diverse forces into one big effort to mould, through the medium of local facts, a more intelligent public opinion. This in the long run would tell mightily in shaping the city's course for say ten—perhaps more—years to come. A non-partisan movement to improve Topeka, with the specific understanding that the fact-gathering and interpretation in this program of community self-education should be done by disinterested outsiders—this was something all good citizens could unite on. But obviously Topeka's 50,000 or more people could not meet and work out a survey en masse.

A representative committee was appointed to the task. It included business men, large employers, labor leaders, working-

FATHER TIME READING THE RECORD OF DEATHS

The Topeka Survey was distinctively illustrated with cartoons by A. S. Harkness of Springfield, Ill. These were used in both the reports and the exhibit visited by 20,000 people.

FOUR LEADERS IN PLANNING AND CARRYING OUT THE SURVEY

men, ministers, doctors, lawyers, teachers, social workers, city commissioners, and others specially related to particular problems or population groups. They secured the Department of Surveys and Exhibits of the Russell Sage Foundation to make the survey, and the department in turn drafted in still other resources.

In fact, the survey was used as a sort of giant lens to draw together in one large co-operative whole the forces which sooner or later would touch Topeka, and which, by thus uniting, might make more illuminative the work of each.

This striking co-operation is well illustrated in the investigation into public health and sanitation, made under the direction of Franz Schneider, Jr. The resources drawn on include the State Board of Health, the city Sanitary Department, the State University, the State Agricultural College, Washburn College, and the offices of the State Hotel and Dairy Commissioners.

City Commissioner W. L. Porter, for instance, delegated the city's three san-

itary inspectors to the survey work. They were charged with the enumeration and inspection of all privy vaults and private wells, and the preparation of maps showing the data. Dr. S. J. Crumbine, secretary of the State Board of Health, brought in his five food and drug inspectors to assist the survey, and also helped in securing the milk and water analysis and the investigation of the sewer system. W. J. V. Deacon, vital statistician of the State Board, analyzed the vital statistics.

The State Educational Administrative Board, the State University, and Prof. C. C. Young, director of the State Water Survey, co-operated in making possible the remarkable service of analyzing 1,700 samples of well water, the analyses being made under Professor Young's direction. Prof. Granville R. Jones of the State University and engineer of the State Board of Health, inspected the sewer system; the state hotel commissioner, Miles Mulroy, inspected a number of lodging houses and restaurants; and the state dairy commissioner, G. S.

Hine, went over the dairy and milk depot situation. The State Agricultural College loaned assistance to the chemical and bacteriological examination of milk; and similarly Washburn College assisted through the bacteriological examination, under Prof. Edith M. Twiss, of samples of ice cream, and the inspection of places in which ice cream was handled; and students from Prof. D. M. Fisk's classes in sociology in Washburn College aided in collecting samples of well water.

In addition, a number of individuals gave personal help, among them, in marked degree, Mrs. Charles B. Thomas and Mary R. Vose, secretary of the Provident Association. The city commissioners appropriated \$500, and gave office room in the city building—this not alone to the health work but to all divisions of the survey.

In view of this generous assistance, together with that received in other investigations, it will be seen that the survey represented a much larger financial outlay than the several thousand dollars raised by the Topeka committee. It was in fact a community enterprise,—backed, supported and assisted by individuals and agencies of the community.

In his report on health and sanitation Mr. Schneider deals first with vital statistics—the book-keeping of life, death and disease. These show that Topeka's death rate, while comparing favorably with that of the country at large, is, after applying the proper corrections, still 20 per cent larger than that of the state of Kansas; that though her birth rate is only medium low, it is over ten per cent lower than the state's; that her people suffer real losses from preventable disease and death—clearly 15 per cent, and possibly 30 per cent, of the deaths being from preventable diseases; and that these diseases are especially prevalent in certain parts of the city.

Going into general sanitary conditions, the report states that analyses of the public water supply made by the survey showed it to be of excellent sanitary quality, but that over 5,000 private wells still exist in the city, and that the tests of 1,673 samples of well water disclosed

CATCHING THE PIECES

The guard saved the workman from injury when this power emery wheel burst in the Santa Fé railroad shops.

64 per cent as showing unmistakable signs of pollution of intestinal origin.

The city's sewer system was found to be faulty, and 7,257 privy vaults—over 60 per cent unconnected with the sewers—still persist. The east side of the city, with a population of about 7,000, is the largest unsewered community in all Kansas.

Other health subjects dealt with are milk and food supply, tuberculosis, infant mortality, venereal diseases, housing, refuse disposal, physical examination of school children, organization of the city's health department, its finances, inspection service, control of communicable diseases, records, etc., the report including detailed recommendations for constructive action.

The second investigation, made by Zenas L. Potter, took up problems of delinquency and corrections. In the year ending October, 1913, more than 1,600 persons were arrested in Topeka. "What her police department, her courts, her jails and her probation officer," to quote the report, "are doing with these of-

fenders and how far they have kept abreast of developments aimed at more effective study, care and treatment, and, to outline plans for improvement where needed, has been the purpose of the investigation."

Continuing the report says: "Before presenting the details of local conditions, it may be said that in general the essential idea of re-forming prisoners—of protecting society by transforming law-breakers into law-observers—has not been applied to most of the correctional work of Topeka or of Shawnee county in which it is located." By this it is not implied that the system is without its credits, for the report points out much good service rendered. The evidence submitted, however, tends to show the city a good way behind what is being done in some other places.

In addition to detailed recommendations on all points taken up, the report calls for general improvements as follows: abandonment of the present jails for confinement of prisoners after conviction and the development of a farm institution; plans for increasing the effectiveness of the police force; changes in court procedures and penalties; establishment of probation and parole work for adults; provision for a juvenile detention home, and increased emphasis upon the work of preventing crime.

Municipal administration is handled by D. O. Decker, the report being the third in the series. It also shows many things to the city's credit, among them being the successful local sale of bonds and the efficient management of the fire department. Defects, on the other hand, include charter limitations working against proper organization and administration of the public work; the ab-

sence of revenue and liability accounts in the city bookkeeping; failure to provide an adequate sinking fund to take care of public debts; absence of cost accounting; no program of street repair and cleaning, and in many places absence of proper record-keeping and publicity.

The report on city plan, made by Charles Mulford Robinson, deals with the street plan, its general characteristics, focal points, traffic ways and residence streets; street development, its standardization, center and side parking, sidewalks, street trees and lights, curbs, gutters and pavements; civic, local transportation and steam railroad centers; limitation of heights of buildings, and adoption of a building line; and the park system, existing parks, park additions, boulevards and parkways. This report was specially backed and financed by the Civic Improvement Committee of the Commercial Club.

Industrial conditions were investigated also by Zenas L. Potter. "Topeka,"

to quote the report, "would hardly be thought of as an industrial city although one of the largest railroad shops in the country (the Santa Fé) is located here, and although there is considerable diversified manufacturing, including farm implements, clothing, furniture and bedding. Printing and publishing employ a tenth of those in manufacturing pursuits; and work in the State Capitol draws a large quota. Eight flour and grist mills,

BY WAY OF CONTRAST

How Kansas City breaks the vicious circle in treating alcoholics.

A DUG WELL

two large creameries, two canning and pickling factories, a large slaughtering and meat-packing plant, and two establishments packing eggs and poultry also do business in the city."

The investigation covers the Santa Fé shops, hours, wages, work conditions in that plant together with its bonus system and its apprentice school; the street railway workers of the city; women workers in general; child labor; labor unions; public employment agencies; workmen's compensation; and industrial accidents.

In general the report shows the interests of the workers inadequately safeguarded, either through lack of protective legislation, the breaking down by the largest employers of collective action of the workers, or the lack of appreciation by the general public of its own stake in industrial conditions in the city.

The study of recreation facilities and needs in the city was another sample of local co-operation. It was made by Dr. E. W. Burgess of the Department of Sociology at the State University, and with the aid of the Playground and Recreation Association of America.

The Topeka survey committee wanted to make the findings reach a still larger group of people than those who would see the printed reports or even the generous newspaper summaries, and to this end an exhibit was prepared, and displayed in a vacant store building in the heart of the business district. In the ten days that it was open over 20,000 people viewed the maps, photographs, cartoons, diagrams, and other graphic material which aimed to make the facts of local conditions more easily understood and longer remembered.

The hundred and more exhibit panels prepared under the direction of E. G. Routzahn, of the Department of Surveys and Exhibits, with the assistance of

A COMBINATION TO HIS LIKING

Topeka has 7,257 privies and 4,932 wells. A well, the survey report states, is a rural device but a municipal menace.

Walter Storey, Mary Swain Routzahn, and Matilda Spence, will remain in Topeka for use in the autumn and winter.

To begin at the beginning again, action for a survey of Topeka began in the fall of 1912 with the appointment of a survey committee in the Men and Religion campaign, E. A. Austin being chairman and W. J. Rickenbacher secretary. After the organization of the Topeka Federation of Churches the earlier committee joined with the federation, and under the leadership of the Rev. Roy B. Guild the movement received a new impetus and was vigorously pushed.

The federation assumed the financial responsibility for the preliminary investigation and report which led directly to the organization of the general survey committee with Judge T. F. Garver as chairman, and H. T. Chase as secretary, the generous gifts of time and thought by both being invaluable contributions through many months.

The consecutive attention by C. G. Blakely to the setting up and administration of the exhibit is not to be the end of the survey activities as follow-up plans for action in the fall have already been made.

ROAD-MAKING vs. THE ROCK PILE

KANSAS CITY: PRISONERS AT WORK ON THE ROADS OF THE MUNICIPAL FARM

TOPEKA: PRISONERS BREAKING ROCK IN A SHED BACK OF THE CITY PRISON

Settling Labor Disputes in Australia

From an interview with Mr. Justice Higgins, President of the Commonwealth Court of Conciliation and Arbitration, and his Decisions as given in the Commonwealth Arbitration Reports

Mary Chamberlain

"BUT why do your American trades unions prefer the bludgeon of the strike to the modern rifle of arbitration and conciliation?"

That was the question which puzzled Mr. Justice Higgins, president of the Commonwealth Conciliation and Arbitration Court of Australia, when he heard, on his recent visit to America, that much of the opposition to minimum wage legislation and arbitration in the United States was bred in the American Federation of Labor.

The assurance of this eminent judge that wage boards and the arbitration system in Australia are promoting rather than hindering effective labor organization is worth consideration by those who claim that the strike and the strike only is effective in improving conditions for working people. Indeed, when a legal minimum wage is still regarded as a timorous experiment in most of our states and when compulsory arbitration of labor disputes is practically unknown in America, few trans-Atlantic passengers this year have brought us a more interesting contribution of practical experience with labor problems than Mr. Justice Higgins of Australia.

The Commonwealth Arbitration Court, over which Mr. Justice Higgins has presided for six years, must be clearly distinguished from the wages boards, which exist in practically all the Australian states, and from the State Industrial Arbitration Courts.

The chief aims of a wages board system are to regulate hours, wages, and conditions of employment by the determinations of boards created by application or petition for specified industries. With the Industrial Arbitration Court system an industry does not technically come under review until a dispute has actually arisen, when the president of the court has power to summon a compulsory conference.

THE Commonwealth Arbitration Court, instituted by a parliamentary act of 1904, follows this principle, but only so far as to interfere in an industrial dispute which extends beyond the limits of a single state. Confronted with problems of interstate competition precisely similar to those which exist here in the United States, the awards of a state

HENRY BOURNES HIGGINS has been a justice of the High Court of Australia since 1906, serving since 1907 as the president of the court which is known the world round for its successful work in arbitrating labor troubles and preventing strikes. A native of County Mayo, Ireland, but a resident of Australia since 1876, he has been a member of the Bar of Victoria since 1876, the chairman of the Commission for Reform of Legal Procedure and attorney general for the commonwealth.—E. B.

board are liable to be influenced by awards for similar trades in a neighboring state. The Arbitration Court of New South Wales, for example, refused to raise the rate of wages for journeymen in the boot trade above that awarded to operatives in the same trade in Victoria, although the cost of living in the two places was practically equal.

The Commonwealth Arbitration Court according to Mr. Justice Higgins, is the only industrial tribunal in Australia that can put competing employers in all states on equal terms and take the weight of interstate competition off the back of the wage-earner.

Although no direct appeal can be made to the federal court from the findings of any state wages board, the court has tended to build up a uniform policy throughout Australia, both by fixing standards in interstate disputes which are used in state determinations and by publicly reviewing in the course of its business the findings of wages boards in the several states. The decisions of the federal court prevail over those of state courts.

Cases of interstate disturbances may be brought before the federal authority by organizations of employees or employers registered in prescribed manner under the act; by a state industrial authority requesting the court to adjudicate; by the public registrar certifying that it is a dispute proper to be dealt with by the court in the public interest; and by the president referring to the court a dispute which he has tried in vain to settle by voluntary agreement between the parties. Mr. Justice Higgins asserts that much of his best work has been

done in quiet conference behind the court, procuring agreement without arbitration.

The awards of the court are not challengeable by any other court, though the president may state a case on grounds of jurisdiction for opinion of the High Court. Failure to observe the awards involves liability to penalty of £100 or three months' imprisonment, and process may be issued not only against the property of any organization but, when this is insufficient to meet the penalty, against the members of the organization.

Up to the present time none of the unions which have had an award or agreement under the auspices of this court has broken its pledges.

The section of the act which is regarded with the greatest scepticism and open to the most criticism is that which forbids strikes or lockouts under penalty of £1,000. Since interstate strikes still exist in Australia it is proof that this clause has not been strictly enforced and that industrial uprisings cannot be quenched by a mere parliamentary measure. They have, however, been greatly minimized, according to Mr. Justice Higgins, and a peaceful means for redress of certain widespread industrial grievances has been substituted for violence and other extreme courses.

WHILE the right to strike is denied the Australian laborer, the right to organize is sanctioned and definitely encouraged by the act. One section expressly states that the object of the law is "to facilitate and encourage the organization of representative bodies of employers and employees and the submission of industrial disputes by organizations."

"Why," exclaimed Mr. Justice Higgins, "the whole system of arbitration rests on responsible unions to guarantee the awards of the courts. Only organizations can make a plaint before the court and should it be necessary the attorney general is given power to actually create a union. Furthermore, I am allowed in my awards to make an order for preference to members of the union. Since the principle of the minimum wage demands that the strain and stress be taken off wages and put on skill and character, I am very loath to interfere with an employer's business in selecting the best man, union or non-union, available for the place. But

wherever, as in the case of the Brisbane Tramways Company, there is evidence of discrimination *against* the union men, I feel it my duty to protect an organization by an order for preference."

In view of the fact that Massachusetts, Colorado, Washington and other American states are at present formulating standards to determine a fair wage to women employes, perhaps the most important information given us by Mr. Justice Higgins is his principle in fixing a "fair and reasonable" rate of wages.

"The test of a fair and reasonable standard," he states, "is a wage sufficient for the normal needs of the average employe living in a civilized community. The essential needs are food, shelter and clothing. A full and generous allowance for these should be made the average man who may be assumed to support an average family consisting of himself, his wife and three dependent children. This living wage must be kept as a thing sacrosanct for all employes.

"When this has been secured then I try to determine the wages due to skill. In this, the ratio of wages paid by an employer is a tolerably safe guide as to the relative merits of the various classes of work although the absolute amounts may be too low.

"Finally, having settled the minimum remuneration which I regard as fair and reasonable for the several classes of employes, I may safely leave the men of special skill or special qualifications to obtain such additional remuneration as they can by bargaining with the employer."

Fixing the Living Wage

Just as in the United States, Mr. Justice Higgins arrives at the living wage by investigating the cost of living in different communities. This is usually done by four methods: by securing the statements of storekeepers and land agents, by finding out the average purchases of certain workers' families in the co-operative stores, by examining the allowances made to dependents of organizations and inmates of institutions, and by investigating domestic budgets submitted by workmen and their wives.

There is one point of difference, however, which the justice noted in observing the operations of wages boards in this country, and that is the minute detail with which a budget is computed. Such items as recreation, carfare, church, etc., are not differentiated in Australia, but are lumped together and added to the bare cost of sustenance to make a fair standard.

Mr. Justice Higgins insists that the needy employer should, under the award, pay at the same rate as his richer rival. "It would not otherwise be possible," he states in one of his decisions, "to prevent the sweating of employes, the growth of parasitic enterprises, the spread of industrial unrest which it is

the function of this court to allay. . . . I face the possibilities of this mine [Broken Hill Proprietary Co.] remaining closed, with all its grave consequences: but the fate of Australia is not dependent on the fate of any one mine, or of any one company; if it is a calamity that this historic mine should close down, it would be a still greater calamity that men should be underfed or degraded. . . .

"In short, the remuneration of the employe cannot be allowed to depend on the profits actually made by the individual employer. This proposition does not mean that the possible profits or returns of the industry as a whole are never to be taken into account in settling the wages. For instance, the fact that the industry is novel and that those who undertake it have at first to move very warily and economically might be favorably considered. So long as a workman gets a living wage, I can well understand that workmen of skill might consent to work in such a case for less than their proper wages, not only to get present employment, but in order to assist an enterprise which will afford them and their comrades more opportunities for employment hereafter. For this purpose it is advisable to make the demarcation as clear and as definite as possible between that part of wages which is for mere living and that part which is due to skill."

Another principle to which Mr. Justice Higgins adheres in fixing a minimum wage is that the unhealthy conditions which individual employes suffer, if the conditions are not necessarily incidental to their employment, are to be ignored in framing a scale of wages and left to parliamentary regulations.

"I decline to make an award on the basis of conditions which are unnecessarily unwholesome or degrading," he said, "in other words to treat employes as entitled to *purchase* the right of treating men as slaves or as pigs."

There are, however, certain exigencies of work that the justice does consider in naming a wage. An additional ten shillings was awarded to marine stewards in one case, not because of skill, but because of the "exceptional obligations" imposed on this class of workers in respect to keeping up a good appearance, wearing a uniform, exercising tact with passengers and bearing responsibility for their employers' property.

AGAIN, Mr. Justice Higgins gives special attention to irregular employment. Where the seasons are clearly marked and the intervals between them long, the justice's position is that the worker should be expected to find other employment to supplement the occupation in question.

But at the same time, he believes that "regard should be had to the short pe-

riods of employment, to the expenditure of money and of time in getting to the work, to the broken time of the employes, and to the fact that they are paid by the hours of actual work." Thus in the case of traveling shearers and in the case of the cannery workers, the principle of fixing wages by the *returns of the expedition* was applied. The problem was to find what should be a fair return for a man starting on such expeditions, the time and expenses of going and returning being brought into consideration.

Again there are certain trades where the intervals of unemployment are short and uncertain and where the waiting involved is necessary for employment. Thus the cabman must wait at his stand and the wharf laborer at the dock. In a remarkable decision for the dock laborers recently rendered by Mr. Justice Higgins he points out that whereas the work is casual, uncertain and the jobs short, "the necessities of the man and his dependents are certain, continuous and incessant."

On the basis of thirty hours work a week, which was the average computed for the average dock worker in Australia, Mr. Justice Higgins ruled that 1s 9d per hour should be awarded as contrasted with 7s for an eight-hour day, estimated in an earlier investigation as the minimum living wage for an unskilled laborer in Australia. At the same time he strongly recommended the employers to set their house in order and to devise some system of co-operation such as would enable them to give the men full weekly work at weekly wages. In view of such readjustment the award is to be regarded as provisional.

Women's Rate of Pay

When the wages of women are under consideration, and this is surprisingly seldom in the federal court, Mr. Justice Higgins stated it as his opinion that a different principle should be followed since a woman is not, like a man, under legal obligations for the support of her family. In commenting upon our American system of regulating wages for women only, he supposed that we had "to stick our fingers in, before we got our heads through."

"Of course," said the justice, "many girls have family responsibilities but an employer cannot be told to pay a particular employe higher wages because she happens to have parents dependent on her, any more than he can be allowed to pay her less because she has a legacy from her grandparents or because she lodges free with her parents and merely wants some money for dress. The minimum wage must be the rate paid for a *class of workers*."

"Now I make a distinction of three classes. The first is the class in which all or practically all the workers are men, blacksmiths for instance, and to which a

man's wage should be paid, recognizing that one of the normal needs of the average employe is the need for domestic life.

"The second class is one such as fruit picking in which men and women do the work equally well. For this class too, a man's wages should be insisted upon, both because it tends to greater efficiency in the work when there is true and healthy competition, and because it prevents the displacement of men by women in industry.

"But for the third class of workers, the class where women are continually employed in preference to men, another standard should fix the legal rate of wages. I believe that this should be the cost of living for the individual girl, living away from home with the responsibility of supporting herself."

It is clear from talking with Mr. Justice Higgins and from reading his decisions that no award of the federal court is made in a bungling, haphazard manner. In one place he writes: "It might be a very pleasant function to sit in my court all day giving agreeable wages away, but that function is not mine." Instead every determination means painstaking study of every angle of the industry.

It is the duty of the justice to examine the legality of bringing the dispute before the Commonwealth Court, to investigate the cost of living not only in one vicinity but in each community where the dispute is smouldering, to consider the effect of the proposed increase of wages on the industry unless, as sometimes happens, the respondent admits the ability of the industry to bear an increased rate.

Most important of all, the justice must decide whether for some especial reason employes should receive a minimum wage higher, or perhaps lower, than that reckoned by the cost of living. In the case of the federated marine stewards, for example, Mr. Justice Higgins decided that the problem before the court is the ascertainment of the income accruing to employes from all sources by virtue of their employment and therefore "tips" must be taken into account.

Fixing Piece Rates

Finally, where piece rates are to be fixed, it requires much testimony from employer and employe as well as expert accounting to compute such piece-work rates as would enable an average worker to earn the minimum wage paid for time work in the trade. Piece-work does not, however, seem to be as prevalent in Australia as in the United States.

In the Australian boot-makers' case, Mr. Justice Higgins referred to the piece-work system and its effect in America. "Despite the high wages in the United States, the labor cost is only 21½ per cent of the value of the product, whereas in Australia the labor cost is

HENRY BOURNES HIGGINS

President of the Commonwealth Court of Conciliation and Arbitration in Australia

28¾ per cent. This result is mainly due to the fact that the men attain higher speed in the United States. They are paid by piece-work, the more work, the more pay."

The same deliberate care with which Mr. Justice Higgins makes his judicial decisions is manifested in his criticism of the whole minimum wage and arbitration systems in Australia. He does not enthusiastically endorse every detail of the present scheme. He freely admits that state tribunals are often influenced to fix low rates by the consideration of interstate competition and that the competition of wages boards is about as detrimental as the competition of industries.

He admits that in certain instances a wages board has been dominated by capital and expresses doubt as to the expediency of a mere wages board where a board is confined to a single undertaking and the employes who are members have no chance of getting similar employment in the same locality. When a board was formed for the Brisbane Tramways Company, for example, the members were the manager, superintend-

ent and employes of the company. Every proposal was made by the manager and accepted unanimously by the men who held their positions at the manager's will.

As to the federal court, Mr. Justice Higgins makes chief objection to moving in "technical hobbles"—to the legal restrictions with which the court is surrounded. As actually happened in the Merchant Service Guild Case, he may spend days and weeks in going into the merits of claims and then after the award the whole proceeding may become a nullity because some dissatisfied party may make an application for prohibition on legal grounds and be sustained by the High Court. Naturally, as time goes on, precedents are being established to define and clarify the act. But at times it looks as if the United States were not the only country in the world whose learned judges are often more concerned with quibbling over words than with promoting human welfare.

The time-honored objections to the principle of the minimum wage are not sustained by Mr. Justice Higgins. "It's wonderful," he commented, "to note how

often what you expect to happen does not happen. Industries have not been driven out of states where there are wage boards. Of the first thirty-eight wage boards established in Victoria, application for eleven was made by manufacturers. Now, with more than 130 in existence, employers very generally favor them.

Neither has the maximum wage become the minimum. "Individual bargaining still exists but on a legitimate level. Manufacturers still pay a high wage to secure particular skill or a plentiful supply of good labor. As for the consumer bearing the brunt of the minimum wage, the cost of necessities of life is certainly greater now than 20 years ago. But this increase in prices is not confined to countries with a protective policy, or to countries where there are wages boards or arbitration courts,—it is at the present time causing much distress and public anxiety in America and in Europe."

The persistent criticism of the minimum wage doctrine, that thousands of workers would be thrown out of industry, is safeguarded in Australia, according to Mr. Justice Higgins, by the gradual adoption of the system in a few industries at a time and by the granting of permits for apprentices and for aged, slow and infirm workers. In some cases the number of these workers is limited.

The granting of permits is accorded in different ways by different wages boards, but it is usually done with such publicity that the custom is not abused by employers. Sometimes it is given by the chief inspector of factories after submitting the application to the union secretary, if the man is a union member. Sometimes it is granted by a board of reference consisting of an equal number of employers and employees in a trade.

"It is clear," said Mr. Justice Higgins, "that unless these exceptions are carefully guarded the whole principle of the minimum wage will be rendered nugatory."

IN this connection it is curious to note that apparently Australia is giving much less attention than the United States to making her laborers "fit" for a minimum wage. Although Mr. Justice Higgins speaks of the "pestilent manufacture of imperfect tradesmen" and suggests the closer association of factories with the technical schools, he did not emphasize the tendency now manifest in the United States to increase the efficiency of the workers by introducing the efficiency engineer and the factory school. This is doubtless due to the retention, however slender, of an apprenticeship system in many trades, to the lack of extreme specialization in industry and to the large amount of pastoral occupation.

Altogether Mr. Justice Higgins believes that the great experiment of minimum wage legislation and compulsory arbitration in Australia has been a success. Attacks upon the arbitration court have come, he asserts, from two main sources: from the conservative employer who believes that the conduct of his business is a matter which concerns himself only; and from the syndicalists, corresponding to the Industrial Workers of the World, who adhere to the strike policy which the arbitration laws are framed to discourage. "Extremes meet here," said the justice.

But the great mass of employers and the great mass of workers uphold arbitration and the legal minimum wage. High wages, it is admitted, mean better machinery and greater efficiency in conducting industry. At the same time they mean greater efficiency in the employee. Arbitration means fewer strikes and less attendant human suffering.

"A growing sense of the value of human life," asserts Mr. Justice Higgins, "seems to be at the back of all these methods of regulating labor; a growing conviction that human life is too valuable to be the shuttlecock in the game of money-making and competition; a growing resolve that the injurious strain of the contest—but only so far as it is injurious—shall, so far as possible, be shifted from the human instruments."

Organizing the Law Courts for Efficiency

By Herbert Harley

SECRETARY, AMERICAN JUDICATURE SOCIETY

THERE are encouraging signs that the reaction of the legal profession to the storm of criticism which burst upon our judicial systems a year or two ago is to be distinctly helpful. In many states the more public-spirited lawyers are seeking to forward constructive reform.

The stage of inquiry is not yet passed. Just what it is that makes justice painfully slow and uncertain is still a matter of disagreement. It is understood that in England and Canada, among people similar to ourselves, and where the substantive law is closely related to ours, the courts are self-conscious and ambitious—that they "make good." The natural expectation is that in America the courts will eventually reflect the national instinct for effectiveness; that they will become practical, economical of effort, efficient.

If one were to endeavor to synthesize all the many causes for dissatisfaction with American courts he might well say that our courts, while they do not exemplify our instinct for practicality, are a perfect reflection of our national timid-

ity in government. We have the most thoroughly decentralized government the world has ever seen.

In recent years we have come to see that the dissipation of individual responsibility, inherent in our system, is most to blame for our governmental inefficiency, and we are moving rapidly in our great revolutionary work of reconstructing the machinery of government so that responsibility will become the powerful factor which it must be in any successful scheme of human affairs. We are first simplifying our municipal government so that responsibility will flow in direct lines from the people's servants to the people. We are learning not to ask of the electorate superhuman qualities. We are finding that good government can be won without making angels of all voters, by improving the machinery of government and giving expression to that natural instinct for order and restraint which every normal mind possesses.

The movement is beginning to extend to state governments, and it appears that soon we will have real politics in

this country in place of the degrading hustle for office which has been heretofore the mainspring of public action.

We are beginning to see that the trouble with our courts is almost identical with the troubled experience in municipal government which persisted so long that we had become fairly pessimistic when the short ballot under the guise of "commission government" came in.

We have no real judicial department, as they have in England and Canada, though our fundamental scheme calls for a judicial branch. Instead we have a certain number of judges more or less loosely associated in certain courts in every state, but these courts do not constitute an entity with a mind, a nervous system, and muscles that can perform its certain definite task.

There are well trained judges everywhere, but no judge possesses all of the judicial power of the state. This power, which we must think of as essentially indivisible, is parceled out among an unorganized lot of judges. It is a piece-work system which is all right so far as it makes for specializing, but implies

as a requisite some central and controlling mind. This central mind and this power to control are wholly lacking.

The complaint is not so much that judges do not know the law or do not conscientiously apply it. The complaint is largely as to failure on the administrative side of the judicial function. The best agents must fall short if their activities are not intelligently directed.

If all the numerous judges, in some states several hundred in number, are to do their individual piece-work so that there will be real effectiveness in the output of the entire force, there must be a centralized intelligence to direct their efforts and this intelligence must have power to enforce its will. There must be finally one single person held responsible for the execution of the centralized will of the judicial department and for harmonious work. That single responsible person must be accountable directly to all the people of the state.

Lawyers very generally have accepted the theory that the courts must have and exercise far greater power with respect to creating, amending, and enforcing procedural rules. There are some few large features of procedural law which may well be controlled solely by the legislature, but the great bulk of procedural law is nothing more nor less than directions pertaining to the petty details of litigation, and it should emanate from the judicial branch itself, constituting a flexible system of rules.

Lacking any administrative machinery in our judicial systems, we have been obliged to legislate a great volume of mandatory and inflexible rules in an effort to force judges to do the right thing. As a matter of fact, judges almost always want to do the right thing, but they are constantly confronted by this inflexible procedure which compels them to do awkward and uneconomical things through which great injustice results. Legislated rules confer substantive rights and our over-contentious system obliges lawyers to take advantage of every opportunity and compels judges to subordinate rights to mere form.

For Substantial Justice

It is now quite generally agreed that beyond a short practice act, all rules of procedure should be rules of court which will permit of variance in the interest of substantial justice. Lawyers talk this doctrine in two score bar associations, but there is no step toward putting it into effect, and the reason is that the judicial system is so flabby that there is really no place where this important power can be safely vested.

But no great change is needed. There need be no such sweeping change as takes place when a city adopts commission government. It is merely necessary to create a unified organization of the courts of a state, making very little change in the accustomed courts. There will still be judges devoted to the trial

of all sorts of causes and a court for appeal, and local judges of limited jurisdiction.

The central authority, which must exist to exercise the rule-making power, which must be transferred largely from the legislature to the judiciary, can be brought into being by providing a judicial council of five or seven or nine judges. The head of the council will be the chief justice of the state. These men will spend much of their time on the bench, but as a judicial council they will have important administrative powers, will become, in fact, responsible for the enforcement of department rules and for the economical and prompt functioning of the entire department.

Judicial Statistics

The larger questions involved will be settled by the judicial council whose orders will be executed by the chief justice. The lesser details, arising from day to day, will come directly within the province of the chief justice. To keep him in touch with the system he must become the recipient of frequent reports from all the judges and branch courts and must compile and digest these reports and publish them so that the people will know what is going on in the judicial department. They do not now know and have no means of knowing. As a matter of fact, nobody knows. The wealth of data of vital importance in framing policies and legislation is now entirely beyond our ken. Ours is the only government in the world in which judicial statistics are lacking.

Of course procedural rules, so made, will be subject to the veto of the legislature, but experience in England and Canada has shown that the unified and organized courts exercise this power so well that the legislature is not tempted to interfere, and it, in turn, is benefited by having this duty, foreign to its nature, taken from its shoulders.

Such rules will naturally tend to expedite business in the courts because judges prefer to make work short rather than tedious. They will inevitably assume a rational and simple form, and then finally we will have achieved the exorcism of that deadly formality of the law courts with which we have struggled in America and in the mother country for many centuries.

Given the slight orientation, the simple organization, the centralized responsibility which is here suggested, and our courts will inevitably come to reflect the practical good sense and love of genuine achievement which is a leading characteristic of the people of this country.

The American Judicature Society, called into being expressly to study the needs of the courts and procedure and to further a movement calculated to make our judicial systems expressive of the democratic ideal, finds its present scope for activity largely in this insistent need for proper organization. It is a work

more of political science than of law. The political scientists have been too shy to invade this field. The lawyers have not appreciated the non-technical character of this constructive work.

The field has been unoccupied until now. The American Judicature Society, which has enrolled lawyers and political scientists in practically every state to form an advisory and critical body, conceives of the present need as calling especially for concrete recommendations in the form of model acts. The society is now engaging the best available talent in the country to draft judicature acts and is submitting these acts to its council and to experts generally.

The field divides readily into municipal and state courts. Of course there should be ideally complete unification of the courts of a state, but the cities are so much more in need of betterments, and the complaints are so much more insistent among them, that it seems probable that reorganization dependent upon constitutional amendment will come about first in certain of the larger cities, and that having proved itself in these cities, states will later be induced to move to the higher plane.

A Model Act

The first draft of a model act to create a unified judicial system for a metropolitan district has been prepared and circulated by the society. It will be re-drafted after sufficient time for criticism. The society is about to launch its first draft of a state-wide judicature act.

In time these model acts will be supplemented by schedules of rules constituting simple and rational procedure, and suitable for enactment as a substitute for the great body of procedural law which has accumulated. The organized courts will then be given power to revise and develop this system of procedure to meet needs as they arise.

It is true that in most states there must be constitutional changes in order to permit of the adoption of any model court organization, but this is not because anything drastic or strange is proposed; it is merely because the constitutions reflect the ideas of a more primitive age, because they went unnecessarily into detail.

In all these suggestions there is no proposal to alter any substantive law or to affect any substantive right of any parties litigant. The idea is merely to unify courts into a simple department so that the plain duty of adjudicating controversies may be performed with a minimum of effort and inconvenience; to give somebody power to get good results on the administrative side of the judicial function; to hold those persons to whom such power is given strictly accountable for results; to let a flood of daylight into our court business, and to acquire from the courts the data upon which constructive social and criminal legislation can be founded.

Driving "Devils" Out of Samoa

How the Task of Saving an Island Race from Disease and Superstition is Being Met in the South Pacific Ocean

IN the little traveled expanses of the South Pacific, 1,500 miles east of Australia, a group of tiny islands that appear in one's geography as dots amid the myriad dots of Oceania is today being benefited by a modern fight against diseases that have long held the population in check and brought misery to thousands. The latest phase of this fight is the effort to train native men and women as nurses. It is meeting the obstacles of ignorance, superstition and lack of money.

These islands are the American Samoan group. Escaping exploration until 1768, they have been left until recently, except for the introduction of Christianity in 1830, to the sway of primitive tradition and the pursuit of savage practices.

There are many theories as to the origin of the Samoans. One is that they were originally a Caucasian people from southern and eastern Asia which, branching out through Japan, reached far beyond the Pacific islands inhabited by black races and established themselves in Samoa, thence spreading throughout the islands of Polynesia. "Their light skin, well-formed features, wavy hair and fine figures," says Colquhoun, "are united to many graces of disposition."

YAWS

Seventy-five per cent of all Samoans contract this loathsome disease in childhood.

It is a belief of the Samoans that nearly all illness is due to "devils." In consequence a cult grew up that professed to have power to drive away these "devils," and so cure disease, by means of exhortations, cutting with pieces of glass, and the use of various leaves. Some of these leaves have since been found to be very powerful and even dangerous in their action.

Such sanitary essentials as latrines were unknown among the Samoans. Flies and mosquitoes found abundant facilities for breeding, the former in the quantities of organic excreta to be found everywhere, the latter in the numerous pools and swamps fed by torrential rains and favored by the absence of any attempt at drainage. Dysentery, tuberculosis, yaws, elephantiasis, diarrhoea, abscesses and "sore eyes" were very prevalent. Some of these diseases are attended by frightful skin excrescences and the swelling of legs beyond all semblance to the human form. Carelessness toward women in confinement and the ignorance of mothers in the care and feeding of their infants, contributed to a high mortality.

The American Samoan Islands were taken over by the United States, by agreement with England and Germany, in 1900. The need for medical and san-

WHERE "DEVILS" ARE DRIVEN OUT

The modern hospital in American Samoa which has superseded the native cult that fought disease with exhortations and cutting by glass.

OVERLOOKING THE HARBOR OF PAGO-PAGO

Another view of the Naval Hospital which, if it can find money to carry out its plans, may prolong the life of the fine race of Samoan people.

itary measures was at once seen. The government of the islands was placed in the hands of the commandant of the naval station in the harbor of Pago-Pago, Tutuila, and the medical department, handicapped by lack of appropriation, undertook to improve conditions among the natives.

One of the first difficulties was to induce the Samoan to present himself for treatment and education. He was found to cling with tenacity to his old customs and it was some time before modern diagnosis and medicine, and especially surgery, could be made to find favor in his eyes. Gradually, however, the daily clinics increased, and the "tomai sili" (head doctor) came to be trusted.

In spite of occasional increases of hospital area and the final erection of new hospital buildings in 1911, great numbers of sick people are never reached. The actual area of American Samoa is a few hundred square miles, but the islands are scattered over an expanse of 18,000 square miles. They are volcanic in

origin, with the result that transportation is extremely difficult. Many villages are thus actually so remote from the hospital that numbers of sick people are never brought in. Sanitary conditions in these remote parts suffer proportionately.

It is proposed to meet this difficulty by training native young men and women to act as visiting and resident nurses throughout the islands. A school for this purpose has just been started. Two of its students may be seen in costume at the head of this article.

But though this project has been begun, the same lack of funds that has all along proved such a handicap to sanitary and medical care, may hamper its effectiveness. The appropriations of the Navy Department for the upkeep of its station at Tutuila are not designed to rid the islands of disease. The Samoan hospital, moreover, has just been made a free institution, so that the small fees heretofore received from the treatment of the natives are cut off. The revenue

derived from the single export—the dried kernel of the ripe cocoanut—is declared to be barely sufficient for the maintenance of the islands.

The building used as a home for the nurses in training is being paid for in installments, the first payment having been met by the proceeds from a bazaar given jointly by women at the naval station and by native women. It is estimated that \$5,000 would reasonably insure the success of the training school.

The school is at present conducted by two navy nurses. The native men and women who will be sent out from it will be trained particularly in midwifery and the care and feeding of children and will perform the duties of sanitary inspectors.

So heavy has been the toll of disease among the inhabitants of these islands that the population—8,000—has been unable to do more than hold its own. It is believed that the effect of the plans here outlined will be nothing short of prolonging the life of this fine race.

Four Wards of the Hospital

Sarah N. Cleghorn

THE ACCIDENT WARD

TWISTED and maimed, so many, how came you hither?
(Listen, Captains of Industry:
Hear, O Judges!)
"The knives and cogs of the Moloch machine lay waiting
For the fagged and the dazed and the faint and the over-speeded
Into their sharp-set racking embrace they drew us,
Cracked like a shell the handiwork of the Almighty,
And cheaply flung us, seared and scalded and broken,
Legless, armless,
Into the long white ward."

THE TUBERCULOUS WARD

WHENCE came you; O hollow and hectic faces?
(Listen, Landlords,
Listen and hear them coughing.)
"Finished product we of the sweatshop chemist,
Who from the dust, the dark and the damp distils us:
Frankenstein of the sunless, airless chamber;
Death's industrious, accurate, skilful Foreman."

THE ALCOHOLIC WARD

WRECKS of manhood, search your sodden remembrance:
Tell the City,
(Alas the thoughtless City!) how you came hither.
Death's industrious, accurate, skilful Foreman."
Vainly up and down the City we sought her,
Till she called us into the dingy gin-shop.
There she dwells, unkempt, forlorn, degraded,
Where the City
(Alas, the blind, blind city!) has lodged and left her."

THE NAMELESS WARD

WHENCE came you, O sad, O strange little children?
(Listen, Mothers and Fathers!)
"A sick and shuddering woman led us hither,
Turning away her face and weeping for pity.
All in vain, in frenzy of fear, our mothers
Strove to loose from her soiled and tattered garments
The clutch of our baby fingers.
She herself, the friendless, shelterless woman,
Sought in pity, and all in vain, to leave us.
Where she wanders, lost and ruined and wasted,
Little Children
(Listen, Mothers! and Listen Fathers!) must follow."

The Westinghouse Strike

“A Matter of Class-Consciousness and not of Dollars-and-Cents”

George V. S. Michaelis

“A PURELY class-conscious strike with dollars-and-cents bargaining hardly a factor. It is not an attack on the companies. It is direct warfare against the institutions of society. The strike leaders are idealists. They dream of a co-operative commonwealth. But they limit its benefits to workers alone. They are trying in a day to overturn institutions which it has taken centuries to build up. The strike, therefore, has been hopeless from its inception. It cannot win. The companies, in a sense, are not involved. The strike will be beaten by the organized society of the present day and by the financial depression of this year.”

Thus the writer spoke of the Turtle Creek Valley strike against the Westinghouse Companies, so-called, of the Pittsburgh district. His auditors were a group of Pittsburgh social workers and the editor of *THE SURVEY*.

The editor finally said: “That is an interesting interpretation of the strike. Why not write it out for *THE SURVEY*.”

This article, therefore, is an individual expression. It does not seek to express editorial opinion. Responsibility for its views must be recognized as resting solely upon the writer.

A Clinical Study

A director of one of the Westinghouse Companies involved has been interested for many months with me in an endeavor to work out some method of bringing industrial peace that shall be fair to all factors involved, including capital, management, ability, labor, overhead, consumption and organized society as a unit. He suggested that this strike might afford an opportunity for, shall we say, a “clinical study” of the problem. In the Westinghouse Electric and Manufacturing Company alone nearly 9,000 workers were out and half as many more from the other companies involved.

So I went to Pittsburgh, arriving Friday morning, June 26, when the strike was exactly three weeks old, as the workers walked out on Friday, June 5. Tensard de Wolf, the secretary of the Voters' League of Pittsburgh, secured introductions and piloted me to East Pittsburgh.

We first walked about the village. No saloons were open. “Closed since the strike began.” The strikers say they ordered this, and as Socialist officers who were allied with them control two

[From 1909 to 1914 an officer of manufacturing corporations; now managing a selling agency; and associated with a group of manufacturers, business men, and others, in working out plans for an “Industrial Peace Movement.”]

boroughs of the three involved, they deserve two-thirds, at least, of the credit.

There was quiet without gaiety. The feeling was more than this: it was somber. On the streets there was no note of bitterness, except at opening and closing hours of work, when the feeling against the “scabs” ran up. Men moved about or stood, but did not give the effect of being loafers. Rather the impression was one of waiting—a dumb, silent waiting. This was understood when later investigation showed that the strike was called in emotionalism. The waiting was a matter of feeling, not of defined intellectual watching for developments.

At the headquarters of the Allegheny Congenial Industrial Union we called out from the committee room, Bridget Kenny, an active, intense young woman of “many years of shop life.” “There’s a committee meeting. Speak to Mr. Barrett. I’m sorry I can’t give you time now.” Men and boys were waiting, but there was less confusion than at a political headquarters. A nervous, lithe, white-shirted, quick-spoken man appeared and disappeared saying: “I’m Barrett. See O’Keefe at the Labor Tabernacle. He’s chairman of the executive committee. Some of these gentlemen will gladly show you the way.”

We walked along Braddock avenue and crossed the creek into the borough of Turtle Creek and on to a baseball field where stood the Labor Tabernacle. It was a huge, flat, flimsy shed erected hurriedly a few weeks before for a revival of the “Billy” Sunday type. Not a seat was left—3,500 people at least were seated, hundreds stood around, clustered even against the outside walls, opened by the raising of horizontal shutters.

One of our guides brought out Mr. O’Keefe. He was in shirt sleeves and gave the impression of a vigorous, intense personality. He had to speak next, he explained, but invited us to stay. “The meetings of this union are open to all. We have nothing to conceal.”

From now on, with perhaps a single

exception, names of leaders will be omitted. There are two reasons for this. In the first place, in the existing state of society, including both employers and employes, there will be less risk of inviting criticism upon the leaders as individuals from either “bosses” or unionists.

In the second place, this was a strike without personal advertising. Personalities were deliberately kept in the background. Let not the significance of this be passed over. The real leaders of the strike were fighting for an ideal. You and I may not agree with them or we may. But in fairness recognize this fact—they wanted not personal aggrandizement, they stood for a cause.

No Special Grievances

The first and the abiding impression was that this was a strike without specific grievances having been the cause. This the body of the strikers will deny. They do not distinguish between grievances following a separation, and those before it. John and Jane have lived together for years. Let us say that Jane becomes interested in the Rolutulo Movement (it does not exist so I am safe from criticism by “pros” or “cons”!) Her interest becomes absorption. At last from a sense of duty she leaves her husband. Out of the quiet years would come up many and many a real or fancied grievance never thought of before.

The chief of the grievances brought out were: That when 5,000 were dropped during the early part of the year 300 members of the union went, including 30 active leaders; “efficiency systems”; and a reduction in hours of work in order not to cut down the force further.

Why did the strikers walk out? They, themselves, could not give clear cut, definite reasons. It is not forced humor or current jest to say it was a “psychological strike,” for that is just what it was. Months before, a little group of men who had been reading de Leon, Trautmann and others caught fire from the glowing dream of the “workers’ co-operative commonwealth” to be brought about by “one big union.”

The Turtle Creek Valley section was a fertile field for their zeal and missionary work. For twenty years socialistic propaganda had been working there. Socialists were gaining numerically until local municipalities elected their tickets. Furthermore, nineteen nationalities could be counted among the Westing-

house workers. These were no sodden peasants, dumb and stupid. They were highly literate. Many wrote in two languages. No plants in the country had a higher type of employees.

The only personal grievances the leaders may have had were unconscious. In these days of business organization of huge size, these men were left in the ranks. They had no outlet for their energies that was big enough to use up their force. In simpler days they would have worked into the ranks of "bosses" or been active in politics. Events proved that they were born leaders; untrained, impracticable and not masters of men, yet leaders.

The Socialists and the I. W. W. were aware of this demand for mental feeding. They poured in their history and their economics. Politics no longer teaches the foreigner. This might have been done in the days of detailed organization, but of recent years no steps have been taken. On other lines the welfare work of the companies has been notable.

Swallowing Marx Whole

The companies were doing their part. But organized society was doing nothing. It was left to a part of society to feed the hunger of these active brains. Unity is a law of life on all planes. "Unity" was the keynote of these teachings, but it was a mangled, lopsided unity, limited to workers only. They did not see this. To them "the workers" include all. Marxism was accepted on faith, without analysis or deliberate thinking. "The worker produces all wealth." Hence all wealth that does not come to him is property of his of which he is deprived.

Organized society and its laws protect those who have thus deprived the worker of wealth—therefore organized society and its laws are immoral and to be disregarded by moral men. The writer, as an individualist in his own beliefs, utterly repudiates this doctrine. He would like to defend his position, but it is the views of the Turtle Creek strikers that are being considered, not his.

A new ideal was soon combined with this principle. It was preached by the Detroit Industrial Workers of the World. In saying what I am about to say I will receive criticism from many an associate. A few weeks ago, I would have shared their views. I still regard all the I. W. W.'s and kindred bodies as entirely wrong, but I now try to understand them. Let us sympathize with their intention and try to guide their efforts to put it into effect, and not rest with denouncing them.

This new ideal is that, as labor owns all, it is folly to use effort to get a little of its own. What is needed is to cement the brotherhood of workers. Therefore attack society piece-meal in order to demonstrate power until power has

grown so strong that all industries may be taken over. The dream is that organized society will then peacefully consent to its own extinction and a new structure rise.

An Industrial Union

Trades unions, to this school, are sordid and cowardly. "Capital" itself was not more abused than was the American Federation of Labor in this strike. The very organization of the union expressed the protest. No crafts were recognized. Note the following "declaration of principles of the Alleghany Congenial Industrial Union":

"We affirm the irreconcilable difference of interests between the employer who buys labor power in the labor market for the purpose of making a profit on the one hand, and the wage-earner who sells his ability to produce wealth to some employer, in order to secure the necessities of life, on the other. We know from bitter experience that the buyer and seller in the labor market can never see things from a common viewpoint, as the employer always buys as cheaply as possible and we as wage-earners wish to sell our labor power for the highest possible wages.

"We are therefore determined to band together in an industrial union which recognizes no distinction as to craft, sex, religious creed, political affiliations, age or nationality for the purpose of compelling our common employers to give us every concession we can force from them by industrial solidarity."

"Drop class sympathy for a moment," was said to one of the leaders, "and read that declaration as a member of organized society—what does it mean? What could you say?"

The man was honest: "I'd say—war is declared, I guess I'd better look out for trouble."

Now read the reply by the companies, signed by Westinghouse Electric and Manufacturing Company, Westinghouse Machine Company, Union Switch and Signal Company and Pittsburgh Meter Company:

"We submit the principles for which the Westinghouse Companies stand committed:

I. Westinghouse Shops Shall Be Open Shops.

We stand for the principle of an open shop in which Union and non-Union men may work without molestation or being forced to join any organization.

II. Westinghouse Employees May or May Not Be Members of Any Organization.

We do not require of our employees that they shall refrain from joining labor organizations any more than we attempt to restrain them from joining any other bodies, but we maintain for all our employees the right to refrain from joining any organization

without prejudice to their positions, or their security, or their comfort in our employ.

III. The Pay of Skillful and Productive Westinghouse Employees Shall Not Be Regulated by the Pay of the Inefficient and Less Productive.

We pay wages and maintain shop conditions which compare favorably with other manufacturers in our industries.

By this means and by the added inducement of steady employment, we endeavor to attract the best workmen.

In order to compete with other firms, both at home and abroad, we must introduce all of the agencies by which the best efficiency is obtained.

We reserve the right to determine the compensation of our employees on the basis of the service they perform for us as well as by the day rate which measures only the time spent in our works.

IV. Every Westinghouse Employee Has the Right of Conference With the Management.

We receive any one employee or any number of employees from any department, or any properly chosen committee whose selection shall be truly representative from any department or of the whole body of our employees.

V. Every Westinghouse Shop Shall Be Safe, Sanitary and Comfortable, and All Suggestions of Employees for Improvement in Shop Conditions Are Welcomed by the Management.

We seek to maintain the best standard of sanitary and working conditions in our factories as we believe that to provide as good surroundings as the character of our operations permit is the best guarantee we have of obtaining and holding the best class of employees."

If space permitted it would be interesting to go into the details of the discussions with the leaders. One point deserves to be noted. In their intellectual interest they followed me closely, although I was propounding views in opposition to their own. We met in sympathy. I had been touched by the women and children at the mass meetings and their endurance of suffering. I felt that the nature of the strike was such that organized society, of which Mr. Herr, the labor leaders and myself were all components, could not give in in one single particular.

Talking It Over

The strike had challenged the world. Furthermore, my own knowledge of labor conditions this year enabled me to know that men are everywhere seeking work and that it was only a question of time when the works would be filled and the strikers still out would be suffering. Only suffering could come from the strike's prolongation.

It was remarkable that I was permitted to talk so frankly. Think of the fact that "Bill" Trautmann, himself, was recently assaulted and nearly killed after

criticising a branch of the I. W. W. But the reception given my "peace propaganda" is an illustration, that to me is notable, that this was no ordinary strike. Unconsciously the strikers were feeling their way. The quietness I had noted that first night was characteristic. The workers were thinking, thinking, thinking. They were not used to thinking and the effort stilled them. This is in seeming contradiction to my statement that the strike was emotional and that the strikers were not illiterate. But the contradiction is only in terms. The strikers were not reasoning—had they reasoned there would have been no strike. The facts would have been recognized and "1914" would have punctured the bubble at the very start.

Vested Rights in Jobs

The strikers thought—most labor men think—that all property by rights was theirs as a class, and that as individuals, each had a property right in his job. They merely took the typical property owner's attitude when they objected to "scabs" and "strike-breakers" being employed on the jobs they had left.

Before I went to Turtle Creek Valley I had believed the hatred of the "scab" was the old caste feeling, similar to the clubmen's feeling regarding cheating at cards. I now believe it is the result of thinking over the economic teaching of the Socialists, which is the only teaching that American workers have received for twenty years.

The Allegheny Congenial Industrial Union—as the local organization was called—denounced the school system from the platform as it did the legislatures and courts, in common with trade unions and all other agencies of existing society. It need not have!

All that our schools are doing is to fit pupils more easily to take in and accept the Socialist or I. W. W. doctrines with their attractive phrases.

This will explain some of the statements and demands that were so obviously wrong as to be pathetic. Municipal authorities made official demands that "gunmen" or company watchmen be removed. Yet the union had men officially on duty in the Labor Tabernacle to keep out disorderly persons and to prevent fire. This was all that the companies were doing. Not once did the companies take the aggressive.

The deputy sheriffs were "ordered" out in ignorance of the law and of the fact that Allegheny county only this year had finished paying for the millions of damage done by the rioting in 1877. When the State Constabulary were called in by the sheriff, rage ran high, but the men felt helpless. To the onlooker it seems ominous that this splendid body of soldierly young men, truly comparable to the Northwest Mounted Police of Canada, should be so

hated.

After three weeks and more of remarkable restraint, on Monday morning, June 29, there was trouble. The "pure democracy" of the union was yielding to the discontented and radical element, and on Sunday the leaders were forced to consent to a picketing that should keep out everyone—foremen, clerks and firemen, previously allowed in unmolested. "There was no violence—we didn't kill anyone" said one of the leaders in perfect simplicity. Said another, "We have picked up people, carried them through the crowd and sent them home." Would you think it "violent" to be seized by a number of excited men; dragged, kicked, carried and stepped-on through a pressing crowd; spit upon and kicked on your way?

Congressmen and courts had been quoted at mass meetings to prove picketing "legal". In Washington it is called "peaceful picketing." In Turtle Creek picketing is "keeping men from going to work" and "peaceful" picketing is not killing them. This will be denied, but a hundred statements proved it. You and I may call the killing of a scab "murder", but to the modern, class-conscious workman it is no different from the "justifiable homicide", of the law when you kill a burglar in the act of entering your house.

That is why the Turtle Creek Valley paid no attention to the killing of non-union men in Colorado, but waked to frenzy over the "Ludlow episode" in which the women and children, smothered to death in the tiny cavern in which they were placed and sealed, became "victims of Rockefeller"—"martyred by Capital." Pathetic reasoning, childish reasoning—true; but it is the reasoning of a growing number of American citizens. They not only vote—they believe that they have a moral and a legal right to kill in defense of their jobs. When the State Constabulary's quiet and terrible efficiency prevents this, they become "Cossacks" and are hated.

Mounted Law and Order

Never was I so thrilled by a marvelous demonstration that to preserve peace, the law must be enforced, as I was when I saw three "troopers" in dark gray, idling on the covered bridge, while people filed in and out of the works where the day before thousands had stormed unawed by the deputy sheriffs. Why does not organized society in Pennsylvania see that the people of all classes look at these troopers as they are—the embodiment, the manifestation of law and order, and not as individual villains?

"Why not?" I can answer that question—for the same reason I thought "Bill" Trautmann a "red" and a "villain" before I met him. They don't know

the facts. If nothing else came out of my trip I should regard my knowing him as worth while. I still regard Mr. Trautmann as entirely wrong in his plans and policies, but we are both working for humanity, brotherhood, unity—call it what you will—only we approach it in different ways.

I agree with Sir Oliver Lodge that "there is no indication in twenty thousand years of recorded history that there has been any change in human nature." Trautmann believes a new type has sprung into existence. He believes that in twenty years the civilization of twenty centuries can be changed and all its institutions overthrown. Trautmann may be right or wrong, but I do know this, that organized society is doing nothing to assist him in reaching a right decision. He wants to be right, but nothing is done to help him.

The Turtle Creek Valley strike is over. It was beaten, as it had to be beaten, things being as they are. E. M. Herr, the quiet, firm, fatherly, sympathetic employer has taken personal charge of the human relations with his force. Lied about and misrepresented by the newspapers, he never wavered. But he could not take back the leaders first dropped—before the strike. This was impossible. I told these leaders so myself and pointed out the reasons for his position. They acquiesced.

An "A B C" Needed

What I ask of organized society is this: Should men like Trautmann, O'Keefe, Hartsorn, Bradley, Harrison, and a score of others, be forced to be enemies of society as it exists, or shall we meet them face to face and talk things out?

I still hear the pathetic cry: "If only the employers had sat down with us and explained things, this strike would never have come about," of one of the ablest leaders, and one of the most "dangerous" at that.

I wish THE SURVEY's readers could have seen the wonderful organization for disseminating news and information; the brotherhood of nationalities so perfect that Austrian and Servian brushed aside the killing of the archduke with "nothing shall separate the workers;" and finally the trial of the "pure democracy" principle, with its repudiation of conservatism and reasoning and its yielding to emotion and impulse.

The Turtle Creek Valley strike was more than "laboratory experimentation". Many a scheme was given "a practical working test". But what is most important is: Is peace possible so long as the separation of classes be accepted as inevitable and be encouraged—as it is by us all—some by indifference, others in ignorance, others in sympathy, and by others through popular propagandas of all kinds?

"Beauty for Ashes"

Albion Fellows Bacon

Chapter X--Victory for the People

ACROSS the state of Indiana we went in October to beautiful Fort Wayne. Through woods that were aflame with scarlet and crimson we passed, through orchards hung with rubies. The russet fields on either side were heaped with gold where piles of pumpkins lay. And there among them stood shocks of corn like folded palms upraised, praising the God of Plenty. All day we rode in a trail of glory that lifted from my heart for a time the shadow of the cities where the little children live. It was for the purpose of laying that shadow upon other hearts that I was going to Fort Wayne, to make a final appeal for help to the State Federation of Women's Clubs before the Legislature met.

The city was on a holiday to greet the brilliant gathering of women who came from all corners of the state. Every form of intellectual and social entertainment was provided, and all prepared to make the most of every happy moment. But how could one dance with a ball and chain fastened to one's ankle? The responsibility of that last chance of appeal weighed me down in just that fashion. I felt that every woman there *had* to know and to care about the "homes" in our slums.

At other times, in free moments, I should have found their talk on music, literature and art most interesting, but now it fell upon me like a shower of rose leaves. Even the great movements of the clubs, to which I had always given earnest thought, failed to hold me. "But these things will keep; they don't require legislation, and you can always do them," I pleaded. "The Legislature meets in a few months, and if we fail to pass a tenement law now, we may never get it."

Clubs Give Support

Dear Mrs. McWhirter! I shall always love her for the way she understood. "This is our one big fight for this year," she declared, and, as president, threw all her strength and influence into it, arranging that The Homes of Indiana should have some place on all programs where she appeared. All the leaders of the federation were most generous in regard to this movement. A number of them even wanted to pass resolutions condemning by name the men

who were responsible for our defeat in 1911.

"But wait, and let us see what happens," I said. "I believe some of them will change their minds. They will realize how badly housing reform is needed, and will be convinced that the bill is fair."

Gaining Recruits

October was the end of the federation year, and chairmen of committees were laying down their tasks for others to take up. But my work lapped on around the year. I should still be on that race course in March. No rest till then. This was only a breathing space. I drew some big deep breaths in the home of the Guldin's, who entertained me, for their views were as generous and roomy as their grounds. People who live in a park and give gardens and playgrounds to their city can be expected to put a high estimate on sunlight and air, space, outlook and beauty. But not all of these, having set their hearts on such things, are willing to turn back to the consideration of slums, with their filth and ugliness. The Guldin's, however, did consider these things; and, to crown all, Mrs. Guldin, who was a national authority on home economics, agreed with me that housing reform was a vital and fundamental part thereof. With her characteristic energy she took up the housing work of her city, and joined in the state movement.

This visit gave me a coveted opportunity to call upon the dear old mother of one of our legislators. She was a noble lady, widely known for her good works, and I was delighted to find that she regarded the needs of the poor just as I did, and promised to do all she could for the tenement bill.

It was wonderful to see how, through the months previous to this meeting, sentiment had grown for the housing movement, through interest of the federation women. Such was the character of these women that their endorsement made housing reform not only popular but fashionable all over Indiana. In Mishawaka, Indianapolis, and other cities, the women's club numbered several hundred; in many towns it numbered 50 or 75. Some towns had a dozen or more clubs, and these were all political factors of decided importance. Not only

CHARLES B. CLARKE

Senator from Indianapolis who had charge of the tenement bill in the senate in 1913

were the members' husbands men of prominence, but the women themselves were influential in their communities.

One shrinks from making use of one's friendships, or from making political capital of honors graciously bestowed; but inasmuch as they were given for the purpose of helping our cause, it is only fair to acknowledge how well they served that cause.

First State Housing Association

During this time another organization had been formed, that took in the men who wanted to help with the housing movement, as well as the women. It was the Indiana Housing Association, the first state association for that work in the country. Alexander Johnson came from his country place in Angola to preside at the organizing, and we put him at the head of our advisory committee. Mr. Cox, of course, was elected president, and I was made secretary, thereby acquiring official responsibility for the work we had been doing hitherto.

Just to look at the printed list of our officers and committees gives me courage. Among them are Judge Howard, Hon. William L. Taylor, Dr. Hurty, and Amos W. Butler. We have Dr. U. G. Weatherly, of our Indiana University, who took a class of students over to Indianapolis and directed a housing survey of three districts of the city. In his classes it is safe to say there are no future slum landlords. We have too, some of our leading club women, some architects, and one of the largest real estate men in Indiana.

We had all of our charities secretaries in the association at the start. As "pov-

erty doctors" they were indispensable, for they knew more of the actual needs of the poor than any one else. Some of them were located in towns where the poor were regarded much as a colony of lepers would be. The public gave the secretary their money at the end of a long pole, and it was understood that the secretary was paid to do all the visiting of the dirty, smelly places, and to save the town from the heartaches that a sight of misery gives!

No wonder some of the secretaries have such big sad eyes. But how courageous they are! One of them, Rhoda Welding, has been a constant wonder to me, for she has braved even thugs and gunmen, and never hesitates to call out in her talks the names of the landlords who own the most disreputable old traps.

As we had no funds to help in our housing campaign, we could get surveys, etc., only by voluntary service, and this the secretaries gave most gladly.

Elements of Strength

Counting up the elements of our strength, I return to the State Board of Health. Since our defeat in 1911, they had used every opportunity to further housing reform. The subject was introduced into health institutes, and I was asked to speak at a number throughout the state. Dr. Hurty also asked me to address the health officers of the state, in convention, and they passed a resolution asking the Legislature to enact a tenement law. After speaking to the state Association of Trained Nurses, who prepared a similar resolution, I felt that every power for health was aligned with us. Finally, at a full session of the State Board of Health I was given a most cordial hearing, and they offered to help in every way possible. The most valuable result was a bulletin showing the relation of tuberculosis to housing, which they had printed, and laid on the desk of every member of the Legislature.

One strong and decisive move, that enlisted the churches of the state, was the plan for a Housing Sunday all over Indiana. We arranged the details through the charities organizations, sending through them letters to every minister in their towns, asking that one service of a certain Sunday be given to the consideration of conditions of the poor in their city. Each minister received a brief statement of our housing problem, also a sermonette to use if desired.

I saw newspaper reports of some of the sermons, and they were the sort that should stir men's souls. It was surprising what texts were found, ranging from the question of Cain, "Am I my brother's keeper?" on through all the books of the Bible. A striking text was taken from Deuteronomy: "When thou buildest a new house, then thou shalt make a battlement for thy roof, that thou bring not blood upon thine house, if any

man fall from thence."

I should like to know what penalties Moses would have prescribed for those who bring "blood upon their house" by omitting fire-escapes.

From time to time a number of pulpits of the state had been opened to me. I had spoken in Jewish temples and churches of every denomination. Most distinctly I remember giving a "sermon" in Indianapolis at the time of the charities conference when, as was customary, the conference speakers filled the pulpits of the city. It was published afterward in *THE SURVEY*. "Follow Me," was the text, and I tried to show how, if we follow Christ all the way, we must go among the homes of the wretched and needy as he did. As simply and plainly as possible I told the story of the poor in Indiana, and made an appeal for help in the name of Christ.

Enlisting a Senator

There were many of my friends in the church that day besides those who belonged to the congregation. Among them was one who sat near enough for me to notice his close interest in the story. Long afterwards he said to me, "I made up my mind, sitting there in church, that I would run for the Legislature for the purpose of carrying on the housing fight."

It was Senator Charles B. Clarke. He was elected to the Legislature of 1913, and made the tenement bill his chief charge, working for it with untiring energy.

He was one of the strongest Democrats in the Senate, and that party had an overwhelming majority. His political strength was a most valuable asset, but it was the spirit with which he went into the fight that made his leadership invincible. Senator Clarke is a man of splendid physique and indomitable courage. My last fear of the "big dog" vanished when I looked at his broad shoulders and towering height. The test of his efficiency, however, was in the finer matters of difficult diplomacy, and the use of a keen wit. The latter was ready for all occasions, as we found at our social gatherings in his home. I remember one dinner party there, at which we were comparing our Irish ancestry—he was from the Clarigs of County Kerry. One of the guests of different blood listened with passive interest. "Well, I always defend the Irish," she said. "They don't need it," flashed Senator Clarke.

Making Sacrifices

It was later in the session that I found how much of a sacrifice he had made in entering the Legislature. It was not only that a heavy and exacting law practice had to be laid aside, but certain interests were entirely forfeited.

In the same spirit the Coxes had kept

'See *THE SURVEY*, Oct. 3, 1912.

from me the fact that the tenement law of 1909 directly affected some of their property. I mention these instances to show what pure and exalted motives actuate some men in our assemblies, despite the sneers that are often flung at legislatures.

The autumn passed and the winter closed about me like an iron tower, bringing the day of doom steadily nearer. Instead of lessening anxiety, my experiences increased it, for I knew so much better with what I had to contend. Moreover, I was growing sensitive about the "spot-light." My first campaign had been, as before said, like going into a burning house to rescue a child. But to go into a second fire to rescue the same child was, I had felt in 1911, more spectacular than was pleasant. And now to go the third time into the flames to save that identical child, seemed just too much like a vaudeville "stunt!"

It was almost more than I could bear. At the thought of that last public ordeal, that horrible night of my defeat, I felt in my heart that I would rather walk over coals, of fire than to go through the experience again—if it would have done the work. But it wouldn't. There was nothing to do but to shut my ears, eyes, and my very soul to all the things that hurt, to set my teeth and go back again.

But before going back I was determined to lay siege to every good power that could be expected to stand for the welfare of the state, in opposition to selfish interest. Beginning with the governor and the lieutenant governor, I went on down the list, sending a personal letter with data of the housing conditions in Indiana. To each member of the Legislature went the same data, with literature showing how health and morals were endangered by bad housing, and a letter that made a direct appeal.

This time we had the help of prominent men all over the state, who were in our housing association. We had men of all parties, and women of all beliefs. It was a kind of sublimated politics, made up of the best elements, all mingled in one. Sometimes I was a bit anxious, as, for instance, when two good friends of different parties tried for the same office. No one could tempt me to partisanship. I had only one answer to those who said:

"Wait until the Progressives are in power and we'll pass a tenement law."

"Wait until the Socialists are in power and we'll pass a tenement law."

"Wait until the suffragists are in power and we'll pass a tenement law."

It was, "I can't wait. We will get our law first."

Interviewing Mr. Taggart

There was only one of the political leaders whom I had never met, and when both Republicans and Democrats asked, "Haven't you seen Mr. Taggart

FROM HOVELS TO PALACES—

yet?" I realized how important a man he was.

"You'd better drop everything and see him," said my husband. And he arranged a brief interview for me.

It was brief, indeed, lasting only ten minutes, and they were interrupted by many people on many errands. But I found that Mr. Taggart didn't need any arguments or any explanations, for he knew the whole history of the tenement law, the law itself, section by section, the reasons for each, the conditions of the poor, and everything that I was prepared to tell him.

I think I must have sat with mouth and eyes wide open, as he took up my own story and went on with it. I was dumbfounded, for I had never met anyone before, not an expert, who understood the whole subject, without any explanation. He spoke with definite knowledge and with kindling anger, of some tenement conditions he had seen. I hardly knew where to begin again, when he stopped.

"And so we are asking for this law," I said.

"Who is 'we'?" he demanded, with a searching look.

I was glad to have the names of the officers and committees of the Indiana Housing Association to lay before him.

"And the Federation of Women's Clubs, and the charity organizations"—

"But you are the 'Mother of the Tenement Law,' are you not?" he asked.

"Yes," I admitted, feeling very small and unreasonably shy. Then I plucked up my courage. "I'm not asking you to put this bill through, but only to help us to get a fair fight," I said; "I'm not appealing to you as a politician but as a man, for the sake of your state, and of the poor, and the working people—and the children."

"I can't say what we shall be able to do," he said, very cordially and kindly, "but I will help you all I can,—and that is something I very seldom say," he added.

I went away with a light heart, with absolute confidence in his word, a confidence that he honored under the severest stress of opposition. And I never asked any one else to approach him.

We had taken it for granted, and it

seemed only fair, that we should adhere to the bill of 1911, to which we had agreed after so much discussion, although we should have liked to introduce Mr. Veiller's model law, as it stood.

But one morning I was surprised to receive a letter from one whom we counted a supporter of the cause, in which he stated some views of his own and of one of the architects about the bill that fairly took me off my feet. The letter urged objections to the bill, and suggested vital changes that, if made, would have left a bill not worth fighting for.

There was no reason for me to be alarmed, but fear outruns reason. Just as an apparition will make one's hair rise who does not believe in ghosts, even the shadow of a danger that I should have known was imaginary, gave me an actual chill and a veritable fever, with a feeling about the limbs as of having run a long distance. For half a day I was sick in bed. Then I crept down stairs, and called up Mr. Cox by long distance, and told him all about it.

"Don't be alarmed," he said. "There's no danger."

And such was my faith in his judgment, as well as in his ability, that I ceased to fear. Then the reaction set in, and the ebbing tide of strength and courage swept back in a flood that left me at the fighting point. It is a good thing for timid people to get a scare once in a while. It always leaves me stimulated and more determined than ever. In this case we found that there was only some misunderstanding, and we reached a friendly agreement without trouble.

Back to the Senate

Days passed, and the day came when I had to go once more to the Legislature.

"Mother hates to leave you again, but you understand how it is," I said to the children.

"Yes, we understand, and we want you to get that bill through," they replied.

"You get it passed, and when I grow up I'll see that it's enforced," said my little son.

"Yes, and so will I," echoed his sister, valiantly.

Now, once again the surging crowds,

the thronged corridors of the State House! Once more, "Pibroch of Dhonil Dhu, Knell for the onset!" Mr. Cox advised that we begin in the Senate this time, so there we had our bill introduced, and, to our great relief, it sped smoothly and merrily on its course. No one could have been more courteous than our Lieutenant-Governor O'Neill. No one could have made things pleasanter than did Senator Curtis, the majority leader. Hitherto we had had to use our entire forces to drum, drum, and poll, poll; but now, thanks to Senator Clarke's thorough work, that was not necessary.

On "ringing grooves" the bill went spinning along, and all the jangling of opposing forces only lent excitement and zest. Not only were old friends back in the Senate, but a number of them who had strongly opposed us before, now seemed to realize that the time was ripe for housing reform. Many elements conspired to aid us, and many voices mingled in the harmonious chorus of friendly interest.

Another chorus, like an angelus echo, a far-off chorus of women's voices sounded through the pauses of our battle hymn.

It was the State Federation of Women's Clubs!

One of the members of the Legislature said, that session: "The men elected us, and as soon as we get here, the women tell us how to vote."

It has been called "a women's session," as it really was, in a way. There were more bills for women than had ever been known, bills for a teachers' pension, a mothers' pension, for suffrage, for shorter hours for women workers, and numberless others. Women were there lobbying, too, by the dozen.

"Some of the men don't seem to want to be bothered," a lady lobbyist told me. I did notice that some of them had an unusually hunted look, which was quite different from "that absent, far away look" I have heard spoken of as customarily on the faces of legislators. I felt that with so many women wanting so many things I must be very, very circumspect, and took orders from Senator Clarke before speaking to the men. Besides, if they had expressed an intention of voting for the tenement bill,

— IN THE HOMES OF INDIANA

that was enough. I was surprised afterwards to find that several of the men were rather hurt because we had not asked them to do something for us.

"I spoke for your bill, even though none of you asked me to," one said. And then I had to explain that as he had stood for housing reform in 1909 and 1911 we didn't want to seem to doubt his loyalty.

Side Lights

It must not be imagined that all the slum landlords had experienced a change of heart, and were willing with one accord to take their teeth out of the poor. Until the millennium comes, we need not expect selfishness and greed to disappear; and until they do, the weak will have to be protected by law against the strong. There will be need for housing laws until the Holy City, pure and clean, descends to earth, and one cannot imagine that there will be any landlords in it—in that capacity, let me hasten to add.

True it was that we saw familiar cloven hoof prints, all about the legislative halls, and I was sure a few times that I had come face to face with the Evil One in person.

One morning, on reaching the Senate early, I found that some hand had laid on every desk a typewritten sheet in regard to our bill. It announced that the "So-called Mrs. Bacon's housing bill" was in reality a bill of the building and plumbers' trusts, and that they paid me \$5 a day for my services as lobbyist! Certain sections of the bill were held up to ridicule, one especially being designated as "the plumbers' delight."

We couldn't but laugh over the absurd statements, but Mrs. Foor and I quickly gathered them all up, before the senators came in. This was the last I ever heard of being called a paid lobbyist, until a few months ago, when one of the opposition made such a statement in the presence of one of our friends.

"But who on earth would pay Mrs. Bacon's expenses?" the friend objected.

The answer was that some Indianapolis company that I never heard of, had paid them!

There was really a fight at the last

reading of our bill in the Senate, enough to rally all our friends to the defence, and to call out all our artillery of oratory. After Senator Clarke spoke, champions arose all over the room, and at the last Senator Woods finished with a brilliant climax.

Then, in a few minutes, we were all congratulating ourselves over a rousing victory—there, on that same old ghost-haunted battle-ground of other days!

And now, avoiding as best we could the trail of the hoof prints, we took hold of the red-tape clue and began to thread the mazes that led to the other house.

New Faces in the House

With a change in the scene of this drama, new characters are introduced. The Senate had been full of familiar faces, but how many strange ones I saw in the House! My heart sank as I wondered how many personal interviews I ought to give. By what algebraic formula, I thought, could we ever determine the "unknown quantities" among those hundred men. A Democratic land-slide had given that party an overwhelming plurality, and swept into the Legislature a certain number of new men whose course would be difficult to predict. Knowing who were dominant in certain districts, we could make a strong guess at the affiliations of many, and we knew from experience which would be helpful and which hurtful.

Studying the legislative directory, I was always glad to see the word "farmer" after some of the names. "Editor" was also encouraging, and so was anything that promised connection with the labor unions, for these men realized, by this time, that our work was for their homes, and they stood by us manfully.

Removing the party balance so far from the center of gravity, made a very unwieldy body, and the heavy responsibilities thus put upon the party in power made their task doubly hard. It was made more difficult by the fact that the House was gathered into factions in such a way as to require the utmost diplomacy in getting the ordinary business of the session done and also to give great uncertainty as to results.

To my great relief, Mr. Cravens and

Mr. Eschbach were still there, and ready to rally our old adherents. But Mr. McGinnis was absent, and Dr. Foor, and though both lent their aid, we missed them on the floor. As before, the first district (ours) was "solid," and our men from home stood by most gallantly. One of these, "Jim" Ensle, was a commanding figure in debate, and one of the most popular leaders.

We were most lucky in having our bill in charge of Robert Hughes, from Indianapolis. Although one of the younger members, his career in the House added luster to the line of statesmen from whom he comes. Through some of the most trying legislative ordeals that I have ever known, Mr. Hughes never lost his poise, his serenity or his courtly manner, and the thought of them will always shine through my recollection of those clouded times.

It was when our bill stuck in the house committee that we began to scent danger ahead. Now, as before, news poured in from every side, of the doings of the opposition. As one instance, an hour after a prominent citizen shook hands with me, and wished me success, we were reliably informed that he went to his representative and told him not to vote for the tenement law, that it was "no good."

Antidotes

Wherever we turned, we saw these constituents "from home." As we passed by their members' desk, we saw their heads bent together over the tenement bill, with glowering faces, and heard the words "my house," "my lots." But we never heard these land-owners mention public welfare, health or safety. There was nothing to do but to wait until the constituents left, and then to find the man whose word was the antidote to this poison of personal interest. I remember bringing half the prominent men in the State House to steady one wavering member, who was distracted between duty and friendship. It is only fair to add that duty prevailed.

One fine old fellow, who had stood by us from 1909, came to me one day, in distress over a wealthy friend who owned "valuable flats," and who was in high displeasure over his adherence to

our cause.

"Are those flats as valuable as a child?" I asked him. But he was too worried to take in my meaning.

"Won't you talk to him?" he pleaded. I complied most heartily, and when the flat-owner, who was really a young man of fine possibilities, was convinced that he was already well within the law, I was nearly as glad as my kind old friend.

No matter if enemies with bayonets had covered all the grounds about the State House, I was determined not to show any fear.

"There's a great big bunch of real estate men here, all up in the air over this bill," excitedly announced a big representative, whose allegiance we held by a thread.

"Oh, they won't do any damage," I answered, airily.

"But they're all just as mad as can be! They're going to make trouble for you," he insisted.

"Now you just wait and see," I answered. "They won't give us a bit of trouble. It will all blow over."

But at our last committee hearing there they were, with grave and darkling looks. They were a good, substantial type of men, too, well known and respected business men. And we saw that they had three typewritten pages of objections to our bill, and they had come for the purpose of seeing the bill changed to meet these objections.

The committee sat in silence, with a grave judicial air, waiting for every one to assemble for the hearing. At one side, Mr. Cox was introducing me to some of the real estate men.

"I wish we might have had an opportunity to talk over these objections with you, before this hearing," I could not refrain from saying to one of them. "Very likely there are points that we could agree upon, and it would save so much time and trouble."

Meeting Objections

I was much distressed, knowing the fatal possibilities of the occasion. But to my great relief, the men agreed to give us a hearing, in the office of Mr. Winterrowd, the building inspector, at the City Hall. Mr. Cox could not go, but Mr. Winterrowd was a host in himself. When I reached the office, I found the men sitting or standing about the long table—twelve to twenty or more, if I did not see double. But so many arms were waving, and so many voices were raised in excited discussion, that it was hard to tell at first how many there were.

The noise sank to a buzz as I slipped into the chair reserved for me, beside Mr. Winterrowd. Something more than rapid walking made my heart beat fast and my breath short, but I glanced up with a smile, and was surprised to see that all the scowls had vanished and the smile had spread around the entire table.

"Now, let's see what's the trouble," I began, and Mr. Winterrowd and I went through the entire list of objections with them, explaining the causes and reasons and wherefores to the end. Of course, these restrictions were all new, and it was only natural that they should be concerned about their effect. Once again, my study of the history of housing laws in other states came to my aid.

"I guess she knows about as much about these things as we do," said one of the elder men, and I felt much flattered.

We found that most of the objections were the result of misunderstanding of the effect of certain provisions, or of misinterpretation. I must say that I have never met a more reasonable set of men. All they asked was to be convinced that the provisions were fair, and they were as quick to see what was unfair to the tenant, or detrimental to the community, as we could wish. At the last there were only three points upon which they insisted, and these we yielded cheerfully. Then we all shook hands, and parted in the best of humor, and they never came near the State House again. The House committee accepted our agreement, and the three points were changed, as the men wished.

The Bill in Committee

And so the cloud vanished. But landlords kept boiling up, all about us, and I couldn't shake off the feeling that every hard-faced man who stood by the doors of the House was a slum-owner.

There were thirteen men in the committee that had our bill. It was hard for them all to get together to sit on all their bills, of which they had an enormous number to consider. And until they all sat on our bill, and went over every word of it (it had 99 sections) they wouldn't report it out, they declared.

"Of course not," we answered, shocked at the very idea. But they continued in not all getting together on it, and a few of them began to be touchy when asked about it, and the situation would have been very funny, after awhile, if it hadn't been so serious, and the danger of offending any of them so appalling. An X-ray picture of our situation would have disclosed some obstructions that never showed in our faces or our speech, for our diplomatic relations became almost Oriental in their formality.

Finally, the committee announced that they were ready to take the bill in hand and go over every word, for they had decided that certain changes must be made in it. I think I must have given a little groan, and murmured something about the technical parts of the bill having been carefully prepared by experts.

"We aren't going to hurt your bill, we are just going to make it better and stronger," one of the committee re-

assured me in the kindest manner.

"Did you ever sit by during an operation on one of your own children?" I asked. And there was always a little bit of that in my thought of the bill. After having nursed and doctored and lived with and sat up at night with a creature like that for so long, I had begun to feel as if, in a way, it were really human.

The operation was long this time, for our bill stuck for seventeen days, and we had to sit by and wait for it to come out of the committee's hands.

"There's plenty of time," they would say, but I knew the danger of delay. And, of course, I couldn't say that I wanted to go home and see the children, because the committee were not asking me to stay.

And so we waited, all those seventeen days, hoping that each day would end our anxiety. If we women could have had some knitting to do, we might have made mittens for the blue fingers of many of the poor while we waited. Mr. Hughes was doing all he could. Mr. Cox came and went, directing, working, reassuring, giving much time from his many cares. Senator Clarke was at hand. We never left the field. Many times I was tempted to go out and get a moving-van full of the miserable looking tenants of the worst slums of the city, and bring them down to sit in the front seats, on the principle of jury trials. I could have found plenty of consumptives, and if they had coughed, it would have been very impressive. But that was too deadly to risk.

It would make a thrilling tale if I could tell all we saw and heard as we sat there, with so many coming and going. It is really too bad not to give more of the "atmosphere" of the story, but if I gave any of the real atmosphere my readers would get up and go out for a gasp of air.

The House was called "the smoke house," because of the blue tobacco clouds that never lifted. Our clothing, even our hair, reeked of it, as if we had all been smoking. But that wasn't as bad as the reek of the slums.

Friends in Deed

While we are waiting, let me go back and tell who "we" were, and how I was situated.

This session, my friends would not hear of my going to a hotel. So many beautiful homes were opened to me that I went in an orbit from one to another, and never finished the round. Beginning with T. C. Day's, I came next to William L. Taylor's, Senator Clarke's, V. H. Lockwood's, and the Cox's, and then I went no farther. Each and all were "islands of providence," with good cheer, loving care, and strong counsel that gave

"Strength for the daily task.
Courage to face the road."

Looking back over the lonely heart-sick days of my first two sessions, I realized how much it meant to be in these homes.

The last of my orbit brought me to the Lockwoods', where was gathered a little house-party, whose interest centered in the Legislature.

Mrs. Lockwood herself had been one of the generals in the child labor fight of the previous session, and was still watching over the law they had won. She is now one of the state commission appointed to investigate the conditions of working women.

Mrs. W. E. Miller, of South Bend, now on the same commission, was there, working for a bill for shorter hours for women.

Mrs. S. C. Stimson, of Terre Haute, attended the session in the capacity of a member of the school board, interested in the vocational education bill. In the capacity of a Florence Crittenden board member, she was watching several other bills of interest to girls. In the capacity of chairman of the legislative committee of our federation, she was helping with the tenement bill. If she had had as many bills as she had "capacities," she would have needed to be much larger and stronger, and would have been a "subject for incorporation," as some one says. But her greatest capacity was for friendship, and she stood by me, through all our trying vigils, with a brain like a man's and the devotion and patience of a St. Griselda.

Sometimes Mrs. Foor was there. She was looking after a number of health measures from her own and her husband's natural interest in such matters, but was doing most for the tenement bill.

We all sat together, sometimes with local members of our federation housing committee, in one corner of the House, every day. That is, we sat, when we were not reconnoitering or doing active work. We lunched together, downtown, and, at the close of the winter days, straggled into the cheery Lockwood home, weary, draggled, and often homesick. There Mrs. Lockwood mothered us—she has a genius for being a mother—and around the dinner table we discussed our day, while Mr. Lockwood, a lawyer and civic worker, advised, consoled, applauded, or laughed us out of our discouragement.

Then together we planned what moves to make the next day. And the next day we went back with hope renewed—and waited. In whatever way we could, we strengthened our position, but all we could do was much like the efforts of the Blind Men who went Bat Fowling.

It was about this time that I called my faithful housing committee together, with Mrs. McWhirter, Mrs. Clarke, and other federation leaders, and we arranged to send word to every corner of

How the Bell System Spends its Money

Every subscriber's telephone represents an actual investment averaging \$153, and the gross average revenue is \$41.75. The total revenue is distributed as follows:

Employees—\$100,000,000

Nearly half the total—\$100,000,000—paid in wages to more than one hundred thousand employees engaged in giving to the public the best and the cheapest telephone service in the world.

For Supplies—\$45,000,000

Paid to merchants, supply dealers and others for materials and apparatus, and for rent, light, heat, traveling, etc.

Tax Collector—\$11,000,000

Taxes of more than \$11,000,000 are paid to the Federal, state and local authorities. The people derive the benefit in better highways, schools and the like.

Bondholders—\$17,000,000

Paid in interest to thousands of men and women, savings banks, insurance companies and other institutions owning bonds and notes.

Stockholders—\$30,000,000

70,000 stockholders, about half of whom are women, receive \$30,000,000.

(These payments to stockholders and bondholders who have put their savings into the telephone business represent 6.05% on the investment.)

Surplus—\$12,000,000

This is invested in telephone plant and equipment, to furnish and keep telephone service always up to the Bell standard.

Educate Your Child in Your Own Home

The mother is the natural teacher of her children. She knows their peculiarities, their temperaments, their weaknesses—and how best to deal with each one.

But, untrained as a teacher, the time comes when she feels her inability alone to carry them further. Possibly not within reach of really an efficient school, she reluctantly gives them up to be taught with other children.

There has grown up in the City of Baltimore, as a department of a great private day school, an institution the high object and purpose of which is to educate children in their own home no matter where located.

Its course covers the years from kindergarten to the twelfth year. Its work is the same as followed in the Calvert School classes, directed by regular Calvert School teachers, each a specialist in child education.

Under the Calvert system the precocious child is not restrained, the backward child is not hurried.

This system is not an experiment; it has been used many years with remarkable success. One mother writes: "The system seems to me almost magical in its

results." Another, previously perplexed by the educational problem, voices her relief in these words: "A regular Godsend."

If interested, write, stating age of child, for a booklet outlining the plan and courses of instruction, which will be mailed free. Address

the state that the time had come for help. How the letters and telegrams came pouring back in response, to the members of the Legislature, not only from club women, but from prominent men whom they had seen, in different communities!

It happened that when our committee meeting was called Miss Hatfield, probation officer of Lake county, was in the city, and I brought her—a pretty, slender girl, with great dark eyes—to tell our ladies the story she had related to me of the miserable unsanitary homes of the immigrants in Gary, East Chicago, Indiana Harbor, and the other industrial towns on the lake.

Her story made our women gasp, as it had me. "Will you go with us, and tell that story to Governor Ralston?" I asked her. She consented and we telephoned at once to make the appointment, and, going over to the State House, were given instant audience.

We had met Mrs. Ralston socially in her own home, and at clubs and dinners, and knew what emphasis she put upon the home life of the people. We had been received before by the governor, as I think every one engaged in welfare work had been that winter. There was that in his manner that inspired confidence, and gave an assurance of strength that one felt even more than his unusual dignity.

The governor listened with close attention to Miss Hatfield's story, and I saw him start as she related some of the shocking incidents of the wretchedness, the overcrowding and promiscuity of immigrant homes.

He had a few searching questions to ask us in regard to the application of the tenement bill to the housing conditions she had described, and then after a few pleasant words, we withdrew. That night, at a banquet given by Hon. Charles P. Fairbanks, Governor Ralston spoke of our visit, and expressed his deep desire for a better safeguarding of the boys and girls in the homes of Indiana. The effect of his speech, which was in all of the papers, was all we could have desired.

We were counting now our men, our arms and our ammunition, as in a state of siege. How we rejoiced when Spencer Ball, president of the Terre Haute Commercial Club, came over, day after day, to fight with us. He was worth a whole army of privates, and could counteract carloads of paid lobbyists of the type we had to fight.

At this time the help of the Indianapolis press was of more vital importance than ever before, as every issue contained legislative news. I realized how many friends I had in various newspaper offices, as members of the staff, or reporters of the *News*, the *Star*, the *Sentinel* and the *Sun*—representing all politics—met me in the State House.

Strong editorials came out at critical moments. The *News* gave me a chair in their State House office, and a hook on which to hang my wraps.

More than this, a charming, golden-haired feature-writer, with a pen of true steel, often sat or strolled with me on my rounds. The only thing that was not quite so pleasant was the snap shots by various press artists. My husband sent me one that he had clipped from a paper and wrote, "You didn't look like this when you left home. If you look like it now, for goodness' sake come back at once!"

It must not be supposed that any bright little social bubbles on the surface of that deep sea made us forget the great-jawed monsters beneath, or the bones of shipwrecked mariners that lay bleaching on legislative reefs. We were out on rafts, done up in life preservers, and we knew it. But we had to look up because we didn't dare look down.

It was well that I didn't know just how much danger we really were in, till afterward. Several times Mr. Taggart had sent word, "Tell Mrs. Bacon not to worry," but I didn't know until the worst was over, how anxious our men had been over some unexpected developments that had given the opposition a fresh hold, how hard Mr. Taggart had worked for our bill, and how much personal attention he had given it.

At last the committee finished its work upon our bill, and it was reported out, passed its second reading smoothly, and went on to the last.

There is probably nothing else in life like the sensation of having a bill that one has worked for come up in a legislative body for a decisive vote. When one has cared enough to stick to it, night and day, for five years, one cares too much to await its fate with calmness. There ought to be a little curtained booth, or a conning tower, where the sponsor could watch the contest unobserved, for this long, slow, public execution, with every one watching one's face and feeling one's pulse, is awful.

There was a crowd in the House when the calendar showed that our bill was to have its last reading. There was a goodly showing of club women, and a little knot of reporters gathered about me as the debate began. I had to move, though, for in the very last agonies a lady came and wanted me to listen to something about her house being ruined if the bill went through. Her description showed me at once that she was mistaken, but I couldn't convince her.

"Oh, no, no! It won't be! It can't be! You don't understand! Go ask your architect. I can't talk now! Look, they are going to vote," I begged of her, and finally fled.

I found Mr. Cox on the other side of the room, and presently Senator Clarke and Mr. Hughes joined us, and there our

friends hunted me out. And it was not a public execution after all. A splendid avalanche of "ayes" snowed under the single "no" deeper than an Alpine gorge. And oh, then, we wished we could have piled honors upon our staunch lieutenants, as high as a corresponding Alpine peak. No wonder the women applauded, as some of the men who gave their reasons for voting, added, "and because the women wanted it."

The women, the homes of Indiana, were honored that day by the men of our Legislature. And we had won a law for the one hundred cities of our state. It is a foundation broad enough for the tallest structure of housing reform that, in years to come, public sentiment is sure to build upon it.

Suddenly, in the midst of our rejoicing, I realized that the nerve tension of the last few hours had relaxed, leaving every muscle aching and a deadly weakness. Laughingly, our quartet of women took me upstairs into a darkened empty office room, and laid me to rest on some soft wraps piled on a long polished table in lieu of a couch. Afterward, we went to the Lockwoods', and had a lovely jubilee dinner that was planned and ordered, flowers and all, by the eleven-year-old daughter of the house.

The last scene of this act was the Denison hotel; the time, the night after our victory, when a party of my friends assembled for congratulations and good-byes, among them a number of the state officials and their wives.

The thing that gave me the most pleasure that night was to bring together so many strong men, of all politics and all factions, and to see them cordially jubilating together over a victory that they had all worked in harmony to win.

As I looked about me, in the warmth and glow, I recalled how the last time I had slipped away, early and in the rain. How many friends I had now, to bid me good-bye! How many more than at the close of those other two sessions. How many friends—and I loved them all, and loved the beautiful city, with its stately homes, and its great monument, from which the broad avenues radiate, star-like. Part of me lives there still, and draws me back, claiming citizenship in our state's capital.

There were flowers and felicitations, pleasant words and some sad ones, and then the curtain fell.

The epilogue comes in the next chapter, in front of the curtain, which, I hope, has been rung down to rise no more.

CONCLUSION.

The final chapter of "Beauty for Ashes" will be published in THE SURVEY for September 5.

CHICAGO is tackling its pressing municipal problems through commissions on railway terminals, markets, unemployment and waste. Page 489.

THE high note of two recent social center conferences in Wisconsin was the need for paid secretaries. Page 490.

THE SURVEY

COMMON WELFARE

GROUP DISABILITY INSURANCE BY METROPOLITAN

THE METROPOLITAN Life Insurance Company has announced that it will extend its operations to writing insurance against disability due to sickness and against accidental injuries not arising out of and in the course of employment, the latter being covered in many states by workmen's compensation laws.

For the present only group insurance will be written. That is, contracts will be made with employers for the insurance of their employees, the premiums to be paid by the employer, the employer and employee jointly, or by the employee alone; or with lodges, labor unions or other groups. Both men and women are included. The first group to be insured was the entire office staff of the Metropolitan.

Under the policy to be issued benefits are divided into three periods. During the first period of 26 weeks, full benefits will be paid. During the second period of four years and six months one-half benefit will be paid. During the third period, running to age 65, one-quarter benefit will be paid. No benefits are paid for the first seven days of incapacity nor for the first thirteen weeks of insurance. The benefit running to age 65 is unusual—as in fact is the second period payment—for most health policies as now issued to individuals by accident companies, run for 13, 26 or 52 weeks.

The company's announcement states that it has no intention of making a profit on this disability insurance, but wishes to give it "to the working classes of the United States approximately at cost." Payment of the total premiums in a lump sum by the employer substantially reduces the cost. The tables of rates had to be based on foreign statistics, as no accurate American experience is available. The rates fixed upon, therefore, may be raised or lowered after the company has established its own experience.

Lee K. Frankel, sixth vice-president of the company, will be in charge of the newly created disability insurance department.

Advocates of social insurance have hailed the Metropolitan's new work as an important step forward for America. They believe that the company's two chief competitors in the field of industrial insurance will have to follow its lead and that workmen will thus be offered sickness and accident insurance long before their plans for state insurance can become operative.

AMERICAN NURSE TO TRAIN THE GIRLS OF BULGARIA

AT LEAST one effect of the present war between Austria-Hungary and Serbia will be to delay the starting of the training school for native Bulgarian nurses at Sofia, in the plans for which the American Red Cross has come to the aid of Queen Eleanora.

Helen Scott Hay, formerly superintendent of the West Suburban Hospital, Oak Park, Ill., whose salary as head of the new school the Red Cross will pay, had engaged passage for early August, but a telegram from Bulgaria announced that access to that country was blocked and urged her to wait until military operations could be forecasted.

Not only the training of native women as nurses, but a general improvement in the whole public health policy of Bulgaria, if not an entering wedge in raising the health level of the Balkans, is foreseen by Miss Hay in the modest experiment which she is going to superintend. The training school will be established in one department of the government-controlled Alexander Hospital in Sofia. Young women without a day of training will be entered and it is reported that many applications have been received.

Nursing in Bulgaria and most parts of Europe, says Miss Hay, is not accorded the same respect that it receives here. It has not the status of a profession. Even physicians are accustomed to think of nurses as little better than servants and to expect them to show small initiative. This is partly due to the kind of women who become nurses and to their lack of training. They are apt to be of the grade of our orderlies and attendants, says Miss Hay.

Graduates of the new training school will, it is expected, be able to take the lead in teaching mothers better care of babies, better home hygiene and, by acting somewhat as visiting nurses in this country, raise the standard of domestic living. Taught American ideas of public health, they will also constitute an influence, it is hoped, in favor of improved sanitation and governmental re-

sponsibility for healthful conditions in general.

Bulgarian physicians, as a class, says Miss Hay, are progressive in their profession and may be expected to welcome a higher type of nursing service.

STRIKE AMONG SOUTHERN TEXTILE WORKERS

MAKING CHILD LABOR one of their four complaints against their employers, from 800 to 900 operatives of the Fulton Bag & Cotton Mills, of Atlanta, Ga., are on strike and a bitter industrial conflict is in progress. Local newspapers have kept publicity to a minimum, in spite of the fact that the situation is significant as presenting the first effective organization of labor among southern textile workers. This is also the first time that an organized body of southern cotton mill employes have declared emphatically against child labor.

Mediators from the Federal Department of Labor have gone to Atlanta to look into the situation.

The present strike was preceded by a strike in the same mills several months ago, when the workers protested against the docking system of the company and the rules imposed upon them. The management agreed to certain changes and the employes returned to work. But nearly every man who had been active in forming the union was discharged, and as rapidly as the company could find them out all who joined were discharged with the explanation that "We haven't any more use for you."

Almost as fast as they were discharged they were evicted from their homes. The marshal, directing the piling of meager bits of furniture and household goods in the street, became almost a daily scene for weeks.

One young girl of eighteen, who was in confinement, was taken bodily, in spite of the doctor's orders that she be not moved, to a neighboring house, and a few days later gave birth prematurely to a child that did not live. Another woman, moved without regard to the physician's orders, died in convulsions, leaving a tiny child.

The second strike has reduced many of the strikers' families to the verge of starvation. The men are holding out, however, in the belief that this struggle will mean much to the welfare of thousands of mill workers of the South—men, women and children—who have never before dared speak out.

The operatives have laid down these four demands as the basis of their return to work:

Reinstatement of the men and women discharged for joining the union.

Elimination from the mill of all children under fourteen.

Fifty-four hours work per week for women and minors.

Fifteen per cent increase in wages.

From the first, company officials have

minimized the effect of the strike upon their operations. Children and Negroes have been substituted. "We can use whole families" appeared in big type over the company's name in the papers for days. The Cotton Manufacturers' Association, organized originally to fight child labor legislation, has loaned such of their skilled workers as would consent to go for the special compensation of two and a half dollars a day. The mill officials have asserted in public statements that fewer than one hundred of their employes had left, this be-

Thomas Evans is city warden of Atlanta, Ga. He says he is not an agitator. A bitter strike of the operatives of the Fulton Bag & Cotton Mills is going on there. In its efforts to give publicity to the cause of the strikers, denied in the news columns of the papers, the executive committee of the Men and Religion Forward Movement recently quoted Mr. Thomas as follows in a paid advertisement:

"Many mill owners help a great deal. But there is hardly a factory in the city employing this class of labor that pays the employes enough for their self-sustenance. Society through the City Government and private charities has to make up the deficit; that is, the immediate deficit. I don't know who pays the deficit in the lives of the little children who work in the mills.

"The profits go into the pockets of the mill-owners. I often wonder if the profits are equal to the value of the lives.

"I am not an agitator, understand. I am merely telling what I think of the causes of the City's poverty.

"THE TROUBLE IS THAT THERE ARE TOO MANY PEOPLE ON THE RAGGED EDGE OF POVERTY AND SUFFERING. With it all, there is work for every charitable organization and more. And there always will be, I suppose, as long as our system of woman and child labor with poor pay is maintained."

ing the number that walked out at one time in protest against the discharge of others.

On the failure of the newspapers to give publicity to the strike, and the consequent lack of public support for the strikers, the executive committee of the Men and Religion Forward Movement published display advertisements in the papers calling upon the workers to follow the example of their employers by uniting firmly, and insisting that the differences be arbitrated "by men whose sole object is to learn the truth and see that impartial justice be done." The committee denounced mill conditions and the refusal of the owners to treat with their employes collectively.

The guiding hand throughout the fight has been the United Textile Workers of America. It has been due largely to the influence of these organizers that the workers have been led to commit themselves decidedly against child labor.

"To put our little children in the mills before they are much beyond the cradle," said C. A. Miles, organizer of the United Textile Workers of America, in addressing a meeting of the strikers, "is only to keep them and the generation that follows poor and ignorant. The low wages and feudalistic system has fastened child labor upon us in spite of ourselves. What we want is decent living wages so that our children can be kept in school and have some chance to grow up healthy and strong."

MURDER, POLITICS AND VICE IN CHICAGO

THE TIDE seems at last to have turned against political protection of segregated, commercialized vice in Chicago. It required a grim police tragedy to turn it.

The reorganization of the police department, under the ordinance passed by the City Council two years ago, has been proceeding slowly and tortuously. The second deputy superintendent of police was required by the ordinance to be a civilian. On this account the capable civil service appointee to that office, Major Funkhauser, was deprived from the start of co-operation by the regular force. The effective supervision which he and his inspector of morals have increasingly exercised over the vice resorts which survived the breaking-up of the segregated districts seems to have been another grievance against him and his "morals squad."

A series of raids in the precinct including the old red light district, after the captain in charge declared it had been cleaned up, resulted not only in the disclosure of many open violations of the law and police regulations, but aroused the open enmity of the protected resort keepers and the silent opposition of the precinct officials.

After the prisoners captured in open violation of law had been sent in the patrol wagon to the station, the two officers of the morals squad left in charge of them, while their fellow officers hastened to make another raid, were viciously attacked by a mob of men, suspiciously followed by automobiles. Backing away under an elevated railway, where their assailants evidently planned to finish them, they were suddenly confronted by two new accessions to the crowd, who advanced upon them with drawn revolvers. The two officers then fired, and one of the other two men fell dead. There was a rain of bullets, from which these two officers strangely escaped the death plotted against them. The dead man was found to be a plain clothes policeman. The

wounded among the mob were spirited away by the automobiles of resort keepers.

One of these wounded men was afterwards discovered at a hospital to be a gunman, formerly identified with a New York gang, some of whose members were executed for the murder of the gambler Rosenthal. This man had been convicted in Montana of a murder. He was sentenced to 50 years imprisonment but was liberated by political influence in time to attend the funerals of his fellow gunmen in New York.

The police situation in this Chicago precinct was thus thrown so suddenly into the limelight that no one could run to cover. Pending the investigation ordered by the chief of police under the civil service trial board, and the grand jury inquiry by the state's attorney, and the "still hunt" by Major Funkhauser and his morals squad, the captain of the precinct has been summarily transferred. In his place one of the best commanding officers in the force, Captain Max Nootbaar, has been installed. He at once declared that with official co-operation he would "clean up the district in thirty days."

Whether he receives the co-operation of the men higher up than the chief depends upon the relative strength with the mayor of two factors of the situation. One is the political influence of the aldermen of the first ward, "Dinky Dink" and "Bath House John", who have

long disgraced the City Council and the city. The other combines the indomitable second deputy; the Committee of Fifteen's published lists of owners of record whose property is illicitly used; the vigilant press; Alderman Merriam's council committee inquiring into the causes of crime; the votes of 400,000 women, ever hanging on the horizon; and the explicit reminder issued by the chief of police, in the absence of the mayor, that segregated vice is no longer recognized, and that policemen taking orders from politicians would be cited before the trial board. Last week Mayor Harrison announced himself a convert to the forces standing solidly against a segregated vice district.

THE PROPOSED UNION OF CLEVELAND TEACHERS

THE RIGHT of Cleveland public school teachers to form a union affiliated with the American Federation of Labor has been supported by the courts and fought determinedly by the school authorities. As a result of the dispute which now has been running for nearly six months indignant citizens are heading up a movement for the extinction of the school board by state legislation and for the adoption of a new form of school administration. Other results may be a union of the school teachers, despite all obstacles, and a higher scale of salaries.

The present situation in which the

Board of Education is holding up appointments of teachers for next year, while angry citizens threaten state legislation which will allow extinction of the board by popular vote, arose from agitation started last winter by the Grade Teachers' Club. It maintained that the minimum salary of \$500 a year and the maximum of \$1,000, reached after 15 years of service, were altogether inadequate and that school instruction was suffering from over-supervision. The protest was formally presented to the Board of Education. It met with the reply that no funds were available for increased pay, and that the system of supervision had been well worked out and might be considered permanent.

The teachers responded with threats of a union which would force higher wages and other improvements. Leaders in Chicago's successful teachers' union came and gave their advice. At a mass meeting of teachers in mid-spring, under the auspices of the Grade Teachers' Club, a definite vote was taken to unionize.

This vote was followed by charges that less than half of the teachers had assented to unionization and that probably a majority of the teachers—but certainly a majority which had no organized expression—was against such action.

The Board of Education took cognizance of the proposed formation of a union by voting that any teacher who

THE CONSUMERS' LEAGUE LABEL

A temporary injunction has been issued against the Triangle Waist Company in New York for using a label alleged to be an imitation of the label of the National Consumers' League. The Triangle is the company in whose factory 140 girls lost their lives by fire. The figure 34 in the Triangle label is the size mark.

THE ALLEGED IMITATION

joined such a union would not be reappointed in the succeeding year, on the ground that a union would be bad for the spirit of the profession and would have harmful influence on the pupils.

The Cleveland Federation of Labor took up the cause of the teachers, and secured an injunction from Judge Neff in the Court of Common Pleas, with the ruling that the Board of Education could not legally fail to reappoint any teacher because of membership in any union or other organization. Action contrary to this ruling would be punishable as contempt of court.

The situation was further complicated by the vote of the Board of Education to restrict the teaching of German in the schools, which meant that a large number of teachers in any event probably would fail of reappointment. This vote was followed by a threat of court action on the part of German-Americans.

When, in the latter part of June, the board made public what it termed a partial list of appointments, many familiar names were missing. The board announced that further appointments could not be made until the exact status of German instruction was known. Some teachers had been left off "for the good of the service"; some others because they were German teachers, the board said.

But persons of inquisitive mind profess to have found that among those not yet appointed are most of the teachers prominent in the agitation for unionization. The Federation of Labor has promised legal action if final lists of appointments do not contain these names as well. Meantime, the teachers' union is unformed, and the independent school board is threatened with extinction.

THE CONSUMERS' LEAGUE LABEL AND ITS OFFSPRING

THE TRIANGLE WAIST COMPANY, New York, was last week temporarily enjoined from using on its goods a label declared to be imitative of that of the National Consumers' League.

This is the same Triangle Waist Company in whose factory a fire killed 140 girls in 1911—it being afterward proved that doors leading from the factory, which was on the ninth floor of a loft building, had been locked.

It is the same Triangle Waist Company that, two years and six months later, was again convicted of having its doors locked, and whose head, Max Blanck, was given the minimum fine on the ground that he was a first offender.

The National Consumers' League authorizes manufacturers to use its label only after investigation has showed that the goods on which it is to be used are made under "clean and healthful" conditions. The Triangle company has never been authorized to use its label.

The label declared to be an imitation, which is here reproduced, was first discovered by the Consumers' League last spring on some goods in a Boston department store. The buyer of the store told a representative of the league that he was buying waists with the league's label on.

It required several months to trace the label to the Triangle Waist Company. An effort was then made to induce employees of the Triangle company to sign affidavits declaring that the suspicious label was used by that concern. The employees' fear of being blacklisted among manufacturers frustrated this.

A few weeks ago the Consumers'

League served the Triangle Company with a summons and complaint in an action for a permanent injunction and with motion papers for an injunction pending trial, until final decision could be reached, which will not be till next winter. The league's action is based on the common law rules governing unfair trade and unfair competition. The label is not a registered trademark.

The Triangle company, in its answer, admitted the use of the label, but declared that it had not intended to imitate any other label, and denied knowledge of the existence of the National Consumers' League. It also questioned the right of the league to sue, on the ground that the league is not a manufacturer of shirt waists with a financial stake involved in the protection of its label, and therefore cannot invoke the common law rules cited above.

In granting the temporary injunction, Justice Leonard A. Giegerich, of the Supreme Court of New York county, declared that he was satisfied that the Triangle Company's label was an illegal imitation. While it is felt that this decision strongly presages the granting of the permanent injunction, it is pointed out that the question of law involved is a new one.

The nearest parallel case is said to be that of labor unions, which have been granted injunctions in behalf of their labels. These decisions have, however, rested on the ground that the members of the union had a financial stake, i. e., their wages, involved.

The league contends that it is but a logical extension of the "financial stake" theory to protect it in the use of its label. In anticipation of just this point, however, Bertha Rembaugh, attorney for the league, joined both a manufacturer of waists and a retail store in the action against the Triangle Company. These concerns, it is contended, have a financial interest in the protection of the league's label because their own sales would be affected by its fraudulent imitation. Should the case go against the league, it is feared that the opening which this would give to the imitation of the league's label would go far to destroy the effectiveness of the league's label work.

WAR

MARY CAROLYN DAVIES

THE women wait, and strain their eyes ahead,
One hand upon their eager sons, in dread.
Is there no other way that leads to light?
Must blood and darkness be the door to right
Nor nations treat until more lads lie dead?
The women do not speak. In silence still
They bear the constant old yoke of men's will.
They who have given life must watch it tossed
A sop to war; the gift they gave so, lost.
Thus old dark rules these later days fulfill.

The women weep alone. They do not know
The way to give their wishes words. For slow
Are bonds to break. But when, hand clasped in hand
The wakened women sure and strongly stand
In new-found freedom, will these things be so?
Will they who know the cost of life obey
The old tradition? send, for war to slay,
The sons that hold the future in their hands
Of all the races, all the earth's wide lands,
Or War's grim power be broken in that day?

HEALTH

SOME IMPRESSIONS OF A SEEKER AFTER HEALTH— BY ELIZABETH DOBELL

*I wish myself could talk to myself as I left 'im a year ago:
I could tell 'im a lot that would save 'im a lot on the things that 'e ought
to know.*
—Rudyard Kipling.

WHEN WE WENT WEST, we traveled for the last part of our journey through fields of azure, rose and violet pentstemons, enchanting as the magic flowers that bewitched Proserpine. Beyond these fairy meadows were the foothills; on the horizon, the Rockies, blue and snow-crowned, sun-dappled and black-shadowed, against the summer sky.

To the health-seeker, Colorado is in more senses than one a country of lights and shadows, of depths and heights. It is to him a world apart—a place of comedy and tragedy dramatically mingled—of baseness and of beauty. He is in a land of exiles fighting for their lives. If the sight of that contest sears, it still invigorates him with a richer sense of experience, a truer understanding of failure, and a deeper reverence for the unconquerable human soul.

From the very moment of arrival some of the difficulties of the situation become apparent. Outside of sanatoria, which are expensive and have other drawbacks, it is hard to find lodgings. You must hunt for a place to stay, at a time when you are unable to do so, not only because of illness, but because of the effect of the altitude. If your conscience permits you to say that your cough comes from bronchitis, that you took a little cold on the train, or if you will swear that you are not tubercular, some landlady will probably take you in, assuring you that she has no consumptives in her house. For though you lie and she lies, and you each know the other lies, this arrangement leaves her free to pursue the criminally dangerous course of taking no sanitary precautions whatever.

I have known newcomers who arrived filled with hope that the climate would act as an elixir under whose stimulus they would almost instantly regain health, to drag about day after day in a search for boarding places when every door was closed to them because they seemed so far gone.

I know of a boy who in the beginning of his illness, definitely injured his diseased lungs by carrying a heavy suitcase from house to house as he looked for rooms; and of another who applied at our colony having walked all the afternoon with a temperature of 104 degrees. He was given a glass of milk and nearly cried at such kindness. Then he fainted, and I am glad to say that as the head of the house, a former trained nurse, happened to be a humane woman, he stayed with us, and became a regular boarder.

I knew of a father and daughter with ample means who would have been evicted from their rooms because the gentleman's death was imminent if a clergyman had not interfered and told the proprietress that if she should be guilty of this barbarity she could not attend his church.

Similar instances are common. Colorado is overrun with invalids. The few well-managed places where they can stay are crowded and have long waiting lists. It is seldom that the patient is fortunate enough to be in the ideal position of having his family or any member of his family with him to make a home in the climate ordered.

Under these circumstances it is better, unless one has the most definite information in regard to the place where one is going, or has enough means to make one's own conditions, to seek health nearer home (not always at home, especially if that be in a smoky or congested part of a city). Nor need such a course seem a half-way measure, for the feeling was strong among many of the doctors at a recent meeting of the Climatological Society that climate is not as important in the care and cure of tuberculosis as has been supposed.

We were soon settled in an expensive tent colony under the shoulder of the range. Below us lay the plain dotted with scattered ranches, glinting reservoir pools and little mesas. All day blue cloud-shadows flickered across it, and at night the moonshine turned it to a white

ethereal sea. Above us rose the profoundly beautiful mountain, holding wonders of many kinds, from the glad little runs at its base which overflowed in the autumn with a glory of golden-rod and sunflowers, purple asters and red-berried kinnikinnick to the canyon near the summit, dark with that mystery which Doré's paintings so richly convey—a mystery of hanging mosses, twisted trees and lichened rocks, of gnomes and trolls and satyrs.

In that colony whose surroundings were so beautiful, that one felt, above any pain, the ultimate bounty of the earth, we had our first intimation of the cruelty with which sufferers from lung trouble are so often met in the West. We had known illness as something to be tenderly treated; to be if possible, comforted and succored, to be, at least, sympathized with and understood. We were not prepared to hear the amused sneers at a young southern girl who was kept by her mother in ignorance of her condition, and who, though she was crucially ill of consumption, believed that she had a light case of malaria; nor the irritated faultfindings with a woman whose cough annoyed the rest of us at night; nor the freely expressed relief of a fellow boarder when the coughing stopped—a relief which she followed by "ohs" and "ahs" of tongue-clicking surprise, but no real, human interest nor regret when she found that the coughing stopped because the annoying woman had died, alone, in the night.

We were shocked at the hideous jests about hemorrhages and weakness, and every form of tubercular ill; at the constant talk of symptoms, "cases" and horrors that would go far to turn the most healthy-minded person into a hypochondriac; and we shrank from the brutal gossip about a young lady who became a standing joke, because she was, in her weakened condition, piteously unable to conceal her passion for her physician; and from the ignorant harshness of a family who would not let their son come home to them because they were afraid of contracting his disease.

We had to listen to the talk of people who apparently delighted in the obscene jokes which go the round of most places where many sufferers from lung trouble are gathered together; and who, fearing the end, would yet jest about it in the most repulsive way. We learned that these stories were not due to painful and shocking lack of feeling, as we at first supposed, so much as to the uncontrol that is part of weakness and to a panic-stricken depth of fear that sought to hide itself in lightness of manner. We had naively supposed those rear so profound a presence as Death grew dignified, exalted; and we were bewildered and wrung to see in its shadow the bridge-playing young woman, and

**TUBERCULOSIS HOSPITAL
FOR NEGROES**

The main building of the Wilson Tubercular Home and Hospital for Negroes, just completed at Wilson, N. C., is used as a center for training nurses and testing the ailments of patients. In addition to this main building there is a farm of 40 acres, half of it in pine woods, on which it is hoped that buildings may be erected for patients who are able to work while taking the treatment.

the man who with only a short time to live, stole the funds which he was collecting for the owner of the colony and ran away to spend them.

We had also believed the world's maxims that "trouble breaks down barriers" and that "Death is the great leveller." But their truth was not confirmed by the experience of a young Jewish man in the camp, who was left out of any gayeties in which the rest of us took part, and patronized by nearly everyone. He was alone, he was ill, he was dying and I can hear him now, as he sat on the porch of the main building, his shrunken chest and emaciated body huddled into his overcoat greeting with friendly banter the group returning from a picnic party to which every other soul in the house had been asked. *Te morituri salute.*

In pleasant contrast to the snobs whose absurd and, under these circumstances, cruel, social traditions could not be set aside was a cultured and democratic English gentleman who, with a rich young butcher from Buffalo, afforded us most of the amusement we found at that boarding place. The former delighted us with reminiscences of a long and distinguished life; the latter with pleasantly rowdy stories, the favorite being a complicated tale of how he and three friends played poker every night, (through a summer when the police were searching for gamblers), in the ice box of his shop. One of his pastimes was guessing how much his fellow-patients gained or lost each week, an accomplishment in which he had become proficient during the two years he had earned his livelihood estimating weights in the side-show of a circus.

Fortunately we were later joined by a lady who not only keenly felt the slights put upon the less educated or less moneyed among us but was sufficiently well and sufficiently approved by the snobs, to draw all together in any general plans that were made for diversion.

Before her coming these plans had all been most harmful. As we were not in a sanatorium there was no resident physician and no rules save those regarding sanitary measures. Therefore the inmates, free to do as they chose, despairing of their condition and starving for entertainment, would rush periodically into gayeties which were insane for people in their state of health.

It is terrible to see a roomful of haggard, highly-feverish, coughing men and women, banging on the piano, tearing about, dancing, playing charades, and having pillow-fights. Yet similar scenes are common in every boarding house I have known where there were tubercular people. Nor were these invalids of an inferior type. Physically weakened by illness, and spiritually degraded by depression, they were like poor Hamlet, "all un-braced," and ready to commit any folly.

Consumptives are acknowledged by the medical profession to be *leicht-sinnig* and it is not surprising that they find it difficult to strike a happy medium between distracting but harmful pastimes and the weary alternative of endless hours of rest with their accompanying reflections.

Careful thought will reveal many amusements in which the sufferer whose disease is not in an advanced stage may indulge moderately with a clear conscience. Reading, naturally, is the greatest resource. Cards, as well as chess, we played at outdoor tables when the weather was so cold that one lady who was not ill but joined the festivities to be with her sick husband, had icicles in her hair. Word games and guessing games went on constantly, and the well people were pressed into service to read aloud, act charades, or play on the piano. At one time a fury for writing jingles possessed the camp. At another, a prize was given for the best short story. A lonely boy I know derived much satisfaction from a phonograph, and another friend found she could prop one of Belamy's charade-books up in front of her bed, and guess, when it was too cold and she was too weak to do anything else. Even in the graver stages one's physician will seldom forbid knitting for brief intervals (we had a co-educational knitting-school at the colony) or learning poetry by heart. And mental games, finding shapes in the clouds, telling oneself stories, fancying long, luxurious day-dreams and like diversions are not to be scorned if they play any part in keeping the spirit serene.

As nearly everyone who can read now knows, the chief requisites in the care and cure of tuberculosis are "fresh air, good food and rest." Impossible as these often are for people in poor circumstances to obtain, one might imagine the rich could achieve them with little trouble. Yet nearly every invalid finds the procuring of one or more parts of this essential trinity beset with the greatest difficulty.

Many people are unable to take the dozens of eggs, quarts of milk and great bulk of food which is needed to build up the patient's run-down system and furnish surplus power with which to overcome his disease.

Others—but these are few—cannot sleep outdoors in winter because, through poor circulation, weakness, etc., they lose more in resisting the cold than they gain by the fresh outer air. Some, who sleep out, feel they get air enough at night, and remain much indoors during the day whereas the intention should be to spend just as small a fraction of the twenty-four hours as possible in a confined place because in the active stages of tuberculosis every hour in the house is an hour lost.

The patient in prosperous circumstances may usually plan his day so that only time for bathing is spent indoors; and, in the cold weather, time for meals as well. It will not be so difficult to stay out if one takes pains to be comfortable; and this should always be done, for suffering from cold, sitting in a high wind, or sleeping in a thinly covered or damp bed will only hinder instead of aiding recuperation of wasted forces.

Keeping comfortable outdoors in the most inclement weather, by means of shelter, warm clothing and hot bottles, becomes a fine art, but it is one which can be practiced by anyone with means, in any climate, as is witnessed by the

fact that we slept outdoors and sat outdoors all day happily and successfully in the East, when it was ten degrees below zero and in Denver when it was twenty below.

Still other invalids—and these are by far the largest class—either do not, will not or cannot rest. One would suppose the invalid who lies awake in a torment of anxiety, wondering where the money to pay the bills is coming from, would be the one who could not relax. But a doctor tells me that the person who knows his stay at a sanatorium or a boarding place is limited, who *must* get well in a certain time or not at all, is the one who puts every atom of his will power into recovery. He is much more likely to succeed than the prosperous man who is apt to take his job more lightly and who, even if he intends to be conscientious, feels that when he takes a chance and slips a cog or two, he has plenty of time later to make up what he has lost.

We were familiar with many well-to-do invalids who said that they were "too nervous" or "too spirited" or "too energetic" to lie still, who "just couldn't do it" or who sincerely believed mild exertion as curative as complete quiescence. They saw no difference hygienically between a day of lying in a hammock and one of playing bridge. A danger for such patients is their tendency to compare themselves with those who are well or with themselves as they used to be—"why shouldn't I walk as far as the store? I used to walk twenty times as far without a thought." But the conscientious "chaser" must leave bitter comparisons behind or, as my doctor once said to me, "Don't regard yourself as a human being, but consider you are a clam."

Through our observation there grew in us a strong conviction that the invalid whose tuberculosis is active, is better for rest and rest and rest and more rest—and then some. Most physicians will prescribe rest, but few in this country order the unlimited quantities that we profoundly believe are needed in the active stages of the disease. For those who are not earning their living there can be no objection to trying the effect of complete quiescence, because it can do no harm. In our experience, with all those who have tried this course, it has done enormous good. There is a sanatorium abroad which keeps its inmates (whose trouble is in the active stages) in bed, and does not permit them to walk a step when temperature is above normal, no matter how slight the variation, and I know of discharged patients of that sanatorium who are at work breaking stones.

One of the most heartening aspects of our experience was the devotion of those who were caring for their relatives. I saw no more noble service than that of one girl who gave three years to saving her sister—a girl who kept house, cooked and worked, between times performing vaudeville stunts at the bedside for the invalid's amusement; who cheered, encouraged and comforted; who never left a stone unturned which might benefit her sister's health, yet always be-

haved as if the whole task and the exile from home were a delightful adventure, and who actually made it to her recovered patient one of the happiest memories of her life.

We were deeply impressed by a struggling, self-supporting, young woman who every month sent money west for the care of a former worker in the same office, a fellow stenographer.

From abroad came reports of the staunchness of a medical missionary who, after discovering that she was gravely ill with tuberculosis, stayed at her post with her disease gaining upon her every day because she would not leave her patients till her place could be filled.

The little wife I have mentioned, who played cards while icicles froze in her hair, was one of the most loyal standard-bearers in the fight. It is largely through her that her husband is now, after years of grave illness, to all intents and purposes well and leading a busy life as one of the most successful physicians in his community. "Many's the time," she once told me, "that I've put the wind into his sails, and then gone away to cry by myself." Theirs was indeed a true marriage, a real union "for better, for worse."

And of the same inspiring profundity was the relation between a young gardener of our acquaintance and his wife. They were practical, hard-headed young people, so the poetry and romance of their self-sacrifice and struggle was the more satisfying to the observer. He had left his work in an eastern city when his fiancée, a young girl doing general housework, broke down. He brought her west, helped pay for her care at a sanatorium, got employment as near her as he could and took a railway journey every week to visit her. He cheered and comforted her; though she said, there were times when her only solacing reflection was that when she died he would have her life insurance. She worked faithfully to regain her health, improved rapidly, and, as soon as she was well, they married. Now they have a baby and are going, like the prince and princess of the fairy tale, to live happily ever after.

But perhaps finest of all in his devotion was the husband who, because he was too poor to afford more than general care in a hospital for his wife, used to go early in the morning to bathe her and get her up, then work all day at hard physical labour, return in the evening to care for her, and reach his room in a cheap lodging-house late every night, so weary that he could not undress but only fall upon his bed to sleep till his manifold duties of nurse and wage-earner called him again.

These faithful ones and their charges had not only their love to sustain them, but they were working wisely in the right direction, without opposition. One of the difficulties in following the course mapped out for one is the lack of sanity in the attitude of most invalids toward the conscientious patient. The man who takes care of himself as he should (a process always spoken of in tuberculosis slang as "chasing the cure") is scorned by the majority of health-seek-

ers, while the man who kills himself by overdoing is lauded as a "dead game sport."

"Oh, yes," I overheard one of the boys on the piazza commenting one morning. "Bob's the best chaser in town. Came here three years ago on a stretcher. Been tied to his mother's and the doctor's apron-strings ever since. Never has missed his two quarts of milk a day. Never has been up later than seven o'clock. Worst old Dub and Nanny you ever saw. Oh, yes (grudgingly) he's getting well all right, all right."

The same boy had a profound admiration shared by most of the town for a New York man who, on his arrival in the West, had a good chance of recovery, and had thrown it away by spending his days in polo and tennis at the country club whose membership is largely made up of invalids, and his nights playing cards in a hot room or dancing.

"He's true blue," people said of him, "he'll die game."

It is possible to understand this boy's misconception of real gameness when one considers what a selfish work care of oneself may at a first glance appear. There is none of the glory of service for another. This seems an intensely petty task in all its infinitesimal detail. To conscientious men who feel bitterly their dependence on their families, the man who overdoes in activity, whether that activity be work or gayety, is, however mistakenly, enviable.

A young man, ill for more than ten years, who was taking a new, practically untried and very drastic, bacterial treatment, told me that he realized the method was one of "kill or cure," but that he would rather die than be supported any longer in idleness. This one despairing confidence, which he afterward laughingly said was just the result of a blue day, was the only sad remark I

PHILIPPINE MEDICAL METHODS

The pictures abundantly confirm the following extract from the latest annual report of the secretary of the interior, by Dean C. Worcester of the Philippines:

"The only thing which prevents my recommending a radical increase in the number of scholarships available at the training school is the fact that after exhausting every available inch of space in the General Hospital, and utilizing room badly needed for other purposes, existing dormitory facilities are very inadequate for the number of nurses already in training. The proposed new nurses home for the graduate Filipino nurses should be erected at the earliest possible time and I earnestly recommend that this be done."

ever heard him make. He was uniformly controlled, cheerful and amusing, but the long, long strain told finally, and he contracted a drug habit, married when he was in a dying condition, and made several attempts at suicide before his struggles ended in merciful death.

To do each hour in the day the little apparently trivial duty which is the doctor's order for that hour: taking temperature, swallowing raw eggs, walking five minutes, resting two hours—whatever it may be—to do this conscientiously and faithfully, yet never in its performance to grow self-centered or, as the phrase goes, "hipped about yourself"—to keep the spirit busy and happy while the body is wholly inert—to be cheerful, while suffering and despair are all about you—this is a colossal task.

It is not so for anyone who has help from without, but it is cruelly, desperately hard for the one that fights alone—and very many of the invalids in the West are alone. College boys, broken down in the midst of their rich and full young lives; women, whose husbands in order to provide for their care must stay at home and work; men whose business has absorbed them, and to whom much leisure is a heretofore unknown and a dangerous possession; girls who are weak and young and filled with desires for joy—people of all kinds, are here, alike only in that they have had to use before little restraint or control, and whose lives now depend on their using restraint and control and fortitude and wisdom and power and apparently all the gifts of the gods.

In our experience we were sorriest for the men. There are more of them (at the camp there were just twice as many sick men as women) and they are so resourceless.

The majority, like the old men in front of the country store, "Sometimes set and talk and sometimes jest set." They "set" with such drooping shoulders, such despairing eyes. Poor boys! It is not surprising that the richer of them are apt to fall into gambling and dissipation, and it is easier to understand than to blame those sick men and women whose stories are told in Blanktown with such gusto, and who did wrong because they were crushed by despair. Oh, the life of hearing a child of eighteen say "Life isn't worth the living!" And the mockery of imprisoning, in a room with nothing to enjoy except a volume of Emerson, a "drummer" who had never amused himself with anything except vaudeville, chorus girls, and poker!

There were many who, besides being like all mortals "with premeditated evil, round enmeshed," had to struggle with idleness, weakness and a tormented spirit. Yet we saw little sordidness or evil of which anyone who "knows his naked soul" must not acknowledge himself capable. And we saw courage that seemed beyond the power of man—divine—immortal.

There was the young minister, poor and gravely ill himself, who, finding a destitute and dying man sitting upon a doorstep, took him to his own tent. He performed this compassionate service for nineteen other wayfarers, until a score of men, fed by chance donations, were living with him in tents outside the town.

All were so sick that one day when a large bag of provisions was left on the ground outside the camp by a careless grocery boy, not one of the campers but was too weak to lift and carry it into the kitchen shack.

None of them had any money, nor much food, nor any of the care they should have had. But they had a great deal of faith. They all hung together and cheered each other, and usually one of the twenty was able to get about and cook, and so they kept alive from day to day. Now the camp is more prosperous. Most of the time the men have food. The future looks brighter to them than it did a little while ago, and they are still trusting, still fighting. Heart-breaking as their life seems, yet in the midst of its desolation a miracle is made manifest, for those who seem to have nothing, yet have what Galsworthy called the most hopeful and inspiring of all things on earth, "courage without hope!"

There was also the boy who at a crisis of his disease insisted that his mother should not be sent for because she would worry, and who said gaily to his nurse, when the doctors thought him dying, "Well, it looks as if I should have to buy a Stetson hat and a steamer rug and 'chase the cure' all winter, doesn't it?" We were profoundly stirred by the valiant little group at a sanatorium who, like shipwrecked mariners seeing a fellow sailor return to freedom, raised their voices and cheered when one recovered patient drove away.

We are all familiar with Stevenson's merry reference to the "damned bed" and with his remark about some trivial matter—"it is of no more importance than the blood on my handkerchief." But unheralded and unsung is the youth who, though he did not expect to live through the winter, could not keep his mind on so personal a fact, and spent most of his time happily poring over a gun catalog, choosing the rifle he would hunt with in the spring.

"Optimism is at once reflected. How great this influence may be we are learning more and more to appreciate." So Dr. Trudeau tells us in his inspiring address on The Value of Optimism in Medicine. It was our privilege to see illustrated more than once the wonderful effect faith radiating from one courageous soul will have upon other sufferers in their time of need.

In one sanatorium a child of six was strapped to a board from the waist up for many months. Laughing aloud, and kicking his little legs all day in sheer, bubbling, irrepressible joyousness, he encouraged and gladdened all the grown people about him.

A woman of my acquaintance used to make a half-day's journey into town for treatment every morning, when she was in a burning fever. Because there was no one to bring her food if she stayed lying down, she got up and dressed when she was pitifully weak. She had no place to sleep outdoors. In short, she was confronted by apparently insurmountable obstacles in regaining her health. Her own malady had been too advanced to permit her ever to become a "cure." But her case has been arrested, and she is able to live not only joyously, but

as actively as before her illness.

During the most doubtful months of her struggle she was always the light of the house where she lived. She amused people. She was sympathetic and gay and glad, and she gave ten or twelve formerly despondent fellow creatures an irresistible impetus towards healthier, happier lives.

"Optimism is the one thing that is within reach of us all, no matter how meager our intellectual equipment, how unpromising our outlook at the start, or how obscure and limited our careers may be." These words spoken of the medical profession are equally true of those who are struggling to overcome disease in themselves.

Optimism was seemingly the only asset of a needy dressmaker, who was told by several physicians that she could not live a month. She and her husband went to Denver and took a room which had no facilities for outdoor sleeping. She spent all her time in the effort to get well. She took an almost incredible amount of raw eggs, milk and beef juice. She went to the park and stayed in the open all day, when she was so weak she had to lie down on the seats of the street car. Her fight was a long one, but she persevered, and today she is absolutely well—and well not in idleness, but in the taxing and wearing duties of a housekeeper, seamstress and supporter of her family.

Although she lived in one of the most congested districts of Chicago, a little girl whose courage never faltered improved marvellously, sleeping in a backyard tent; and a young man to whom stopping work meant stopping his livelihood and who yet so sorely needed rest that it seemed he had no chance of recovery without it, found, by determined effort, light but profitable outdoor work, and is now cured.

We saw cures of the disease, as well as arrested cases of it, which seemed miraculous, and we learned to feel belief in the frequent, splendid results of conscientious and wise care under hard and often nearly impossible conditions. "Let us not, therefore, quench the faith, nor turn from the vision, and thus inspired many will reach the goal." And if for most of us our achievements inevitably must fall short of our ideals, nevertheless all will be well with us for, as Stevenson so rightly tells us "to travel hopefully is better than to arrive and the true success is in labor."

In the thought of the increasingly widespread and increasingly successful war against tuberculosis, let us take hope for those who may recover. And for those who may not, let us do all that lies in our power to do, remembering in the midst of our sorrow that this joy remains to them:

Oh joy of suffering!
To struggle against great odds!
To meet enemies undaunted!
To be entirely alone with them!
To find how much one can stand!
To look strife, torture, prison, popular odium, death, face to face!
To mount the scaffold! To advance to the muzzles of guns with perfect nonchalance!
To be indeed a god!

INDUSTRY

THE CLEAVAGE OF MASTERS AND MEN AT CHICAGO —By CHRISTINA MERRIMAN

OUT OF THE curious mixture of truths and half-truths, plain speaking and fencing, good will and bitterness, that made the Chicago hearings of the Industrial Relations Commission as interesting as any yet held, came some definite constructive suggestions for improving industrial conditions and making for industrial peace.

Some of those generally agreed upon as possible were an industrial court to settle legal issues, and a federal industrial council which could be depended upon for an impartial investigation and statement of facts in strikes, so that the public, always a strong factor in settling disputes, might have dependable data on which to base its judgment. Mine operators and miners agreed that in the coal industry federal supervision might do away with over-production and consequent unemployment. The secretary of the Illinois miners' unions told of co-operative stores which the unions had started, as a supplement to their wages, and which were yielding dividends ranging from 8 to 12 per cent a quarter.

Running through the testimony was an insistence on the part of the employers that the unions should change their methods and put in a higher type of men as responsible leaders, and an equally strong protest by the labor men at the methods used by employers to choke the spread of unionism. This opposition, they felt, was not based on the isolated cases of misused power cited, but was a fight against a movement which tended to equalize the power and put the union man in a position to enforce his demands for justice.

"There's a strong feeling," said Duncan Macdonald, secretary of the Illinois Mine Workers, "that the laborer is regarded as a nonentity, and there'll continue to be industrial unrest until he gains a greater share than he has now of his just due."

William O. Thompson, counsel for the commission, laid stress in his interrogations on the proposition that labor unions are essentially democratic organizations, —in theory, at any rate—and asked the labor representatives what remedies were available for meeting the complaint that many unions are dominated by "rings" and "bosses" who throttle the will of the rank and file.

Another subject for inquiry was the attitude of the unions towards the militia. All of the labor officials denied the existence of a rule forbidding their members to enlist, but condemned strongly the use of the militia "for purposes other than those for which it was created." When it was used for breaking strikes, one witness said, "the self-

Probing the Causes of Unrest

IX

The ninth of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

respect of every union man would prevent him from enlisting."

The gist of the testimony given by the employers—if such a diversity of opinions could be summarized—was that they believed in the principle of collective bargaining. They held, however, that in practice, as unions are at present organized, they had found it impossible to concede the constantly encroaching and unreasonable demands of the unions and continue in business, under the highly competitive conditions of modern industry.

The unions, they said, found themselves with a new and growing strength to enforce higher wages and shorter hours and were ruthless in their use of it. More than that, they charged, this advantage was used by unscrupulous officials and business agents for purposes of blackmail and extortion, especially in the building trades, where contractors were threatened with strikes unless they paid their price for peace. The contractor, driven to the wall, had the alternative of buying them off, or fighting the union.

They condemned too, the "permit system," by which a union man from another city was given a card which entitled him to work if there was a place for him; but in case a member of the local union was out of a job, the "permit" man was turned out by the union leaders, and the local unionist substituted for him. The contractors said this was done regardless of whether or not the permit man was the better worker.

In the building trades of Chicago, the employers organized in self-defense after being "held up" for some years by jurisdictional and "sympathetic" strikes, and because of the power this organization afforded had been able to force the

unions to come to an agreement which had in large measure done away with strikes and was working out pretty satisfactorily for both sides. The Building Construction Employers' Association and the Building Trades Council (the union organization) now deal with each other through committees, to which they refer all disputes.

In the metal trades, however, things had worked out less happily. Charles Piez, of the Link Belt Company, said at the outset of his testimony that he had started out a strong believer in unionism, but had been forced to change his mind. He told of long experience with the unions during which he had had dealings with Sam Parks, who, as walking delegate, had agreed to let non-union men do certain parts of the work. These non-unionists, however, had red-hot rivets and wrenches dropped from mysterious heights upon their innocent heads and when they protested were ruthlessly "beaten up."

"After that and for a term of years we were absolutely in their grip," said Mr. Piez. "We were so tied up with various contracts in New York that we could not declare any degree of independence. It was well known he was a crook, but he was kept at the head of that institution; and we had to deal with him in accordance with the methods that he outlined, not in accordance with the methods we cared to follow."

And this was not all, Mr. Piez claimed. In shop work, given union wages and demands, there was a "steady and insidious" restriction of output until the production was cut down 35 per cent. On the whole the unions had demoralized the shops by putting loyalty to the union ahead of loyalty to the employer; "and being in a highly competitive business," concluded Mr. Piez, "we felt we couldn't continue an agreement with an organization which followed monopolistic methods."

Since 1906 they have run what Mr. Piez claimed was an open shop. Union men who spoke later, claimed strongly that through a system of spies and blacklisting it was in effect and reality a closed shop against the union. And some color was given to this claim when, after Mr. Piez had added the use of the boycott to his list of objections against unionism, Commissioner Garretson brought out that the Illinois Manufacturers' Association has a system of carding the workers in various trades to which all employers have access and that it might be "possible" that these cards noted a man's union affiliations and activities.

"I presume a union man would call that a blacklist?" asked Mr. Garretson.

"I presume so," said Mr. Piez.

"And a similar list of employers kept by the unions would be called a boycott?"

"I presume so."

"But," protested Mr. Piez further, "there is absolutely no check on the rapidly increasing power these gentlemen on the other side are exerting except the check constituted by strong employers' associations. If you are going to permit unions to grow stronger, and extend their privileges by legalizing boycotting and picketing, you've got to counteract that influence by strong manufacturers' associations, or force the unions to incorporate or be subjected to federal supervision."

On the whole Mr. Piez's testimony was fairly indicative of the opinions of most of the employers. John D. Hibbard, commissioner of the National Metal Trades Association, added that the crucial test of collective bargaining was whether, granted certain wage increases were just under good business conditions, the unions would accept the corollary—reasonable decreases under business depression. The test came; the unions struck to protest against the cut in wages, and the result was the breaking of the unions' power. Since then there has been a so-called open shop in the metal trades.

Mr. Hibbard said very frankly that, while they did not question men as to whether or not they belonged to a union, he was not in favor of having in his employ "agitators" who would try to unionize the shops and teach loyalty to the union rather than to the employer. And given 50 or 60 per cent unionism, it was impossible to run an open shop. He was strongly in favor of unions when properly organized and officered. This, however, was not true of many of the unions in Chicago. And he quoted Barney, an iron-worker friend whom he had asked why a certain walking delegate had been chosen to represent "a decent lot" of men:

"You believe, don't you, that if all the people really had a chance to vote right in city elections, they'd elect good men? Show me why you have that bunch in City Hall, and I'll tell you why we have that walking delegate."

John Walker, president of the Illinois State Federation of Labor, was the strongest witness for the workers, who, he said, were organized to see that "those who work for a living get more justice." He did not mince words in going at what he felt was the root of trouble—labor's distrust of the courts, the employers' insistence on large returns regardless of the workers' conditions, and, most important of all, the "double standard" of the public in judging the demands of the employer and the employee.

This double standard, Mr. Walker explained, comes in when the working man is not supposed to ask for more than what the employer arbitrarily considers a fair day's wage for a fair day's work—which means that he is supposed to work until he's "tuckered out" and then be given just enough for rent, food, and clothing to keep his family from "being subjected to criticism for not being decent." Any demands for wage increase above that point were considered unreasonable.

On the other hand, there was no scale or standard set for a "reasonable" re-

turn for the employer. In fact, said Mr. Walker, "people accept it as all right if the employer doesn't work at all and they are given credit for getting as much money as possible for the least amount of work. The workers feel this, consciously or unconsciously, and there can't be peace while that condition exists."

Edward T. Bent, of the Illinois Coal Operators' Association and Duncan Macdonald, secretary of the Illinois Mine Workers, told of the joint trade agreement which had made the coal fields of Illinois famous. Although this agreement has practically done away with strikes and meant a better wage scale for the miners, there is a great amount of unemployment due to the fact that there are three times as many coal mines running as there is demand for fuel. As a result, the mines operate on an average of only 170 days a year, and the miners can't live on their earnings, which Mr. McDonald claimed average less than \$600 a year under these conditions.

Mr. Bent agreed with Mr. Macdonald that one way out was government regulation similar to the German system under which a mine cannot be opened unless there is a commercial need for it.

On the subject of the courts, the labor men and employers seemed hopelessly apart. Elizabeth Mahoney, of the Waitresses' Union, which is on strike now for a closed shop, told of constant arrests of peaceful pickets and of bail demands which amounted to over \$125,000; and charged that the employers in resorting to court procedure to bankrupt the union had at least the tacit support of the court.

Dudley Taylor, counsel for the Chicago Employers' Association, was equally emphatic in saying that for years the tide in the courts had been running strongly against the employer. And while he would hardly use the word "toady" he felt they were disposed to "pass the buck" through fear of antagonizing union labor.

He agreed with most of the witnesses on both sides that an industrial court for the settlement of legal disputes would be helpful. Mr. Taylor also thought the idea of a federal tribunal or council to act as mediators might be a good plan and raised a laugh by his naive statement that such a council would be most effective if made up of lawyers.

James Mullenbach, who served for two years as chairman of the Hart, Schaffner & Marx trade board, made up of employers and employees, was one of the strongest advocates of unionism that appeared. Under the present order of industry the worker was helpless, he said, unless he organized to express his desire and will through collective bargaining, and he should sacrifice his individual liberty, if necessary, and pool his activity to secure more reasonable working conditions for the majority. And when an employer is dealing with collective bargaining, it is to his interest to be faced by a strong union with responsible officials, on whom he can throw part responsibility for the conduct of that business.

He took a fling, too at those who had

disclaimed sympathy with violence in times of strikes.

"There's a great deal of pretense and some hypocrisy on both sides. As long as we are human beings we're going to have some violence when our livelihood is at stake. It's almost inevitable. The worker has his home at stake, his family, his means of earning a living. The employer has the responsibility for an expensive plant, machinery, and his output, and with such a clash of interests in case it comes to a strike it's only a miracle that prevents violence. All of us," he concluded, "are about the same variety of human beings."

And taken all in all, the onlooker at the hearings might conclude that we were. The employers who agreed with the principle of unionism, but charged corruption or lack of democracy in union practice, were not ready to say that members of employers' associations suspected of bribe-giving always got their just deserts.

During the hearings, a business agent of one of the unions was arrested in Chicago for extortion, and \$150 in marked bills was found in his pocket. Mr. Piez had charged in his testimony that often the unions were represented by men of the type of Sam Parks "well-known to be a crook." It was impossible to trust them or deal with them. Just here Commissioner Weinstock took a hand in the discussion:

Mr. Weinstock: "Would Sam Parks have been a bribe-taker had there been no bribe-givers?"

Mr. Piez: "You cannot have one without the other. Yet here is the point: When a man holds a gun to your head and says 'cough up!' what can you do?"

Mr. Weinstock: "Give up, of course; then go after him as fast as you can. Were not the employers of New York to blame for not bringing Parks to justice sooner?"

Mr. Piez: "On high moral grounds, yes; but on grounds of practicability I'm not so sure."

Mr. Weinstock: "What steps do employers' organizations take to drive out dishonest employers?"

Mr. Piez: "I think the standards of morality among employers are higher today than ever."

Whether they were high enough to drive out the bribe-giver and, more serious, the strike-buyer, was not brought to light although this question was put to many of them, and the recent lobbying activities of the National Association of Manufacturers was hinted at.

At the same time, there was a strong apparent feeling among some who were in sympathy with labor that in some of the unions there was need for housecleaning and a more democratic method of electing officers.

Mary McDowell, for twenty years head resident of the University of Chicago Settlement, said that while labor unions were essential for getting better conditions for the worker the exorbitant fees charged by some of them shut out many who were in great need of protection and help. She felt, too, that there should be more democracy in the election of officials and in the administration of union affairs.

One of the causes of industrial unrest, she had concluded after long and close contact with the workers' families, was the constantly increasing demands by the municipality for a higher standard of living. The worker's children are told at school that flies are breeders of disease. The worker has no money to buy screens. The same is true where dental and medical inspection reveals defects which the worker feels he cannot pay to have remedied.

There were, of course, individual expressions of opinion which stood out and away from the general discussion. John G. Shedd, president of the Marshall Field department store, which employs about 15,000 persons in its wholesale and retail departments, raised groans and laughter when he said that old-age pensions "would not be such a burning question if we, as individuals or collectively, had stamina enough to refrain from the use of tobacco or alcoholic beverages in any form. The savings thus produced, if deposited in a savings bank weekly, would insure our people and their families from dependence in both youth and age."

All of which brought more or less of a grimace from some of the women present and a round of applause for Commissioner Garretson when he inquired whether Mr. Shedd realized that for many laboring men these forbidden dissipations constituted the sum total of their luxuries.

Another expression of feeling came when John M. Glenn, secretary of the Illinois Manufacturers' Association, made a bitter attack on the unions. Unionism, he said, was "unpatriotic and un-American, a menace to civilization" and he didn't see how it was they could exist along side of the churches as the "church was based on love and unionism on selfishness."

"Just where is the laboring man more at variance with the church than the employer?" asked Mr. Garretson, whereupon there was a discussion as to who was driven out of the temple in the Bible version, and the "den of thieves," in which Mr. Glenn came out decidedly second best in his logic as well as his knowledge of Bible history.

Mr. Glenn volunteered the opinion that a good deal of the industrial unrest was originally created by a number of people interested in maintaining it, such as Edward T. Devine, Jane Addams, John M. Glenn of the Russell Sage Foundation, New York, and others.

However, as he said in almost the same breath that a state of unrest was healthy and without it "we'd all die of dry rot," the charge against the agitators simmered down, upon analysis, to their being a much needed vaccination against innocuous desuetude.

Mr. Glenn asserted that he was in sympathy with "humane" legislation, and that the employers had been the first to put forward a workmen's compensation act in Illinois.

"It's a fact, isn't it," said Mr. Garretson, "that it was generally felt that the bill supported by your association was a blind, and wouldn't really compensate?"

Mr. Glenn said that people were quite wrong in thinking so.

"Well, is it or is it not true that when a real workmen's compensation bill went through, the Employers' Association chartered a special train to go to the State Capital and ask the governor to veto it?"

Mr. Glenn replied that it was quite true, but it was because they objected to certain provisions of the bill.

Agnes Nestor, president of the Women's Trade Union League of Chicago, told of the fight for the woman's ten-hour law and the minimum wage and of the opposition of the Employers' Association to those bills.

"But even after we get the laws," said Miss Nestor, "a strong organization is necessary to enforce them. Employers are constantly discharging women because they testify to violations of the ten-hour law. Under union conditions we could protect these workers."

The hearings drew large audiences, among them many women, who followed the testimony with evidence of close interest. It is worth noting, too, that the Chicago papers gave very full reports of the testimony of both sides, which was not the case with the New York papers during the three or four weeks' hearings in that city.

And what with the Federal Board of Mediation and Conciliation in session in the effort to avert a strike of 55,000 railway engineers, and with a federal grand jury inquiring into alleged union blackmail plots of gigantic proportions, industrial questions were very much to the fore in Chicago during the week.

The Commission went from Chicago to Lead, S. D., to hold an inquiry into mining conditions, and from there will go west to Butte, Mont., Seattle, Wash., Portland, Ore., San Francisco, Los Angeles, and thence back to Denver, where it is due for a three days' hearing beginning September 16.

THE BASIS OF A SICKNESS INSURANCE BILL

A YEAR and a half ago the American Association for Labor Legislation announced a Committee on Social Insurance. Five months later it organized the first American Conference on Social Insurance, in Chicago, and with the published proceedings presented a convenient classified bibliography for the encouragement of students. At its annual meeting in Washington last December the association devoted half a day to the discussion of carefully prepared papers and reports on sickness insurance, believing it the most urgent of the problems in this field, now that much progress has been made toward compensation for industrial accidents.

Recently, after many conferences for discussion and revision of proposals, the committee has formulated a tentative statement of the essential lines which it purposes to follow in the drafting of a sickness insurance bill. In the hope that this statement may call forth helpful suggestions and be of substantial assistance in formulating legislative plans in the several states in which the subject has

begun to receive attention, it is published below:

1. To be effective, sickness insurance should be compulsory, on the basis of joint contribution of employer and employee and the public.

2. The compulsory insurance should include all wage-workers earning less than a given annual sum, where employed with sufficient regularity to make it practicable to compute and collect assessments. Casual and home workers should, as far as practicable, be included within the plan and scope of the compulsory system.

3. There should be a voluntary supplementary system for groups of persons (wage workers or others) who for practical reasons are kept out of the compulsory system.

4. Sickness insurance should provide for a specified period only, provisionally set at twenty-six weeks (one-half a year), but a system of invalidity insurance should be combined with sickness insurance so that all disability due to disease will be taken care of in one law, although the funds should be separate.

5. Sickness insurance on the compulsory plan should be carried by mutual local funds jointly managed by employers and employees under public supervision. In large cities such locals may be organized by trades with a federated bureau for the medical relief. Establishment funds and existing mutual sick funds may be permitted to carry the insurance where their existence does not injure the local funds, but they must be under strict government supervision.

6. Invalidity insurance should be carried by funds covering a larger geographical area comprising the districts of a number of local sickness insurance funds. The administration of the invalidity fund should be intimately associated with that of the local sickness funds, and on a representative basis.

7. Both sickness and invalidity insurance should include medical service, supplies, necessary nursing and hospital care. Such provision should be thoroughly adequate, but its organization may be left to the local societies under strict governmental control.

8. Cash benefits should be provided by both invalidity and sickness insurance for the insured or his dependents during such disability.

9. It is highly desirable that prevention be emphasized so that the introduction of a compulsory sickness and invalidity insurance system shall lead to a campaign of health conservation similar to the safety movement resulting from workmen's compensation.

The chairman of the Committee on Social Insurance is Edward T. Devine, and secretary John B. Andrews, secretary of the American Association for Labor Legislation.

STENOGRAPHERS INCLUDED IN EIGHT-HOUR LAW

The Colorado woman's eight-hour law is sweeping in its application, and includes bookkeepers, stenographers and cashiers who are employed in mercantile, merchandise and manufacturing establishments, according to a ruling of Judge C. C. Butler of Denver.

SOCIAL AGENCIES

THE SOCIAL SETTLEMENT AND ITS CRITICS—BY MARYAL KNOX, UNION SETTLEMENT, NEW YORK

IN THIS DAY of rapid changes new things arise, are of use and then are cast aside as antiquated in surprisingly brief periods of time. That the social settlement is one of these ephemeral productions of modern life is being said by many. Thirty years ago it did not exist, ten years ago it was a force and today, so say the critics, it is one of those outworn institutions that cumber the ground using money and energy to no purpose. If these critics were all in the ranks of its foes, the Settlement might ignore them, but the most discerning were formerly its friends. Some of them are still its friends but they have a protective apologetic attitude that does not add to the self-respect of the befriended.

We all know the criticisms:

"Settlements do not conduct classes in anything as well as the public schools conduct them. Why not leave teaching to the schools?"

"Settlements cannot disperse money with the wisdom of the relief society. Why disperse it at all?"

"The recreation center manages clubs in a more wholesale manner than the settlement. Why compete?"

The list might be prolonged indefinitely. There is not one activity of the settlement that is not or could not be better carried on by some other organization.

The fair answer to this line of argument has always been: "It is perfectly true and we are glad of it. It is a function of the settlement to find new ways of meeting old needs and having proved that the new is good, to pass it on to some group that can do for the many what the settlement has done for the few." And one thing more: the activities of the settlement are not an end in themselves, they should be conducted as well as possible, but they are only a means to an end, that of becoming better acquainted with the neighborhood.

There are other critics. Years ago there were many who said: "It is all very well to feed the body and to expand the brain but how does that help the immortal soul?"

The question is a little out of date, although it is still asked. But the modern form of the question is asked every day: "What is the use of being a friend of the working man if the trade union, the labor union and the various political parties that make for progress are not supported by the settlements as a whole?"

Do the questions seem different? They are not really so in underlying principle. Those who asked the first wanted the settlements to pledge themselves to work

for one form of religious faith. That they refused to do. They were firm in the belief that underlies Christianity and Judaism alike, that God is served by service to man. But they reserved the right to express that belief in whatever form they chose, and claimed that right for the people among whom they lived. As individuals they had their individual preferences, as organizations they had none.

Now the demand that the settlement ally itself with one party or with one organization is exactly parallel with this. Beneath all the dreams of the best leaders of all the parties is the one hope that our land, our states and our cities shall be so governed that every man shall have a fair chance. In every party there are those who work for this unceasingly and in every party are those who as unceasingly work for themselves.

The settlement resident must choose the party which seems to him to be working most constantly to realize his ideal, and to his neighbor he must leave the same privilege. The settlement can no more dictate the politics of its residents and neighbors than it can their religion. One thing more may be said in this connection: that settlement has utterly failed which has not given to some among its ranks a higher conception of the meaning of good citizenship, and it has also failed if it has not given to some at least a nobler ideal of the life of service.

There is a third group of critics who say: "If you are not educational institutions and are not political parties why don't you at least improve your neighborhoods? Oh, yes, we know you have had a playground or two opened by the city and have had a few public baths established, and you have a junior league for street cleaning here and there; but you do not improve your neighborhoods as a whole. Tenement house conditions are the same all over the city and the casual wanderer in the street would find it quite impossible to separate the blocks influenced by the settlements from those knowing no such organization. The outward and visible signs of the influence of a settlement upon its neighborhood are negligible."

Before admitting the truth of this criticism, attention is drawn to the fact that these particular critics refer to the New York settlements. Of course, neighborhoods show no visible signs of improvement—the neighbors are new every day. No sooner is part of one group helped to realize the best in itself than it moves away and another arrives in the steerage of the Imperator to take its place.

If the settlement can be proved to be worthy of a permanent place in New York its cause is won everywhere, for

nowhere else are such problems to be found. The overwhelming pressure of immigration subjects every agency in the city to continuous and well-nigh impossible tests. Things are always at the crisis in New York. There is never time to take account of stock, look over the situation and plan what is best to do next. Life is lived at the height of an ever-present emergency. Every effort must be made to meet the need of the moment, but no moment of the hour, no hour of the day is less important, less difficult than any other. We cease studying the figures of immigration. They appall the imagination and paralyze the will.

Perhaps it is true that there are no outward and visible signs of the settlement's life in its neighborhood. But in the outlying suburbs, in the country villages, in the less densely populated parts of the city itself, there are many who are desirable residents helping in all that makes for the welfare of their communities, because the first days of their life in America were spent near settlements. There they were helped to keep some Old World standards and to learn that, when translated, these standards need not be read in terms of dollars and cents alone but that in America, too, honor and duty count—that perhaps they can count for more than ever they did abroad.

The critics are right. In New York the outward and visible signs of the influence of a settlement upon its neighbors are negligible because the tide of immigration is ever bringing new neighbors to its door; also because these institutions for which the settlement has fought, such as baths, libraries and recreation centers have sprung up everywhere.

But why have they sprung up? Public opinion does not arouse itself and the struggle settlements have made to get some special things accomplished have borne fruit a thousand fold in the awakened social consciousness of the age.

Settlements are not responsible for every good thing—far from it. But, because the residents of settlements have lived in over-crowded neighborhoods, not from necessity but from choice, and there learning the necessity for reform have constantly kept this necessity before the eyes of the public, they have had their part, and it is not a small one, in the overwhelming zeal for social righteousness that is the glory of the Twentieth Century.

But the critics are not silenced. They say: "This is all true, but it merely brings us back to our original contention that the settlement is an ephemeral growth. It had a mission: to help to arouse the public conscience. But that conscience is now working in a hundred ways and

the settlement is no longer needed. It would better close its doors and let the neighborhood association, the social service nurse, the visiting teacher and the social center take its place."

But to this those of us who believe in the settlement say, No. The settlement has a distinct work to do today and it will need to exist as long as there is a difference between the East Side and the West Side; so long as there are groups of people upon whom our housing and our industrial conditions bear unfairly. When there are no longer unfair conditions, then will the reign of righteousness be established upon the earth. But until that day the settlement will be needed.

Why? For two reasons:

First, it is true that even in this day of one hundred per cent efficiency that the one hundred cannot be made efficient save by the integrity of each of the hundred, that the multitude cannot attain a level higher than that attained by each of the multitude. It is true that whatever work helps individuals to live up to the best that is in them helps the city, the state and the nation to reach a higher standard of righteousness. It is as necessary today to help one's individual neighbor as it was yesterday and it will be as necessary tomorrow as it is today. The settlement is not unique because it cares for its neighbor. So does the hospital, the school and the church. But the settlement does it, and for that reason it is of use.

The settlement is absolutely unique in its second claim and upon that one thing alone it could base its right to exist.

The settlement resident alone among all those who seek to help their neighbors sees life as it is really lived by the dweller in tenements. The school teacher sees life from the point of view of the child. She judges a family by the regularity with which it sends its children to school. That family which keeps its children at home to do the washing and care for the baby is viewed with disfavor and there is no time to seek extenuating circumstances.

The doctor thinks of tenements as populated by the sick. The relief visitor sees in them none but the financially dependent. The probation officer sees the streets crowded with bad girls and thieving boys, while the playground worker sees in them a horde of children in imminent danger of death from passing vehicles. To the trade union leader, men are possible members of the organization, while to the preacher they are probable sinners and potential saints.

But to the resident of the settlement who knows what he is doing and why he is doing it, the tenements are large groups of homes—homes without too much privacy and lacking in many of the external attractions of homes—but homes none-the-less, filled with fathers, mothers and children, groups of friends and individual enemies. It is normal life lived under abnormally crowded conditions.

Are the people in the tenements bad? Like those on Fifth avenue, some are bad and some are good. Are they lazy or industrious, temperate or drunken,

THE HANGING GARDENS OF CLEVELAND

ON a rooftop in the Haymarket district, the most crowded section of Cleveland where no green things do grow, the Central Friendly Inn Social Settlement has established a farm.

The farm is measured not in acres, but in feet—twenty feet long by eight wide. The barns and houses and cows and ducks are of pasteboard, and the families are dolls. But the beans and corn and morning-glories are real. And very real and live are the forty farm hands, little immigrant girls of the neighborhood.

THERE they are learning not only how oats, peas, beans, and barley grow, but something of the scheme of modern life—the duties of father and mother and children, the care of a house, whence come meat and vegetables, and how wool from a fleece comes to be a little girl's jacket.

WITH it all come lessons of the open air and the country. The whole plan was conceived by Elizabeth Neff, president of the board of trustees of the Central Friendly Inn, and carried out by Mary Wine, the volunteer teacher.

learned or ignorant? Like the dwellers in a country village, some are one thing, some the other. Are they dragged down by their surroundings or do they rise above them? Like the members of your own circle of friends, some of them yield to every temptation and others follow an ideal that rises ever higher as they approach it.

What is the use of having settlements if all they do is to prove that life in tenements is the same as life elsewhere? The relation of the settlement to other forms of social work is that of the family doctor and the specialist. The specialist sees the trouble, the doctor tells him what, in the history of the patient or of his family has caused it, and together they seek to remove it.

The use of the settlement to its residents and to its neighbors is to provide opportunity of seeing the oneness of life among those of all environments, that through this new understanding of the essential goodness of human life, they shall be aroused to ever greater and more constant efforts for the service of mankind.

What proof is offered for the truth

of these claims that the settlement does thus arouse its residents and neighbors to stronger efforts for good?

In the last analysis the only proof of the worth of an organization is the character of those most strongly influenced by it. It is the knowledge that children actually acquire and the habits of thought they form that proves one system of education good and another bad.

The children are the proof. It is by the lives of its adherents that a religion is judged. Thus it is by its people that settlements, too, are judged. Today, all over our cities, boys and girls are being trained to be of service to others because they have belonged to settlement clubs. Young men are going into the fight for good government because their ideals have been raised by some friend in a settlement. College graduates are seeking to serve their country because they have learned to wish to do so by residence in settlements. Men and women are treating those who serve them more fairly because through settlements they have realized that those who serve them have as real a life as they have themselves.

THE RISING ANTI-ALCOHOL MOVEMENT—By Elizabeth Tilton

AN ANTI-ALCOHOL movement is surely rising in Massachusetts. Blowing across from the laboratories of Germany, it has touched the selected minds first, and while it has not yet reached the "book" stage, it is voicing itself in pamphlets. Three notable ones have appeared this winter and spring; The Menace of Drink, by President Emeritus Eliot of Harvard; The Charge of Bishop Lawrence to the Episcopalians of Eastern Massachusetts; and the Report of the Commission to Investigate Drunkenness in Massachusetts.

Dr. Eliot sums up his reasons for becoming an anti-alcohol convert thus. First "the terrible effects of alcoholism in increasing the number of the feeble-minded, insane and criminal in our American communities. Later, I had the opportunity of studying the German investigations on the mental effects of very limited doses of alcohol, doses which most people have always supposed to be completely innocuous. The German investigations seemed to me to prove that even twenty-four hours after taking a small dose of alcohol the time-reaction in the human being is unfavorably affected. Now the quickness of the time-reaction is important to every mechanic; to every artisan, and particularly to every person who is engaged in a dangerous occupation, like driving an automobile for instance, or managing a circular saw, or, indeed, in the tending of any powerful machine or hot furnace. Lastly, somewhat more than a year ago, I had a long opportunity of observing the difference between the white race and the Japanese, the Chinese, the Indian, the Malay, and some of the Mahometan people, in regard to susceptibility to the alcoholic temptation. The white race is inferior to all the other people I have named in regard to this susceptibility to the temptation of alcoholism. . . . The alcoholism of the white must be overcome or that vice with the licentiousness that it provokes will overcome the race."

In his charge to his people, Bishop Lawrence summarizes the terrible economic cost of alcohol, especially in its relation to the social evil, and makes three clean-cut points: First, that "the time has passed when any intelligent person claims that drink makes a man more efficient. . . . Industrial efficiency is driving the drinking man, even the rather moderate drinking man, to the wall;" second, that "drink, and that not to excess but habitual, gradually disintegrates the physical, nerve and moral fiber;" third, "that every public spirited citizen, every parent, every man and woman who cares for his fellow men and women, every son and daughter of the Church of Christ will have this terrible scourge of society of which he is a part upon his conscience, and will in his personal habits and his public duty govern himself accordingly."

Lastly we have the report of the Commission on Drunkenness. This document piles up the costs of drink and its ramifications. In the year ending September 30, 1913, there were made in

Massachusetts 104,936 arrests for drunkenness. Since 1901, arrests for intoxication have increased 88 per cent, and the report calls attention to the fact that many drunkards never come to arrest.

It shows that in one year, 67 per cent of all our commitments were for drunkenness. It enlarges on the actual costs of these trials and imprisonments as well as all the ramifications following in their wake—accidents, disease, insanity and tuberculosis, poverty, neglected childhood, desertion, divorce; and lastly it shows that this tide of alcoholism must not be laid at the door of the immigrant, as 19 out of every 20 men arrested in 1912 were of American or British birth.

It recommends for this great and costly evil—among other things—education, municipal posting of the facts to the thinking people; municipal recreation centers, since men must meet and talk; no selling at drug stores except on a doctor's prescription; but lays its stress principally on the fact that drunkards are not criminals but alcohol-sick men and must be cared for in hospitals. It asks for a hospital for delirium tremens in Boston.

Dr. Southard, a member of the commission, put the whole idea in a nutshell when, speaking before a group of doctors, he said: "Individual liberty seems to be a great doctrine and from it I will not dissent. But I will say that a state that licenses shops that sell insanity should pay out its millions royally to support the victims of its hobby. We need hospitals all over this state for the alcohol-sick."

The Boston papers found the report "sane." The state papers were not so favorable. The *Springfield Republican* said that the recommendations were good enough in their way. The *Gloucester Times* found municipal recreation centers the only constructive measure, and asked if saloons were to run full blast forever and we to stand around and pick up the wreckage. The *Lynn News* said that the more people analyze the report the more evident it becomes that the commission did not have the courage to strike at the root of the matter and say that the present boasted license system is turning out drunkards faster than the state can take care of them.

One wonders precisely what the state of Massachusetts missed in that painstaking report. It was not, I fancy, prohibition, for even the Progressives of Massachusetts have not yet declared with their brothers in Maine, Ohio and Indiana, for national prohibition. I fancy what was lacking in that report was the note of Dr. Eliot—"the alcoholism of the white race must be overcome"—the note that says, not how shall we carry the alcohol-sick, but how shall we stop the manufacture of them. In short, Massachusetts is asking itself whether a sane people can devise no better method of recreation than the saloon, and no more potent treatment of the alcohol problem than our present licensing system, a system that gives us 67 per cent of our prison and jail commitments.

NBW FACTS ABOUT DELINQUENCY—By George Everson

NINE THOUSAND and nineteen children were arraigned in the New York county Children's Court during the year 1913. The report of the court for this period, with its charts and statistical tables, gives more detailed information concerning juvenile delinquency than has been given previously by this or any other court.

Twenty-five per cent of the children were brought into court for trifling offenses, while 38 per cent were cases of improper guardianship. This leaves 37 per cent who were under really serious charges. The ordinary statutory classification of offenses which are clear to the lawyer are apt to confuse the layman. In this report an endeavor has been made to give the statistics a more popular appeal and a less criminal sound by classification under such captions as "minor offenses against the peace," "offenses against property," "unlawfully employed," and the like.

The prevalence of tendencies leading to the gang spirit among juvenile delinquents is aptly shown by a table of "single and group delinquency." Over 54 per cent of the children were associated with others in offending against the law.

The table of "parental condition" shows that approximately 35 per cent of the children came from broken homes, where one or both parents were dead, the parents were separated, etc. The remaining 65 per cent came from apparently normal homes, though no account has been taken of drunkenness of the father or mother if the parents were living together and maintaining a family life. Authentic information regarding home environment is difficult to get but of great value when obtained.

The statistics relating to school and employment records are full of interest. Only about 6 per cent of the total number of children investigated are enrolled in special and ungraded classes. A study of the figures leaves the impression that much more can be done towards the proper classification of children with tendencies towards delinquency.

A table on residential distribution shows in what parts of the city delinquency is most prevalent, and the report expresses a hope that this will be of value to those interested in the general social problems of various sections of the city. The districts correspond with the boundaries of the 1910 census districts to facilitate comparisons between delinquency and other facts already available concerning these districts.

Other facts brought out are that about 20 per cent of the children had one or more previous court records and that the ages from thirteen to fifteen are the years when both boys and girls are most liable to get into trouble.

In preparing the report the officers of the court have had the helpful cooperation of the Committee on Criminal Courts of the Charity Organization Society.

CIVICS

FOUR CITY COMMISSIONS AT WORK FOR CHICAGO— BY GRAHAM TAYLOR

CHICAGO SEEKS GUIDANCE from four expert commissioners in developing the city's policy on railway terminals, municipal markets, the disposal of waste and unemployment.

The Railway Terminal Commission is the auspicious outcome of a long and strenuous struggle between citizens standing for some comprehensive city planning and a group of railways, allied with the Pennsylvania system, intent upon its own way regardless of all other interests.

Through public hearings and the educational agitation of the Chicago Plan Commission, the City Club and the Citizens' Terminal Committee, the City Council was supported in resisting the attempt to "railroad" ordinances through to vacate streets and alleys in order to make way for great passenger and freight terminals where they would have blocked all city planning and dangerously increased the congested traffic at the business center.

Upon the advice of two able engineers, whose report was adverse to the railways' plan, another site and scheme for this terminal was sought and secured from the roads. Then the Council Committee on Terminals became the nucleus of this Terminal Commission, consisting of experts representing the administrative, legal, engineering and traffic interests involved.

The mayor's dispatch of the commission to study the rail and waterway terminal facility in other American, Canadian, British and European cities has a public significance, which has been temporarily obscured by an incident due to an irritating misunderstanding. The coincident appointment of public school officials to inspect educational agencies abroad was publicly resented by one of the commissioners as an intrusion upon the party and plans for the study of terminals. Ella Flagg Young, superintendent of schools, and Gertrude Howe Britten, member of the Board of Education, promptly disavowed any identification between the two groups. Still less occasion for the unseemly objection to the presence of women appeared when several of the commissioners were accompanied by women of their own households.

The Terminal Commission's contribution towards some fundamental and comprehensive policy and plan for the solution of Chicago's acute terminal problem is expected to be highly valuable, not only because all the official and corporate interests involved are represented by their own specialties, including the street and steam railways, but also because of the presence of such experts as

Walter L. Fisher, the former secretary of the interior, Bion J. Arnold and J. F. Wallace, the distinguished engineers, E. H. Bennett who, as the partner of Daniel H. Burnham, designed much of the Chicago Plan and George E. Hooker, civic secretary of the City Club.

This club has just issued Mr. Hooker's valuable contribution to the present discussion and to the permanent literature of the subject, under the title *Through Routes for Chicago's Steam Railroads*. This handsomely printed book of 89 large pages, enriched by many interesting pictures and illuminating maps and diagrams, will be reviewed in a later issue of *THE SURVEY*.

The City Club has published also a program of a competition for plans for a neighborhood center, which was described in *THE SURVEY* for July 11. It is based upon an interesting discussion of the indispensable value of city neighborhoods to the city at large, and upon the important service to be rendered the neighborhood by grouping its public, social, trade and recreative buildings at a strategic center of its life and activities.

The Municipal Markets Commission's able preliminary report and recommendations emphasize the dependence upon better terminal facilities for shipping and distributing produce in any effort to reduce the cost of living by bringing producers and consumers directly together. The inadequacy of the commission men's famous "South Water Street," the farmers' and truck gardeners' stand at the Randolph Street "Haymarket," and the Ghetto sidewalk vending is vividly portrayed. The ample provision in other cities for the people's market is well described.

The saving of the cost of food by eliminating some or all the six or eight middlemen, always standing between producer and consumer, is estimated to

be at the annual rate of \$21.47 for each consumer, \$98.78 for each family, and \$51,393,304 for all Chicago.

So expensive are the delays in hauling goods through the congested streets, and the duplicated traveling involved in retail deliveries, that it costs less to transport 100 pounds of food stuff across the lake from Michigan than to deliver the same 100 pounds of goods five miles away from the dock in Chicago.

The commission recommends the city to establish and control a system of wholesale terminal markets; a retail market where food can be sold more cheaply than by retailers, privately, in rented quarters; farmers' markets, where the consumer may buy directly from the producer, and also to encourage and regulate peddlers, hucksters and pushcart men, and to permit trolley-freight service on street railways and interurban lines at night.

This commission, as constituted by the City Council, consists of three aldermen, three social settlement workers, one member each of the Association of Commerce, the City Club, and the Women's City Club, and one transportation engineer. The term of its service has been extended through the current year to render a final report on the location and management of public markets.

The Chicago City Waste Commission, whose interesting report was reviewed in *THE SURVEY* for August 1, has also been continued for a second year's investigation and co-operation with the city administration.

The Mayor's Commission on Unemployment was headed by Charles R. Crane as chairman, and by Prof. Charles Richmond Henderson as secretary, at whose suggestion the mayor appointed the commission. Its investigation extended over two years.

The effort to ascertain the extent of unemployment by the questionnaire method of getting facts from employers and labor union officials proved indecisive

and variable in result. A fine study of the casual and seasonal workers sheltered by the municipal lodging house, out of their working season, was furnished by James Mullenbach, covering part of the period during which he was its superintendent. Grace Abbott's discussion of economic, sanitary and moral conditions among some railway construction gangs was characteristically terse and suggestive.

The inquiry into the function and standards of private and public and pri-

vate agencies by Prof. E. H. Sutherland, which is printed as an appendix, is of permanent and general value.

The commission finds unemployment a chronic problem, frequently becoming acute, and therefore demanding a permanent public policy to deal with it. Labor exchanges in cities and states, co-operating with each other throughout the nation are urged. Bills for legislative acts to establish such agencies sum up the commission's recommendations.

ORGANIZING SOCIAL CENTER WORK UNDER PAID SECRETARIES

No one would think today of sending his children to school on the mere chance that a teacher would be found there ready to take charge of their instruction, or of asking that teacher to work without pay.

Why, then, should anyone think of sending his children to that same school for systematic recreation, on the mere chance that some one will be found there to take charge, or of asking that person to work without pay?

No deliberative body of elected representatives—aldermen, county supervisors or state legislature—would think of carrying on its work without authorized and paid secretarial service.

Why, then, should a deliberative body of those who are represented—meeting regularly and systematically in school houses and other social centers—carry on its work without authorized and paid secretarial service?

These questions were the motive power that drew together two recent conferences in Wisconsin—the breeding ground of social centers. The answer to them, after discussion, was a bill directing school boards to employ "civic secretaries" to take charge of non-partisan gatherings of citizens wherever these are organized as social centers. Half of this officer's compensation is to be paid by the school board, half by the state.

The bill will be urged upon the next Wisconsin legislature and upon the legislatures of other states in which there is provision for the community use of school buildings.

It was the sense of these conferences that this step is necessary to give force and direction from now on to the social center movement. And the social center movement, with its opportunities for wholesome recreation and for public threshing out of political and social issues, means, in the view of those who attended the conferences, nothing short of conserving and organizing the forces of democracy.

In his call to these meetings at Madison, addressed "to superintendents, principals and all others interested in community organization," C. P. Cary, state superintendent of public instruction, said: "We know from the results of experience in many places in Wisconsin and elsewhere that systematic and continuous social center development is possible only where there is definite placing of responsibility for secretarial service and leadership in each community."

At the first of the meetings, June 19-20, Edward J. Ward, adviser on civic and social center development to the University of Wisconsin Extension Division, declared that volunteer service in this field has been thoroughly tried. He sought to show that the very life breath of the social center movement depends on the provision of paid leadership. Last fall, said Mr. Ward, 800 school principals in Wisconsin who were the logical, though unpaid and unauthorized civic leaders in their communities were given suggested programs for social center meetings and were asked if they would do their part to bring about the general, systematic and continuous use of public school buildings as headquarters for community deliberation and recreation.

Only two hundred answered that they would undertake this task and of these only fifty, said Mr. Ward, achieved any real success.

Margaret Wilson, daughter of the President, summed up the central thought of the meetings as follows:

"If we, the people of the United States, are really to have a part in our government, we must organize. If we do not want the office-holders whom we elect to be under obligations to political machines not of our making, we must make our own machine, 'the machine of democracy,' and demand their allegiance to it.

"All of our representatives are organized into deliberative bodies. We, whom they represent, ought also to be organized for deliberation. The great work that we American people have before us—as I see it—is the conservation and organization of the forces of democracy.

"Not only should the schoolhouses be provided for this use without charge, but paid secretarial service should be furnished—just as this service is furnished for the meetings of aldermen, legislators and other sub-committees of the citizens."

It was the consensus of opinion among those who spoke that in the smaller towns, where the civic secretaryship can not be a full-time job, the work of the position logically falls to the local school principal or superintendent. Paying the school official for this service will have a double effect, said M. T. Buckley, principal of the Sauk City High School.

"You know and I know," he declared, "that the best men are not attracted to school work today. Legislation that will recognize the civic secretarial service of the school principal as worthy public remuneration will help to make school

principalship attractive to the strongest young men in the universities and colleges, for it will make school principalships look like a man-size job."

It was not merely that the work itself merits remuneration that led to these expressions of opinion, but the even more important consideration that only when such service is paid for does it assume desired importance in the eyes of the community. Only then, it was declared, does it have that official backing and endorsement necessary to make it effective. "The greatness that it will give the principal," said Mr. Buckley, "is the greatness of official recognition as the servant of the whole community."

At the second of the two meetings, July 2, the final draft of the proposed bill was approved. President Wilson sent a message expressing his "sincere and growing interest in the program and method" of social center development. P. P. Claxton, United States commissioner of education, and Frank P. Walsh, chairman of the Federal Commission on Industrial Relations, spoke in favor of the purpose of the conferees. Hosea E. Rood, patriotic instructor of the Grand Army of the Republic, made a plea for putting the responsibility for community organization for patriotic celebrations in the hands of the school principal as part of his civic secretarial function.

One of the duties of a paid civic secretary, as specified in the proposed measure, is to act as secretary at all meetings of the citizens' organization. He shall "organize, publish and announce such a program for each meeting of the citizens' organization as the organization may direct, shall communicate with and invite or notify such speakers as the citizens' organization may wish to hear, and shall carry on such correspondence as may be necessary to secure from the University Extension Division or other source of information, suggestive material upon such public questions as the citizens' organization may desire to consider."

FOR THOSE WHO MUST LIVE IN TENEMENTS—By John Ihlder

THOUGH WE may pray that no other American city will ever imitate New York's type of housing, it will certainly profit other American cities to study New York's problems if only that they may be confirmed in a determination to do better. The 46-page pamphlet issued by the Tenement House Committee of the Charity Organization Society under the title, *Housing Reform in New York City*, tells a story of progress and illustrates it with pictures that drive the points home.

The improvement of housing conditions is never an easy task, it was and is an usually difficult one in the metropolis which bears the doubtful honor of housing more persons per acre than any other city in the world. The pamphlet tells of some of the difficulties encountered and how they were overcome. It tells of the law, of the work of the Tenement House Department which administers the law, of some of the more important court decisions upholding the

law and the department, of improvements which experience has shown are desirable.

Then it takes up some of the questions still awaiting answer: the fight over the three-family house and the two-family house, the proposal to regulate the height, area and location of buildings, the possibility of providing small houses instead of tenements for workmen, the proposed building code, the education of the tenant.

Here in small compass is a record of accomplishment and a prophesy of greater accomplishment.

Mildred Chadsey, chief of the Cleveland Bureau of Sanitation, has written a report which gives us glimpses—but clear and interesting glimpses—of the best, the average and the worst housing conditions of the workmen in her city. Too often housing reports deal only with the worst, perhaps necessarily at the beginning of a housing campaign when the leading citizens in their ignorance are firmly convinced that theirs is a city of homes. It is necessary to shock them awake, and it is often necessary to make the shock a severe one by directing attention exclusively to the worst.

But Cleveland has been awakened. So Miss Chadsey shows not only what can be done but what has been done to provide good homes for wage earners. With the latter pictures before its eyes, we shall be surprised if Cleveland does not make them its standard and rid itself of all the encumbrances which fall below this standard.

The report is published in pamphlet form by the Department of Public Welfare and is illustrated with many half-tones.

Education, more education, and then still more education has been insisted upon at the National Housing Conferences as essential to any housing program. New York city evidently believes so too. New York has had more experience with bad housing, has accomplished more in raising its standards, has in its Tenement House Department a more effective piece of administrative machinery than any other American city. So if any city knows all there is to know about its housing conditions that city certainly must be this city.

But there are new people constantly moving into the city. Add these to the people who forget and those who missed previous opportunities to learn and the necessity for continuous education is evident.

So the New York Tenement House Department and the Tenement House Committee of the Charity Organization Society are co-operating to teach the people of the city their next housing lesson. This is contained in a sort of primer which bears in white letters on a blue cover the words "For You."

The pages inside tell the inhabitants of the tall tenements what their rights under the tenement-house law are, and why. They tell the tenants how to get those rights, and then put it up to them to do as they would be done by if they were landlords or neighbors. City life

The Fairgrounds Pool, St. Louis, the largest artificial outdoor swimming pool in the world, opened its first full season in June. The pool was completed in the middle of the summer of 1914. It is the only public outdoor swimming pool in St. Louis. As it has never been possible to use the swift-running and capricious Mississippi for public bathing purposes, the pool has had enormous patronage from all over the city.

It holds almost 4,000,000 gallons of water and accommodates 2,500 bathers at one time. Over a half million bathers patronized it in last summer's short season. It is located in a newly-acquired park in the north-central section of the city, is under the management of the Public Recreation Commission. The entire park of 130 acres, laid out by George E. Kessler, is devoted to recreation.

is a complex thing. If city dwellers are to be well and happy they must themselves have, in addition to good intentions, some knowledge and intelligence. This little book supplies the knowledge which will enable New York "cliff dwellers" to use their intelligence and their good intentions to the best advantage.

BRIGHTER HOMES FOR BROOKLYN

THE TENEMENT HOUSE COMMITTEE of the Brooklyn Bureau of Charities has published a report of its work during 1912 and 1913 which contains a number of surprises for many who live no further away than the Manhattan ends of the East River Bridges. For instance, Brooklyn, the one time city of homes and churches, contains more tenement houses than does Manhattan, the old city of New York which Jacob A. Riis has pictured for us. While the Brooklyn tenements are smaller than the Manhattan tenements, there is a warning in the fact that they are beginning to approximate them.

The report describes at length frustrated attempts to weaken the tenement house law which protects a constantly increasing proportion of Brooklyn's inhabitants, of clean-up campaigns and of campaigns of education designed to in-

form tenants of their rights under the law. The most striking achievement is reported from the campaign against dark rooms. In 1909 a census by the department showed that Brooklyn had 172,286 dark rooms. On December 31, 1913, it had only 26,766. The number of windowless rooms was reduced from 49,000 in 1910 to only 909 in 1913.

Best of all, a considerable part of this progress was made with the hearty co-operation of tenement house owners.

CHICAGO QUIET

Most unthought-of sources of noise are revealed in a little circular put out by the Committee on Reduction of Noise of the City Club of Chicago. Restriction is put on dogs, hucksters, auctioneers and hotel runners. There are also laws regarding whistles on autos and motorcycles, locomotives, river vessels and stationary engines. Blasting, firearms, and transporting of metals on the streets are covered in other ordinances, and there is a law against disturbing religious meetings by making noise.

The committee urges citizens to give publicity to these ordinances by distribution of the leaflet.

Communications

The latch-string of the Communications Department is out to all readers of THE SURVEY. Lively debate and good cheer are to be had within. But the space available for the department makes necessary the following house rules:

1. Communications of 250 words or less, criticising, protesting against, or developing something published in THE SURVEY, will be published, so far as possible, in the first issue after receipt.
2. All other accepted communications will be published in the order received, if space remains after the letters described in paragraph 1 have been used.
3. The maximum length of communications is 500 words, except in cases where the writer convinces the Editor that more is needed. The extreme limit is 1,000 words.
4. Contributing Editors and authors of signed articles will be given an opportunity for rejoinder in the same issue in which letters of criticism are published.
5. In discussions back and forth between readers, each succeeding letter is limited to half the length of the previous one from the same contributor.
6. The Editor reserves the right to reject letters which he regards as libelous, letters of spite, letters on subjects outside the field of THE SURVEY; and for other good and sufficient reasons which he would be prepared to defend.

THE 7-DAY WEEK

TO THE EDITOR: Indeed, but I meant to pay no compliment to THE SURVEY in my protest against a so-concentrated food in weekly doses. It is annoying to come home tired on Saturday night and meet it—the dose—on the doorstep. And worst of all, the package is so attractive and the coating so well applied that I swallow it, package, coating and all, although I very well know that the process of digesting the weekly allotment will carry along into Sunday. And now that I come to think of it, you advocate and I believe in a six-day working week. So much for consistency! A. C. B.

FOR TRAVELERS

TO THE EDITOR: The National Brotherhood Council of England is now arranging a great campaign, "To every man in England" to be held from November 8 to 15 of this year. It will be more upon social service lines than the so-called missions have been, and is for the purpose of showing to every man that brotherhood principles can and will solve many of our difficulties and sorrows.

Extensive preparations are being made throughout the country for thousands of meetings to be held and a large amount of literature is being prepared for distribution.

Some of your readers who are interested in the progress of humanity may be intending being in England at that time. I write to say how pleased I shall be to introduce them to the movement and to receive their help in speaking at some of the meetings.

The presence and assistance of brothers from across the water would be an exemplification of brotherhood and do much to aid us in bringing it before the manhood of England. Will any who are interested or who are coming, please write to me? W. G. WILKINS.

[Alderman and ex-mayor]

Derby, England.

POSTING WORK TIME

TO THE EDITOR: I note in your issue of July 11, in reporting the hearings on the recodification of the New York state labor law, that I am quoted as urging the posting of state regulations of working hours in department stores. That is a mistake. What I advocated was the posting of the exact working hours of each girl working on shift or overtime. At the present time it is difficult to properly enforce the 54-hour law for mercantile workers because there is no way of checking up the exact number of hours employees work.

A law regulating the posting of the working hours of irregular workers in the mercantile trade is in force in Massachusetts. In New York state there is such a provision for factory workers.

ELIZABETH DUTCHER.

[Treasurer, Retail Clerks' Union]

New York.

WHAT'S THE USE?

TO THE EDITOR: There should be some systematic comparison made, showing results where the new social experiments have been tried. What is the use of an expensive laboratory for the purpose of repeating tests which are already available? For a few instances:

New Zealand has enforced arbitration of labor disputes. But no one goes to New Zealand to live.

Australia has an 8-hour day, and is a labor union paradise. But Australia has only a population equal to that of Ireland, and it has not increased one per cent in ten years.

Colorado has had woman's suffrage longer than any other state. But Colorado is the only state in the union today without a republican form of government, order being maintained by United States troops.

Berlin has had the benefit of the highest talent in city planning. But Berlin has more one-and two-room tenement homes than New York.

Western Canada has some form of the single tax. How does it work?

Iowa has the highest percentage of cultivated farms, and Iowa shows a decrease in population by the last census.

Wisconsin is a model in making its state university useful to its rural population. But many Wisconsin counties show a loss in population in the decennial period, the growth of the state being almost entirely in the cities.

Instances come to mind faster than I can record them. In the name of pragmatism, let us see whether these things "work" before we try them all!

JOSEPH D. HOLMES.

New York.

EARLY CLOSING

TO THE EDITOR: In your issue of July 11 an interesting statement is quoted from a Buffalo firm, recognising the right of its employes to shorter hours, and announcing its intention of closing at six o'clock on Saturdays, "no matter if every other retail clothing establishment in Buffalo keeps open till midnight and does a land-office business." In your comment on the progressive spirit thus shown by C. A. Weed & Co., men's clothiers, employing men only, you remark that an early closing movement for men is practically unknown outside the large cities such as New York, Philadelphia, and Chicago.

May I bring to your attention the fact that a number of Syracuse firms employing men only, have for three years past given a Saturday half-holiday, although the custom is not general even among department stores, as it is in Buffalo. One large hardware firm in particular, Alexander Grant's Sons, has shown a fine spirit in closing alone among retail hardware stores.

It is no doubt due to such a progressive policy by a few, that a committee was this year appointed by the Syracuse Business Men's Association to bring about a general six o'clock closing on Saturday for the summer months. It is hoped that this may in no way interfere with the Saturday half-holiday movement which has been supported by some hundred firms including a single department-store, Dey Brothers and Company, always a leader in improved conditions for employes.

EMILY LEVETT EATON.

[President, Consumers' League]

Syracuse, N. Y.

EMPLOYING LEISURE

TO THE EDITOR: A canoe trip this week took me down the river to Ipswich. It chanced to be the last of the week and the men who work in the mills Monday, Tuesday and Wednesday were having holiday. Occasionally one was found working in a little garden and I learned of some who spent their three off days each week clamming or at other work that offered itself. The greater number, however, crowded the pool rooms or played cards on the door steps or in vacant yards.

The people seemed to be Poles and Greeks. Many of the women were doing fancy work. The houses, judging by bedclothing airing on lines and fences, must be overcrowded. The children crowded the streets. There was a large playground in which a number were swinging in the hot sun. Boys I talked with were well informed on the child labor and compulsory education laws as well as concerning how much they had earned in the blueberry fields.

Toward evening I tramped out of the town and met a party of boys coming from a ball game. The leader, probably fifteen years of age, called to a man sitting on his door step. The answer was "Four days and twenty per cent off." The boy exclaimed "Thank God, that will help my poor mother out."

The question that comes to me is: What has been done in any community to utilize the forces set free from work at the time of slack occupation? Is there any city which has met this problem from the standpoint of either recreation or directly productive activity?

FRANK A. MANNY.

East Bedford, Mass.

WITH APOLOGIES

TO THE EDITOR: I was interested in the article on longshoremen in your issue for June 20 [report of the Industrial Relations hearing, page 320].

You speak of "F. W. Hursey, of the Bush Terminal," when as a matter of fact he represents the Funch, Edye Line, who lease a Bush Terminal pier, but are in no way a part of the company. That the pier or steamship people have been too indifferent in the past to the irregularity of employment and to compensation of accidents among their employes, goes without saying.

I think, however, you give the impression that the Bush Terminal Company expresses itself, through F. W. Hursey, (who is not in our employ) as satisfied, and "justifies" the bad conditions that exist. This is so far from the truth that I think you will be fair-minded enough to let me protest. Before my entering the employ of the Bush Terminal Company it had an accident department and paid the employes, when injured, a larger compensation than is required by law, and also cared for the widows of the men killed, while in the employ of the company.

As a company, we do not employ longshoremen. The business of the Bush Terminal Company is storing, and we fill the warehouses with the goods, which the longshoremen on the piers take from

the ships. Our laborers receive even poorer pay than the longshoremen, but it is more steady work—so much more steady that many of the wives of the men prefer it to longshore work, with its irregular hours and pay.

We are not satisfied, however, and are at work at the moment on a scheme to put the reliable laborers, who have been for years with the company, in a different class of increased pay. This will eventually affect from 600 to 1,000 men, and will be of as great benefit to the company as to the men, for increased remuneration always means increased efficiency.

ANTOINETTE GREELY.

[Social Service Dept. Bush Terminal Co.]

Brooklyn.

SUFFRAGE

TO THE EDITOR: In the July 4 issue of THE SURVEY there was an article by Graham Taylor on the Biennial Session of the General Federation of Women's Clubs in which the full text of the resolution passed by the federation endorsing woman suffrage was given a prominent place in the center of the page. Dr. Taylor dismisses the fact that there was a minority report with a few brief words.

In a spirit of fairness and for the sake of the many readers of THE SURVEY who earnestly endorse many of the principles for which the editors stand, while taking issue with them on the question of woman suffrage, I hope you will give space in your columns to this letter of mine as well as to the minority report, as introduced at the General Federation, a copy of which I enclose.

ALICE HILL CHITTENDEN.

Guilford, Conn.

"The minority members of the General Federation of Women's Clubs wish to present and place on record a protest against what is called the *unanimous* action of one million women in an endorsement of equal suffrage.

"When such leaders as Sarah Platt Decker, a pronounced suffragist individually, stated publicly and privately that such endorsement by the federation would militate against the educational value of the federation, in different sections of the country; when well known and unknown women throughout the United States, as directly interested in this convention as any delegate present, have also opposed such endorsement, a great injustice is done by the widespread assertion that a million women composing this body favor political equality."

[Professor Taylor's report stated that the resolution "supporting the cause of political equality" was adopted by an "overwhelming majority of affirmative votes" and continued: "But when the big majority had gone far enough to express their enthusiasm, the president summarily cut off excessive demonstration, and afterwards declared it in order to spread upon the minutes the protest of the minority against any impression that the endorsement of equal suffrage was unanimous which claimed that not

only those opposed to woman's suffrage, but some favoring it, deemed endorsement by the federation inexpedient."—ED.]

SAFETY-AT-SEA

TO THE EDITOR: A considerable amount of misinformation has been published on the question of safety of life at sea, and I fear some of the articles in your excellent magazine have not been right to the point.

The chief perils of late seem to be (1) fire, and (2) quick sinking of the vessel from collisions, stranding, etc.

The first—fire—can be controlled in any vessel and at small expense. A vessel carrying cargo, or its equivalent, below the main deck or at most, below the spar deck, i. e. in tight holds, can have installed a system using a gas that will smother any fire. There are several on the market. If a vessel has also, passenger accommodations cabins, alleyways, etc., etc., they can be supplied with thermostats and a sprinkler system which will hold a fire there.

The second—quick sinking—it is quite within the ability of our marine construction engineers to overcome by double hulls and bulkheads. This is far more expensive but it is not commercially or financially out of reach for new vessels.

It would certainly be a great relief to the traveling public to know that all vessels using our ports, either inland or coastwise, whether engaged in foreign or domestic trade, ten years from now must be thus constructed and equipped, and that meanwhile the present fleets are approximating as much as possible, those conditions.

The need and demand we now have for a life boat seat for every passenger should not exist. Eliminate fire hazard and furnish a ship which cannot sink for days, and the wonderful aids to navigation and to summon help will save every one on board and probably the vessel itself.

I believe the United States steamboat Inspection Service have the authority today to compel these changes, but if the authorities at Washington think the present statutes are insufficient it would be a simple matter to give the power to the Government Service which is now especially entrusted with safety of life at sea.

WILLIAM C. BREWER.

Newton Center, Mass.

THE MELTING POT

TO THE EDITOR: I note that in your article of the fourth of July, called A Pageant of the Melting Pot, you speak of "Americans with no folk-lore of their own, no traditions, no specific expressions of mood in music, movement or color."

I am afraid that your characterization is nearly true as regards music and movement, or at least that our one-step and rag time are not subjects for rejoicing. You ought not, however, to forget some of the phenomena of undergraduate life like football songs and the serpentine dance at Harvard after a fortunate Yale

game. I do not think the Comarinskaia can beat the latter for dizzy effectiveness.

As for color, I do not know that there is any existing school of art that can much beat Whistler, Sargent, Tarbell, Benson and the other late exponents of American painting. But perhaps that is not the sort of color in daily life that you mean.

As to traditions, I don't know why it should be said we have none. It seems to me that from the Mayflower to Apomatox we have traditions that are worth preserving and that are as valuable as those inherited by the Irish, Bohemian, Croatian, Polish, and Ruthenian peoples whom you mention—although I confess that I am personally not well versed in Ruthenian or Croatian history. To many of the old stock the Fourth of July itself still stands for something.

As to folk lore, Newell says in his *Games and Songs of American Children*—of which he gives more than a hundred examples—that America at the time he writes of (namely, the time just before the great immigration) was richer at least in that important form of folk lore than any other country, the reason being apparently that it had been up to that time a fairly homogeneous country and one whose people lived largely in village communities.

But whatever the value of American or of foreign tradition, folk lore and power of expression, the phrase "melting pot" is well applied. Whatever of this sort Americans or foreigners possess is almost certain to disappear when the various races have melted into an indistinguishable mass. Language—at least of a sort of pigeon English sufficient for daily use—will survive; and a few necessary institutions such as the legislature and the courts will still be carried on; but artistic expression must inevitably perish, as our literature has already done.

Foreign peasants, it is true, are still willing to come out and show their costumes in pageants, but they will not wear their costumes in daily life, and will not have them even to show for very long. Nor will they teach their native dances to their children for more than a generation or so, while the American folk lore has already so thoroughly disappeared that you in your article speak of it as non-existent.

"Melting pot" means the reduction of every race, with all that it has learned, to the bare value of the crude metal of which it was composed. So far as what we had previously learned was an evil and not a good, the change will be to our advantage. So far as there was anything valuable in what the various races have painfully acquired during the last few thousand years, it must be a loss.

Boston.

JOSEPH LEE.

SAID OF THE SURVEY

Enclosed please find stamps for one copy of *THE SURVEY* for January, 1914. You will please mail this to me at my home, as I think it worthy of a "place on my piano."

Milwaukee.

HENRY HILL.

JOTTINGS

Ohio State University, Columbus, will hold a county life week August 10-14.

Robbins Gilman, headworker of the University Settlement, New York, has resigned to take effect September 1.

Examination of candidates for the position of welfare nurse, Department of Public Safety, Trenton, \$1,000 a year, open to women only, will be held by the New Jersey Civil Service Commission, August 12.

The Bureau of Child Hygiene of the New York City Department of Health will request a budget allowance for 1915 of \$554,670, or \$123,780 more than this year. The increases asked for are to provide for 9 additional medical inspectors, 3 surgeons, 9 dentists and 84 nurses.

In a recent bulletin, it is disclosed that the Census of 1910 finds the word "pauper" is gradually passing out of use along with its local habitation, the "poorhouse." The new terms are "poor," "indigent," "dependent," and "infirmary," "hospital," "home."

A study of training for public health service and of the organization of such service in England, Germany and Denmark will be made by the General Education Board as a basis of formulating a plan for creating schools of public health.

21,000 signatures—7,000 more than enough—were secured to a petition to put the proposed Arkansas child labor bill before the voters next month. This is the first child labor bill submitted by initiative action. The bill is modeled on the National Child Labor Committee's model law.

New York's one-day-rest-in-seven law has been upheld for the second time in a decision by Judge Fish of the Niagara County Court. The New York and Massachusetts acts, both passed in 1913, replace the old Sabbath observance laws in permitting seven-day operation in industry provided each worker is given one free day out of each seven.

Rose McHugh, district secretary of the Chicago United Charities and last year a Red Cross worker at Dayton, has been put in charge of the investigation and the rehabilitation work at Salem. The bread line has been abolished and effort centers now on finding employment. Secretary of Labor Wilson is co-operating in this. Subscriptions to the relief fund are over a half million dollars. In addition, Congress has voted \$200,000 and Massachusetts \$100,000.

Just before Austria declared war against Serbia, it was announced that Prussian government officers would make an unofficial tour of inspection of American prisons and reformatories in August and September. The trip, lasting about thirty-five days, has been arranged by the Prison Association of New York. Last year four official representatives of the Prussian government spent a month and half on a similar visit, but their report has not yet been received.

The Alumnae Association of Bryn Mawr College is raising a fund as a memorial to Carola Woerishoffer. The income is to be given each year "to the furtherance of such work of social betterment or improvement in New York city as the committee believe most nearly for the time being represents the lines of activity in which Carola Woerishoffer was during her lifetime interested."

A "personal" in the *SURVEY* for July 18 stated that John R. Howard, Jr., had resigned from the general secretaryship of the Thomas Thompson Trust, Boston, to become superintendent of the New York Orthopaedic Dispensary and Hospital at White Plains, N. Y. The hospital at White Plains is the country branch of the main dispensary and hospital on East Fifty-ninth street, New York, of both of which Mr. Howard is superintendent.

THE SURVEY

COMMON WELFARE

WAR AND ITS EFFECT ON IMMIGRATION

THAT THE EUROPEAN war will have an important effect on immigration is the opinion of men in both houses of Congress. It is of particular interest in the Senate, which has before it the Burnett immigration bill which passed the House by a large majority.

Anthony Caminetti, commissioner-general of immigration holds that the natural thing to expect after peace is declared again is a quickened flow of immigrants to the United States. If the war is serious and causes general business depression in the countries which it affects, increased numbers of the working classes will have to seek opportunities in this country.

The normal flow of immigrants to this country is now more than 90,000 a month. Those who have already planned to come but have been held back by the war, Mr. Caminetti expects to sail as soon as they can get accommodations after peace is declared. Moreover, many of the foreign men who may leave this country to take part in the war, if they can obtain passage, he expects to return later to resume their work here. Adding together those whose trips have been postponed, those who have left the United States temporarily and the normal yearly number would send immigration records up to a new high mark.

That, however, is pure speculation, and Mr. Caminetti doubts if we shall beat our biggest records—1,285,349 in 1907, more than 1,218,000 in the year ended June 30, 1914, and more than a million each in 1905, 1906, 1910 and 1913.

Against the tendency to sail Mr. Caminetti checks "the resumption of commerce and agriculture in Europe [which] may mean an increased demand for laborers which will keep a great number of people at home who otherwise might come to America in case of foreign depression." But, on the other hand, there is a possible increase of one-third over last year so far as boat accommodations stand today, for he estimates that the trans-Atlantic liners could have carried that many more immigrants.

In view of the situation, it is now a question in Washington whether the

Senate will pass the pending bill to regulate the immigration of aliens to and the residence of aliens in the United States, during the present session. This bill includes the literacy test which will meet opposition in the Senate as it did in the House. And in view of complications which might arise it is believed by a number of Senate leaders that the immigration bill will be postponed until after Congress meets in December. There are some members, however, who may press for its passage before adjournment.

The bill as it passed the House is similar to the one which was acted upon favorably by the same body during the previous administration but was vetoed by President Taft because of the literacy test. There has been some speculation as to whether President Wilson might not also veto the present bill with its similar provision.

New York State Workmen's Compensation Law.

Beginning Monday July 20th, 1914, one cent will be added to the amount of every laundry bundle. We think it but just to our customers to say that it is on account of the cost of the Workmen's Compensation Law. This charge is made, instead of raising the price of any one article, to provide for part of the cost

We are firm believers in Workmen's Compensation, but it undoubtedly increases the cost of production

All increase in the cost of production, whether they be caused by shorter hours, increased wages, increased cost of raw materials, or Workmen's compensation, must be borne by the consumer. There is no other way IF BUSINESS IS TO GO ON. In this instance the employer simply acts as the tax collector and we are told that was the intention of the framers of this law

PUTTING IT ON THE CONSUMER

New York city laundries have met the cost of insurance under the new workmen's compensation law by charging one cent extra on each bundle, as announced in the circular letter reproduced above. For the first ten days after the law went into effect applications for compensation came in at the rate of 1,000 a day.

LEGAL COMMITMENT OF THE FEEBLE-MINDED

GOVERNOR GLYNN of New York has appointed the commission authorized by the last Legislature to investigate "the subject of the public provision for the care, custody, treatment and training of the mentally deficient, including epileptics." Robert W. Heberd, secretary of the State Board of Charities, is chairman and the other four members are: Dr. Max G. Schlapp, director of the New York Clearing House for Mental Defectives; Dr. Charles Loomis Dana, professor of nervous diseases at the Cornell University Medical School; Prof. Stephen P. Duggan, Psychopathic Laboratory of the College of the City of New York, and Mary C. Dunphy, superintendent of the Children's Hospital and of the Custodial Asylum and School for Feeble-Minded at Randall's Island.

The commission is directed to make its report, with recommendations, by February 15, 1915.

Many students of the feeble-minded in New York feel that the greatest need at present in the effort to segregate this class of defectives is more buildings.

The last legislature passed a bill which makes it possible for a judge of a court of record to commit a feeble-minded person to an institution upon certification of his feeble-mindedness by two physicians and after a hearing before the court on the part of those interested. This was supplemented by another measure allowing the heads of institutions for the feeble-minded to apply to the courts for the formal commitment of persons now in custody.

This puts the care of the feeble-minded in this respect on a par with that of the insane in New York. The segregation of the former still lags woefully behind that of the latter, however. Of 32,000 feeble-minded persons in the state, only 5,000 are in institutions designed for them. One of the greatest services which the new commission can perform, therefore, will be the creation of a public sentiment that will demand from the legislature adequate appropriations for new buildings for the feeble-minded.

A CAMPAIGN FOR COOK COUNTY INSTITUTIONS

THE CRISIS of the struggle to determine the future of the great humanitarian service of Cook county (Chicago), has been transferred from the Board of County Commissioners, as described in THE SURVEY for July 11, to the vigorous campaign for the county elections in November.

While no party has had the bravado to renominate any of the majority commissioners, who are charged with doing much harm, most of the minority commissioners have been renominated. Alexander A. McCormick heads two primary tickets for renomination to the presidency of the County Board—the Progressives, and a formidable independent Republican ticket. Mrs. Joseph T. Bowen and Mary E. McDowell are also running on the Progressive primary ticket for nomination to commissionerships. Mrs. George Bass, president of the Chicago Women's Club, is named by the Democratic party for commissioner. The commissioner who dared break with his colleagues of the dominant party, is its choice in the primary for nomination to the presidency of the board.

The county, therefore, is assured of an honest administration whatever party wins. But the great future for its humanitarian work, initiated by President McCormick and his minority colleagues, depends upon their re-election and reinforcement.

A citizen's non-partisan county committee is preparing to announce a citizens' split ticket, including the best nominees of all parties. If a strong working majority is elected to support the minority policies, Cook county will be assured of an enlightened and advanced development of all its welfare institutions and agencies.

The contrast between its management and that of the majority is counted upon to help decide the election.

The psychopathic hospital was built under President McCormick's supervision at a cost of \$2,100 a bed.

The still unfinished Cook County Hospital, contracted for by his predecessor the notorious Peter Bartsen, will cost \$4,600 per bed; and would have cost \$5,800, had not many wasteful expenditures been prevented. The big hospital costs the county over \$6,000,000, has a capacity of only 517 patients, and has required three years to construct it.

If the same efficiency and economy had been available for its construction as for that of the psychopathic building, only half the time would have been required, half the cost, and there could have been ample provision for 1,800 instead of 517 patients.

PROTECTING NEGRO CHILD LABORERS IN VIRGINIA —BY A. J. McKELWAY

THE JOHN KING Peanut Company, of Suffolk, Va., was found by Inspector Clinedinst, of the Virginia Bureau of Labor, to be employing 217 Negro children under 12 years of age, to whom permits had been sold by the local magistrate, E. G. Privott, at 50 cents apiece. The mayor of Suffolk was one of the stockholders in the peanut factory, and according to the testimony of Privott he authorized the magistrate to grant these permits on the ground that it made no difference about Negro children.

The Virginia law, which has lately been superseded by a better child labor statute, allowed children between 12 and 14 to be employed upon a permit issued by the magistrate. One of these permits, showing the children to be 10 years old, is herewith presented.

The commissioner of labor felt that the law had been so flagrantly violated that he moved the impeachment of Magistrate Privott before Judge McLemore. The testimony which had been prepared in the criminal prosecution of the peanut company was not made available because the company plead guilty, being fined twenty-five dollars and costs. Judge McLemore reprimanded the

magistrate but balked at fixing upon him the disgrace of depriving him of his citizenship through impeachment. The action of the judge was severely criticized by the Richmond *News-Leader*, one of the leading papers of Virginia.

Incidentally, the unofficial testimony of some of the local physicians was secured as to the tendency to tuberculosis among the workers in the peanut factory, the processes of cleaning the peanuts from the soil adhering to them, and the subsequent polishing to render them more marketable, creating conditions of dust in the atmosphere that have been peculiarly efficacious in the spread of tuberculosis among the workers.

The incident is interesting as showing the interest which the authorities and newspapers of Virginia have taken in this case of the local employment of Negro children. The present Virginia law still maintains a poverty exemption clause for children between 12 and 14 years of age, but it is so guarded by requiring that the facts shall be entered on record before the judge of the court instead of before the magistrate, as heretofore, that not much trouble is anticipated in the way of the abuse of this rather unfortunate provision.

CANADA'S NEW POLICY OF DEPORTING THE UNEMPLOYED—BY RUFUS D. SMITH

SECRETARY, MONTREAL CHARITY ORGANIZATION SOCIETY

RECENTLY a deputation of Ukrainians and Ruthenians waited upon the Canadian superintendent of immigration with the request that something be done for them as they were without work, without funds, and had no prospect of immediate employment. The reply, which was given wide publicity, was to the effect that the Immigration Department would deport to their own country all out-of-works dependent upon public charity who had been here under the three-year limit.

This step, in the light of present-day extensive unemployment in Canada, is very serious and radically changes the immigration policy. Heretofore able-bodied men temporarily out of work have been refused deportation. Since this new policy has been made public, Canadian charitable agencies have been besieged by requests for deportation. A batch of twenty-five Ruthenians have just sailed under it.

In a few years, Canada has quickly built up its immigration by systematic advertising, by bonuses, by subsidies and by payments to immigration agents. Never has artificial stimulation been so extensively used in persuading people to emigrate to a new land. Fifteen years ago the newcomers to Canada numbered a few thousand. During 1912-1913, 400,

000 reached its shores. Compared to its widely scattered resident population of seven to eight million, 400,000 immigrants is an enormous number to get planted and safely rooted in a single year.

Many newcomers have been able to secure only what amounts to odd jobs. Especially was this true in the West with its real estate speculation and wild cat values.

Business depression began about last August and continued throughout the winter. The suffering among the newcomers has been extensive and severe. Social agencies in the West were few, constructive leadership on the part of the government was badly needed and unemployment drifted along from bad to worse in the hope that the turn would come in the spring. Such has not been the case and unemployment is to be found in nearly every Canadian city in all lines of activities.

In British Columbia all immigrants, skilled and unskilled, have been excluded for six months and this order has been extended for another period. The immigration department has endeavored to check its over-stimulation by officially advising those intending to emigrate that only agriculturists and domestics are needed in Canada.

Immigration laws at the border are being rigidly enforced. As a result, immigration will be from 50 to 70 per cent less this year than last.

After a year of greatly increased burdens, it is impossible for private charitable societies to shoulder the unemployment problem. Government measures on a large scale are needed but as yet the federal authorities only sit by and state that they will deport out-of-works as undesirables.

Near Montreal is a stretch of clay road running through the fields which connects this city with the King Edward Highway, the main road to New England and New York. After every rain, automobiles and wagons are stuck in this stretch like flies in tanglefoot. Urgent appeals have been made to the government to put six hundred men to work on it at once. Not a move has been made as yet although able-bodied men are being deported from Montreal on their own request.

If the Canadian government had stood aloof from attracting immigrants, it could rightly refuse the responsibility of doing something in this situation, but having adopted the policy of artificially stimulating immigration, it is the duty of the Canadian government to do something towards carrying the unemployed immigrant through this period of stress. To deport able-bodied men under the present circumstances is making a farce of British justice.

OH, GOD, FORGIVE

MADGE E. ANDERSON

OH, God, forgive me that I fail to see
The heroism now surrounding me,
Nor count that hero great, whose spirits fail
Because his body poorly fed does quail
Beneath a task which he is set to do,—
A task too hard for him,—that we the few
In idle ease on luxuries may live:
My God, that we forget him, oh, forgive.

All day my Brother labors in the field;
Labors that the brown Earth may richly yield
Its strength of substance, that my life may live,
I do not think of him—oh, God, forgive.
And this my sister in the sweat-shop stands,
Her heart so human, struggling with weak hands,
'Till Death, more kind than Life, says: "Cease to live"

Oh, God, I thought not of her—oh, forgive.

Within the heated depth of darkest mines,
Ten thousand slaves of poverty one finds,—
They never see the sunshine. In the dark
They labor on 'till Death does stiffen stark

Our Brother's forms. Let their starved spirits
rise

To life in Light, in homes beyond the skies.
We thought not of them, laboring to live,—
Remembering now we pray: oh, God, forgive.

Upon our streets the clubs our watchmen wield
They wield for us, our safety, nor do yield,
No matter how their weary arms may ache
Nor feel for needed rest, they can forsake
A duty tedious, stale of interest,
In care for you, for me, that none molest.
Ah thus from year to year we see them live,
Yet never think of them, oh, God, forgive.

The fireman rushing to the burning home,
The sea-men who o'er angry oceans roam,
The builders of the iron-trails which link
This world of men, from oceans brink to brink,
The men who swing great bridges high in air,
And those whom pestilence can never scare—
These all are Heroes, and among us live
We seldom think of them—oh, God forgive.

INDUSTRY

THE TAMMANY TIGER'S PAW ON LABOR LAWS IN NEW YORK STATE—BY MARY CHAMBERLAIN

THE "SPECIAL INVESTIGATOR" of the New York State Department of Labor is announced. Whereupon the merchant or manufacturer is led to expect a careful overhauling of his establishment with particular attention and expert advice in relation to hygiene, sanitation and safety.

The "special investigator," be it known, is no ordinary factory or mercantile inspector, but is supposed to be a more expert person receiving a salary of \$2,000 a year instead of the \$1,200 to \$1,500 paid the factory and mercantile inspectors.

Neither is he subject to the orders of the inspector-general of the department, as are the regular inspectors, but is under direct charge of the commissioner of labor in the Division of Industrial Hygiene, the expert arm of the labor department. It is upon him that the Industrial Board must largely depend for information as to the special problems affecting the safety and healthfulness of factories and mercantile establishments.

Yet this special investigation of stores and workshops in New York state is being conducted by professional politicians, ex-saloon keepers and factory hands.

Although the work concerns particularly the hours and working conditions of women and children, not one of the investigators is a woman. They are nearly all active politicians; half of them well distributed through assembly districts are members of democratic county or city committees, engaged, apparently, not for any particular experience or qualification, but for ability in "landing" votes for Tammany Hall.

Indeed, so meager is the technical knowledge possessed by these men that for three months following their appointment they were obliged to accompany regular factory inspectors on their rounds, and since that time, it is reported, they have frequently relied in making their investigations on the assistance of a medical inspector transferred from her own duties.

This is especially true in cases involving women, as in the investigation of hours of work of women ticket agents in the Brooklyn Elevated system when it was almost impossible for a male investigator to secure data without the aid of a woman inspector. In other words, results which ought to be obtained by one trained investigator at a salary of \$2,000 have been costing the state twice as much money through the employment of incompetent political appointees unfamiliar with industrial hygiene.

But these inexperienced, unknown investigators in the Bureau of Industrial

Hygiene must not shoulder all the blame. They are only one example of a tendency manifesting itself more and more to make the enforcement of labor laws in New York state the reward of political aspiration.

When the State Labor Department was reorganized in 1913, it was believed that an efficient system had been evolved to administer the progressive legislation of the past two years. The first indication that the lives of factory workers were to be subserved to political ends came with a request from Commissioner of Labor Williams in April, 1913, that 28 positions in the reorganized department be exempted from civil service examination. At that time the Civil Service Reform Association, the Consumers' League, the New York Child Labor Committee and other organizations, made an earnest appeal to the State Civil Service Commission that the petition be denied and the entire inspection force organized on a competitive basis.

The State Commission delayed action for several months but later, when Commissioner Lynch renewed the request of ex-Commissioner Williams, the Civil Service Commission granted 21 exemptions including the positions of investigators in the Bureau of Industrial Hygiene. All were approved by Governor Glynn.

The inspectors and investigators who were appointed under this exemption aroused the mistrust that the Department of Labor was being loaded with political hangers-on and labor-union graduates with more or less political influence. Since that time the selection of other men to fill vacancies in the department, both by Governor Glynn and by Commissioner Lynch, has increased the suspicion.

More recently a Workmen's Compensation Commission has been appointed in New York state. The law which this commission will administer is in many ways superior to any other law thus far enacted in the United States, and the commission will be charged with greater powers and responsibilities than any similar body. They must pay compensation to thousands of injured workmen every year, they must approve systems of mutual insurance and self-insurance, they must as time goes by face actuarial problems fully comparable to those encountered in great insurance companies.

Not one of the men placed on this commission by Governor Glynn possesses scientific knowledge with respect to the intricate problems with which they will be called upon to deal.

Unquestionably J. Mayhew Wain-

wright knows more about the problem than any other member. As chairman of the Employers' Liability Commission of 1910, he has to his credit a constructive piece of work, and he acquired by that experience a knowledge of compensation and insurance principles that will be very valuable to him in his new position.

John Mitchell, too, by his acquaintance with labor conditions and his sympathetic insight into the problem of work-accidents from the standpoint of the wage-earner, will bring to the commission an indispensable element. The appointment of Wainwright, Mitchell and Professor Mosher, a third member, could only be applauded if the other members of the commission possessed the scientific knowledge which they lack.

As it stands, Mr. Wainwright, who knows probably more about the subject than any of the five, serves, at his own request, for one year, while the full five-year term and chairmanship at \$10,000 go to Robert E. Dowling, better known for his Tammany affiliations than for his interest in workmen's compensation. And the three-year term goes to Dr. Thomas Darlington, defeated Tammany candidate for borough president in 1913.

In designating members of the commission, Governor Glynn has declared that his choice was made without regard to politics and with the single purpose to get the best candidates. It is possible that this object has been attained. But that the selection was made without political influence bearing an important part, seems dubious since the recent appointment of ten deputy commissioners by the board itself. Again there are to be found admirable appointments, such as that of Cyrus Phillips of Rochester and certain labor men who will render valuable service to the commission. But these are outnumbered by appointments which are doubtful or notoriously unsuitable.

Furthermore, there is at present before Governor Glynn a resolution to exclude from civil service examination 18 assistant deputies, an inspector of risks and safety engineer, an examiner of claims and several minor positions in the commission's employ. The State Civil Service Commission, consistent with its year's policy, has already sanctioned the request, and it now remains for the governor to decide between an impartial test of ability and an opportunity for patronage grab. Should he follow the latter course, it may be predicted that, as in the Labor Department and in other commissions, in proportion as the positions become less conspicuous the men will be selected less for merit and more for political affiliation.

Nearly \$700,000 has been appropriated for the Department of Labor this year. Three hundred and fifty thousand dollars

has been appropriated for the administration of the workmen's compensation act. It is criminal neglect of the working men and women in the state, it is unjust to employers and unfair to taxpayers that even \$4,000 of this money be used to support a political "heeler" instead of an experienced, efficient deputy.

On the honest and efficient expenditure of this money depends the health, happiness and usefulness of wage-earners. The following records of men appointed during 1914 in the Department of Labor and on the Workmen's Compensation Commission testify to the public usefulness which may be expected of each appointee:

The Labor Department

Member New York State Industrial Board. John G. Walsh, New York city. Appointed by Governor Glynn for four years beginning December 1, 1914, salary \$3,000. (Full time not required.)

For many years traveling salesman for John Dwight Soda Co., Royal Baking Powder Co., Stalwert Bros. Chocolate Co., vice-president J. Monroe Taylor Soda Co., president four years of New York state branch of the Travelers' League, claiming 85,000 members whose purpose is to induce traveling men to return to their home cities for elections. Mr. Walsh asserts that the league backed the last presidential campaign and the McCall (Tammany) campaign for mayoralty. Mr. Walsh claims to be "an independent democrat with a clean political record." It is not politic for me," he declared, "to be a member of Tammany Hall, though my affections are there and I am a close personal friend of Charles F. Murphy."

Secretary New York State Industrial Board. John Williams, Utica. Appointed by the Board, salary \$5,000.

Appointed commissioner of labor by Governor Hughes, 1907. After the adjournment of the Senate in 1913, Governor Sulzer accepted the resignation of Mr. Williams and made John Mitchell a recess appointee as commissioner of labor, with Williams as first deputy. Both appointments were declared illegal by the courts. After that Mr. Williams was connected with the department in a semi-official way performing the work of first deputy until John R. Shillady, former secretary of the board, was ousted from his position on the grounds of "incompatibility." A carpenter by trade. Former president United Brotherhood of Carpenters and Joiners of America. Elected to the Assembly as a Republican from Oneida county in 1897-1899. Appointed state factory inspector by Governor Roosevelt in 1899; in 1901, when various branches of the Labor Department were consolidated, appointed first deputy. In 1911, while commissioner of labor, affidavits were filed with Governor Dix, alleging that Williams used the influence of his department to aid Republican candidates in Westchester county. The charges were denied by Commissioner Williams.

New York State Commissioner of Labor. James M. Lynch, Syracuse.

Appointed by Governor Glynn for four years, salary \$8,000.

Member Typographical Union since 19 years old. President Syracuse Typographical Union at 22. President Syracuse Central Labor Body for seven years. Vice-president 1898, president 1900 International Typographical Union and served continuously until elected labor commissioner. During his presidency of the International Union, led the printers' fight for the eight-hour day, instituted the old-age pension and insurance benefits and promoted a membership increase from 33,000 to 65,000. Nominated for labor commissioner by Governor Sulzer but not confirmed by the Legislature. Renominated by Governor Glynn and confirmed October 22, 1913. Endorsed by the New York Typographical Union No. 6 and by nearly every prominent labor organization in the state. An enrolled Democrat of Syracuse and is understood to have had the backing of William Kelly, regular Democratic leader of Onondaga county. In commenting upon his appointment both the New York *Herald* and the New York *Tribune* state that the Democratic organization had no objection to him before, but refused to confirm his nomination because the patronage of the office would be controlled by Governor Sulzer in his fight against Tammany.

First Deputy Commissioner of Labor. Frank J. Prial, Brooklyn. Appointed by Commissioner Lynch, salary \$5,000. Serves as inspector general of the state.

Formerly head of the bureau of claims, New York city finance department, salary \$5,000. Entered the department as a clerk and received rapid promotion under Comptroller Metz (Tammany). Retained under Comptroller Prendergast for four years. Instrumental in organizing civil employees association to secure legislation granting to dismissed civil employees the right to court review. During the McCall mayoralty campaign (1913) publicly supported McCall, the Democratic candidate, opposing Comptroller Prendergast, his chief and President McAneny, who is opposed to court review. After election, salary was reduced from \$5,000 to \$2,400 and title changed. Declined to accept and was dismissed as a "martyr to the cause" according to the civil service employee newspapers. It is reported that Senator Wagner "took care of him" and got him appointed first deputy. Member Democratic County Committee from the 16th assembly district, Kings county; 6th congressional district committee, 5th municipal court district committee.

Chief Factory Inspector. Edward D. Jackson, Buffalo. Appointed by Commissioner Lynch, salary \$4,000.

Democratic assemblyman from 8th district, Erie county, for past 7 years. Voted with Tammany, but a leader in securing legislation to better the condition of wage-earners. Sponsor of the 54-hour bill for factory women, bill prohibiting employment of women at night, "full crew" bill. Member Employers' Liability Commission appointed 1909 by Governor Hughes and of State Factory

Investigating Commission, 1911. Occupation, as given in the legislative directory, switchman. Member Switchman's Union of North America of which he was secretary for four years.

Chief Factory Inspector. Jeremiah J. Flood, New York city. Appointed by Commissioner Lynch, salary \$4,000.

A lieutenant of Senator Frawley. Under Borough President Ahearn, was superintendent of construction of sewers at \$3,000, but was dropped by President McAneny in 1910. Became known in connection with the famous "Letters to a Boss" published in the New York *American* in December, 1909, a correspondence between Charles F. Murphy and his political henchmen in New York city. Certain of these letters from John Skelly, assistant secretary to the Municipal Civil Service Commission, discussed the finding of a snug berth for "Jerry" in the Dock Department before the new administration came in. "Jerry" was Jeremiah J. Flood. Appointed one of the four supervising factory inspectors made exempt by the previous Civil Service Commission, and was the only one of these who later did not enter the examination for the other inspectorships, which had been made competitive. Member Democratic County Committee from the 26th Assembly district; city committee; 18th congressional committee, 6th municipal court committee. A plumber by trade.

Assistant Chief Factory Inspector. Edward L. Pierce, New York city. Appointed by Commissioner Lynch, salary \$3,000.

Appointed by ex-Commissioner Williams at \$2,500 as one of four supervising factory inspectors exempted from civil service examination in 1912. Later, when these four positions were placed in the competitive class, Pierce was "covered in" and retained. An enrolled Democrat of the 2nd assembly district, the leader of which is Assembly leader "Al" Smith. Was janitor of a building at 110 Front street where he lives.

Chief Investigator Bureau of Industries and Immigration. Marion K. Clark, New York city. Appointed by Commissioner Lynch, salary \$3,000.

Mrs. Clark states that since 1898 she has investigated child labor and other conditions in the Pennsylvania anthracite coal fields; alien children in public schools in and near New York city, and immigration on the Pacific coast. Her work was done independently, she says, not under the auspices of any organization, and none of it has been published. She is said to have been Senator Frawley's choice.

Assistant Counsel. Max S. Levine, New York city. Appointed by Commissioner Lynch, salary \$3,000.

A lieutenant of State Senator Christopher Sullivan (relative of late "Big Tim" Sullivan) in the 8th assembly district and his partner in the law office at 51 Chamber street. When Florrie Sullivan (Tim's cousin) was leader of the 8th, Levine was his right hand man. Appointed by "Big Florrie" as district captain in 1903, served as his personal

secretary and for four years as secretary of the Florrie Sullivan Association. Tammany alderman from the 8th district 1905 to 1913 when he was defeated by Fusion. As alderman, voted against the Folks ordinance regulating motion picture theaters, against measures for reform in police administration, and for measures attacking the merit system for city employees. According to the Citizen's Union he "voted consistently against the public interest." Is a graduate of the New York University Law School and a member of the New York County Bar Association. Member of Democratic county committee for the 8th assembly district, city committee, 13th congressional district committee, 2nd municipal court district committee. Known as the "Former Mayor of Avenue B."

Supervisor Printing and Publication. John H. McCann, Albany. Appointed by Commissioner Lynch, salary \$3,000.

Enrolled Democrat. Printer on Albany Argus, democratic machine paper supporting Governor Glynn. Member Albany Typographical Union.

Special Investigator. John McArdle, Brooklyn. Appointed by Commissioner Lynch, salary \$2,000.

Democrat, 16th assembly district, Kings county. Connected with Mailers' Union No. 6. Vice-president Allied Printing Trades Council of New York state.

Special Investigator. Edward V. Gilmore, New York city. Appointed by Commissioner Lynch, salary \$2,000.

Tammany alderman 1911-1913. 22d assembly district, Manhattan. As alderman, voted against the Folks motion picture ordinance, against measures for reform in the police administration and for measures attacking the merit system for civil employees. The Citizens Union reports "when recorded on important issues voted against the public interest." Lives in Senator Frawley's district. Member Democratic county committee for 22d assembly district; city committee, 18th congressional district committee, 6th municipal court district committee. At one time a foreman in a tin-foil factory; also recorded as a salesman.

Special Investigator. Michael Coan, New York city. Appointed by Commissioner Lynch, salary \$2,000.

Enrolled Democrat 34th assembly district. Business representative Garment Workers' Union.

Special Investigator. Robert M. Wood, New York city. Appointed by Commissioner Lynch, salary \$2,000.

For seven years an inspector of highways. Promoted to inspector of vaults by (Tammany) Borough President Ahern and Superintendent Scannel. Member Negro Democratic Club and Charles F. Murphy's first lieutenant in matters pertaining to Negroes. President New York State Colored Democracy. Appointed by Governor Sulzer as chairman of the Emancipation Proclamation Commission. In this capacity he has "stacked" the commission with Tam-

many men. Member Democratic county committee 24th assembly district.

Special Investigator. Richard E. Quirk, New York city. Appointed by Commissioner Lynch, salary \$2,000.

Member Democratic county committee, 32d assembly district. Formerly a trainman.

Special Investigator. Antonio M. Caridi. Appointed by Commissioner Lynch, salary \$2,000.

Italian interpreter in the municipal court, Manhattan, 1911, pending the establishment of an eligible list. On October 18, 1911, the Municipal Civil Service Commission promulgated the eligible list with Caridi 36th on it. The civil service rules, which have the force and effect of law, require that provisional appointments shall not continue for more than ten days after a list has been established. Notwithstanding this, the name of Caridi on the payroll was approved until January 31, 1911. When the Civil Service Commission refused to approve Caridi, he appealed in turn to the corporation counsel, the legislature and the aldermen. Did not succeed. Said to be the secretary of the Italian Tammany Club in the 3d assembly district.

Special Investigator. John E. Hickey, Valatie, N. Y. Appointed by Commissioner Lynch, salary \$2,000.

Enrolled Democrat; occupation, saloon keeper.

Special Investigator. Robert Nethercott, Portchester, N. Y. Appointed by Commissioner Lynch, salary \$2,000.

Member Democratic county committee and 7th election district committee. In 1906 Democratic and Independence League (Hearst) candidate for Assembly in 4th Westchester county district. The N. Y. Daily News (Tammany) for October 30, 1906, stated that he based his fight for the Assembly on his friendliness for the labor movement and his opposition to the local option bill which Mr. Wainwright introduced in the legislature. By trade a bricklayer, for many years secretary of the local bricklayers' union, also its business agent. Member legislative committee, N. Y. State Bricklayers' Union.

Confidential Agent. Jacob Heintz, New York city. Appointed by Commissioner Lynch, salary \$1,500.

Member Democratic county committee for 22d assembly district, 1st congressional district committee. Occupation (city directory), salesman.

Confidential Agent. Charles E. Hurley, Albany. Appointed by Commissioner Lynch, salary \$1,500.

Enrolled Democrat. Salesman for wholesale produce dealer.

Detective (not created by statute). Joseph Grandon, New York city. Appointed by Commissioner Lynch, salary \$1,500.

Clerk Senate Committee on Finance, of which James J. Frawley was chairman. Member Democratic county committee for the 26th assembly district (Senator Frawley's district).

The Compensation Commission

Member Workmen's Compensation Commission. Robert E. Dowling, New York city. Appointed by Governor Glynn for five years, salary \$10,000, as chairman of the commission.

President City Investing Company and a prominent real estate man. Chairman executive committee Citizens' Committee on Rapid Transit for New York city, 1910. In 1911 organized the Tilden Club to regenerate the Democratic Party in a campaign against Tammany Hall but in 1909 he was discussed by Charles F. Murphy as candidate for mayor. His friendship for Murphy is shown in the following from the *World* when returns were received at Tammany Hall on the night of the last election: "Murphy had just returned from Delmonico's and was seated against the wall between Robert Dowling and Justice Joseph Moss." Member New York State Factory Investigating Commission 1911, but seldom attended meetings. Member Democratic county committee, 15th assembly district.

Member Workmen's Compensation Commission. John Mitchell, Mt. Vernon. Appointed by Governor Glynn for four years, salary \$7,000.

Twice nominated for commissioner of labor by Governor Sulzer, but both times the Senate refused to confirm his appointment on the ground, according to the *World*, that he once supported J. Mayhew Wainwright, Republican candidate for senator in Westchester county, and that in 1912 he had refused to endorse the Democratic candidates put up by leader "Mike" Walsh, a friend of Murphy's. "In other words, the established independence of Mitchell," says the *World*, "constituted the reason for Murphy's refusal to accept him." When made a recess appointment as commissioner of labor by Governor Sulzer, his appointment was held invalid by the courts. President United Mine Workers' 1889-1908 and leader in the anthracite strike of 1902. Worked in the coal mines from childhood. From 1908-1911 chairman Trades Agreement Department National Civic Federation; but, it is said, the radical element of the miners' union compelled him to resign. Also a member of the Civic Federation's joint commission on the operation of workmen's compensation laws. A vice-president of the American Federation of Labor.

Member Workmen's Compensation Commission. Dr. Thomas Darlington, New York city. Appointed by Governor Glynn for three years, salary \$7,000.

Ex-commissioner of health (Tammany) under Mayor McClellan, 1904, and defeated Tammany candidate for borough president, 1913. His appointment as health commissioner credited to Louis Haffen, leader of Tammany in the Bronx. During his administration, first class laws enacted against sale of drugs, a plan of school inspection formulated, fight waged against the sale of impure food, death rate declined from 20.01 in 1904 to 15.98 in 1910. It was said, however, that he was practically

controlled by his assistant, Dr. Walter Benschel. Mayor Gaynor stated in 1910: "I suppose every informed person knows he [Darlington] has not run the Health Department for over three years, though nominally at the head of it." Elected chairman general committee Tammany Hall, 1911. When the old general committee of Tammany Hall was reorganized into the new county committee, Dr. Darlington was elected chairman in 1912. Re-elected 1913. Dropped as a member of National Democratic Club along with Murphy, Foley, Gaffney and Plunkett, but reinstated later. Appointed a sacheem of the Society of Tammany April 20, 1914. Graduate College of Physicians and Surgeons, Member New York County, State, and American Medical Associations. Welfare secretary American Iron and Steel Institute.

Member Workmen's Compensation Commission. Howard Mosher, Rochester. Appointed by Governor Glynn for two years, salary \$7,000.

A professor at Rochester University. Chairman county Democratic committee, 1910. Ran the campaign of James S. Havens, Democratic candidate for representative in Congress against the Republican boss, George W. Aldridge. When Democratic State Chairman William Connors, friend of Murphy, offered the services of the state organization in the campaign, Mosher wired him to "keep out of the fight."

Member Workmen's Compensation Commission. J. Mayhew Wainwright, Westchester. Appointed by Governor Glynn for one year, salary \$7,000.

Republican senator from Westchester county since 1908. Assemblyman 1901-1908. Nominated by the "Ward machine" of Westchester county, but grew steadily independent and has made an excellent record. A friend of Governor Hughes and supported most of the Hughes reform measures. Active in investigation of graft charges in Senate, following Allds bribery investigation. Chairman Hughes Employers' Liability Commission, 1909, and sponsor of several bills on workmen's compensation. Author of the compensation law declared unconstitutional by the Court of Appeals in 1911. Went to Europe in 1910 to study methods of dealing with industrial accidents. A lawyer by profession. Two years president of the Westchester Bar Association, two years in district attorney's office New York city. An active supporter of Theodore Roosevelt at the Chicago convention but did not bolt to the Progressive party.

Secretary Workmen's Compensation Commission. Frank A. Spenser, New York city. Appointed by the commission, salary \$5,000.

From 1906 to 1914 secretary New York City Civil Service Commission, beginning as a clerk in 1896. When the Mitchel administration came in (Fusion, 1913) new commissioner asked him to seek a transfer. Tried to transfer to the Board of Estimate and was then appointed on the Compensation Commission. As secretary of the Municipal Civil Service Commission, Spenser was implicated in

the transactions between John Skelly, assistant secretary, and Tammany Hall. A letter written from Skelly to Senator James Frawley (Letters to a Boss) intimated that Spenser had stretched the civil service law so as to pass a constituent of Frawley's who was up for police promotion and that he was "digging up" a place for "Jerry" Flood in the dock department. Skelly wrote: "We have a friend in Spenser and a friend that can be relied upon who is willing at any time to go the limit for us." Later President Polk asked the State Civil Service Commission to investigate the case of Spenser and he was absolved by the state board from blame.

Deputy Commissioner Workmen's Compensation Commission. Patrick Whitney, New York city. Appointed by the commission, salary \$4,000.

Tammany commissioner of corrections 1910-1913. First deputy fire commissioner under Commissioner Hayes (Tammany) in the McClellan administration. Tammany made a great effort to place him in the Gaynor administration and he is said to have obtained his appointment after he received the endorsement of the mayor's friend, ex-City Chamberlain Hyde who was later convicted of fraud in connection with the failure of the Carnegie Trust Company. As commissioner of corrections, Whitney and his warden, William Wright, were accused of favoritism to William Crimmins, president of the Carnegie Trust Company, and Charles H. Hyde by allowing them the "warden's suite" and other privileges while incarcerated in the Tombs. Although the grand jury found that Commissioner Whitney had entrusted the entire management of the Tombs to Warden Wright, Whitney did nothing towards removing Wright. Whitney was also accused of mismanagement in connection with the penitentiary workshops. He appointed, on recommendation of Tammany Assemblyman McGrath of the 20th district, Dr. Baxter, the man recently convicted for selling drugs to inmates of the workhouse while physician there. More recently Mr. Whitney has been involved in the connection between the New York, New Haven and Hartford Railroad and "14th Street." It has been brought out that he was in the employ of the New York, Westchester and Boston Railroad between the time the Board of Aldermen gave the Westchester the franchise and the date the Board of Estimate modified it according to the desires of the New York, New Haven and Hartford. Mr. Whitney states that he was employed during that time as a "clerk," but the New York World of April 29, 1914, states that he was carried on the payroll "at a salary in excess of that paid to the general manager of the concern." Member Democratic county committee, 12th assembly district (Murphy's district); city committee, 15th congressional district committee, 4th municipal court district committee. A life-long friend of Charles F. Murphy, an active member and for many years treasurer of the Murphy political organization in the 12th district, the Anawanda Club, and for a

time recording secretary of Tammany Hall.

Deputy Commissioner Workmen's Compensation Commission. Thomas J. Curtis, New York city. Appointed by the commission, salary \$4,000.

President Central Federated Union, New York city. Fifth vice-president New York State Federation of Labor. President Joint Compensation Conference of the Labor Bodies of New York. Secretary International Tunnel and Subway Constructors' Union. Business agent Rock Drillers' Union. In 1909 while Curtis was the labor representative on the Reform Committee of 18 which came together to select a committee of 100 in the Fusion fight against Tammany, he called on Charles F. Murphy to declare for John Benschel (Tammany) president of the Board of Water Supply, as candidate for mayor. Curtis explained that he was only acting as a representative of his union and that he personally was with the Committee of 100. The explanation was accepted, but Curtis was viewed with suspicion and disciplined by the committee.

Deputy Commissioner Workmen's Compensation Commission. Thomas Drennan, Brooklyn. Appointed by the commission, salary \$4,000.

Secretary Board of Assessors since 1910, recently resigned. Prior to that, deputy receiver of taxes for Brooklyn to which position he was transferred by (Tammany) Comptroller Metz from collector of arrears. Democratic leader 4th assembly district, Brooklyn. When the Kings county Democrats rebelled against the leadership of Senator Patrick McCarren, in 1908, Mr. Drennan remained loyal to McCarren and in the primary which ensued won the 4th district leadership. Member Democratic county committee, 4th assembly district Kings county; judiciary committee, city committee, 5th congressional committee, 3d municipal court district committee. McCooey (Brooklyn Democratic boss) reported in all political gossip to have promised him this job and to have had hard work landing it.

Deputy Commissioner Workmen's Compensation Commission. August Lauter, New York city. Appointed by the commission, salary \$4,000.

Cashier in Sheriff Julius Harburger's office (Tammany) January 1 to March 1, 1912. Secretary German Democracy in the Bronx (Democratic club). In the real estate and fire insurance business.

Deputy Commissioner Workmen's Compensation Commission. John N. Fitzgibbons, Oswego, N. Y. Appointed by the commission, salary \$4,000.

Ex-mayor (Democratic) of Oswego. Legislative representative Brotherhood of Railroad Trainmen. Said to have had a secret ante-election bargain with Governor Sulzer whereby Sulzer was to sign the "full crew" bill in return for Fitzgibbons' campaign help and said to have written a letter to the brotherhood men recommending Sulzer. This correspondence with Sulzer used as one of

CHURCH and COMMUNITY

Edited by GRAHAM TAYLOR

AN EPISCOPAL VIEW OF THE CALUMET COPPER MINERS' STRIKE

THE COMMISSION kept itself in daily touch with the situation for the twelve months past and in personal touch with many of the principal actors on both sides of the question, basing its statements on facts carefully verified at first hand. They endorse the report of the Copper Country Commercial Club as an accurate statement of conditions in the affected district. They highly commend the attitude of the governor of the state of Michigan, and the efficiency of the militia as an auxiliary of the civil authority in restoring order. They point out how the difficulties of those who were trying to bring about an equitable adjustment of the difficulties were augmented manifold by careless statements, and deliberate falsehoods sent out broadcast. These prolonged the strike four months and aroused a nation-wide bitterness which bodes no good to the efforts of those who would promote a harmonious relationship between labor and capital. Justice can never be built upon falsehood.

Industrial and Social Conditions

These compare favorably with those of the average American worker; work is steady; general lay-offs unknown; unaffected by nationwide panics; in fifty years no labor disturbances of any importance; safety first; average death rate below that of other copper producing states; called the ideal mining camp.

Churches numerous, of many languages, well attended; miners incline towards enthusiastic types of religious life. School system complete; Calumet High School enrolls over 1,000; one of best equipped in Michigan. Physical director of Chicago Public Schools said that he had never seen healthier or better dressed children than those about the Calumet schools.

Housing conditions superior to those of large cities. Generally well furnished; many pianos; tables well spread; average person per house 6.3; average per family 5.4; some houses crowded usually from choice; one such of five rooms has ten men, two women, three children; this rents for five dollars a month and has an income from the mine of seven hundred dollars a month. At new mines the companies must build houses for the men until the success of the mine is assured. These rent for one dollar a month, including pasturage, garden space, etc. There are about 1,800 company houses and 16,000 privately owned houses.

The common danger which attends the underground worker, and the rugged life develops a spirit of comity, of good fellowship, and social unity. The tendency in the individual is towards inde-

*I*N this department of *The Survey*, contributions are published, as are the communications from readers in other columns, without committing any one but the authors to the opinions expressed. Here as there *The Survey* is hospitable to those who agree to differ in freely expressing their opinions. It cheerfully prints views at variance with its own and claims the right to continue to differ from such views.

The following view of the Michigan copper miners' strike is printed at the request voted unanimously at the annual convention of the Marquette diocese of the Protestant Episcopal Church, "that an abstract of the report of the Social Service Commission be made and forwarded to *The Survey* by the secretary of this convention together with the request for its publication."

*I*T is only fair to call attention to the fact that this account of the situation differs materially from the report of the patient investigation made by one of our staff and published in *The Survey* for November 1, 1913. Comparison is invited, for instance, between the primary causes of the strike cited by *The Survey* and the very secondary considerations alleged as such in the abstract—"innate laziness" for example.

The contrast between the accounts given in *The Survey* for January 10, 1914, of the Citizens' Alliance, and the indiscriminate "credit" given it in this abstract is hardly explained by the emphasis placed upon "the fact that public meetings for consultation were opened with prayer and closed with benediction."

The accompanying abstract was furnished by the Rev. James E. Crosbie of Vulcan, Mich., secretary of the diocesan convention which met at Negaunee on June 3.

pendent self-reliance combined with a willingness to do one's part.

Political domination in the mines is a possibility minimized by the Australian ballot. The present judge, county attorney and congressman in Houghton county (population 90,000) were not the choice of the mines. There is a large citizen body living in many villages only indirectly connected with the mines; an

influential businessmen's club of several hundred; many social clubs; literary clubs; fraternal societies; civic improvement associations; \$75,000 Y. M. C. A.; a great deal of travel at home and abroad.

Causes of the Strike

Influx of large foreign population not yet absorbed in community life.

Minor grievances. Inflammatory talk calculated to arouse class hatred. False promises.

Innate laziness. To quote from prominent strike sympathizer, "Many of the strikers will not return to work if the federation is recognised or not. Such people believe that the world owes them a living, and they seldom make any effort to secure a livelihood. It is usually from such that the greatest demonstrations are heard. It is useless to talk to them."

The Real Issue

Recognition of the federation which meant that shortly all mine workers must join this union, and all negotiations between workers and employers must be supervised by the officials of the Western Federation of Miners.

The operators had the support of more than 60 per cent of the men; the federation of less than 30 per cent. The men petitioned the managers not to recognise the federation. At the Calumet and Hecla less than 400 struck, about 400 left the district, about 3,400 signed a request that the mine be reopened and they be allowed to earn their own living.

Why the Strike Failed

We gather from federation sources the following: "premature"; "bad advice"; "did not receive the endorsement of the A. F. of L."; "misjudged and defied local public opinion."

From other sources we gather the following: Grievances did not justify upsetting the industrial peace of 100,000 people. Unprovoked and premeditated violence. Over against fifty years of industrial peace of the mines the workers set the stormy career of the federation. Because of the characters of the local leaders. Because the majority of the men opposed the strike. Because of the failure to fulfil promises.

We quote from an attorney who for eight months gave intelligent support to the strike, a leader among his nationality: "Think wisely—do not permit yourselves to be deceived by the agitators. Others are taking your places—they come to the copper district because they can earn more money than elsewhere. Public opinion has been against this strike from the beginning and no strike has ever been won where public opinion was against the strikers. The people of the copper country believe the federation will bring nothing but harm to this

district and their belief is based on the history of the organization in the west. Added to this is the confession of John Huhta, the federation secretary of South Range, who admits his complicity in the brutal murder of Painesdale. * * * The time will come when those who are still striking will find that they have been willfully deceived. When the strikers know the facts, God have mercy on the agitators."

The Strike Hung on After it was "Lost"

Governor Ferris said, "If outsiders would keep out the employers and employees would quickly adjust their difficulties." Liberal strike benefits, comfortable houses, inherent laziness, intimidation of those who would return to work, hope of further concessions, and that the mines would ultimately be turned over to those loyal to the federation, discharging all others, kept many in the rank of the strikers.

Violence

There was much unprovoked and premeditated violence, fostered by paid agitators. Intimidation of workers, of women and children, and of strikers who were losing interest. The attitude of the mobs was frequently that of small boys stoning frogs and laughing at their struggles. An official of the I. W. W. said that when it came to rough work the W. F. M. had it on the I. W. W. The midnight murder at Painesdale was deliberately plotted by a federation official and not the outcome of untoward

events.

This intimidation was exercised against many who wished to remain neutral. The violence and braggadocio and insolence of the labor leaders when in power for one week lost for them the confidence of the better class and, when contrasted with the liberal policies of the mines for fifty years, caused the citizen body to cast the weight of their influence with the men who wished to work.

The Attitude of the Citizen Body

The citizens generally had no desire to 'take sides.' But found they could not shirk a manifest responsibility. The promptness with which responsible citizens took hold after the James murder prevented retaliation, stopped violence, set the dormant courts in motion, secured a promise from the managers to keep their jobs open for the men not aggressively violent, alleviated suffering, tried to prove that old friends were the best friends, formulated plans for teaching the foreigner the customs of his new home.

We credit the fair-minded attitude of the citizens in this crisis to the fact

that the public meetings for consultation were opened with prayer and closed with benediction, while intercessory prayer was held by the women in adjacent churches. This represents the attitude of 90 per cent of the population excluding actual strikers.

Suggestions

No law can prevent these outbreaks but the spirit of Christ in men's hearts. Arbitration laws should rigidly exclude all who profit by these disturbances. Steps should be taken to graft the foreigner into community life and instruct him in the obligations of citizenship. Certain laws should be readapted to meet the needs of mining communities. The Church should preach the Golden Rule as the one fundamental on which social justice can stand, without which the most utopian scheme is doomed to failure. It was St. Paul's message of Christian love, "Receive him as a brother", that broke down Roman and Grecian slavery, and not the revolution of Dymakos or Spartacus. She must ever say, Why do ye strive? Are ye not brethren? One interest must ever be upper-most the interest of humanity.

A SERMON ON HEALTH BY AN ASSISTANT SURGEON GENERAL

DR. W. C. RUCKER, assistant surgeon general in the United States Public Health Service, has this to say

on The Relation of the Church to Industrial Disease:

"Should we as Christians permit such things to continue? Should we allow the necessities of our lives to be produced at the cost of human suffering which is entirely needless and wholly preventable?"

"If any Christian is really desirous of knowing the conditions under which the things which enter into his life are produced, let him but investigate one industry, and he will be appalled at the sacrifice of human life which he will find therein. The porcelain dishes from which we eat are covered with lead glaze in the production of which hundreds of human beings contract chronic lead poisoning. Other glazes are just as practicable, yet lead is used because it requires a lower degree of heat and therefore lessens the cost of production.

"A portion of the clothes which we wear is made of cloth the initial fabric of which was gathered from the garbage dump by women and children and sorted in dusty rooms by women. A few years ago, in investigating the rag industry in a certain portion of this country, I was told that Russian women made the best rag sorters, 'because' said the foreman, 'they last the longest.'

"Consider the high morbidity rate among the women who work in the pneumatic tire manufactories of England. Think of the chronic brass poisoning which occurs in the foundry workers who have made the bright work on your automobile.

"Imagine, if you can, working in a steel mill under high temperature for twelve hours per day, seven days in the week, three hundred and sixty-five days in the year, and you will comprehend that you, as a Christian, have a duty to perform in the correction of these evils.

MAROONED *Newark Evening News*

"Even the very festival which celebrates the birth of our Lord and Master means a physical drain upon the shop girl, who for \$6 or \$8 a week is selling her very body, and perhaps her soul. The toys which are given to children at Christmas-tide have been produced for the most part by the labor of other little children—little children in foreign lands, perhaps, but none the less our brothers. If as Christians we believe that the body of man is the temple of God, it is our duty to drive out these money changers in the temple, who would transmute the souls and bodies of men and women and little children into the coin of exchange.

"The men of this congregation will go to their businesses tomorrow morning and will take no thought of the cleanliness of the halls and rooms of the buildings in which their offices are located. If they will but wait until nine o'clock tomorrow evening they will see the bent and broken figure of a woman kneeling on the cold flags of the floor, scrubbing. Recent investigations show that these women are for the most part widows, having dependent children, and that the wage which they receive is barely enough to sustain life. The little children are left at home alone all day to acquire what habits no one knows, and as soon as they are old enough to command a certain price in the labor market they are put to work.

"The Russian mother, on her flying sledge,
Chased by the leaping wolves, the hungry wolves,
Is said to throw one child to those fierce fangs
To save the others—may be, throws them more.
So, mothers of the poor, beside whose doors
The wolf sits always, scratching at the sill,
Send out one child to stop his mouth awhile,
Or two, or more, to keep the rest alive."

"There are many laws upon the statute books prohibiting the employment of children under certain ages. Yet anyone who has investigated the subject knows that age certificates are constantly being falsified in order that girls may receive the kiss of death from the shuttle, and that boys may pick the slate from the coal around whose ruddy glow we Christians gather for our family prayers.

"It is not through the impracticable doctrines of the zealot that this will come to pass. We must investigate, we must correlate, we must legislate, and we must administrate and while the problem as a whole is so great and there is such an entanglement of right and wrong that it cannot in its entirety be grasped by a single mind, there are nevertheless many tangible things on which we may lay hold, and as individual Christians work toward remedying the conditions of industry.

"And so will come the conquest of industrial disease, if we, the members of the living Church of God, will but accept our individual responsibility to the toilers of this earth. The remedy cannot be fixed and inelastic. The problem is

too great to be grasped by the mind of man and reduced to a set formula or equation. It is as big as God's own nature and it is only by approaching its solution in His spirit that we can hope for the alleviation and cure of this disease which rots the very woof and warp of our social fabric."

THE INSIDE OF THE CUP—By Gertrude Seymour

AN ANTHOLOGY of reviews of *The Inside of the Cup* [Macmillan Company, \$1.50 net] would seem more feasible than a new review at this time when the book is in its eighteenth printing. For the opinions expressed about Mr. Churchill's work are legion.

The book has been relegated to the era of Robert Elsmere and the days when *A Singular Life* was really singular. It has been criticised by scholarly churchmen as inaccurate in its hostile data, as the portrayal by a hostile pen of Christianity with Christ left out. The hero has been called unfair, untrue. No man, the protest goes, could in this day and generation remain for fifteen years, in even a small and secluded parish, unaware of the intellectual unrest surging through the world. No church could be so belated, so benumbed, as to allow its rector to vegetate, undisturbed, for fifteen years.

This last criticism has, however been guarded against by an inconspicuous sentence, as brief as it is significant: "Whiteley's men had never struck." The Rev. John Hodder was not unaware of the great unrest; it simply had not come nigh him. Chiefly because Whiteley was Whiteley, Hodder's gentle parish lived undisturbed by strikes, and socialistic theories remained in books read by ineffectual men. But as his leading parishoner drives him through the dingy streets between the station and the parish house of his new charge, he looks out through the carriage windows as if in recognition of possibilities foreseen. And his response to Mr. Parr's comment on the new and different conditions awaiting him is instant: "I know it."

So the dramatic necessity of the story is met. Given the conditions, given the personality—from their meeting there can be but one result.

The more technical theological criticisms must be passed by. We are not theologians. Detailed ecclesiastical history is beyond our ken. We have not read up the Arian heresy nor studied the Council of Nice. We read patiently all the chapter of Hodder's dissertation to Alison Parr, yet our chief impression was of wonder at the lady's power of attention—explained in some degree, of course, by "human interest."

But the story's great significance lies, it seems to us, not in the arguments, be they logical or otherwise, but in the enlightenment and readjustment of a strong personality in a new contact with other personalities. As a student, Hodder turned first, inevitably, to history and record in his attempt to square the circle of his problem. Yet it was not in history and record that he read an answer to the questions that tortured his life. The new Hodder, all the dynamics

of his conviction and his work, came from contact with people who, wronged, suffering ignored, were nevertheless spinning eternal truth out of the stuff of every day. And before this eternal truth, all doctrine that was merely academic slipped away.

But all this is, of course, an individualistic interpretation. There remains when one has closed the book, a question of social significance—what became of St. John's on this new basis?

Perhaps considerations of space prevented Mr. Churchill from carrying his story beyond this question mark. Or is there no material available for the purpose? Up to this point the story need not be deemed wholly imaginative. Hodder's glowing words have been quite equalled. Witness, for example, a resolution passed last fall by the convention of the church which Hodder represents:

"We . . . do affirm that the church stands for the ideal of social justice and that it demands the achievement of a social order in which the social cause of poverty and the gross human waste of the present order shall be eliminated."

But was the resolution wholly a forecast? Back of its conviction was there not accomplishment? Some, undoubtedly. But on the whole, Hodder stands not an exaggeration but a representative of new faith, and of new work, newly begun.

The book leaves a twofold challenge: to the church—so to multiply its Christian service in practical social endeavor that knowledge of it cannot be hidden away, tacitly classified, in "reports;" to the skillful writer—to find and to illuminate the significance of this new service, turning "reports" into literature and challenging action as he has challenged thought.

THE LONDON SURVEY

What new ground plans are being laid by the churches for their own community work is happily illustrated by *The London Survey*. It is a report on a limited survey of education, social and industrial life prepared for the Men's Federation of London, Canada, by the Presbyterian Committee on Religious Education, the Methodist Department of Temperance and Moral Reform, and the Presbyterian Board of Social Service and Evangelism.

The pamphlet is unusually graphic and practical in its outlay of the work done and projected. Pointed and pithy are the recommendations based upon the facts tabulated and presented in graphic form. Industrial education is discussed in its connection with religious education. Industrial conditions including wages and family budgets, housing and markets, are considered as the concern of the churches. The relation between delinquency and recreation as it bears upon conditions in London is vividly portrayed. The liquor problem and social vice significantly follow the discussion of public health.

Such surveys give promise not only of new vitality in church life and new aggressiveness in church work, but also of newly planned and reconstructed communities.

COMMON PROBLEMS OF NEGRO AND WHITE IN THE SOUTH

THERE GATHERED recently in the buildings of Clark University and Gammon Theological Seminary, Atlanta, Ga., (two institutions for the advanced training of Negro students) one of the most notable companies that has come together in the South in many years. There were 550 students and professors, representing eighty-one Negro institutions throughout the South, some forty or fifty of the leading ministers of the Negro church and about seventy leading southern white men and women who came together to discuss the common problems that face the two races in the South.

The first purpose of the conference was a study of the Negro church and its message for the present day. The four morning sessions were given to addresses and to the discussion of this most fundamental problem. The Negro church has a larger relationship to the Negro race than has any church to the white race. It is not only the place of religious life, but it is the social center as well as amusement and recreation place. One morning was given to a careful study of the relationship of the Negro church to better homes; another to the relationship of the church to the up-building of race ideals and race consciousness.

Afternoon sessions of the conference were given up to the study of race co-operation. Addresses on the basis for economic co-operation, religious co-operation, and educational co-operation were discussed, both by the leaders of the white and of the colored races.

Evening sessions were devoted to discussion of the Christian leadership of the race, including the ministry, the men who should be sent to Africa as missionaries, the secretaryship of the Young Men's and Young Women's Christian Associations, and other similar organizations.

In all these sessions both Negro men and women in the South and white men and women spoke. There was not a session in which there were not both white and colored speakers appearing. This is a great step in advance, the two races coming together in cordial co-operation for the study of the fundamental problems of Negro life.

Dr. John R. Mott of New York city, who is head of the Foreign Department of the Young Men's Christian Association, and also head of the Student Department in the home field, acted as presiding officer. His counsel and inspiration was invaluable to the whole conference. He also made two addresses, one on the present-day opportunity throughout the world for the advance of Christianity, and another on the Christian life as a basis of all co-operation.

Throughout the entire four days of addresses and discussions there was hardly a jarring note. There was a most cordial sympathy from both sides and the utmost frankness and thoroughness of expression. The harmony that prevailed throughout this conference did

not arise out of suppression of conviction but out of a wholesome spirit of brotherhood dominated by the spirit of

Jesus Christ.

At the close of the conference the following statements or findings were unanimously adopted as expressing the spirit, the purpose and the results of the meeting:

FOR THE CONSERVATION OF THE CONFERENCE

Adopted by the Conference

Recognizing fully the difficulties of making this conference a reality in our communities, recognizing fully the handicap under which the colored people in the South labor, and recognizing just as fully the fact that all co-operation is two-sided, that both races need to be ready to do their share in bridging the chasm of misunderstanding, we wish to make the following suggestions for the conservation of the work of this conference:

First: We believe that race co-operation can be promoted only by the good spirit which has characterized this gathering. Bitterness of expression, sarcasm and stinging words from either side will never bring us together in brotherly fellowship. Here we have had Negro men and women, and southern white men and women, meeting side by side in the spirit of friendliness. We were told by timid souls we could not do this, but we have done it,—and this is not the first time. If this can be done here, then all the people in the South can do this, when the spirit of Jesus sufficiently dominates our hearts that colored and white alike forget their prejudices, their grievances, and their difficulties and rejoice in a chance for united service. We would, therefore, recommend that each member of this conference go back to their respective communities to urge this mutual confidence and trust between races.

Second: Believing as we do that religion is life, and life is right relationship, we recommend that a renewed emphasis be placed on a sane but aggressive evangelism. To this end we recommend that white and colored churches in various cities and in country communities enter upon united evangelistic campaigns, such as have been so successfully conducted in some of our southern communities.

Third: Believing that faith and mutual understanding will be promoted not by criticism but by service, we recommend that an effort be made in every community to unite the races in community wide social work. This work may well take the direction of improving health conditions, working out a plan of real sanitation for all sections of the city, seeing to it that the housing conditions are improved, that saloons and houses of pollution are not saddled on any part of the community, and that back alley, back yards and other hidden spots be cleaned up—thus working for a truer and sweeter community life.

Fourth: Believing that ignorance is always the harbinger of prejudice, we wish to urge that white and colored colleges and churches alike

start thorough classes in the study of the conditions of the needy people of both white and colored in our cities. It may not be known to you that this conference here is the legitimate outgrowth of just such study groups in scores of colleges and churches, both white and colored. This meeting not only could not have taken place, but it would not have taken place if there had not been in the last few years thousands of students and professors studying these difficult problems.

Fifth: Recognizing that 70 per cent of the colored people live in the country, we recommend that our colleges give much attention to the organization of classes in the study of the country problem, including the study of the country church and the country school, rural sanitation and health, and rural economics.

Sixth: We recommend further that every delegate shall seek every opportunity to report, not only the facts but also the spirit of this conference in the colleges, churches, young people's societies, and public schools of their local communities. We should all write one or more articles for our local papers.

If this conference has brought heart and confidence to us, we have a definite obligation to take this message of confidence and answering trust back to those who have not had this privilege. If this conference does not send us away, both white and colored, with a sweeter temper, with a greater confidence, with a profounder faith in each other, then it has been a failure, and just in so far as any one of us goes away to criticize, to complain, to nurse our prejudices or our wrongs, just in so far as this conference failed. Mutual confidence, mutual respect, mutual trust and love are the keynotes of this conference, and these key-notes can alone be made to dominate our lives through the spirit of Jesus Christ, and it is an obligation to foster this spirit in both races.

The most marked characteristic of Jesus Christ lay in the fact, that though He always spoke with perfect frankness, His words were touched with that sweet gentleness that left no sting in the human heart. If the members of this company go back to their several communities to speak frankly, but without bitterness or rancor, we shall have made a valuable contribution toward the removing of barriers between man and man. For all days to come may it be said of us as it was said of the Great Deliverer,—a bruised reed would He not break, and smoking flax would He not quench.

HEALTH

THE VALUE OF TUBERCULIN IN THE TREATMENT OF TUBERCULOSIS—BY JAMES ALEX. MILLER, M. D.

WHEN ROBERT KOCH in 1882 announced the discovery of the tubercle bacillus as the germ cause of tuberculosis, hopes for a method of successfully coping with the germ were immediately aroused. When eight years later this same scientist announced that he had discovered in tuberculin an agent which, when injected into animals or human beings with tuberculosis, appeared to have distinct curative value, all the world was immediately aroused to a high pitch of excitement. A sure cure for tuberculosis was confidently hoped for and when, in a comparatively short time experiments demonstrated that tuberculin was not such a cure, the reaction was as intense as was the previous enthusiasm.

In those days tuberculin was given in large doses, and it was easy to prove that in many cases great harm was done. The good effects reported were less striking and for many years lost sight of.

A few patient investigators, notably in this country Dr. Trudeau of Saranac Lake, continued to experiment with tuberculin in the laboratory and in the clinic until a method was devised very different from the original one suggested, by the use of which no harm could result and considerable benefit in certain types of cases was observed.

Encouraged by these observations, tuberculin gradually became more widely used in small doses, until in the last decade it has re-established itself as an important aid in the treatment of tuberculosis.

Tuberculin, as originally prepared by Koch, is a preparation of glycerine broth cultures, in which the tubercle bacilli has grown for several weeks, and then the germs are removed by heat and filtration. This preparation contains some of the poisonous products excreted during the growth of the germs and also small particles of the broken up bodies of the dead bacilli themselves. These small particles probably represent the active principle in the tuberculin.

There are many other preparations of tuberculin; one in particular worth mentioning is prepared by grinding up the particles of tubercle bacilli into a glycerine emulsion. It would appear, however, that all the preparations of tuberculin act in a similar manner and that their special action is due to the same element in all.

In recent years, scientists have learned a great deal about the problems of immunity in various infectious diseases. One of the most interesting phenomena is what is known as anaphylaxis, or the increased sensitiveness to bacteria, or to be specific, an increased sensitiveness

Announcement by a New York hospital of new methods of administering tuberculin, of marvelous results from its use, and of a training course for physicians in the administration of tuberculin, led The Survey to ask for this article by Dr. Miller. He is widely known in tuberculosis work, both as chief of the tuberculosis division of Bellevue Hospital, New York, and as a director of the National Association for the Study and Prevention of Tuberculosis.—Ed.

to the protein constituent of the body of the germ.

In tuberculosis anyone who has ever had the germ in his body, be it even in a very slight degree, has this increased sensitiveness which is most generally recognized in the tuberculin reactions. Of these, the skin or Von Pirquet is the best known.

It now develops that this increased sensitiveness to tuberculin is one of the processes of immunity and the problem in tuberculin treatment is to so influence this reaction in the body cells that either an increased resistance to the germ may be produced, or else an increased tolerance to the poisons of the germ in the system. Recent investigations would tend to indicate that there is no direct immunity in the ordinary sense of the word to tuberculosis, but rather an increase of resistance to what is known as superinfection. For example, a slight infection with tuberculosis during early life may never give any symptoms, but the individual will as a result always react positively to the tuberculin test, and also very possibly has developed an increased resistance to later infection with the same germ.

It is thus evident that in tuberculin treatment we are dealing with very sensitive and delicate reactions. The results obtained are not always easy to see and the treatment itself should always be given with the utmost care by those well versed in the proper methods.

The great majority of cases of tuberculosis would better never be treated with tuberculin at all, but for certain other cases, the selection of which should always be left to an experienced physician, the results appear excellent. In general, it may be said that the more suitable cases are those in which the disease has become localized in the system. This is best seen in cases of so-called surgical tuberculosis, that is of the bones, glands, or joints, etc., and similarly to the more localized chronic cases

of pulmonary tuberculosis.

The injection of small increasing doses of tuberculin seems to favorably influence the course of the disease as evidenced by diminution of general symptoms, with a corresponding improvement in general health, and particularly by diminishing the liability to relapse when the patient goes back to ordinary methods of life.

Another way in which it has been suggested that tuberculin can be given is by what is known as autoinoculation. If a patient with tuberculosis takes physical exercise and does physical work it has been shown that there is produced a reaction in the blood due to the absorption of the poison from the diseased area. This poison, to all intents and purposes, corresponds to the artificial tuberculin.

Dr. Patterson of Frimley, England, devised a method by which the work or exercise of his patients should be very carefully graduated and the reactions checked up by careful blood examinations. In this way a system of controlling the amount of poison liberated into the blood was developed, that is, autoinoculation was controlled, and tuberculin treatment was in that way carried out without the necessity of the hypodermic injections of the artificial tuberculin.

This method is now in use in a number of places and good results have been reported. It must be said, however, that many conservative physicians consider this method of treatment somewhat dangerous as it is not easy to absolutely control the amount of autoinoculation. In any event this method should never be carried out excepting where patients are under the very strict supervision of expert physicians.

The results reported from this method are very similar to those reported by the use of injections of tuberculin, and the type of cases in which it is employed is the same.

In the past few years laboratory investigations looking toward the cure of tuberculosis are beginning to be more in the direction of finding some chemical agent which will act directly upon the germ without doing harm to the tissues of the body. The brilliant results which have attended experiments in this field are "Chemotherapy." In other diseases, notably syphilis, the results lead us to hope that the future has something in store along these lines for the treatment of tuberculosis also.

Certain it is that, in the tuberculin and other similar methods of treatment designed to act favorably in tuberculosis by influencing the resistance or immunity to the disease, we have a very limited field of usefulness.

In the first place, as we have seen,

the cases which are suitable for this treatment are but a small proportion of all. Secondly, the amount of increased resistance obtained is relative and not absolute. It is therefore to be hoped that the newer field of "Chemotherapy" may have something better to offer.

In summarizing the present status of tuberculin in the treatment of tuberculosis we may say:

First—That a method has been devised by very small and gradually increasing doses by which no harm can result, provided only suitable cases are selected.

Second—That considerable clinical evidence exists showing that in such suitable cases tuberculin helps the patients to improve, and also makes their improvement more permanent.

Third—That any increased resistance of immunity to tuberculosis, which tuberculin treatment may produce, is quite limited.

Fourth—That tuberculin is in no sense a cure for tuberculosis, but is simply an aid to the other generally accepted methods of treatment, such as good food, fresh air and the proper regulation of rest and exercise.

A NEW UNIT IN MEDICAL SOCIAL SERVICE—BY DANIEL MORTON, M. D., ST. JOSEPH, MO.

BETWEEN THE METHODS of the doctor of today and those of his predecessor of a quarter of a century the contrast is great. The practice of medicine and surgery has been completely revolutionized by the application to medical research of the inductive method, as well as by the appropriation from biology, chemistry and physics of discoveries applicable to the prevention and relief of disease, and to the prolongation of human life.

The practice of medicine is today an applied science drawing upon every field of human knowledge for facts that may prove useful. The principles of laboratory investigation used in the physical sciences have been applied to the problems of health and disease. Out of this condition of affairs has come the medical laboratory with a necessary division of labor in medical practice, one physician confining himself to the execution of laboratory methods, another to the application of their results in actual practice. No longer may one man cover both fields.

It is the function of the Medical Laboratory to study by all known scientific methods, the solids, the fluids and the parasites of the human body and to relate the information thus gained to the diagnosis, cause, relief, cure and prevention of disease.

The part which the medical laboratory plays as a factor in the community for the conservation of human life and efficiency is therefore paramount and fundamental. Upon it the whole superstructure of scientific practice is built, it matters not whether that practice is in hospital, in home, in city, in town, in country.

For this essential aid, both people and doctors must depend upon a central medical laboratory located with reference to tributary country, and to rapid and efficient communication by rural route, parcel post, automobile and telephone. Here may be sent for analysis all the specimens from the sick, telephone reports on the findings being made to the doctor in attendance. It thus becomes a clearing-house for pathological specimens. The doctor adds the information thus obtained in the medical laboratory to that which he has himself obtained by a study of the patient.

Thus located it may supply the need to all the inhabitants living in the geo-

graphical and trade zone of its home city.

In the scheme of medical social service, the laboratory should be an independent factor having a physical plant of its own supported by endowment, donation, and fees, and conducted by a board of trustees. It should not be an adjunct to a hospital, but an essential unit of coequal or greater importance. It should not be a private agent for the commercial exploitation of medical knowledge with no thought of its social relation to the community.

In the medical laboratory there is always the possibility of bringing to light some unknown medical truth that will be a boon to a suffering world. It is here that the problems of tuberculosis and of cancer will finally be solved. The work constantly broadens the horizon of medical knowledge. It is, therefore, essential to progress. "Investigation and practice are thus one in spirit, method and object" (Flexner).

Heretofore the hospital has been looked upon as the great material agent for the improvement of medical knowledge. Hence endowed hospitals abound on all sides. What is the present day condition? The medical laboratory is the fundamental agent for advancement in the fields of medical research, of preventive medicine, and of curative medicine. It is therefore, far and away, more important than the hospital. In the field of curative medicine alone it may be made to reach a larger number of sick. Ninety per cent of all the sick are found in the homes of the land, only ten per cent in the hospitals.

In the hospital the direct benefits are confined to the sick coming within its walls. The medical laboratory may be made to benefit not only those within the walls of the hospital but it may reach the suffering in the homes of the entire territory tributary to the city in which it is located, the ninety per cent. Thus the benefits of modern medical science may be carried to the patient on the distant farm, sick at home.

No field of medical social service for humanity offers greater returns for money invested than the medical laboratory. No method of foundation is better than endowment.

When trustees are named to carry out bequests of this nature they are usually chosen with exclusive reference to abil-

ity as business men. It would seem, however, that the ideal board of trustees of a medical laboratory should be composed of men, some of whom are financiers, but others of whom are men having a personal knowledge of the work to be done as the result of lives devoted to it, physicians and social workers.

Thus would be insured a comprehensive survey of this type of social service, the very nature of which requires special technical knowledge in the three branches of human endeavor—medicine, sociology and business. Co-operative endowment offers another method for financing medical laboratories and affords opportunity for investigation and discussion before investment. The best example of this type is that of church foundation with the membership as a permanent financial asset upon which to draw for support.

Twenty-five thousand dollars would be sufficient to establish a clinical medical laboratory in a community of one hundred thousand population having a tributary territory of four hundred thousand additional people. Its demonstrated usefulness would result in the acquirement of a physical plant and an endowment.

No other material agency will do as much to provide adequate medical service in the home, the most important unit of society.

BOSTON BABY WELFARE COMMITTEE

AS A RESULT of a conference called last June by the Milk and Baby Hygiene Association of Boston, there was organized a co-operative committee of the chief agencies in Boston dealing with babies. The purpose of the committee has been to study the field of welfare work for babies in Boston with a view to finding gaps, suggesting means of filling them, and stimulating effort toward preventing duplication and toward meeting unmet needs. The results accomplished during the first six months were of such moment that the committee, which was formed at first only for the summer, has been continued, and may possibly be permanent.

The early studies of the committee pointed to a general demand for convalescent homes. As a result of the committee's work, the State Board of Charity has undertaken an investigation of this subject with a view to ultimate authoritative report.

The committee last summer printed and circulated widely a list of all the medical and non-medical agencies in the city that might be called on for aid for babies. The committee will work for proper health appropriations in the budget of the city which comes up in February.

NEWTON MEMORIAL HOSPITAL

Through a bequest of Elizabeth M. Newton, Chautauqua County, N. Y., will have a hospital for tuberculosis. A site is yet to be chosen. The bequest includes funds for building and maintenance. Management is given to the County of Chautauqua.

SOCIAL AGENCIES

SAGAMORE—AN OPEN FORUM OF PEACE AND GOOD WILL—BY WARREN DUNHAM FOSTER

TWO HUNDRED PEOPLE spent three days together in a little Massachusetts village. They talked informally about the race problem. The addresses were no more informing than many others by the same and other great leaders. The program committee sat together for a few hours and produced a set of resolutions no more brilliant than the smoking lamp by the aid of which they were finally written.

Why, then, is the meeting absolutely unique? Why does it have a distinctive power in this land of the free-discussion and home of the brave convention-trotter?

The answer is twofold.

First, the Sagamore Sociological Conference is a real meeting of real minds. The discussions discuss. No speaker has an audience as an audience is commonly considered. Every one speaks to his peers, who, the next moment, will speak. And woe is he, if his thinking has not been clear. The spirit of Sagamore is the spirit of the Ford Hall Meetings. That the Sagamore meetings are made up of the leaders, titular and real, of the social world and that the Ford Hall Meetings are made up of dwellers of the North and West Ends makes no whit of difference.

Second, George W. Coleman, the originator, president, and chief host of the conference has given to it the tone that makes it of genuine usefulness in a world deafened by superficial, cut-and-dried, heart-ignoring discussion.

The conference, with Dr. Riley of Alabama, decided that the Negro wants and should have a hook, not a fish; with the colored clergyman of Springfield, Mass., that he should have a man's chance, no more, no less; with the calm, sane, A. Caswell Ellis of Texas, that the Negro in the South is a brother and a problem; with Dr. Griffis that to the thoughtful man, there is no East, no West; with Professor Evans that every man should be proud of his race but much prouder that he is a human being; with Freda Rogolski that her Christian neighbor going to church and she going to the synagog are taking the same road—the road of righteousness.

When Dr. Schmidt proved that there is no such thing as the Jewish race or the Anglo-Saxon, his fellow speakers applauded. When Dr. Loeb insisted that biology had no word to offer against the intermarriage of the races, two hundred men and women listened in respectful and interested silence. As in all cases, however, they were interested in the statement, not the eminence of the man who made it.

THE TIME:

Now—the moment before the breaking of world blood madness.

THE PLACE:

Rose-covered sand dunes blown by the winds of Cape Cod Bay.

THE PEOPLE:

Jew, Gentile; Negro, Caucasian; Oriental, European; Southerner, Northerner; leaders Here and There; plain people, all; hard-thinking, soft-hearted; citizens of a world-republic, one-God-ruled.

THE RESULT:

Knowledge, insight, persecution, scholarship, experience, fused by vigorous, free discussion, by warm friendliness, into an intelligent body of common understanding—race sympathy substituted for race antagonism.

THE CAPTION:

Eighth Annual Sagamore Sociological Conference.

Two tangible movements were stressed at Sagamore.

A committee is at work to determine whether or not Sagamore Beach shall be made a permanent home for sociological meetings. If a sufficient national need is found, at the little village by the bay there will be erected the buildings to accommodate, throughout the summer, the various organizations concerned with social work, that wish a meeting place away from city distractions yet accessible. Since the parent Sagamore Conference has now outgrown the facilities at hand, either enlargement or abandonment is necessary. Already several organizations have responded enthusiastically to the idea. The headquarters of the committee canvassing the situation, of which the writer happens to be chairman, are at 41 Huntington avenue, Boston.

Following the Sociological Conference, one hundred and fifty clear-thinking, result-accomplishing leaders, each giving himself aggressively to the task of showing to all men God at work in the world, came together to discuss methods for forwarding and perfecting open forums. Clergymen and laymen gave reports which showed that from one end of the nation to the other open forums are in efficient operation, bringing the unchurched to the church and making the church a still greater power

for righteousness, here and now, in the common life. These reports demonstrated conclusively that the vast ethical and spiritual forces lying just outside the church are dynamic-charged for civic betterment, and that the right-to-talk-back, the particular discovery of the Open Forum, is as effective psychologically as it is democratically.

Although no attempt was made to define the purpose of the Open Forum, or to standardize it, George W. Coleman, director of the Ford Hall Foundation, stated the consensus of the council's opinion when he said that the Open Forum exists to

Bring the church to the man who hates it—or thinks he does—and distrusts religion and everything tagged with that name.

Bring together opposite and extreme views.

Discuss those great social and economic questions often neglected by the church.

These purposes, the council discovered, are being carried out in many ways. Out of the many examples of successful forums in actual operation reported to the Council, the Ford Hall Foundation now has record of types of proved effectiveness sufficient to furnish specific precedent to almost any church under almost any circumstances.

Unique among the open forums reported is that conducted by the Rev. Julius F. Hecker, head of the Russian department, Settlement and Church of All Nations, Methodist Episcopal Church, New York city. Hundreds of Russian immigrants, taught by the Greek Orthodox Church of the nation whence they fled to hate all the name of religion, Mr. Hecker has brought within the institution which they thought they despised. How? By proving to them that the church is intelligently and aggressively interested in those problems that are crushing in upon them from every side.

An informal round table discussion of the practical questions threw much light upon the practical management of open forums. The main addresses range in time from twenty to ninety minutes; questions from the floor, answers from the speaker, and discussion from the floor, take from forty minutes to a period terminated by the sexton's convincing threat that if the audience doesn't go home he will turn out the lights. Addresses, it was thought, should be related definitely to community problems, even though under most circumstances questions of partizan politics and denominationalism should be excluded. In some forums, a distinctly ecclesiastical tone has been maintained; into others, nothing remotely suggesting the church routine has been allowed to

creep. All, however, have been fundamentally religious, in that they have powerfully furthered the Kingdom of God. Symposiums have proved valuable, but debates have been questionable. Questions from the floor should always be spoken, never written. Although questions must be restricted to the subject under discussion, the utmost freedom must prevail.

The conferences—the Sociological Conference and the Open Forum Coun-

cil—were notable in that they practiced what they preached. Southern white men, Negroes, Japanese, syndicalists, socialists, trade unionists, business men, conservative churchmen and radical churchmen—all sorts of real men and real women of the most widely divergent views—frankly discussed with perfect friendliness and without personal controversy the most controversial topics. Never was there a better example of the effectiveness of the open forum.

IMMIGRATION AND THE WORLD'S CONFERENCE OF THE Y. W. C. A.

WHEN PEOPLE from twenty-six different countries representing widely separated social points of view and many different expressions of the Christian religion, join together in a common expression of their common faith, it means progress. Less than a generation ago, such a meeting could not have happened. On June 14, during the Fifth Conference of the World's Young Women's Christian Association, the conference of 800 people joined in a united communion service in the old Cathedral of Stockholm.

The papers and discussions developed the fact that not only the "young countries" and European nations but the Near East and the Far East as well, are all actually at work upon the same great problems.

The general conference subject was the life of women today—in church, in home, in community, in nation. Under the title of Women's Life in the Community a three-sided discussion from Holland, Sweden and France brought out the fact that the social, and hence political, position of women is changing in every country. The speaker from France pointed out that this changed position is no new or sudden revolution but is one which has been silently in process for many years; that amongst some nations the movement has gone on more swiftly than in others; that today nations are presenting only different periods of the same universal process.

Each speaker in a different way make the point that this coming of women into the life of the world as "individuals" amongst individuals—in place of the old separation into a "class" by mere circumstance of being in one sex instead of the other—entails obligations, private and public, upon women, which under the old regime have not been recognized. At the same time the speakers made it clear that this change in position and equalizing of individual opportunity does not mean a wholesale change of occupation—that the foundation of society is still homes.

In different addresses during the conference, speakers gave the opinion that largely upon women rests the responsibility for spreading the accepted standard of personal morality known in all languages as the "single standard." Again and again, from speakers of different races, came condemnation of the modern barbarism called the "white slave traffic."

Emigration and immigration aroused intense interest because the subject had

These notes on a world-wide meeting of women at Stockholm were written and mailed from Russia three weeks before the outbreak of war by Mrs. Harry M. Bremer, in charge of immigration work for the National Board of the Y. W. C. A. in New York.

practical application to every country represented. Speakers from countries sending out emigrants—Russia, Finland, Sweden, Denmark, Germany, the Balkan States and Greece, Hungary and Italy—gave statistics of emigration, conditions inducing emigration, and efforts of governments and private agencies to counteract the general restlessness of the people and to protect those determined to move.

The countries which are receiving immigration—Egypt, Australia, Canada, South American, and the United States, were all represented except South America. From the composite view it developed that "the whole world is on the move;" that the newer countries which are receiving annually large numbers of foreign settlers represent only one phase of a world-wide phenomenon; that the movement is mainly amongst the youth of every nation; that although proportions have shifted in the past decade, the actual numbers annually on the move are increasing.

The governments of Germany, Denmark and Sweden do more than other countries for departing emigrants. Italy and Sweden do most to encourage would-be emigrants to stay at home. Russia does most in regard to internal emigration, which in her country is enormous. The United States both has the largest problem of arriving immigrants and does more than other newer countries for their protection and friendly assimilation, though Canada and the states of South America, Egypt and Australia are active.

A special session was called to consider how the World's Y. W. C. A., through national committees in each country, can do its share towards giving practical assistance to emigrating girls. The result was a plan by which the world's committee, from its headquarters in London, is to enlist the co-operation of the various national committees in compiling and distributing along main routes of migration, much needed information about countries through which

strangers pass en route to ships, and about laws and customs of strange countries to which they go.

The president's message sums up the social resolutions of the conference: "Movement and progress are the watchwords of the twentieth century, especially as regards women. The age of complacency, if ever there was one, is over. We must face present social conditions with courage if we are to stand for advance of womanhood. If we would have girls live good, pure lives we must make it possible for them to do so by striving with others to remove stumbling blocks of all kinds, including unsanitary conditions and inadequate wages. As an organization we must help to form a right public opinion on these matters. The time has come for national associations to be recognized by governments of their countries as strong powers working for righteousness."

The Hon. Mrs. Waldegrave of England was elected president to succeed Mrs. Tritton. The next conference will meet in Egypt in 1918.

JUST HOW THE INFANT WELFARE MOVEMENT STARTED

Dear Madam:

You ask for information as to "how the infant welfare movement started, and by whom."

It is difficult to make an unqualified statement on this subject for the reason that the recently discovered Babylonian inscriptions have not yet been fully deciphered but, so far as the record goes, I understand that the infant welfare movement started soon after the closing of the Garden of Eden and was carried on with unequal success in the first two cases. There is a record of a successful effort to save a difficult case by Hagar in the wilderness.

The first definite study of eugenics is believed to have been made by the Hebrew breeders association, under the leadership of Jacob, who discovered that the laws of heredity were not infallible in that even twins displayed the most unequal development.

The founder of modern methods in dealing with foundlings was her Royal Highness, the Daughter of Pharaoh, who originated the method of boarding out babies in family homes. She made her selection with great discrimination and the results were highly satisfactory.

King Solomon made some discriminating studies of the matter of maternal instinct and parental affection resulting in the conclusion, which has been confirmed by some recent experiments, that the mother should be allowed to bring up her own child when practicable. This is doubtless the origin of the mothers' pension movement.

King Herod made some interesting studies in the matter of infant mortality, from which it appears that in some cases the mortality of infants in Palestine ran as high as 66 2-3 per cent. This gratifying record, however, was excelled by some of the institutions of the nineteenth century which succeeded in getting the rate up to 90 per cent and, in some cases, even to 100 per cent.

FIRE DRILL AT THE CHILDREN'S VILLAGE

Probably the hose cart is the most popular piece of equipment at the Children's Village of the New York Juvenile Asylum at Chauncey. The boys not only man it, but draw it, two abreast, after the very best traditions of all volunteer fire departments. The directors of the juvenile asylum, which is one of the model cottage in-

stitutions of the country, have made a strong plea for larger city appropriations for school and shop work. They state in their report that while the city appropriates \$15 a year for the education of these delinquent and dependent boys, the per capita cost for children in the public schools is about \$47.

Some scientists have maintained that the law of natural selection and the survival of the fittest would preserve the virility of the race and would ultimately eliminate its weaker elements. The Spartans, however, held that the law of natural selection should be supplemented by artificial selection. They adopted the plan of exposing unpromising infants on the mountain tops where only those of extraordinary vitality survived. The modern Hindus and Chinese, perhaps owing to sentimental prejudices, have adopted the milder methods of drowning and suffocation, but there are sanitary reasons which might perhaps lead to a preference for the Spartan plan.

The question of a reliable milk supply has received a great deal of attention. It is now generally agreed that the wet nursing plan is to be preferred. The efficacy of this plan was demonstrated in the case of Romulus and Remus, and has been confirmed by the Italian method of driving goats from house to house and insuring the purity of the supply by allowing the infant to take it direct from the original source.

Babies' welfare! It has been studied from time immemorial and, in our day, we have come back to the original principles that have been advocated for ages: healthy parents; a natural wholesome life for the mother with simple

nutritious diet; breast feeding; cleanliness; mothering; outdoor air; watch, care and advice from the best outside sources available.

What is now called the babies' welfare movement, was started I think by C. F. Powlison, who is now secretary of the National Child Welfare Exhibition Committee, when he originated the New York Child Welfare Exhibit. It is being carried on by various babies' welfare organizations and is being promoted largely through child welfare exhibits.

I am requesting the following named organizations to send you their literature:

The Philadelphia Baby-saving Show.
The Babies' Welfare Association of New York city.

Division of Child Hygiene, Department of Health of the City of New York.

The New York Diet Kitchen Association.

Yours very truly,
HASTINGS H. HART.

Director, Department of Child-Helping, Russell Sage Foundation.

BOSTON SCHOOL FOR SOCIAL WORKERS

THE BOSTON School for Social Workers, in June, gave certificates to 43 students for satisfactory completion of the first year program. Also, one

senior in Simmons college who completed that program with a course in psychology and sociology received from the college the degree of Bachelor of Science in social work. Several men received credit in Harvard for work done in the school.

Seven students completed the second year program, four specializing in medical social service and three in organizing charity. Two were men. Five of the seven had completed the first year program, one coming back after a year of work in the field; another was a graduate of the St. Louis School of Social Economy; another came after ten years of social work. One of the women specializing in medical social service, a college A. B., received the degree of Master of Science in Simmons college for the second year work with a course in biology at the college.

Three graduate nurses completed a special course for visiting, public health nursing, arranged in co-operation with the Instructive District Nursing Association of Boston; twenty men and women completed partial courses in organizing charity and neighborhood work; beside attendance on a special course in recreation and an extension course in social aspects of medicine.

For the past year or two the practice work required of every student has been carefully selected and supervised with

reference to individual needs. It now occupies one-third of the first year program, and two-thirds of the second year, built upon that of the first year and arranged in educational progression.

The social service library placed in the school building has been a great help to students, as well as to social workers.

BORROWING DISCOURAGED BY LOAN SOCIETIES

IT WAS EVIDENT that most of the twenty-four societies represented at the sixth annual convention of the National Federation of Remedial Loan Associations, held in Philadelphia in July, are attempting with considerable success to discourage unnecessary borrowing and to enable their clients to put themselves beyond the need for small loans. It was also apparent that some of the societies have not yet fully realized the social possibilities of their work.

At the close of its fifth year the membership of the federation has increased from 13 to 35 with a score of additional societies in process of organization. One of these is the Remedial Loan Society of Philadelphia, which was fostered by the executives of fifteen leading social organizations. Though the required capital has been secured, operations have been deferred for a time as the result of an adverse court decision involving the constitutionality of the Pennsylvania law regulating small loans. The early organization of a society in Dayton is expected. Its formation is being accomplished through the combined efforts of Dr. Garland, the city Director of Welfare, and the Greater Dayton Association.

The following officers were elected: chairman, Charles H. Brown, Jr., Buffalo; secretary-treasurer, R. R. Stevens, New York.

ST. LOUIS SCHOOL OF SOCIAL ECONOMY

THE ST. LOUIS School of Social Economy completed its seventh and most successful year in June, graduating twenty-eight regular students, eight of whom took master's degrees in Washington University. The largest previous number of students graduated in one year was fourteen in 1913. Graduates of the school are rapidly taking positions in social work in Saint Louis and throughout the state.

The number of students taking a full year's work in the school increased from thirty-nine in 1913 to sixty-five during the past year. Most of the students are from Saint Louis. A regular staff of four and two special lecturers handled the three departments of the school work—instruction, practice work and research. The instruction covered the usual fields in social work and for the first time included a course in civic problems.

The practice work brings practically all the students in direct touch with the case work of the leading public and private social agencies.

The research department, which is supported by a grant from the Russell Sage Foundation, has conducted a num-

ber of investigations which have been put to almost immediate practical effect. The investigation into industrial conditions among Negroes, the first of its kind in the Middle West, is being published in book form. Pamphlets have been issued on Prenatal Care and on the Saint Louis Newsboy. An investigation has been made by the school for the State Minimum Wage Commission. It is expected that the material will be published by the commission.

Although the amount of money contributed by the Russell Sage Foundation is being gradually decreased, as in the case of other schools for social workers, Washington University, of which the school is a department, is responding to its need. The school will be maintained next year in a new downtown location. George B. Mangold, the director, is planning to extend the work during the coming year in view of the adoption of a new city charter with a merit system which offers larger opportunities for public service.

DEFECTIVES AND STATE BOARDS

It is the exception when a recent report of a state board of charities fails to lay special emphasis on the needs of defectives. A particularly interesting instance is offered in the last report of the State Board of Charities of Virginia. This shows some very careful investigations and pertinent recommendations, especially as to the defective-delinquent.

The board has been making use of the Binet-Simon measuring scale and has had the inmates of several reformatories, orphan asylums and public schools tested, with results that are even more striking than common. A large majority of the children in the reformatories have been found to be from 4 to 11 years backward.

THE CREED OF THE BOSTON MUSIC SCHOOL SETTLEMENT

THE Boston Music School Settlement believes:

In art for the masses; in giving children and adults an opportunity to learn, play and hear the masterpieces of music.

In the development of individual and social resources through music.

In the development of artistic talent in children of limited opportunity.

In the value of education in music as a strong defense against the degrading pleasures and interests which abound in the congested districts of cities.

IN the spirit of social service which stands for the encouragement of what is best in children and adults without distinction of class, race, color, or creed; for the multiplication of opportunities to improve personal character and capacity, and for the promotion of intelligent and effective citizenship.

The tests of the public schools were conducted in the 4a grades at Richmond. The white children show a slightly higher percentage of feeble-mindedness, and almost exactly the same percentage of retardation as the colored.

The report states that there are at least 6,000 persons in the state "who, while physically mature, are as deficient in essential mental qualities—such as perception, judgment and will power—as little children." Its conclusion on the feeble-minded is that "so far as modern investigation enables us to see, the most pressing social need of our time is the segregation of the feeble-minded."

REFORMATORY SELF-GOVERNMENT

The movement to test the self-governing capacity of law-breakers is spreading. A council was elected recently by the inmates of the New Jersey Reformatory at Rahway, of which Frank Moore is superintendent. Each tier elected two members to the council, making a body of twenty-eight representatives. The purposes of the council are to try to have each boy "keep perfect order, live strictly up to the rules of the institution, reduce the number of reports and when paroled to make good." Weekly meetings are held and suggestions from inmates for the benefit of their fellows are considered.

DRAMATIC LEAGUE

Fifty-four clubs of young people from ten to twenty-six years of age participated in the work of the Educational Dramatic League in New York during its first year, recently closed, according to a statement issued by the league. The purpose of this organization is to promote in public schools, social centers, settlements, churches and other agencies, amateur dramatic performances having an educational value.

The league selected a play to be given by all the clubs who were members and awarded a prize to the club giving the best performance.

MOTHERS' PENSIONS

The act creating the mothers' assistance fund in Pennsylvania was approved in April, 1913, but because of delays in putting it into operation the first family received assistance in February, 1914. 1,369 applications were received up to the close of the fiscal year, May 31. Of this number, 431 were set aside as not suitable. Of the remaining 938 families, 759 were registered with the Registration Bureau and 578, or 67 per cent, were identified as being known to other charitable agencies. At present, seventy-seven families are beneficiaries of this fund, and the total expenditure for allowances alone was \$5,157. The average grant per family, per month, is \$22.

The work of the commission has been handicapped by the small appropriation, about \$3,000, for office and investigating expenses. The amount of money available for pension purposes was much greater than the amount expended, but the commission was unwilling to grant assistance except after competent investigation.

Communications

SPEAKERS WANTED

TO THE EDITOR: The Missouri State Conference of Charities and Correction is going to meet in Springfield, Mo., November 8-9-10. May I ask through THE SURVEY that social workers of prominence, particularly those accustomed to public speaking, communicate with me if they intend, about the time of the conference, to be anywhere near our state. We would like to make arrangements to have them address the conference.

OSCAR LEONARD.

[Secretary State Conference]

901 Carr St., St. Louis.

SAFE

TO THE EDITOR: I herewith enclose you a clipping from the Detroit *Evening News* of July 4, that interested while it amused me. I could not help but admire the picturesque description of the "Sane Fourth Celebration," upon which there was such a "small damage list" of several fires, several people burned by fireworks, and one boy with three fingers burned off the left hand by an explosion of a home-made cannon-cracker—all taking place before 11 o'clock on the morning of the Fourth. How many people were injured and how many fires took place after that time, I have not noted; but I feel I would be doing the "Sane Fourth" idea a poor service if I did not indicate how Detroit interprets the idea.

LOUIS WOLSEY.

[Rabbi, Euclid Avenue Temple]
Cleveland.

KANSAS CITY NEGROES

TO THE EDITOR: On the hottest Sunday in the year, representatives of the eight Negro charities endorsed by the Kansas City Board of Public Welfare, met in a colored church to plan their money raising campaign. They have united under the title of Federation of Colored Charities. About half of the members of the board are white, and the arrangement is that the colored people are to raise \$2,500 and the white \$5,000 to carry on their work. This will give money enough to standardize their day nurseries and homes and their new hospital.

It has given the white people a chance to find how very little they were doing for the 30,000 colored in their midst. They were contributing less than \$1,000 a year to all these charities and their largest contributor died last year. The white membership of the board is a guarantee that the money is to be used correctly and the leaflet circulated describes each society and its particular work. The funds are to be divided according to the needs. Each society

stated the sum which would be wanted to carry it through the year. These were added together to make the total.

Aside from the charities the colored people have other reasons for rejoicing—the \$100,000 Y. M. C. A. building, toward which Julius Rosenwald of Chicago gave \$25,000, is almost completed, and after twenty-six years of watchful waiting by T. R. Coles, principal of the Garrison School, has seen a public bath house completed for the colored people. It contains an auditorium, gymnasium, branch library station and club rooms. It is located on Garrison Square, one of two public playgrounds for colored children in the city.

EDITH M. CRUISE.

[Board of Public Welfare]
Kansas City.

CONVICT LABORATORY

TO THE EDITOR: Your issue of July 25 contains an interesting letter from Dorothy Straus in which she comments on an article of mine published April 11, outlining some of the phases of prison reform which will be undertaken by the National Committee on Prisons and Prison Labor.

Miss Straus urges that, in addition, the National Committee should "begin a concerted effort to establish a laboratory for statistical and psychological research."

The committee has already undertaken work of this nature, having organized a sub-committee on the social hygiene of the prisoner, which will endeavor to create on the part of prison officials and the public at large a realization of the urgent need of the study of the individual prisoner, mentally and physically, in order to determine the elements which have combined to cause his failure in life and the methods which will tend towards his rehabilitation.

This committee will also act as a clearing-house to afford information as to the most approved methods of carrying on such study and the results obtained therefrom. We have been fortunate in the acceptance by James Bronson Reynolds of the chairmanship of this Social Hygiene Committee. Mr. Reynolds will be assisted by Mrs. E. C. Bodman as vice-chairman; while the membership of the committee already includes Katharine B. Davis, New York city commissioner of correction; Dr. Guibord and Miss Robinson of the Bedford laboratory; Dr. von Kleinsmid of the Indiana Reformatory; Prof. Stephenson Smith of the University of Washington; Dr. Goddard and Dr. Johnstone of the Vineland Training School; Frank Moore of the New Jersey Reformatory and Dr. Harriet Noble, of Brooklyn.

The initial work of this committee

is well in hand, and progress will be reported in a series of pamphlets published by the committee.

ADOLPH LEWISOHN.

[Chairman, Executive Committee]
New York.

FRESH AIR HOMES

TO THE EDITOR: In answer to my advertisement in the columns of THE SURVEY on June 13, for an assistant in a fresh air home for children, it has been of great interest to read the earnest and enthusiastic letters from over twenty-five young women from the North, South, East and West. Grasping the feeling of the day, that in the children lies the hope of the good results of the purity movement so vital in the progressive mind, these young women are alive to the fact that there is work to do, and for one position to be filled there are a score and more young women who have to await further opportunity.

Social workers are anxious to get the children out of the congested city. It has been found a hard proposition to move families. They would rather huddle together, six or seven in a room, than to miss the clatter and lights and excitement of the pavements.

It seems one way to move parts of these families, at least, is to make it possible for every child to spend a few weeks in the country every summer, and little by little fill that child with the joy of country life so that by degrees he will influence his family, or part of it, to share the life permanently.

The great trouble with the fresh air homes today is they are not large or numerous enough to give extended visits to the children. One or two weeks is about the limit to a limited number.

A whole summer with a child in a garden would nine times out of ten create in that child a love for the beautiful in nature, a love for his own body and soul created in the image of God, and a desire to keep them clean and pure for the glory of God and for the generations to follow.

RUTH FULLER FIELD.

[The Incarnation Fresh Air and Convalescent Home]
Lake Mohegan, N. Y.

CHILDREN'S PLAYS

TO THE EDITOR: What is needed for the furtherance of the children's play movement:

A higher and more imaginative standard in plays throughout the country.

Greater care and knowledge used in play production as regards simple scenery, costumes and properties.

A wider use of the school auditorium as a benefit to the community.

The use of plays in country schools as related not only to the school, but to the life of the community.

The utilization of material at hand, such as open-air plays on the common or village green instead of in a stuffy schoolroom. The use of unoccupied barns for children's community theaters in summer, of the town hall for the same purpose in winter.

A greater interchange between public

school, social settlement, church guild and social center. In the children's play movement there is already discernable a certain waste of effort and of art. A children's play is made to serve one purpose when it ought to serve ten. Usually a play is given once or twice in a settlement or school, and there is an end of it.

What could be done is this: the play might be given in the school before an audience of children, then before an audience of fathers and mothers. Then it might be taken to the nearest settlement and repeated there, to the nearest church guild and repeated there. What about other places to which it might be giving joy? What about homes for the aged? What about orphan asylums? Children's wards in hospitals? What about utilizing a hall in or near a factory? The play movement is doing a great deal, but not half what it might. The children in district X, to the settlement in district X, and to the school in district X. Why not interchange with their plays?

The social settlements of Boston interchange plays and players with splendid results. All the thought and effort that goes to the directing of a play might be made to serve a number of communities instead of one, and much social waste could be avoided. Interchange in the large cities would do a great deal towards drawing the vast conglomerate mass together.

It is a pity that a simple outdoor stage, such as is used in Palermo and other Italian cities, could not be utilized in tenement districts. It somewhat resembles the floats that were used in mediaeval miracle plays and pageants, only it is smaller, and has two screens for wings. This stage could be set up in a city street and plays could thus be acted out of doors.

CONSTANCE D'ARCY MACKAY.
Shirley Center, Mass.

SAID OF THE SURVEY

TO THE EDITOR: THE SURVEY has been my companion ever since I became aware of its existence, and have learned from it much more than from a good many college text books on political economy and sociology.

ELIAS POWELL.
Madison, Wis.

JOTTINGS

The Chicago Hebrew Institute recently opened the first penny-a-glass milk station in Chicago. It not only sells pasteurized milk but goes the Straus milk depots in New York one better by a package of six crackers for a second penny.

Thanks to the Women's Municipal League of Boston, the Legislature has passed and the governor signed a bill providing that no basement or cellar room shall be occupied for living purposes unless it is at least 8½ feet high in every part, has at least one window on open space, that the floor and walls are damp-proof, and that it is at least 60 per cent above the level of the highest ground within fifteen feet of the outside

wall. This bill is to take effect October 1.

The temporary committee of women organized to secure representation in the New York state constitutional convention has nominated four social workers: Lillian D. Wald, of the Nurses' Settlement; Katharine B. Davis, New York city commissioner of correction; Josephine Goldmark, of the National Consumers' League; and Frances A. Kellor, of the North American Civic League for Immigrants.

INDUSTRY

[Continued from page 502.]

the early threats of impeachment. With Francis Cullen, a Watertown lawyer, he controls the Cullen-Fitzgibbons faction in the Democratic organization of Oswego and Jefferson counties.

Deputy Workmen's Compensation Commission. Cyrus W. Phillips, Rochester. Appointed by the commission, salary \$4,000.

Republican assemblyman from Monroe county. Has made a study of compensation legislation and introduced many bills improving the employers' liability act. Member Employers' Liability Commission appointed by Governor Hughes, 1909. Member New York State Factory Investigating Commission, 1911. Chairman National Civic Federation's joint commission on the operation of state workmen's compensation laws. In 1913 a member of the Joint Judiciary Committee which exonerated Supreme Court Justice Cohan from charges of bribery preferred against him by his former business associate, John Conolly, though the charges had been confirmed by a report of the grievance committee of the Bar Association. For six months chairman Assembly judiciary committee, 1914.

Deputy Commissioner Workmen's Compensation Commission. George W. Batten, Lockport, N. Y. Appointed by the commission, salary \$4,000.

Deputy state treasurer 1911-1913 under John J. Kennedy who committed suicide when summoned to appear before the grand jury as a witness in the highways' graft investigation. At the joint legislative session called to elect a new state treasurer it is reported that the Democrats offered to supply enough votes to the Progressives to elect Homer Call (Progressive), provided the Progressives would agree to retain George Batten. Call admitted he would not discharge any Democrats under him unless convinced they were incompetent. Later, on account of public protest, an ultimatum from a Progressive conference in New York was sent to Call that he get rid of Batten. A chronic office holder. Boss of the Democratic party in Niagara county. Oldest member Democratic State Committee. Charged with working for Hearst in 1906, for Murphy in 1908 and against the Hughes anti-public-betting and racetrack bills. In 1909 made an appraiser on the Catskill Aqueduct Commission at \$50 a day. In connection with this the New York

World, December 18, 1909, states: "George W. Batten a Democratic state committeeman, who is on the commission, by the grace, it is believed of 'Fingy' Connors, put in a bill of \$580 expenses with his last report. Every time Mr. Batten attends a meeting he has to travel from Lockport and usually a whole day (\$50) is spend making the trip."

Deputy Commissioner Workmen's Compensation Commission. Lester Fisher, Rochester. Appointed by the commission, salary \$4,000.

For 23 years connected with the Eastman Kodak Company. Head of the billing department.

Deputy Commissioner Workmen's Compensation Commission. Edwin L. Storms, Dobbs Ferry. Appointed by the commission, salary \$4,000.

Candidate for Senator in Westchester county against J. Mayhew Wainwright, 1910, on Independence League (Hearst) ticket. The New York Evening Post, November 4, 1910, describes him as follows: "Real estate appraiser, high school education, an independent in politics, commissioner of public works in Dobbs Ferry for two years, active in the labor movement, advocates electric lights on all state roads in the county at state's expense, money to be taken from auto tax fund. Thoroughly unfit candidate." The New York American (Hearst) states: "A splendid type of independent politician. Made good as commissioner of public works." Secretary of the Laborist Protective Union, Dobbs Ferry. In the real estate and auctioneering business.

Deputy Commissioner Workmen's Compensation Commission. Thomas Fitzgerald, Albany. Appointed by the commission, salary \$4,000.

Chairman legislative committee New York State Federation of Labor and labor union lobbyist at Albany. President State Council Allied Printing Trades.

Secretary State Insurance Fund. F. Spencer Baldwin. Appointed by the Workmen's Compensation Commission, salary \$6,000.

Dean of Boston College of Business Administration, professor of political economy at Boston University, chairman of the Boston City Statistical Department and secretary of the Massachusetts Old Age Pension Committee. Selected on merit from 150 applicants.

Chief Actuary. Joseph H. Woodward. Appointed by the Workmen's Compensation Commission, salary \$6,000.

In the State Insurance Department since 1908. A graduate of the Sheffield Scientific School 1893. Member of the council of the Actuarial Society of New York.

Chief of Bureau of Claims. Daniel Goulden, New York city. Appointed by the Workmen's Compensation Commission, salary \$4,000.

Murphy Democrat who led a primary fight against Ross Williams, anti-Murphy leader of the 17th Assembly district in Manhattan.

The GIST of IT—

AFTER years of effective work following earthquake, fire and flood, the American Red Cross is called upon for war service. Mr. deForest, vice president, is in charge at London. Mr. Bicknell, national director, is crossing. Miss Boardman is holding the fort at Washington. Funds are wanted. A relief ship and the gruesome paraphernalia of field surgery will be sent. Page 515.

JAMES JENKINS, first of many traveling social workers to reach home, witnessed an anti-war demonstration in Paris and saw some clever police work in handling a mob without clubs. Page 518.

WHILE Mrs. Wilson lay dying the Senate rushed through an alley bill—but a makeshift bill and not the constructive measure the President's wife had worked so hard for. But alley legislation has been measurably set forward by her activity. Page 515.

DOCTOR HART finds Thomas Mott Osborne's book based on a week of voluntary servitude at Auburn Prison "a remarkable study of the mind of the convict." Page 528.

GIVEN through routes, Chicago's steam railroads could tremendously increase and simplify the city's travel. The big La Salle street terminal, seen in perspective in the City Club's report, is a monstrous development of the village hitching rail. Page 519.

FRESH fish is to be sold retail as well as wholesale at the Washington municipal market—a sturdy blow at the high cost of living. Page 520.

SEATTLE reports its municipal lighting plant a great success. Page 521.

THE Greenwich village section of New York is figuring on how to squeeze 24,000 children on 16,000 square feet of playground. Page 521.

MEDICAL missionaries, schools and a growing number of native physicians trained in western ways are gradually working out the health problems of China. After Siamese doctors have banished the native practice of sleeping on a package of "medicine" for gunshot wounds, perhaps they will prescribe for the Americans who carry a rabbit's foot or wear a lead ring for rheumatism. Page 525.

THE "sick club" of a mining town in Washington promises to be the forerunner of a movement similar to that of the English Friendly Societies. Page 526.

TURNING on the fire hose and cracking heads will neither cure unemployment nor permanently muster out the unruly "armies" of the unemployed, argues the secretary of the Church Federation of Sacramento. Sacramento has tried it and ought to know. Page 523.

THE SURVEY

COMMON WELFARE

MRS. WILSON'S DEATH AND WASHINGTON'S ALLEYS

ON THE DAY of Mrs. Woodrow Wilson's death, August 6, the news dispatches carried the story of how the United States Senate had passed a bill to abolish alley slums in the District of Columbia, and how the District Committee of the House of Representatives had met in the morning and voted favorably on a similar bill, all of this action in one day coming as the result of the interest of the President's dying wife in much needed alley legislation.

These stories read well the day they were printed, but the sad thing to relate is that the Senate did not pass the comprehensive bill which Mrs. Wilson and the President, the Board of District Commissioners and social workers of the Washington approved, but rushed through a makeshift.

The House committee voted favorably on the piece of constructive alley legislation which had the President's and the commissioners' approval, but when this bill may be acted on in the House is a big question. Mrs. Wilson's dying wishes that Congress pass the alley law has made an impression on members of the Senate and the House, however, and there are now good chances for the enactment of effective legislation at next winter's session.

Late in the evening of Wednesday and early in the morning of Thursday, August 5 and 6, Mrs. Wilson, during periods of consciousness, asked the President and her daughters, who were at her side, time and time again about the status of the alley bill.

The President asked Secretary Tumulty early Thursday morning to get as much information as possible about the bill and to learn what could be done to expedite action. Secretary Tumulty talked with Secretary Bryan and Oliver P. Newman, president of the Board of District Commissioners, and the two immediately got into communication with leaders of the district committees in both houses of Congress.

The Senate committee had considered the comprehensive measure looking to wiping out alleys in Washington within

the next ten years and the creation of minor streets, but Senator Jones, of Washington, expressed opposition to this bill privately and it appeared that it would be impossible to get quick action on it. The Senate then took up the makeshift which arbitrarily puts an end to the use of alley slums without providing for the acquirement of property and cutting of minor streets to take the place of the alleys.

The House District Committee met on a hurry call from Chairman Ben Johnson, of Kentucky, and voted favorably on the comprehensive measure approved by the President and the commissioners and which eliminates alley inhabitation in Washington at the rate of one-tenth a year for ten years, providing either for a promulgation against the use of alley property or for the acquirement of the land by condemnation proceedings when it is desirable to establish minor streets.

It is expected that action on the last named measure will come during the next session, and that the interest stimulated by Mrs. Wilson's work will result soon in wiping out the National Capital's alley slums.

Carter in New York Evening Sun

ANOTHER TRIPLE ALLIANCE

THE AMERICAN RED CROSS AT THE FRONT

WHILE THE GERMANS were making their first attacks on Liège and before fighting in Alsace had yet begun, Ernest P. Bicknell, national director of the American Red Cross, accompanied by his assistant, Lewis E. Stein, left for Europe to assume personal charge of Red Cross war relief.

Meanwhile Robert W. de Forest, of New York, vice-president of the American Red Cross, who was abroad when war broke out, opened relief headquarters in London, pending Mr. Bicknell's arrival. The plans of the latter were not matured at the time he left America.

Early in the hostilities, even before England had announced her stand, it was decided at a joint meeting of the International and War Relief Boards of the Red Cross in Washington to charter a vessel and send hospital units in charge of men of army and navy medical experience to augment the foreign Red Cross and army and navy relief corps.

The vessel will fly the Red Cross flag. In addition to hospital supplies, it will carry doctors and nurses to each country involved in war. Under the protection of the treaties of Geneva and The Hague, it can enter any harbor for the discharge of its duty.

Haste was later imparted to this plan by the receipt from Ambassador Herrick, at Paris, of an urgent request for hospital supplies for sick and wounded French soldiers. The request called for 150,000 kilos of absorbent cotton, 150,000 kilos of ordinary cotton, 150,000 meters of soft gauze for dressings, 50,000 meters of starched gauze for plaster splints, and a large quantity of thin box wood for splints.

Mabel T. Boardman, chairman of the Red Cross National Relief Board, cabled Ambassador Herrick that surgical supplies would be sent on the Red Cross ship, but that the full amount asked by him, requiring over 100,000 cubic feet of space, could not be provided at once because of other shipments and the necessity of carrying a large quantity of coal.

The ship will be taken charge of by Rear Admiral Aaron Ward, U. S. N., retired, who will meet it in London.

Simultaneously with the decision to charter a ship, an appeal for funds was issued in this country. The appeal was addressed "to all of our people; to the governors of states, as presidents of the Red Cross state boards; to the Red Cross chapters; to mayors of cities; to chambers of commerce; to boards of trade; and to all associations and individuals. Contributions may be designated by the donors, if they so desire, for the aid of any special country, and will be used for the country designated; but assistance will be given to all, in the true spirit of the Red Cross represented by its motto, 'Neutrality—Humanity.'"

A week after this appeal was issued the New York branch of the Red Cross had received \$20,000. A statement issued from the Washington headquarters said:

"Reports from various sections of the country continue to indicate an active interest on the part of Americans of every lineage in the campaign of the American Red Cross for funds with which to finance the European relief project. Entertainments of various kinds and other means of raising money are being arranged at many places and in all sections. Some weeks may elapse before a substantial amount of these contributions reaches headquarters, but the campaign for funds is well started and is expected to result very satisfactorily."

On August 11 a cable message from Berne, by way of Rome, was received in New York stating that the Federal Council of Switzerland had proposed a guarantee of neutrality and had offered to convert the whole of Switzerland into a colossal Red Cross hospital camp for the reception of the wounded, irrespective of nationality.

Meanwhile Americans were manifesting interest in the nature and scope of Red Cross organizations in the countries at war. Lieutenant Baudoux, of the Belgian infantry, who reached New York August 11 from Antwerp, and prepared to return immediately to take part in the war, informed a representative of *THE SURVEY* that in his country the Red Cross is a civilian organization and is not allowed to operate at the front. Regular military surgeons alone are permitted to care for the wounded along the line of battle. The Red Cross is allowed, however, to station itself at the rear and dress the wounds of those brought to it.

Neither is the Red Cross in Belgium, said Lieutenant Baudoux, organized to administer relief to the families of wounded soldiers or of reservists called to war. These are compelled to look for help to other philanthropic agencies or to the voluntary beneficence of neighbors.

PLANNING RURAL PROGRESS IN MASSACHUSETTS

WHEN PRESIDENT BUTTERFIELD asked at the Country Life Conference at Amherst, Mass., the other day: "How many towns study themselves; make plans for improvement, carry out those plans?" he indicated the purpose of the conference.

To make the Agricultural College and other agencies competent aids in rural betterment was the purpose of the conference. The college has come to feel that greater productivity of the soil is not as important as better organization of the farmer's business, and that the farmer's business is much less important than the farmer's home. Formerly the farmer was told that because of his partnership with the soil he was independent and could flock by himself in splendid isolation. In the inevitable reaction he has come to feel that, even more than his city brother, his future depends upon recognition of the fact that he is but one of a community.

Not only the individual farmer, but rural institutions have come to realize that no institution is worth while unless it serves the community. Husking bees, barn-raising, quiltings, spelling matches, singing classes, lyceums, lodges, granges, churches—all have come into the same classification of servants to the common good. President Butterfield warned the various agencies represented at the conference that unless they made the community interest greater than their interest, unless they made the community service of greater importance than their own service, they had no warrant to live and would inevitably die.

The conference divided itself into sections for the study of the rural church, rural sanitation, rural education, library work, civic betterment of the countryside, and kindred topics.

Reports of actual work accomplished in many rural communities were of prime interest. For instance, the Rev. Howard F. Legg told how the country church at Wilbraham, Mass., had become a community church, and told of the community Fourth of July and the community Christmas when every one of the 582 persons in Wilbraham received a present from the Christmas tree. One saw a sign that now is the Kingdom of our Lord becoming the Kingdom of this earth, as far as Wilbraham is concerned. He told of scores of upright, self-respecting and respected citizens of Wilbraham who had eagerly come into the church when it became the servant of the community.

The librarian of the little country library in Brimfield told how her library stood in an apple orchard, with its reading room dominated by the open fire, and where whispers were tabooed because one could talk really out loud if he wanted to. That same library is the meeting place for the poultry club.

Mabel T. Boardman of Washington told of the work of the rural nurses of the Red Cross and every day Ernst Hermann, director of the Newton Playground Commission, showed what can really be done in healthful play and what possibilities there are in organizing the experience of individuals into real community joy.

Every variety of rural community was represented. Most of the difficulties—and they were as many as there were communities—were catalogued and tabbed. The principal advantages of the community church, the motion picture entertainment and the open forum, as devices for bringing the community together were recognized and discussed. Perhaps the greatest result of all was the determination taken as the text of the conference that not only the individual but the institution must subordinate itself to the service of the community.

TEN BILLS READY FOR THE MISSOURI LEGISLATURE

ALREADY MISSOURI is fairly alive with legislative proposals for the session of the General Assembly which meets in January. Never in the history of the state has so much social and industrial legislation been proposed in the form of definite bills. Three legislative commissions are at work—one on a workmen's compensation act, another on the minimum wage, and a third on the abolition of convict labor. A governor's commission is actively at work throughout the state on a complete revision of the court system and legal procedure.

The State Conference of Charities and Correction, which has been responsible for a large amount of social legislation the last five years, and which has retained a lobbyist at Jefferson City during the last three sessions of the Legislature, has ready a complete program of ten legislative bills relating chiefly to the administration of state institutions and the protection of children.

The movement for placing the state factory inspector's office on a salary basis and extending it to all counties in the state, which has failed in the last two legislatures, is now being pushed by a considerable array of forces, including the State Federation of Labor. It seems even probable that a more sweeping act will be presented, creating an industrial relations commission to group in one department all the activities in the state relating to industry.

Saint Louis organizations are particularly busy in lining up at an early date all their legislative proposals in the social and industrial field, in order to familiarize candidates for the Legislature with their work before the November election. This is being done through the Conference of Federation, a clearing house which reaches over 200 organizations throughout the city.

AN ANTI-WAR DEMONSTRATION IN PARIS AS SEEN BY A BROOKLYN SOCIAL WORKER

JAMES JENKINS, Jr., superintendent of the Department of Social Betterment of the Brooklyn Bureau of Charities, who sailed for England July 3, returned to New York August 11 after witnessing many of the preliminary preparations for war in France and Belgium and seeing one violent anti-war demonstration on the part of Socialists and workingmen in Paris.

Mr. Jenkins, who left with a party of social workers to attend the International Garden City and Town Planning Conference in England, returned on the *Kroonland*, of the Red Star Line, having sailed from Antwerp on August 1.

On her way to Dover the *Kroonland* sailed through the English fleet, then at anchor in the English channel, and later sighted a German cruiser in mid-ocean.

"When I reached Paris July 18," said Mr. Jenkins, "there was only a vague apprehension of a general European war. Paris was in gala dress and the cafés and places of amusement were still awl with undiminished, though excited, crowds.

"In three days a marked change occurred. Tuesday night, July 21, as I was returning to my rooms, I met a Viennese acquaintance who had served in the Austrian army. He asked me if I didn't want to see a demonstration against war, adding that he would show me a 'typical Paris mob.'

"The demonstration was taking place, where so many demonstrations take place, in front of the office of *Le Matin*. Thousands of Frenchmen were surging back and forth on the street and sidewalks. Before I arrived M. Juarez, who was later assassinated, and other Socialists had made speeches.

"The crowd was so violent that that

whole section of the city had been put under practical martial law. The ordinary police could do nothing. We came just in time to see the *Guard de Paris*, which corresponds roughly to the state constabulary in Pennsylvania, sweep down the street and drive the crowd back. They rode four, six and eight abreast, and simply pushed the people aside. This is a regular measure to avert trouble at times of excited demonstration. Another, which was taken that night, is to prohibit the cafés from serving food and drink on the sidewalks.

"Eight hundred people were arrested that night, some for fighting, some for excessive anti-war talk. Yet I never saw a crowd better handled. No one, so far as I could see, was hurt. Paris police carry no clubs, and though they have guns they use them only in dire cases. On this occasion they simply pushed, and if anyone pushed back he was arrested.

"This was the only anti-war demonstration I saw, though the papers reported them all over Europe. I was told that Socialists of other countries were extremely disappointed at what was felt to be the failure of German Socialists to take an active stand against war.

"Two days later, July 23, paper money had become useless, except in the payment of bills already incurred. Americans couldn't cash checks. Signs were hung up in all cafés: 'If you haven't silver or gold, we prefer that you shouldn't buy here.' I found that many merchants would rather take my calling card than a hundred-franc note.

"July 29 I went by train from Paris to Brussels. The uncertainty of traveling was shown by an experience I had on arriving at Brussels. The night clerk at my hotel gave me Belgian paper money for an American Express Company check. Next morning the day clerk re-

fused to change one of the paper bills which the night clerk had given me. There was a run on one of the banks that morning.

"Friday, July 31, I took a train from Brussels for Antwerp. Trains were now in the hands of the government and were guarded by police. At every station we witnessed the most pathetic scenes of leave-taking.

"Friday night I found the cafés and amusement places in Antwerp closed. There were rumors that the boat would not sail the next morning.

"In Antwerp I met some of the Chicago aldermen and others who had come to study terminal facilities in Europe. They had just landed from England and asked me what to do. I told them to return to England or to go home. I did not believe they could carry on their investigations on the continent just then.

"But one of their number made a spread-eagle speech, in which he painted the ridicule that American papers would heap on them if they were turned back at the outset of their trip by the prospect of 'a little European war.' I believe they decided to stick to it.

"Many passengers on our boat had originally engaged passage on other steamers. One couple who had engaged a \$1,200 suite on the *Imperator* were glad to get in the sub-cellar on the *Kroonland*.

"The impression I received in France, and this was strengthened by conversations with Americans who had long lived there and with French people themselves, was that the French working people have been heartily opposed to war all along. Now that it has come, on one doubts, however, that they will support the war to the limit.

"Everywhere there is admiration for the wonderful organization of the German soldiers. But one hears many stories pointed with unfavorable criticism of the slowness and red tape resulting from this organization. My Viennese friend, who had served in the Austrian army, pointed out some French soldiers in their baggy uniforms, and said: 'The sloppy appearance of those troops goes against my grain horribly, but somehow I can't get away from the feeling that they can fight like hell.'

Mr. Jenkins brought with him an English daily paper of July 31, containing a story the headlines of which ran thus: "How to Earn £17 a Week: Join The Royal Naval Air Service: New Chance For Youths: Applications Pouring In At The Rate of 50 a Day." Issued before England was at war and therefore having no bearing on the present conflict, it yet shows, he said, the sort of recruiting campaign that is constantly going on in the Old World.

When Mr. Jenkins left Antwerp, Lawrence Veiller, director of the National Housing Association, was in Switzerland. Thomas J. Riley, general secretary of the Brooklyn Bureau of Charities, with Mrs. Riley, was in Switzerland also, and Madge D. Headley, secretary of the Tenement House Committee of the New York Charity Organization Society, was in Paris.

Donahy in Cleveland Plain Dealer

CIVICS

THROUGH ROUTES FOR CHICAGO'S STEAM RAILROADS—BY SYLVESTER BAXTER

WHEN THE PRESENT writer first saw Chicago in 1881, he found the passenger terminal situation of the railways the worst of any great city in the world. In Boston of that day, it was certainly bad enough. Yet both in Chicago and Boston the steam lines then had nearly all the suburban transportation.

Street railway electrification reversed the situation. It tremendously developed suburban growth and its inroads made the local traffic of the steam lines so unprofitable that they would gladly, if they could, have discontinued it altogether.

In both cities, however, the steam lines still have immense possibilities in the way of local traffic and they might easily develop a service that no other form of transit could rival.

A few years ago the Metropolitan Improvements Commission of Boston reported a plan for accomplishing this end. The problem, though vastly expensive, had been made relatively simple by the railway concentration of traffic in two great union stations. The solution was a crosstown tunnel between the two stations and the electrification of the steam lines. This would have created an unrivalled swift-transit metropolitan service, bringing all sections of Greater Boston within convenient reach of each other, as well as of the urban center.

Later this plan was practically accepted by the railways, then unified, and it was held that the electrified steam lines would thereby operate the system so conveniently, as well as profitably, as to recover as much of 75 per cent of the traffic that had been lost. But for the disastrous contentions that fomented an economic civil war and wrecked New England's transportation interests, this system might now be in operation.

The like problem has actuated a study of Through Routes for Chicago's Steam Railroads made for the City Club of Chicago by George Ellsworth Hooker, its civic secretary, and just published in a handsome pamphlet practically illustrated with plans, diagrams and pictures. Mr. Hooker is one of the most clear-headed and able of American lay students of transportation and housing problems. This work of his is a concise presentation of facts so clear in their significance as to need little argument.

The transit situation in Chicago today is worse in many respects than in 1881. With all the electrification and unification of street railways, supplemented by the rapid transit of elevated lines, facilities have not kept pace with growth. The railroads, to be sure, have elevated their tracks and have built

monumental terminals. In their costly magnificence, these terminals have in a great measure ossified conditions and made rational revision prodigiously expensive. Mr. Hooker indicates very clearly that the logical solution lies in connecting up the steam lines and devel-

oping thereby various through routes for local transit.

Chicago, being the most spread-out community in the world—considering its population—stands in greatest need of rapid conveyance over the distances involved. Its steam lines carry their passengers at an average of 24 miles an hour, its elevated railways at 14 miles an hour, its surface lines at only 9 miles an hour. Yet the steam lines carry

EVANSTON TO HYDE PARK.

Via terminal routes—one hour and ten minutes.

Via through route—forty minutes.

FOR THE MAN IN THE STREET CAR

The expert report of the Chicago City Club on Through Routes for Chicago's Steam Railroads got over its message to the traveling public by means of striking cartoons

THE TERMINAL—A VILLAGE RELIC

Farmers driving into town from various directions are fully accommodated by the one hitching rail—or terminal. From it they can reach, in two or three minutes' walk, any other desired point.

Chicago's hitching rail—the La Salle street terminal indicated by the arrow. Any point in the congested loop district can be reached in 10 or 15 minutes' walk but the rapidly growing business district stretching out a mile and a half could all be reached from a through steam route without changing cars.

only 41,000,000 local passengers a year as against 164,000,000 for the elevated and 600,000,000 for the surface lines.

Mr. Hooker is not an engineer and he very sensibly attempts to devise no scheme of his own. But by utilizing existing data from expert studies carefully made for Chicago, and plans, either realized or proposed, for other great cities, he makes it plain that the desired solution would be quite practicable. It would be tremendously costly, of course, but to utilize existing lines and supply the necessary connecting links could hardly be so expensive as to create the proposed new rapid-transit system which, at its best, would fall far short of the service possible from the steam lines electrified for local-transit purposes.

The railways have found their local traffic unremunerative because they have performed only one out of the three kinds of local business that they should handle: (1) Into and out of the congested center; (2) to and from the surrounding sections; (3) transit from points in any outlying section to points in any other outlying section.

Under a through routing of local trains all this traffic could be easily and profitably handled under operating conditions that would effect vast economies in train movement, in terminal space and in train frequency. In stub-terminal operation, from 8 to 12 distinct movements are, as a rule necessary for a single train. Through routing requires but a single movement.

Probably the most practical organized method for Chicago would be the Boston plan; a co-ordination and unification of local transit facilities, thus avoiding costly duplications, while a metropolitan terminal company, jointly owned by all the transportation interests involved, would take over and operate on a through-routing basis the local services of all the separate lines.

FRESH FISH FOR SALE BY UNCLE SAM

THE GOVERNMENT of the District of Columbia has begun an attack on the high cost of living problem through the municipal fish market run at cost by the district authorities to control the incoming supply of Potomac fish. Practically all of the fresh fish purchased in the city passes through it on the way to grocery stores and small markets where it is sold at greatly advanced prices.

At large private markets the big purchaser may get low prices at wholesale, but the woman with the family market basket must pay almost full grocery store prices when purchasing at nearby stalls which sell at retail. At the Washington municipal market, the authorities give dealers the privilege of selling with the understanding that they will sell retail as well as wholesale. The result is that a person going to the municipal market can buy sea food at a very few cents above the wholesale price.

A short time ago, the Commissioners appointed a young and energetic superintendent of weights, measures and markets named J. H. Sherman. He was

picked for the place because of the study which he had made of market management, although he also has a thorough understanding of weights and measures. Superintendent Sherman startled the people of the National Capital when he furnished for publication a list of the prices at the Municipal Fish Market that day and in a parallel column gave the prices quoted in the morning papers for fish at private markets.

The prices at private markets averaged just 192 per cent higher than at the municipal market. Sea bass, butterflyfish and flounders were selling at three cents a pound at the municipal market on the same day that the private markets were asking eighteen; halibut sold at thirteen cents on the municipal market and twenty-two cents at the private markets, and so on down the list.

Superintendent Sherman says that "the difference of 192 per cent in prices charged does not represent exorbitant profits for dealers, but exorbitant wastes incurred in storage, transportation charges, rentals, insurance, intermediate profits of jobbers, delivery costs and other items all brought about in the legitimate effort to meet the wishes of the people who usually order their food by telephone, demand quick delivery and other service on the part of the dealer, without thought of the tremendous cost involved."

At the municipal market the products must be carried away by those who purchase them. Congress has been asked to furnish a new market building.

The whole plan is a part of the progressive administration of the District of Columbia brought about by the appointment by President Wilson of Oliver P. Newman and Frederick L. Siddons as civilian commissioners.

SEATTLE COMPETING WITH ALLADIN

SEATTLE CLAIMS to be "America's best lighted city." This, together with the fact that municipal ownership obtains, makes the recently issued annual report of the Lighting Department interesting reading.

The following from the report, by J. D. Ross, superintendent, reminds one of the accomplishments of Aladdin's Lamp. "The department is justly proud of the fact that the past two years' work, judged strictly from the standpoint of an independent business enterprise, has been an unqualified success. A study of the financial statements will show that the surplus for the two years, after paying all operation, maintenance and interest and depreciation charges and establishing a sinking fund, amounts to \$433,954.21.

"But the success of the plant must be considered on a broader basis than this. The lighting plant has furnished adequate electric service to the citizens of Seattle to the most remote suburbs at rates for current that are the lowest in the city's history, and lower, considering residence, business and power schedules, than in any other city in the country. This benefit of extremely reasonable rates extends to the entire city, for com-

petition has brought the rates of the competing company to the same level as those given by the municipal plant.

"Of equal importance with its work in lowering rates is the fact that the plant has done much to establish a fair wage for the rank and file of men employed in its work. While the wages paid are in no case excessive, the aim of the department is to give the humblest employe a living wage. This policy, together with the 8-hour day, the guarantee of one day's rest in seven to every man and constant attention to the betterment of working conditions, has resulted in a loyalty and spirit of co-operation without which the success of the plant would not have been possible. The great majority of the employes of the plant are the owners of small homes, of the class most valuable in building up a city."

ONE SQUARE FOOT OF PLAYGROUND PER CHILD

THE SLOGAN "the more playgrounds, the fewer plaguegrounds," evidently expresses the sentiments not only of Franklin P. Adams but also of the Greenwich Village Improvement Society of New York, which has just presented to the Board of Estimate and Apportionment a report containing the statement that while attention has been centered upon the recreational needs of the Lower East Side, other parts of the city have been neglected.

In historic Greenwich Village, on the Lower West Side, the report says, the total playground area does not furnish standing room for the children living there. There are 24,000 children and only 16,000 square feet of playground.

An interesting feature of the report, the investigations for which were made by Wallace Benedict and Margaret J. Lane, of the People's Institute staff, and William Spinney of the Greenwich Village Improvement Society, is that it represents the voluntary efforts of a group of people who are trying to improve Greenwich Village to induce the city to recognize its responsibility for making things better.

Besides specific recommendations for increasing playground area, the report contains suggestions for improving the paving and street lighting in the district.

FOR RIVERSIDE'S NEW CITIZENS

Riverside, California, held this year its first Fourth of July celebration for new-made citizens. At noon of the holiday, Frank Miller, of the Mission Inn, and Mrs. Miller were hosts to the natives of other countries who had been granted their full naturalization papers during the preceding year. Talks on fellowship and true citizenship were made by the mayor, the city librarian, the head of the school board and others who were guests.

At the same hour, the heads of alien families of the locality were the guests of honor of the city at a dinner in Pilgrim Hall of the First Congregational Church. Greeks, Russians, Armenians and especially Mexicans filled two long tables, gay with flowers and the na-

tional emblem. There was necessarily a good deal of reserve at the start, but this had almost disappeared by afternoon when both parties met in the auditorium of the church for a program of addresses and symbolic tableaux.

PARK MOVIES

Saint Louis has just inaugurated a new experiment in public recreation by appropriating \$2,000 for free motion-picture shows in public parks throughout the city. The work is under the direction of the Public Recreation Commission. The shows began on July 17, and will be given throughout the summer in fourteen parks and playgrounds.

The first performance at Columbus Playground, in the heart of the most congested and cosmopolitan part of the city, brought out an attendance of six to seven thousand people. The exhibitions run from 8:00 to 9:30 o'clock, and the films shown cover a variety of subjects—all, however, with an educational theme. The schedule calls for one exhibition in each park and playground every two weeks. The shows are already more popular than the public band-concerts.

FIRE HAZARDS IN CLEVELAND LODGING-HOUSES

The elimination of fire hazards in laborers' lodging-houses in Cleveland has been determined upon by Director of Public Safety Alfred Benesch. He found conditions of great danger—for example, the only egress from a bunk house room in which nearly 200 men were sleeping was a curving stairway two feet wide.

The director has started a campaign to do away with narrow and closed winding stairways, to have red lights displayed at all turns leading to fire-escapes, to secure the installation of fire-proof doors and concrete stairs wherever practical, to remove bars from windows leading to fire escapes, to have all main exit doors hung outward and to replace inflammable partitions by ones of corrugated iron.

CARING FOR BROOKLYN CHILDREN

The Brooklyn Society for the Prevention of Cruelty to Children announces the division of its case work into two departments, one of child helping, the other of law enforcement against adults. Timothy J. Shea, an attorney and formerly chief probation officer in Syracuse, has just been appointed supervisor in charge of the law enforcement department; Arthur H. Taylor, formerly superintendent of the Worcester Society for the Prevention of Cruelty to Children, has been placed in charge of the child helping department.

The society reports a number of other changes during the past year. These include the employment of women investigators; the organization of the case work according to a district plan; the holding of conferences of agents; increased segregation of the children in the society's shelter; and more effort than ever before toward constructive and family rehabilitation measures.

INDUSTRY

EMPLOYERS' LIABILITY BY LAND AND SEA — BY JAMES WESLEY BRYAN

IF AN EMPLOYER through negligence *injures* an employe so as to maim him or cause him pain and suffering, he must pay such damages as are assessed by due process of law, but if an employer through negligence *kills* an employe there shall be no recovery.

That used to be the law all over the civilized world. It is now and to the time "beyond which the memory of man runneth not to the contrary" has been the common law of England. It was the law in the United States until statutes were passed creating a right of action in favor of dependents for loss of life through negligence on *land*. Louisiana, in a sense, is an exception to the rule for that state has never been subjected to common law.

There is a federal employers' liability law that changes the rule, but the framers of that act were particular to limit its scope to deaths and injuries by common carriers by railroad. An interstate common carrier by steamboat, or by any other means does not come under its provisions. It has no application to the sea. State laws are limited in application to their own territorial jurisdictions.

Then it follows that there is no American law for recovery for death at sea or on the navigable waters of the United States except in so far as it is to be found in state statutes.

As long ago as 1846 England enacted the Lord Campbell's act which supplanted the common law in this regard, both in England and on English vessels at sea, for there are no territorial restrictions in that act. A ship flying an English flag is a part of English territory, and Lord Campbell's act has always applied to English ships at sea as well as in inland waters.

Why is it that our Congress has failed to pass an act providing for such liability? As early as 1851, under the leadership of Senator Hamlin of Maine, there was forced through the Senate a few days before adjournment the indefensible act for limiting the liability of ship owners to the value of the ship and the pending freight charges. Senator Hamlin explained that it was merely an act to make American law gibe with English statutes on the same subject. When the act was finally approved, however, it was much more liberal than the English statute in that it based the liability of the ship owner on the value of the ship at the termination of the voyage, while the English liability was based on value before the injury or loss. Of course, where the ship goes down, it has no value at the termination of the voyage—that is, after it reaches the bottom.

JAMES WESLEY BRYAN
Progressive Congressman-at-large
from Washington.

The purpose of this act was to improve the conditions, to increase the profits, of ship owners. It had no consideration for the human rights of passengers and seamen. There was one redeeming feature about the statute as passed—it was especially exempted from application to rivers and inland waters. But in 1886 they passed an amendatory act making this outrageous liability statute "apply to all vessels used on lakes or rivers or in inland navigation, including canal boats, barges and lighters."

While all this legislation was being enacted to help protect profits, no consideration was given for the human rights of those involved. The American lawmakers ignored the Lord Campbell's act of 1846 which provided for damages to dependents for death at sea.

Under the Lord Campbell's act, the English seaman or the passengers had the benefit of jury trial, but our law makers did not subject American ship owners to any such burden. A more recent compensation act has further advanced the status of English seamen, but the Congress of the United States has not given consideration to this side of the case.

The general proposition of the sovereignty of the ship's flag is well laid down in *Lindstrom vs. International Navigation Company* (123 Fed. 475) Judge Wallace speaking for the Circuit court:

"The territorial sovereignty of a state extends to a vessel of the state when it is upon the high seas, the vessel being deemed a part of the territory of the state to which it belongs."

I have already mentioned the fact that practically every American state

had passed a law supplanting the common law and creating liability to dependents for death through negligence, and it can readily be seen that if this sovereignty of the flag doctrine could be made applicable to an American state then there would be a remedy notwithstanding the failure of Congress to act, for every American ship is registered at some American port and every American port is a part of some American state, and every American state has a law creating this liability.

By a series of federal court decisions these state laws have been applied so as to afford a remedy and a death liability. The state laws are inconsistent one with the other, however, and there are a multiplication of complications that may arise, but the ship owners are now willing to co-operate in the enactment of a federal death statute. I believe Congress should not take any action till an act can be passed that measures up to present standards. I interposed an objection to a proposed makeshift recently and prevented it passing the House by unanimous consent.

What is needed is a federal workmen's compensation act for all carriers both by water and rail which of course would include a provision for compensation in case of death. The present complications between state and federal jurisdiction are, to say the least of it, very exasperating. The unAmerican and inhuman liability statutes have already been referred to, but the court rules authorized by these statutes are very much against the interest of the claimants in the application of the state statutes. It would seem that if state laws can be applied that the right of jury trial would follow. Jury trial though permissible in certain cases, is rarely granted in an admiralty court.

The experiences of the claimants in the suits growing out of the loss of the *Titanic* show that it is imperative that the antiquated and uncivilized standards of American liability for ship owners—to which *THE SURVEY* has already called attention—should be abandoned and the same standard applied on the water as on the land. It is absurd to hold jury trial as an inestimable boon of liberty in civil disputes on the land, but deny it in disputes arising on the water. The *La Follette* seaman's bill is designed to free sailors and seamen from arrest for desertion. A farm hand can quit, and work in a saw mill or a factory if he wants to. Why should a human being working on a boat have less privilege?

The day of wiping out this haven of lawless big business on the mighty main is at hand. It is imperative that the legislation be enacted not by the shipping rings and the steamboat companies but

"SOLVING" THE PROBLEM OF UNEMPLOYMENT WITH A FIRE HOSE

by those who get their orders from the people direct.

There is pending now in the national House of Representatives a bill introduced by me (H. R. 12,807) which would extend the principle of the employers' liability law so that it would apply to all the jurisdiction of the United States, whether land or water. There is no reason why it should be restricted to interstate commerce by railroad as is now the case. I ask for the help of the public in the passage of this bill. It is now before the judiciary committee.

There is pending an absurd ship owners' bill for compensation in case of death at sea (H. R. 6,143). It is a lame attempt. It harks back to days of uncivilized industrial conditions and ought not to have a moment's consideration. Yet it was presented in the most plausible way, endorsed by leading proctors in admiralty, and the American Bar Association. It would probably have passed the House recently by unanimous consent except for my persistent objection.

One section of this ship owners' bill for relief from the effect of state laws now in force re-enacts and re-affirms the present infamous liability protection for ship owners. Another provides for damages for "pecuniary loss sustained" only. Another section protects the ship owners with the doctrine of "comparative negligence." Another section shuts out jury trial by forcing all such cases exclusively into admiralty courts.

Before such a relic of barbarism could be enforced on the railroad employes of this country there would be a revolution. Yet the ship owners will do their best to put through Congress just such a make-shift.

As one on the inside who knows the way this unregulated band of big business manipulators are in the habit of having their own way in Congress, I beg of the public co-operation in a fight that is really just assuming proportions to extend the humane principles of modern industrial justice to industry on the water as well as on the land.

THE ARMIES OF THE UNEMPLOYED IN CALIFORNIA —BY E. GUY TALBOTT, CHURCH FEDERATION OF SACRAMENTO

DURING THE SUMMER and spring months of last year California was infested with a series of unemployed armies. These armies were not simply in the large centers of population, but roamed over the country, stopping at the smaller towns, asking and receiving help from them.

The first of the armies had its origin in Sacramento, where the men were driven from town and refused work by public officials. By the time they reached Stockton, fifty miles away, their numbers had swelled to such proportions that they were becoming somewhat of a menace.

In order to give employment to these armies, private citizens in different cities, notably in Stockton and San Francisco, raised a large fund by public subscription and gave the men work. But as the wage paid them was about one-fourth or one-third of regular wages, the plan did not succeed very well. It was too much like an attempt to take advantage of the unfortunate condition of jobless men.

On Christmas day the first army, when it reached Fresno, numbered 250. The city and county authorities provided food for two days and when that was gone the army was at the mercy of the public. Some of the Socialists and ministers of Fresno co-operated and took care of the army over Christmas, gave them a good dinner and sent them on their way with provisions for two days.

This army was composed of two sections, first, the I. W. W. or the radicals, who really did not want work, and the regulars or trades-union-men, who were glad to take work at any price provided they were not "scabbing" on their brothers in organized labor. When asked as to the reason for banding together in this way, the leaders of the army said: "Not one city is responsible for the unemployed situation; society is responsible, and

we propose to have the different municipalities bear their proportionate share of the cost of caring for the unemployed until such time as work is provided."

Practically every one of the men in this army were industrial revolutionists. Socialists and syndicalists of every type were represented, as well as members of trades unions.

This army divided and subdivided and finally merged into the larger armies in Los Angeles and San Francisco. It was estimated by the State Board of Immigration and Housing that there were not less than 25,000 unemployed in Los Angeles and 50,000 in San Francisco. The suffering at times was intense. The men had no shelter, little food and no work.

The problem in California was aggravated by the large number of casual workers—miners, lumbermen and ranch hands—who have a great deal of idle time in winter. Added to this were the large numbers from the Northwest and the hordes from the East, driven toward San Francisco by the promises of labor in connection with the coming exposition.

The municipal authorities had no means of coping with the situation and the state itself was at a loss to know what to do. One of the aims of the unemployed army was to make society conscious of the unemployed problem. They said: "So long as unemployed men go about singly or in pairs and ask for work, men consider them common tramps or vagrants and think nothing of the problem that lies back of the tramp or vagrant. But when these men band together and go in force through the country, society is bound to face the problem of the unemployed in a concrete way."

This was the definite aim of the last unemployed army, which was summarily disbanded at Sacramento. Its lead-

ARMED POLICE GUARD AROUND THE ARMY OF THE UNEMPLOYED

ers had been in Coxey's army of a generation ago. They proposed to march to Washington with no other reason in view but to make the nation conscious of the unemployed problem. In this they were at least partially successful. Fifteen hundred of them left San Francisco. As soon as they were across the bay they were taken in charge by the police of Oakland, and they were in charge of the police every move they made until they reached Sacramento.

Here the 1,500 were camped against their will by the city authorities. They did not want to stay. They wanted to go on to Washington.

Sacramento was face to face with a new problem. During the winter, the city had had from 3,000 to 5,000 unemployed men. Now there was an additional alien army of 1,500. For two or three days city and county authorities fed these armies and then ordered them to move on. Adjoining counties and the adjoining state of Nevada declared that the army would be met with bayonets and bullets, and the army refused to move. It engaged in a campaign of passive resistance.

Eight hundred deputy sheriffs and special policemen were sworn in and armed with pick handles. The majority of these deputy sheriffs were worse bums and thugs than could be found in the unemployed army. Through the use of the fire department and the pick handles in the hands of the deputies, the army was unmercifully driven across the river into Yolo county. Many were beaten into insensibility, and the most atrocious and barbarous methods were used in handling the men. They were treated not like men, but like beasts.

Then for two weeks the army was camped at the doors of Sacramento and the 800 armed deputy sheriffs were maintained to guard the city against 1,500 unarmed unemployed men. No crimes against person or property were proved against these men while they were in the city or at the city gates, although efforts were made by the authorities to fasten every petty crime upon them. Their leaders were lodged in jail and held incommunicado for several days. Finally the army dispersed, leaving a remnant to harass the authorities of the city. Thus Sacramento

"solved" the unemployed problem.

In commenting on the action of the authorities in dealing with the unemployed armies one of the local newspapers said: "Sacramento did a good thing, after bearing patiently for days with the insults and threats of these men. She established a splendid reputation for herself all over the state, throughout the nation, in fact." But did that solve the problem?

Carlton H. Parker, former professor of industrial economics in the University of California, at present the executive secretary of the State Commission of Immigration and Housing, in analyzing the situation, says: "The riot in Sacramento is merely bringing the problem of the back streets into the strong light. The handling of the problem there is unhappily in accord with the careless, cruel, unscientific attitude of society on this question. . . . The labor unrest in America, our corruption in politics, and commercialized vice are all to be laid, without distinction, at the door of each citizen. American society today begets the vagrant, the user of drugs, child labor, as normal products of its own intent and temperament. Why then should California cities spurn this army as an unclean thing, in whose creation they have played a part? It is part and parcel of their own endeavor and political life."

During the summer months these armies of unemployed are not in evidence, but those who think the armies are permanently disbanded are grievously in error. The men who form our unemployed armies all through this country are becoming socially self-conscious and they cannot be permanently disbanded until a way is found to eliminate the causes of unemployment. San Diego met the I. W. W. free speech army with rails and tar and feathers. Sacramento met the unemployed army with fire engines and pick handles. Thus they "solved" their problems. When this army comes next winter, as come it will, shall we have a more sane solution of the problem?

LOWERING THE DROWNING RATE

Since this swimming pool, designed and largely contributed to by the National Tube Company, but owned and operated by the city of McKeesport, Penn., was established, no instance of boys drowning in the rivers of the vicinity has been recorded. Such accidents were an almost weekly occurrence before. The average daily attendance at the pool, including adults, is 350 and on Sundays, 1,000.

HEALTH

WESTERN MEDICINE IN EASTERN LANDS—A NOTE ON MODERN TENDENCIES'

"FIFTY PER CENT of the population outside cities, is sick, suffers and dies without medical relief."

Such is the report from careful observers of twentieth century conditions in lands of the Far East. The statement was made at a recent meeting of the American Academy of Medicine. At that time a number of men and women who, as trained physicians, are at grips with social and physical life in eastern countries, told of the present outlook in medical work. Strong opposition to the new and unknown; stronger tendencies toward western ways,—these make up the progress (halting, indeed, yet progress) in Changing China, new India, newer Siam.

"The ruler of Siam is progressive," said Dr. L. C. Bulkeley. "But he is hampered by the stubborn allegiance of his people to old ways." It was a government official of high rank who, seriously ill from a bullet wound, yet refused the foreign prescription for an internal remedy, and had a native "doctor" bring daily a fresh package of "medicine" to be placed under his pillow. The attendants of one of the government's hospitals left in the bushes a traveler whom they found wounded, and fled lest if he should die, they should be haunted by his spirit. Next day, however, when they found the man still living, they mustered courage to take him to the hospital.

"With such examples in high circles," said Dr. Bulkeley, "it is small wonder that although the Siamese Department of Public Health tells people how to keep well, cholera and other epidemics still sweep over the country."

Other reforms not touching dear flesh so closely, flourish better. A satisfactory

Acknowledgment is due to the American Academy of Medicine for the use of stenographic reports, and to the Missionary Research Library, New York City, for details of Peking Union College. G. S.

postal system has been organized; railroads have been much improved, and an agricultural expert from Japan was recently called in consultation.

The tendency prevails throughout the East to recognize modern medical science and to adopt its methods; throughout the West, to depend on trained students of eastern countries to better the conditions of their country.

"China's needs are to be met by trained Chinese," said Dr. R. T. Shields, Dean of the Medical School, Nanking University. "This fact was recognized by early missionaries, and the few classes they were able to train have done remarkable work. But only of late has such work been adequately undertaken."

These recent developments in medical work in the East are well illustrated by the China Medical Association, mentioned by several speakers. The Association includes over 500 medical missionaries. It is officially recognized by the Chinese authorities.

"Its members believe," said Dr. Shields, "that the object of their presence in China can be most satisfactorily attained by concentrating energy for the present upon important centers and forming efficient union medical colleges and well equipped hospitals."

Experienced workers in smaller places are being called in to these centers to teach and demonstrate. This means not

only concentration, but co-operation between all agencies in a given territory, and a common policy of work. Schools and hospitals are affiliated with existing educational institutions, and aim to conform to regulations of the Chinese Ministry of Education.

The economy of this co-operative plan is evident. Salaries of expert Chinese teachers must be adequate. To fill the staff from the native student body is part of the fundamental policy. A well equipped medical school is expensive. A few such schools, advisedly located, will become models for future Chinese endowments as well as centers of actual training.

Excellent examples of the practical working of this plan are the Union College at Shantung, where Presbyterian, Baptist, and Church of England societies are co-operating; and the Union Medical College of Peking, where seven English and American societies co-operate. At Peking there are fourteen professors, some of whom give all their time to the college. Five foreign lecturers are secured annually, each giving at least twenty-five lectures during the year.

Graduates receive a diploma from the government. All teaching is done in Mandarin Chinese. Into Mandarin also are being translated various text books on surgery, medical toxicology, clinical methods, obstetrics, and operative surgery.

Its department of research offers remarkable opportunities for pioneer work. The diseases peculiar to China are only beginning to be studied. One of the important recent discoveries is the distinction between pulmonary tuberculosis—thus far a practically hopeless disease in China—and "blastomycosis of the lungs." Cases of the latter disease have hitherto been left with clearly defined tuberculosis cases and have become infected with fatal results. Now, properly separated and treated, these cases are found to recover in large numbers. Study is needed, too, of the fevers,

HOSPITAL AMBULANCE IN RURAL INDIA

ENTRANCE TO SHANTUNG UNION COLLEGE

whose name is legion. Intestinal parasites produce endless varieties of disease. Malaria, hook-worm, pellagra, "dumdum fever," all require special treatment in their special surroundings. The need is immediate for a full survey of conditions, pathological as well as sanitary.

"We ought to help practitioners to keep up to the highest standards," said Mr. Lau, of Canton. "We need laboratories for medical research that we need not be humiliated when we come over here and find ourselves unable to tell about the diseases of our own country."

The Indian Medical Association, with but 250 members, has similar aims. It is concentrating its efforts upon tuberculosis, which is the most serious foe met in Indian medical warfare.

The efficient treatment of cases among the younger generation demands thorough instruction in personal and domestic hygiene, the establishment of sanatoria in various parts of India, and means of extensive village sanitation.

"SICK CLUBS": CO-OPERATIVE MEDICAL SERVICE —BY R. A. ALLEN, M.D., LACLEDE, IDAHO

THE MOST SALIENT defect of our present system of medical attendance is its expense to the patient. Sickness often imposes a heavy financial burden upon the thrifty, one that at times amounts to calamity. The dread of incurring this expense causes many people to avoid calling a physician until all other remedies have been tried without avail or until impelled to do so through fear aroused by symptoms associated in the popular mind with serious disease.

This doubtless is the principal cause of the evils of drug-store prescribing and patent medicine doping. As a result many insidious diseases which can be successfully coped with in their incipency are neglected until they have done irreparable damage or have advanced to an incurable stage, and doubtless many contagious and infectious diseases are allowed to spread for want of a diagnosis.

The result is a great amount of unnecessary suffering, preventable illness and death, and irreparable loss to the community as well as to individual homes. The field of prevention, in which the possibilities for conservation of health and life-saving are simply wonderful, has been opened to a comparatively small fraction of the population.

The solution of this problem will come from those who are most acutely affected, upon whom the burden of medical and hospital costs rests most heavily—from the workingmen. In England they had their Friendly Societies; in Germany, and Austria, their sick clubs; now they have arrived at state insurance. In America the "sick club" idea has taken root and is spreading rapidly.

In the little mining town of Carbonado, Washington, the miners have for thirty years successfully maintained a co-operative medical service. In the early days of this camp, a large proportion of the miners were natives of South Wales and brought with them their knowledge of the value of the "Friendly Society." They organized the Carbonado Beneficial Association, to include all of the employees of the Carbon Hill Coal Company. The company deducts \$1 from the monthly wages of each employe and turns the fund thus raised over to a board of trustees elected by the miners from their own number. This board employs a physician, purchases all drugs and supplies needed, hires nurses, —in short, defrays all expense of necessary treatment and attendance. The association has erected a small building for use by the doctor and containing beds for emergency care of patients. It owns and maintains a cemetery and a morgue.

In return for his \$1 each employe of the company is given all necessary surgical, medical and hospital care in case of sickness or accidental injury, and the

GOLD MEDAL PRESENTED TO GENERAL GORGAS BY THE AMERICAN MEDICAL ASSOCIATION

Acknowledging the medal, General Gorgas said: "I thank you, Mr. President, and Fellows of the American Medical Association. I appreciate, of course, the great honor of this occasion, but I would like to have you think that this honor is to be shared by three or four hundred young Americans who have labored in this sanitary work on the Canal Zone, and I receive this medal in part as their chief and as their representative. Again, I thank you."

members of his family are provided with all necessary medical care and medicines. The service given the men is unlimited; but major surgical operations, hospital care and nursing are not given the members of their families. The physician is also allowed to charge a fee of \$10 for confinement cases and \$25 for venereal cases. Cases requiring hospital care for any length of time are sent to a Tacoma hospital. Surgeons or other specialists are there employed to attend the patients or to perform the major surgical operations. No expense is spared to restore the patient to health and strength.

The working force in this mine numbers about 550 men and includes various nationalities: Welsh, English, Finnish, Italian, Polish, Slovak, Belgian and French. Management of the Association's affairs is left naturally to the more intelligent and forceful leaders among the men, who are elected to the board of trustees.

Thus by a simple co-operative medical service these men are able to secure all but a very small part of all the medical, surgical and hospital care for themselves and their families at a very low cost. They scarcely notice the withdrawal of the \$1 monthly fee. This plan is so much superior to the old haphazard method by which every visit of the doctor and every purchase of medicines added to the piling debts, that the men have no desire to return to that system. Today all the mining towns in the State of Washington have similar co-operative medical service. This is the surest testimonial to the popularity of the plan.

All this is certainly leading toward state sickness insurance. Washington has an industrial insurance law which has been in successful operation for over three years. At the time of its consideration in the legislature, an attempt was made to have incorporated in the act a provision for the payment of costs of first aid treatment; but owing to the opposition on the part

of employers the attempt failed.

Now representatives of the labor interests of the state are vigorously pushing a first aid amendment to the compensation act which will be submitted to the electorate by initiative at the next general election. This measure would provide for the payment by the employer of the costs of surgical, medical and hospital treatment of workmen injured while in his employ. This will be the most advanced piece of social legislation yet adopted in the United States and its working will be watched with interest.

A VERDICT ON MEDICAL PUBLICITY

AT THE recent meeting at Atlantic City of the American Medical Association, the Judicial Council of the Association included in its report an allusion to the widely discussed subject of medical publicity.

'Journal of the A. M. A., July 4, page 82 ff.

The Council recognizes that there is wide-spread interest in progress toward cure in such diseases as cancer and tuberculosis, and believes that the daily press has correctly considered such items as news. "Hence," says the report, "the press has a right to information on medical matters that shall be accurate and given by honorable men."

In order that facts, not garbled statements, may be presented and that the medical profession may prevent the self-advertising of individuals for selfish purposes, the Council recommended the following plan:

"That each county medical society should constitute a publicity committee . . . to give to the daily press accurate information on all medical matters of interest to the public, that this shall be freely given without mentioning names or from whence the information comes and that this committee shall act in an advisory capacity to all physicians of its society in questions relating to publications other than the medical press."

TOM BROWN AT AUBURN—A BOOK ON THE INSIDE OF A PRISON—BY HASTINGS H. HART

IN HIS BOOK *Within Prison Walls*, "Tom Brown" (Thomas Mott Osborne) has given a remarkable study of the mind of the convict. This book should be read in connection with Donald Lowrie's book, *My Life in Prison*, which portrays the prisoner from the vantage point of actual and prolonged experience but without the advantage of Mr. Osborne's wider knowledge of human life and human philosophy.

Mr. Osborne, having been appointed by Governor Sulzer as chairman of the commission to recommend improvements in the prison system of New York, resolved to become a voluntary prisoner at Auburn and to put himself, as nearly as possible, in the place of the actual convict. He frankly declared his purpose in the prison chapel, asking the co-operation of the officers and prisoners to make his experience as realistic as possible; and they took him at his word.

Mr. Osborne's study is an astonishing achievement for a single week. To break the crust of officialism and, without legal authority, to command the co-operation of unwilling prison officers; to overcome the suspicions and reticence of prisoners, to secure their sympathy with his plan, and to gain admission to the inner circles of convict life; and then to really put himself in the place of the prisoner and to realize how he feels, how he thinks, and to catch his viewpoint—to do all this in a week was an astonishing piece of work. While it was of necessity fragmentary, it was a valuable opening, and the really important part has come since, as will be suggested later. The writer has known prison officers who have associated with prisoners for years without obtaining such a knowledge of their mental processes as Mr. Osborne gained in a week.

Tom Brown entered the prison gates in citizen's clothes and was registered by the receiving officer as "Thomas Brown, 33,333x." He was conducted by an officer to the tailor shop, where, "in a corner of the shop without any screens and in full view of all passers in and out, are three porcelain lined iron bath tubs side by side." He stripped, bathed and dressed in the conventional prison suit and was supplied with "a cake of soap, one towel and a Bible." He was admonished by the principal keeper ("P. K."), was given a copy of the prison rules and was assigned to work in the basket shop.

During the first two days he was catechized as to his past life, occupations and habits by the principal keeper, the chaplain, the doctor, and the clerk of the Bertillon identification system, with much repetition.

It had been agreed with the warden that Tom Brown should be placed, at first, with the "Idle Company"; a group of prisoners who were characterized by one of the officers as "the toughest bunch of fellows in the prison." He was disappointed, therefore, when he found himself in the basket shop where the men were courteous, communicative and helpful, and was astonished after two days to discover that this was the "worst bunch in the prison" of which he had been told. Tom Brown was assigned to a cell 4x7½ feet and 7½ feet high. (Many of the cells are only 3½ feet wide.) Many cells of this kind contain two men each. The cell contained a stool, a folding shelf, a folding bed, a wash basin, a tin cup, a broom, a small wooden locker and an electric bulb.

Tom Brown swung open his cell door at a signal, marched in line, carried out and emptied his own cell bucket, ate prison fare in the prison dining-room (including prison hash), did his stint in the basket shop with refractory material that made his fingers sore, and served on a detail moving railroad cars with block and tackle. He received from his fellow prisoners donations of sugar, of doubtful source, for his oatmeal. He received communications and newspapers from numerous sources by underground communication. He learned to talk without moving his lips and he found himself instinctively joining with his associates "agin the government."

Tom Brown reveals startlingly the horrors of prison life to the man of refined sensibilities—the shock of the first night of cell life when the lights went out. "The bars are so black that they seem to close in upon you,—to come nearer and nearer, until they press upon your very forehead. . . . You can feel the blackness of those iron bars across your closed eyelids; they seem to sear themselves into your very soul. How does any man remain sane, I wonder, caged in this stone grave, day after day, night after night."

He experienced the humiliation of being the object of pursuit by pertinacious curiosity hunters and camera fiends; yet the change in his appearance was so great that he escaped recognition by personal friends who were watching carefully for him. The crowning horror he describes as follows: "The cell house has settled down for the night. Only a few muffled sounds make the stillness more distinctly felt; then—suddenly the unearthly quiet is shattered by a terrifying uproar. It is too far away to hear at first anything with distinctness; it is all a confused and hideous mass of shouting—a shouting first of a few, then of more, then of many voices. I have

never heard anything more dreadful—in the full meaning of the word—full of dread. My heart is thumping like a trip hammer and the cold shivers run up and down my back.

"I jump to the door of the cell, pressing my ear close to the cold iron bars. Then I can distinguish a few words sounding against the background of the confused outcry: 'Stop that!' 'Leave them alone!' 'Damn you, stop that!' Then some dull thuds; I even fancy that I hear something like a groan, along with the continued confused and violent shouting. What can it be!

"The cries continue, accompanied with other noises that I cannot make out. Then my attention is attracted by whispering at one of the lower windows. . . .

"The shouts die down. There are a few more vague and uncertain sounds—all the more dreadful for being uncertain; somewhere an iron door clangs! Then stillness follows, like that of the grave."

Tom Brown reported this mysterious occurrence to the prison warden who promised to investigate. Next day the warden "has inquired into it, he says, and found it was only a case of a troublesome fellow sent up from Sing Sing, who was making some little disturbance in the gallery. After they had admonished him he wouldn't stop, so they had to take him down to the jail. When the officer entered his cell, he threw his bucket at the officer and there was a little row. 'I'm inclined to think,' adds the warden, 'that he may be a little bit crazy, and I'm going to look into it.'"

From his fellow prisoners Tom Brown obtained what he believes to be the correct version of the incident, as follows: "There had lately been sent up from Sing Sing a young prisoner . . . pale, thin and undersized; weight about 120 pounds; age 21." On charge of impertinence to an officer he had been kept in a dark punishment cell five days, on bread and water. (The allowance of water was 3 gills per day.) He was sent back to work but was unfit and, next day remained in his cell ill, but "in spite of his repeated requests, the doctor was not summoned. The reason probably was that he was in the state known in prison as bughouse—that is to say, flighty." . . . "In the evening, he created some disturbance by calling out remarks which violated the quiet of the cell-block. He seemed to be possessed with the idea that his life was in danger."

Tom Brown continues: "Now here was a young man, hardly more than a lad, in a sick and nervous condition that had produced temporary derangement of mind. What course did the System take in dealing with that suffering human being! Two keepers opened his cell, made a rush for him and knocked him down.

During the brief scuffle in the cell the iron pail and the bucket were overturned. Then, after being handcuffed, the unresisting if not unconscious youth was flung out of his cell with such violence that, if it had not been for a convict trusty who stood by he would have slipped under the rail of the gallery and fallen to the stone floor of the corridor four stories below, and been either killed or crippled for life.

"Then the two keepers, being reinforced by a third, dragged their victim roughly down stairs, partly on his back, kicked and beat him on the way and carried him before the Principal Keeper, who promptly sent him down to the jail again" (i. e., the punishment cells).

"If it is realized that these officers have what almost amounts to the power of life and death over the convicts it can be understood that such a warning was not one to be lightly disregarded."

Mr. Osborne certified that this story is fully corroborated by careful inquiry from different men and comments as follows: "Doubtless some will say that the statements of convicts are not to be believed. That touches upon one of the very worst features of the situation. No discrimination is ever made. It is not admitted, that while one convict may be a liar, another may be entirely truthful; that men differ in prison exactly as in the world outside. It is held, quite as a matter of course, that they are all liars, and an officer's word will be taken against that of a convict or any number of convicts. The result is that the officers feel themselves practically immune from any evil consequences to them from their own acts of injustice or violence. What follows from this is inevitable.

"The point is this: that no convict has any rights—not even the right to be believed; not even the right to reasonably considerate treatment. He is exposed without safeguard of any sort to whatever outrage an inconsiderate and brutal keeper may choose to inflict upon him; and you cannot under the present system guard against such inconsiderate and brutal treatment."

Tom Brown continues: "I should not like to be understood as asserting that all keepers are brutal, or even a majority of them." . . . But "we must recognize, in dealing with our Prison System, that many really well meaning men will operate a system, in which the brutality of an officer goes unpunished, in a brutal manner."

In view of this episode, Tom Brown determined to undergo the horrors of the "jail." To this the prison warden very reluctantly consented. It was agreed that he should be treated exactly like a convict under punishment except that a "jail suit" should be cleansed for his use, whereas the ordinary prisoners use them interchangeably, without cleaning. Accordingly, Tom Brown suddenly knocked off work, declaring that the material furnished was unfit and he wasn't going to work any more anyhow. He was ordered to the "jail," which Tom Brown describes as follows: "A vaulted stone dungeon, about 50 by 20 feet, having on

THOMAS MOTT OSBORNE

The prison reformer who spent a week in voluntary confinement at Auburn Prison and has written an illuminating book on the convict state of mind.

one side the death chamber for electrocuting murderers, and on the other side "the prison dynamo with its ceaseless grinding, night and day." "It is absolutely bare, except for one wooden bench along the north end, a locker where the jail clothes are kept and eight cells, of solid sheet iron; floor, sides, back and roof. They are studded with rivets, projecting about a quarter of an inch. At the time that Warden Rattigan came into office there was no other floor; the inmates slept on the bare iron and the rivets."

"The cells are about 4½ by 8 feet and 9 feet high. There is a feeble attempt at ventilation—a small hole in the roof of the cell, which does not ventilate." Two windows in the vaulted room outside admit some light but, except on a bright sunny day, an electric light is necessary in order to see the inside of the cell. "Up to the time of Supt. Riley's and Warden Rattigan's coming into office, the supply of water for each prisoner was limited to one gill for 24 hours.

There is a sink in the outer room but "the sink was not used for the prisoners to wash for the simple reason that the prisoners in the jail were not allowed to wash."

On entrance, Tom Brown was instructed to take off his clothes and put on the jail suit, which had been cleansed in anticipation of his coming. He was carefully searched to discover whether he had any weapon or instrument upon his person. His handkerchief was taken from him, presumably to avoid danger of suicide, because a prisoner once strangled himself with his handkerchief. He was given a small tin water can.

The cell contained no seat, bed, mattress or bedding—nothing except a papier-mache bucket. A convict trusty handed in through a slot in the door a slice of bread and inserted the spout of a tin funnel through which he poured into the prisoner's can exactly a gill of water to last through the night. The officers and the trusty departed and very soon five other prisoners in adjacent cells made themselves known. Then followed an animated discussion on prison fare; ethics of the jail; comparative merits of transatlantic liners, politics, prison reform, etc. Tom Brown says: "On the whole, more intelligent instructive and entertaining conversation it has seldom been my lot to enjoy."

To his surprise he finds that these men, presumably the worst in the prison, are human and even sympathetic.

All prisoners punished, whatever the character of the offense, received the same treatment and in addition to confinement on bread and water were fined 50 cents for each day of confinement: the fine to be worked out at the rate of 1½ cents per day, allowed each prisoner as "earnings." A mark upon his sleeve from that day forward indicates that he has been punished and, if he has previously earned a good conduct bar by a year's perfect record, that bar is taken from him and, finally, some portion, if not all of the commutation time which he may have gained by previous good conduct is forfeited. Manifestly a prison punishment is a serious matter to the convict.

After four hours' confinement Tom Brown was offered liberty but refused to go, having determined to experience the full limit of jail life. They left him

very reluctantly.

As the night wore on he says: "Now that all chance of escape is gone I begin to feel more than before the pressure of the horror of this place; the close confinement; the bad air; the terrible darkness, the bodily discomforts, the uncleanness, the lack of water. My throat is parched, but I dare not drink more than a sip at a time, for my one gill—what is left of it—must last until morning. And then there is the constant whir-whir-whirring of the dynamo next door and the death chamber at our backs."

The prisoners seek to mitigate their misery. One asks, "Say, fellows; what would you say now to a nice thick juicy steak with fried potatoes?" One "sings an excellent ragtime ditty"; another "follows with the Toreador's song from *Carmen*, sung in a sweet, true, light tenor voice that shows real love and appreciation of music."

"This is the place where I had expected to meet the violent and dangerous criminals; but what do I find! A genial young Irishman, as pleasant company as I have ever encountered, and a sweet voiced boy singing *Carmen*."

These entertainments over, the night drags on. The wooden floor proves a hard bed until a prisoner instructs him how to make a pillow of his felt shoes and his shirt. Bed bugs infest the place and after killing one, he imagines multitudes. The sick prisoner accidentally upsets his water can and soon becomes delirious, seeming likely to become a raving maniac. There is no way to summon an officer but one of the prisoners with amazing tact and patience soothes his agitation until he finally falls asleep.

At last Brown falls into a doze but is speedily awakened by a patrolling officer who awakens the prisoners at 12:30 and 4:30 A. M. but refuses his request to renew the water spilled by the sick prisoner because it is "gainst the rules."

At 6 A. M. on Sunday Tom Brown is released from his punishment, convinced that the "System" is illogical, antiquated, barbarous, cruel and destructive to the character of prisoners and officers alike. He is exhausted, body and soul; but he finds strength to make a chapel address to the prisoners, which must have been memorable. The prisoners are tremendously impressed by the fact that this man of education, culture and wealth has voluntarily endured for six days the same treatment as themselves. In the endeavor to understand their situation and, if possible, to improve it they recognize that the cell and the march and the shock and the dungeon affect the man of culture and refinement more keenly than the ordinary prisoner; but the thing that affects them most profoundly is the vicarious character of his act. They would almost apply to it the words of the prophet Isaiah: "Surely he hath borne our griefs and carried our sorrows."

Mr. Osborne is not content to discover and reveal the vices of the prison system but he seeks a practical remedy. Jack Murphy, a prisoner in the shops gave him the basic idea. Mr. Osborne says: "For some years I have felt that the principles of self-government might possibly be the key to the solution of the

prison problem; but as yet I have not been able to see clearly how to begin its application.

"Jack agreed with all those with whom I have talked that the long stretch in the cells, from the conclusion of the chapel service, between ten-thirty and eleven o'clock Sunday morning until seven Monday morning—over twenty hours, is a fearful strain both physical and mental upon the prisoners.

"Well, Jack," I say "from what I have heard Superintendent Riley say I feel sure he would like to give the men some sort of exercise or recreation on Sunday afternoons; but how could it be managed! You can't ask the officers to give up their day off, and you don't think the men could be trusted by themselves, do you?"

"Why not?" says Jack.

"I look at him enquiringly."

"Why, look here, Tom! I know this place through and through. I know these men; I've studied 'em for years. And I tell you that the big majority of these fellows in here will be square with you if you give 'em a chance. The trouble is they don't treat us on the level. I could tell you all sorts of frame-ups they give us. Now if you trust a man, he will try and do what's right; sure he will. That is, most men will."

"Do you really think, Jack, that the superintendent and the warden could trust you fellows out in the yard on Sunday afternoons in summer?"

"Sure they could," responds Jack. . . . And there could be a band concert. . . . and it would be a good sight better for us than being locked in our cells all day. You'd have fewer fights on Monday, I know that."

"But how about the discipline! Would you let everybody out into the yard! What about those bad actors who don't know how to behave! Won't they quarrel and fight and try to escape!"

"But don't you see, Tom, that they couldn't do that without putting the whole thing on the bum, and depriving the rest of us of our privileges! You needn't be afraid we couldn't handle those fellows all right. Or why not let out only those men who have a good conduct bar! That's it!" He continues, enthusiastically warming up to his subject, "That's it, Tom, a good conduct league, and give the privilege of Sunday afternoons to the members of the league."

This suggestion of Jack Murphy bore practical fruit. Soon after his "discharge" Mr. Osborne, with the co-operation of the Superintendent of Prisons and the Warden of the Auburn Prison succeeded in establishing a Good Conduct League composed of prisoners, with officers elected by their fellow prisoners. The prisoners are given the liberty of the yard on Sunday afternoons, with a greatly reduced force of guards. They march to and from their cells and their work under the direction of prisoners. They prepare entertainment with the permission and approval of their officers. This plan has now been in operation for several months without the slightest disorder or accident and with marked improvement in the spirit and behaviour of the men.

Mr. Osborne's demonstration makes it

clear that those who believe that severity is an essential part of prison methods need not worry. Every convict is punished. When you pillory a man before the world as a criminal, transport him by public conveyance and march him through the streets in irons, put him behind prison walls, deprive him of his liberty, subject him absolutely to the will of another man who holds practically the powers of life and death, lock him in an ill-ventilated prison cell, 4½ by 7 feet (perhaps with an uncongenial cell mate), dress him in prison garb, exhibit him to curious visitors at 25 cents per head, subject him to strict compliance with thirty to fifty exacting rules on pain of loss of privileges and increase of term, restrict his correspondence to two censored letters per month, permit him to see his wife and children only in the presence of an officer and clad in prison garb—under these circumstances no one need question that the prisoner is punished, even though he may have the privilege of listening to a band concert and watching a base ball game once a week, conversing with his fellow convicts in subdued tones at meals and witnessing a moving picture show once or twice a month. Let it never be forgotten that the convict is punished!

Those who ridicule or condemn Mr. Osborne's adventure make a mistake. It may have been sensational, but there was need of a sensation. His experiment was valuable because it was sincere and because it has brought out the truth.

But there are other prisons! We wish that Mr. Osborne, or some one equally discerning, would allow himself to be arrested, guilty or not guilty, as a suspect of some crime. Let him be subjected to the inquisition of "the third degree," regardless of the rights that are supposed to be guaranteed to every citizen that he shall be deemed to be innocent until proven to be guilty. Let him experience starvation, buffeting insults and detectives' lies.

Then, by all means, let Mr. Osborne's representative await trial in a county jail and discover the beauties of a System twice as vicious as the Auburn Prison System. Let him be thrust into a steel cage and exhibited like a wild beast in a menagerie. Let him share his cell with five other prisoners in a place where he cannot keep himself free from vermin, where he cannot take a bath, and be forced into intimate association, day and night, with a mob of prisoners who are kept in idleness, with no occupation except to corrupt one another and to concoct plans to escape.

It is a good thing to call the attention of the public to the deficiencies of the convict prisons, and the public ought to know that Sing Sing is, and has been for many years, far worse than Auburn. Think of a prison where rheumatism and tuberculosis form an inevitable part of the prison sentence for a large proportion of the prisoners! But the prison problem of the state of New York can only be solved by a thoroughly organized and persistent attack under the leadership of tried and expert men and women. Prisons, like other educational institutions, must be manned by superintendents of proved training and efficiency.

Finger Prints

A NARROW SQUEAK

Theodore C. Merrill, M. D.

She was brave, industrious, was Little Woman, married to a brave, industrious, but poorly informed Little Man. Little Woman stayed properly at home and cared for her nest; Little Man daily went forth to labor at very particular steel things.

Little Woman could do everything about the house; Little Man could do just one thing connected with the manufacture of finely graduated calipers or gauges, capable of measuring the thickness—or rather, the thinness—of writing-paper.

It is not the purpose of this account to describe the conditions of Little Man's job; suffice it to say that he had to spend many bent-over hours each day away from fresh air, benevolent sunlight, and healthful out-of-doors. The development of tuberculosis in Little Man was natural. He wasn't very robust by birth; he wasn't informed about tubercular infection; and all he could do was to "plug along at the job."

Of course, when he became unable to do his work well, that is to say, when "the boss kicked too much," he consulted a doctor. The doctor, a busy man who wrote and talked mechanically, prescribed a mechanical remedy for the mechanic who was to swallow it; for he said that the mechanic's trouble was a "chronic cough." And thus it was that Little Man had a narrow squeak.

The doctor had a medical friend who, himself, had taken chances, gone to Texas, or Arizona, or New Mexico, or somewhere in "the Southwest," and it occurred to the Eastern man, as it occurs to so many Eastern men, that the Southwest was the very place for sick, helpless mechanics who have every opportunity of finding sustenance in a region where factories are practically unknown and specialized mechanisms entirely of the imported variety! So Little Man listened to the advice which pointed him to life-giving prairie air and provided miraculously for work, and went home to Little Woman to talk things over and count up cash. Little Woman knew that Little Man must do something for himself, and, equally that she must do something for them both. Therefore, she would take in sewing or go after it, in that wonderful Southwest of plenteous jobs, while Little Man might work at something—or other—which-the-Lord-would-provide. In this simple way, Little Man would speedily get well, home would hold to-

gether, and a vacation outing would take the place of the mechanical misery of graduated gauges. Cash? They counted it. They had just about one hundred dollars besides the expense of a journey to the Southwest.

It never occurred to them not to trust the doctor—he had often and often trusted them!

It never occurred to the doctor not to trust his own mechanical prescription. He had no time to study rash and dust and other mysteries of very particular steel things.

So the doctor sent the young couple away to the Southwest, omitting to notify his friend the Southwest doctor about them until they were on the train. Then it was too late for the Southwest doctor to do anything but think unprintable things when he learned that he was to meet at the train two ignoramuses fighting tuberculosis and expecting to find jobs waiting under the slim and scanty foliage which competed with cactus for the limited moisture of air and soil.

The "ignoramuses" hadn't written ahead to ascertain about board or a place to stay, or the number of sewing-women in the community. They were going to Healthdom. That was enough. Hadn't the doctor said that?

So they got off the train and smiled just as hard as their new doctor did and the smiles looked almost exactly the same—as hopeful as hopeful could be.

The new doctor examined Little Man and found moderately advanced, but not necessarily hopeless, tuberculosis. The young mechanic had a fighting chance provided he could rest, live in cozy quarters and have good food.

To understand possibilities, the new doctor had to have a private talk with Little Woman. With this doctor of the Southwest, private talks had become almost as mechanical as the prescriptions of his eastern confrère—thank God, not quite!

The new doctor sent Little Man with a letter to the foreman of railway machine shops in the next town—the only mechanical industry in the vicinity.

While Little Man was gone, the new doctor gently explained to Little Woman that she could not earn more than a dollar a week there by sewing or other labor. There were many other women in the locality adding to pin-money, or killing time, or waiting for death to carry away a loved one—all just so many factors contributing to use up money and decrease chances for remuneration.

About the time Little Woman was

crying her eyes out, all by herself, at the terrible prospect she was facing, Little Man came back, smiling cheerily because he hadn't been able to find work and didn't wish to bother wifey with a trifle synonymous with Despair. But he didn't smile when he went to see the Southwest doctor and have a private talk of his own.

The new doctor probed. Little Man had a brother in Manitoba. (Prairie country, that! fresh air! out-of-doors! New doctor felt hope all through him.) Then he asked, falteringly, if the brother could help take care of Little Man for a time.

Hurrah! Brother was not only fully able to support Little Man, but would fairly love to do so. Hurrah indeed! But why—why in—in Heaven—hadn't the Eastern doctor sent Little Man out to Manitoba at once, thereby saving this needless waste of travel expense to the Southwest?

Little Man didn't know.

"You've got just enough money to get you both to Manitoba," pointed out the Southwest doctor. "Hike, while times are good. In three weeks, if you stay here, you'll be on the county—and how would you like that for medicine? Your chance is in Manitoba, not in the Southwest."

So Little Man, mustered up quite a genuine smile, after all, at leaving the Southwest instead of at living there!

In Manitoba he got well. But it was a narrow squeak. "Find out first, find out first," adjures Little Woman; "and be sure to make Eastern, or Western, or Northern, or Southern doctors translate for you and explain all about any prescription beginning, 'Take first train to another climate.'"

JOHN, FINANCIER

Mary June Woods

"No, I can't do it. If John wants spending money he'll have to get it by working, because I can't give it to him," said Mr. Count to his wife, when she asked him to give John a monthly allowance.

"But it isn't unreasonable," said John's mother almost tearfully.

"I know it isn't, but I haven't the money. I'll talk to John and explain it to him." And the father went about his work.

"All the other boys have spending money. John didn't ask for it but told me what the other boys had to spend. I guess I'll try to get some work; then I can give him a small allowance," the mother concluded.

When John came home from school the next day he seemed to be happier than usual. His mother noticed it, but said nothing.

That evening as he was washing the dishes for her he said, "Mother, where do you get our drinking water?"

"From Perrin's, John. Why?"

"Did you ever drink the depôt water?" asked the boy.

"Yes, I have. It is very good, too." "Why don't you use it? It doesn't cost anything."

"I know it doesn't, but Perrin delivers the other," answered Mrs. Count.

"How much do you pay?"

"It usually costs me a dollar a week."

Mrs. Count went about her work and John went to the library to read. He read awhile, soon he dropped the book into his lap, sat with his eyes closed for a few moments, then went to bed.

The next morning he started off to school earlier than usual. All morning Mrs. Count was planning to try to get orders for bread, which would supply John with spending money. But, meantime, John was thinking about what he could do for himself.

At noon he rushed into the house and said, "Mother, will you pay me fifty cents a week if I bring drinking water from the depôt well?"

"Yes, John, I will."

"All right then. I have eight customers at fifty cents a week. Why, I'm earning four dollars a week!"

"Why, John, how does this happen?" asked his mother.

"Father told me that he couldn't give me spending money. He said it was about all he could do to give me enough to eat and to wear without any spending money."

"Yes, that is so. Your father is having a hard time just now. But tell me, how did you happen to get all these customers? Bringing water just to us would give you two dollars a month," said his mother.

"I know it would, but I made up my mind that if father had such a hard time, I'd help by buying my own clothes. If you think that it's necessary, I'll stop school and go to work."

"No, that isn't necessary, John."

"All right. But I'll earn four dollars a week anyway," and John chuckled gleefully.

Week after week he saved his money. When he had twelve dollars, he began to feel the cares of the capitalist. How should he invest his hoard? One night at the supper table, he said to his father. "If I buy the material will you help me build a fence around the back of the lot so that I can raise chickens?"

"Yes, I'll help you. I don't believe that you'll have to buy anything. I think that you can use those laths in the shed, can't you?"

The laths were decided upon and the fence put up. The parents were interested in knowing what kind of chickens John would invest in, but left him to decide for himself. The day after the completion of the fence, John came down the street whistling. He had a Plymouth Rock hen under his arm, which he released in the new chicken yard, and then he went proudly into

the house.

"Could I borrow a basket, mother?" he asked with an air of importance.

"Of course, but what—"

"I bought a setting hen for fifty cents and I can buy a setting of some fancy kind of eggs for one dollar. I want to get some and set her. I've made a nest in the shed."

"John, how are you going to feed these chickens?" his mother asked.

"Oh, I have made arrangements with the Hutchins,' and the Browns,' and the Berrys,' to carry away their garbage after I bring water to them."

For the next few weeks John was very busy. He had to get up much earlier than usual to make the rounds of his "water customers," as he called them,

turning garbage man afterward. He burned the papers, hauled the cans in his wagon to a nearby dumping place, and brought the food scraps home to feed his chickens. At first, before the little chickens were hatched, the food supply was so far greater than the demand that he was forced to bury a part of it. But when the old hen brought out her brood at last, and the chickens grew, he found use for it all.

By and by he had eggs to sell. His "water customers" and his egg income let him pay for his own books, his clothes, and still add something to his savings account each month besides. And his question now, from time to time, is, "Do you know where I could lend ten dollars, father?"

Personals

AT a recent meeting of the National Association for the Study and Prevention of Tuberculosis, Charles J. Hatfield, M.D., of Philadelphia, was elected executive secretary of the association to succeed Livingston Farrand, M.D., who became president of the University of Colorado in January.

Dr. Hatfield is well known to anti-tuberculosis workers. He has always taken a prominent part in the tuberculosis movement in Philadelphia where he served as president and assisted in the reorganization of the Pennsylvania Society for the Prevention of Tuberculosis. He has also been attending physician at the White Haven Sanatorium for a number of years. With the reorganization of the Henry Phipps Institute for the Study and Prevention of Tuberculosis under the University of Pennsylvania,

three years ago, Dr. Hatfield was made one of the directors. For the last two years he has been executive director of the institute, in which capacity he is serving at present.

As executive secretary of the national association, Dr. Hatfield will make his business headquarters in New York, while retaining his home and other medical and official relations in Philadelphia.

Philip P. Jacobs continues as assistant secretary of the association, Dixon Van Blarcom as field secretary, and C. Milton Clark as office secretary.

JOHN P. Sanderson, Jr., will become general secretary of the Buffalo Children's Aid Society on September 1. Mr. Sanderson first became interested in social work through the efforts of Fred-eric Almy, who has inspired many men with the spirit of social service and it is fitting that Mr. Sanderson should be going to this Buffalo organization which Mr. Almy was instrumental in starting.

Mr. Sanderson, who is a Michigan man, attended Cornell University during 1910—entered the service of the Buffalo Charity Organization Society in 1911, resigning in April, 1913, to become extension secretary of the Boston Children's Aid Society, which surrenders him with regret to Buffalo.

The Buffalo Children's Aid Society was organized in 1872 as a newsboys' home. It was incorporated in 1883. In 1910 it organized a Children's Bureau Department, the latter performing a general service for needy children. The society has an important field of service in the western end of New York state and the cordial relations existing among all of the important charities in Buffalo provide a fertile field for the working out of a children's program for that community.

Mary S. Haviland, who has been the secretary of the Children's Bureau, resigned on July 1.

CHARLES J. HATFIELD, M.D.
Executive secretary of the National Association for the Study and Prevention of Tuberculosis.

UNDER the new ordinance passed by the Chicago City Council creating a Department of Public Welfare, Leonora Z. Meder has been appointed by Mayor Harrison to the position of commissioner. Mrs. Meder has been for years active in Catholic social work and is still the president of the Protectorate of the Catholic Women's League. Mrs. Meder is a native of Kentucky and has had the education of a lawyer. Her duties under the ordinance will be the general management and control of the Public Welfare Department, and she will have power to appoint, under the civil service law, all subordinate officers and assistants.

The ordinance creates two bureaus in the department, one on employment which shall operate the municipal lodging houses for men and for women, and gather information concerning work and unemployment conditions. No head has as yet been appointed for this bureau.

For the other bureau, that on social surveys, John Palendach has been appointed. Mr. Palendach is one of the most influential Servians in Chicago and is the editor of two papers, *The United Servian* and the *Balkan World*. He is also president of the American Association of Foreign Publishers. He has been in the United States about twelve years. He is enthusiastic over the possibilities inherent in the scope of his department which is to make inquiries into living conditions, vagrancy, crime, poverty and recreation.

JOTTINGS

According to recent regulations of the Local Government Board of Scotland, all cases of tuberculosis, pulmonary and otherwise, must be reported. Such reports will be considered confidential to avoid annoying publicity.

A commission to consider revision of the penal laws has been authorized by the Pennsylvania Legislature and appointed by the governor. Two of the members are Edwin M. Abbott of Philadelphia and Warden McKenty of the Eastern Penitentiary.

Arizona, Idaho, Nevada, Wyoming and Alaska are the only states in which there is no legislation on the subject of tuberculosis. A report on laws in the other 48 states appears in a recent bulletin published by the National Association for the Study and Prevention of Tuberculosis.

The report of Chief Health Officer Mason, of the Panama Canal Zone, includes the first month's expense account (May) of the new insane colony at Corozal Farm. Expenses were somewhat over \$1,000. Farm-grown products sold (lettuce, tomatoes, eggs, pineapples, guinea-pigs, and much else), netted over \$700, making the net cost per patient per day, twenty-six cents.

Calendar of Conferences

AUGUST AND SEPTEMBER CONFERENCES

AGRICULTURAL DEVELOPMENT AND EDUCATION OF AMERICAN BANKERS' ASSOCIATION, Committee on. Fourth Annual Conference. Chicago, September, 1914. Sec'y, B. F. Harris, Champaign, Ill.

CATHOLIC CHARITIES, National Conference of. Washington, D. C., September 20-23. Sec'y, Rev. Dr. William J. Kerby, Catholic University, Washington, D. C.

CATHOLIC FRATERNAL INSURANCE SOCIETIES, Conference of. Held in conjunction with American Federation of Catholic Societies.

CATHOLIC SOCIAL REFORM MOVEMENT, Conference of. Held in conjunction with American Federation of Catholic Societies.

CATHOLIC SOCIETIES, American Federation of. Baltimore, Md., September 27-30. Sec'y, Peter E. Dietz, 443 University Bldg., Milwaukee, Wis.

CHARITIES AND CORRECTION, Canadian Conference of. Fifteenth Annual Meeting. Toronto, September 16-18. Gen. Sec'y, Arthur H. Burnett, City Hall, Toronto.

CHARITIES AND CORRECTION, Minnesota State Conference of. Bemidji, Minn., September 26-29. Sec'y, Otto W. Davis, Civic & Commerce Ass'n, Minneapolis, Minn.

DISEASES OF OCCUPATION, Third International Congress on. Vienna, September 21-26. Sec'y, Dr. Alice Hamilton, Hull House, Chicago.

HOME EDUCATION, Fourth International Congress on. Philadelphia, Pa., September 22-29. Gen. Sec'y, Mrs. J. Scott Anderson, Torresdale, Phila., Pa.

HOSPITAL ASSOCIATION, American. St. Paul, Minn., August 25-28. Sec'y, Dr. H. A. Boyce, Kingston General Hospital, Kingston, Ontario.

LABOR LEGISLATION, International Association for. Berne, Switzerland, September 15-17. American Sec'y, John B. Andrews, 131 East 23d Street, New York.

SCHOOL HYGIENE ASSOCIATION, American. Philadelphia, September 22-29. Sec'y, Dr. Thomas A. Storey, College of the City of New York, N. Y.

UNEMPLOYMENT, International Association on. Paris, September 18-19. American Sec'y, John B. Andrews, 131 East 23d Street, New York.

LATER MEETINGS

EXHIBITIONS

INTERNATIONAL.

GERMAN ARTISANS' EXPOSITION. Cologne, May-October, 1914.

HYGIENE, Exposition of. Stuttgart, Germany. Middle of May to end of October, 1914.

PANAMA-PACIFIC EXPOSITION. San Francisco, Cal., February 20-December 4, 1915. Social Economy Department—Alvin E. Pope, San Francisco, Cal.

PANAMA-CALIFORNIA EXPOSITION, San Diego, Cal., January 1-December 31, 1915. Director of Exhibits, E. L. Hewett, San Diego, Cal.

SAFETY AND SANITATION, Second International Exposition of. Grand Central Palace, December 12-19. Under direction of the American Museum of Safety, 29 West 39th St., New York.

URBAN EXPOSITION, International. Lyons, France. May 1-November 1, 1914. General Director, Dr. Jules Courmont, Hotel de Ville, Lyons, France.

NATIONAL

SOUTHERN HEALTH EXHIBITION, with American Public Health Association convention, Jacksonville, Fla., November 27 to December 7.

STATE AND LOCAL

COMMERCIAL AND INDUSTRIAL EXPOSITION, Grand Central Palace, New York. September 5-26. Information may be secured by addressing F. J. Oppenheimer, 500 Fifth Avenue, New York.

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. *Always enclose postage for reply.*

Children

CHILD LABOR—National Child Labor Committee, 105 East 22d St., New York. Owen B. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

CHILD HELPING—Department of Child-Helping, Russell Sage Foundation, 130 East 22d St., New York. Correspondence, printed matter and counsel relative to institutions for children, child placing, infant mortality care of crippled children, Juvenile Courts, etc.

CHILD WELFARE EXHIBITS—National Child Welfare Exhibition Committee, 200 Fifth Ave., New York, Charles F. Powelson, Gen. Sec'y, Anna Louise Strong, Director of Exhibits. Bulletins covering Results, Organization, Cost, Construction, etc., of Child Welfare Exhibits. Will assist cities in organization and direction. Exhibit material to loan.

CONSERVATION OF INFANT LIFE—American Assoc. for Study and Prevention of Infant Mortality. 1211 Cathedral St., Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request. Traveling Exhibit. Urges prenatal instruction; adequate obstetrical care; birth registration; maternal nursing; infant welfare consultations.

Health

SCHOOL HYGIENE—American School Hygiene Association. Pres., Dr. Henry M. Bracken, Chairman State Board of Health, St. Paul, Minn. Sec'y, Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

MENTAL HYGIENE—National Committee for Mental Hygiene, 50 Union Square, New York City, Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of insane, social service in mental hygiene, State Societies for Mental Hygiene.

PUBLIC HEALTH—American Public Health Association, Pres., Wm. C. Woodward, Washington; Sec'y, S. M. Gunn, Boston. Founded for the purpose of advancing the cause of public health and prevention of disease. Five sections: Laboratory, Vital Statistics, Municipal Health Officers, Sanitary Engineering and Sociological. Official organ American Journal of Public Health, \$3.00 a year published monthly. 3 months' subscription, 50 cents. Address 755 Boylston St., Boston, Mass.

SEX HYGIENE—Society of Sanitary and Moral Prophylaxis, 105 West 40th St., New York City. Edward L. Keyes, Jr., President. Six educational pamphlets, 10c each. Quarterly Journal, devoted to sex education, \$1.00 per year. Dues—Active, \$2.00; Contributing, \$5.00; Sustaining, \$10.00. Membership includes current and subsequent literature. Maintains lecture bureau.

NATIONAL ORGANIZATION FOR PUBLIC HEALTH NURSING—Object: to stimulate the extension of public health nursing; to develop standards of technique; to maintain a central bureau of information. Publications: Pub. Health Nursing Quarterly, \$1.00 per year, and bulletins. Address Ella Phillips Crandall, R. N. Exec. Sec., 54 East 34th St., New York City.

LIFE EXTENSION INSTITUTE, Inc., E. E. Rittenhouse, Pres. Gives life extension service to subscribers. Service No. 1 \$3.00 a year; Service No. 2 \$5.00 a year. Consists of periodic health examinations, inspection service, and health bulletins on disease prevention. Head office 25 West 45th St., New York City. Phone—Bryan 1997—1998.

NATIONAL HEALTH—Committee of One Hundred on National Health. E. F. Robbins, Exec. Sec., Room 51, 105 East 22d St., New York. To unite all government health agencies into a National Department of Health to inform the people how to prevent disease.

TUBERCULOSIS—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Charles J. Hatfield, M.D., Exec. Sec'y. Reports, pamphlets, etc., sent upon request. Annual transactions and other publications free to members.

SOCIAL HYGIENE—The American Social Hygiene Association (Inc.), 105 W. 40th St., New York. Div. Offices: Chicago, McCormick Bldg.; San Francisco, Phelan Bldg. Full information on request. Individual and society membership. The Association is organized to promote sound sex education, the reduction of venereal diseases, and the suppression of commercialized vice. President, Charles W. Eliot. Executives, James B. Reynolds, Counsel; William F. Snow, M.D., Gen'l Sec'y.

CANCER—American Society for the Control of Cancer, 289 Fourth Ave., New York City. Curtis E. Lakeman, Exec. Sec'y. To disseminate knowledge concerning symptoms, diagnosis, treatment and prevention. Publications free on request. Annual membership dues \$5.

Employment Exchange

SOCIAL WORKERS' EMPLOYMENT EXCHANGE—The Department for Social Workers of the Intercollegiate Bureau of Occupations registers properly qualified men and women for positions in social, religious and civic work. The needs of organizations seeking workers are given careful and prompt attention. Emma P. Hirth, Manager, 130 East 22d Street, New York City.

Libraries

AMERICAN LIBRARY ASSOCIATION—Furnishes information about organizing libraries, planning library buildings, training librarians, cataloging libraries, etc. *A. L. A. Booklist*, a monthly annotated magazine on book selection, is a valuable guide to the best new books. List of publications on request. George B. Utley, Executive Secretary, 78 E. Washington St., Chicago.

Aid for Travelers

AID FOR TRAVELERS—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

Remedial Loans

REMEDIAL LOANS—National Federation of Remedial Loan Associations, 130 E. 22d St., N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Recreation

SOURCES OF INFORMATION ON RECREATION—A classified list of significant publications on recreation giving publisher, price, and printed description. Cities issuing reports on recreation administration are also included. Price 10 cents. Department of Recreation, Russell Sage Foundation, 130 East 22d Street, New York City.

RECREATION—Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y. Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

The GIST of IT—

THE Eden of labor, unionism, Butte, Mont., was visited by the federal Industrial Relations Commission. With all workers organized—from miners to waiters, and machinists to bootblacks—this paradise nevertheless fell on evil days. How dissension and riot came about, how Charles H. Moyer's life was threatened—this time by unionists who thought him too conservative instead of by employers who thought him too radical—were matters explained in some measure by the testimony on general labor conditions in Butte. Page 538.

DEAN SCHNEIDER of Cincinnati and Supt. Wirt of Gark, Ind., have submitted to the New York board of education their recommendations for vocational education in that city. Mayor Mitchel expresses himself on the problems involved. Page 544.

SOME points of agreement and disagreement among 5,000 teachers assembled at St. Paul last month. Page 544.

SNAP shot paragraphs made on a mountain tramping trip show a group of pictures from the helps' "steerage" in a summer hotel to a camp in the midst of bushels of berries where seventy boys ate berries expressed from town. Page 540.

RIVAL pickets of his non-union waitresses were tried by an employer when his restaurants were beset by union pickets in the Chicago waitresses' strike. But the strikers were not provoked to disorder—which they charge was the employer's purpose—and continued their "silent picketing" with unabated vigor. Page 537.

"OUT in the world are the great prizes; go in and win" is too often our inspiration to youth today, said Professor Ross, addressing the teachers at St. Paul. We must counteract the anti-social spirit still found in commercial life by training citizens with "spunk" for social service. Page 547.

NEW York's plan to safeguard her hospitals against fire is at last under way. Page 535.

WHILE doing the utmost to relieve distress at the front in Europe, America's war relief plans should consider the poverty frontier at home. Page 535.

COLORADO'S social workers discuss public welfare—from rural hygiene to the labor troubles—and try to work out a social program for state and nation. Page 543.

THE SURVEY

COMMON WELFARE

REDUCING FIRE PERIL IN HOSPITALS

BY ORDER of the commissioner of charities, John A. Kingsbury, the work of installing an adequate system of fire prevention and life protection in the hospitals and other institutions of the department is to proceed at once.

The plans proposed by H. F. J. Porter and A. L. A. Himmelwright, consulting engineers, include the installation of the "horizontal escape" which Mr. Porter suggested three years ago, after the Triangle fire, and which he described in *THE SURVEY* for July 15, 1911. He has already successfully introduced this safety feature into high and crowded factory buildings.

The "horizontal escape" is accomplished by providing a wall across a building from cellar to roof, with a doorway in it on each floor. In case of fire the occupants on every floor on one side of the wall are notified by a signal and they immediately pass through the doorway to the safe section of the building, closing the fire door after them. They can then descend down elevators and stairs operated under normal instead of panic conditions.

It is pointed out that this method is practically the only safe one for institutions in which invalids are housed. Many such helpless people could not use any sort of vertical escape.

After several months of delay due to the necessary investigations and reports and the need of smoothing out legal difficulties, the work is now to be pushed rapidly. The Department of Correction has asked the Board of Estimate for permission to have the system extended into its buildings. Bellevue Hospital has already had its buildings surveyed and has asked for an appropriation to have them similarly overhauled.

It is understood that health and charities departments in other cities have been waiting for the decision of the New York city authorities, and will now utilize the same system. The changes in New York will involve also fire alarm systems of special design, doing away with steam whistles and large gongs possible in factories but entirely out of place in hospitals where inmates might be seriously affected by noise and excitement.

FREDERIC C. HOWE

Appointed by President Wilson as commissioner of immigration at the port of New York. As a member of the Cleveland city council, as a state senator, and as vigorous supporter and friend of Tom L. Johnson, he was identified with civic and social effort in Ohio. Representing the United States government he made in 1906 an investigation of municipal ownership in Great Britain.

He has been lecturer on taxation at Western Reserve University, and on municipal administration and politics at the University of Wisconsin. He will go to his important work at Ellis Island from the People's Institute in New York where he succeeded the late Charles Sprague Smith as director.

Mr. Howe's books on economic subjects and civic affairs have been widely read, and include: *The City—the Hope of Democracy*; *The British City—the Beginnings of Democracy*; *The Confessions of a Monopolist*; *Privilege and Democracy in America*; *Wisconsin—An Experiment in Democracy*; and *European Cities at Work*.

AMERICAN WAR RELIEF ABROAD AND AT HOME

THE AMERICAN RED CROSS relief ship is now expected to sail for Europe before September 1. In addition to the plans as told in *THE SURVEY* for last week, the announcement is made that Major Robert N. Patterson, of the Army Medical Corps, regularly detailed as chief of the first aid department of the American Red Cross, will sail on it in charge of the ten hospital units which are to be deposited at the most available ports of the countries desiring them. Helen Scott Hay of Chicago, whose departure for Bulgaria to take charge of the proposed Bulgarian nurses' training school was indefinitely postponed on account of the war, will also sail on the relief ship as directing head of the Red Cross nurses.

Meanwhile the American Red Cross reiterated its urgent call for contributions toward financing the ship. Special appeals to summer resorts are meeting with response, and substantial help is expected through the co-operation of business organizations, representatives of which were called together in Washington. The Bush Terminal Company has given the use of storage room at its wharfs in New York for the supplies which are to be sent on the ship, and Col. S. L. N. Slocum, U. S. A., retired, has volunteered his services which will be used in the supervision of the supplies.

Thus far the departure of reservists for Europe has not necessitated any considerable relief for their families left in this country. Only two such families have thus far come to the Joint Application Bureau maintained by the New York Charity Organization Society and the Association for Improving the Condition of the Poor. But executives of relief agencies point out that when the savings of such families are exhausted, there may be a different story to tell.

Already the New York State Charities Aid Association reports a visit from a representative of one of the French societies of New York city, who said that in a short time 400 women with children, whose bread-winners had gone back for army service, would be in need of work. They wanted it made plain that they were not asking charity but

The Colors

Gold and Green are the Fields in Peace,

Red are the Fields in War;

Black are the Fields when the cannons cease,

And White for evermore.

only a chance to support themselves and their families.

In view of the relief problem which thus looms up, a relief agency executive made the point that the national organizations throughout the country which are raising funds for war uses in their home lands might do well to consider the claim which reservists' families, stranded here, may have on their resources.

An earnest request has been made to President Wilson by the Federal Council of Churches of Christ in America that he renew at the first favorable opportunity his offer of good services to the European nations at war. This is the first action by the council since the re-

turn of its delegates to the Church Peace Conference at Constance, Germany. This was held on August 2, but re-assembled in London. Of the 150 delegates expected from twelve nations, about 85 succeeded in reaching Constance. The difficulties of many delegates in traveling to the conference, were followed by still more serious ones in their journeys from it, two delegates even being arrested. At the very moment when the armies were being mobilized the conference sent to European rulers and President Wilson an urgent and solemn appeal to avert the war.

What effect may be secured by the concerted campaign throughout the

country against the rising food prices, remains to be seen. As a result of the investigations conducted in many cities by the federal Department of Justice, it is reported that indications have been found of well-organized conspiracies of retailers to hold up prices. Indictments are expected in Washington, Brooklyn, Chicago and three other cities.

In New York, Mayor Mitchel appointed a special committee, under the chairmanship of George W. Perkins, to make appeals for the patriotic co-operation and active influence of big interests engaged in handling food-stuffs. District Attorney Whitman is conducting an inquiry to discover any price agreements among dealers in provisions. Governor Glynn, through the state superintendent of weights and measures, is seeking information on prices. A similar effort is being made by Mayor Curley of Boston through the inspectors of the Board of Health.

In view of news reports from European countries telling of the war-time activities of the boy scouts, the chief scout executive of the Boy Scouts of America, James E. West, has issued a statement reiterating the non-military character of the organization.

Mr. West points out that all connected with the movement here and abroad are conscientious and firm in advocacy of universal peace. He further calls attention to the fact that the European dispatches report the boy scouts as being engaged in doing all they can to relieve distress and suffering. In Germany they have volunteered to gather the harvests. In England they are offering service as messengers where lines of communication have been cut, and as patrols along exposed lines of communication. The Red Cross is organizing scouts to assist in its work, and it is reported that the boys may be called on to help care for the wounded.

NEW YORK'S NEW PLAN OF STREET CLEANING

WITH THE MAIN object of making New York a more healthful place to live in Commissioner John T. Fetherston, of the Street Cleaning Department, has determined upon a step that may revolutionize methods of cleaning the city. This is to set aside a particular district and to see what improvements over present cleanliness can be accomplished in that district by the use of the most efficient machinery and methods known. The Board of Estimate and Apportionment has granted \$253,000 for the experiment and it is expected that the work will be started next spring.

The district chosen is bounded by Twelfth and Fortieth streets and Sixth avenue and the East river, an area containing nearly every type of city quarter. Not all features of the proposed plan have been worked out, but the main one will be the replacement of

horses with motor trucks. To each truck can be fitted three types of trailers, one for street flushing or sweeping, one for refuse disposal and one for snow removal. This both extends the functions and increases the possible hours of work of vehicles.

For collecting garbage and ashes each building will be provided with standard cans having covers attached. Vehicles will be covered and in place of open dumps at the water front there will be closed transfer stations. Thus present nuisances from odors, flies, dust and loose paper will be abolished.

The new methods are based largely on those in use in Berlin.

FAILURE OF SEATTLE'S PROPOSED NEW CHARTER

THE MAXIM "When in doubt, do nothing" is assigned as one of the reasons for the defeat several weeks ago of Seattle's proposed new charter, which would have made that city the largest in the country employing a city manager. The charter was lost at a special election, when no personal issues were involved, and only one-fourth of the registered vote was cast.

Other reasons for its defeat were the more energetic campaigning of those opposed to its radical changes and the absence of any deep-seated dissatisfaction with the present regime.

It is possible that an attempt will now be made to amend the existing charter so as to include some of what are thought to be the superior features of the defeated instrument. The charter made an administrative separation of the business activities of the city from the humanitarian and cultural activities. Libraries, parks and playgrounds, amusements, housing, unemployment, municipal farms, charitable, correctional and reformatory institutions, together with delinquency, crime and other social problems were put under the control of the mayor, to be managed by a public welfare commission of three unsalaried members appointed by him.

All the business activities, such as public works, contracts, purchases and supplies, engineering, public utilities,

RIVAL PICKETS IN THE CHICAGO WAITRESSES' STRIKE—REPRESENTING EMPLOYER AND UNION

streets and sewers, buildings, health and sanitation, were put under the control of the city manager. This official was to be elected by the council. His salary was fixed at \$12,000.

The fifteen freeholders who prepared the charter worked out a system of counting the returns from the preferential voting, which was prescribed not only for popular election but for all elections by the council. The voter was to be allowed to indicate his preferences among the candidates for any office by writing the figure 1 opposite the name of his first choice, 2 opposite the name of his second choice, and so on.

If any candidate received a majority of all first choice votes he was to be declared elected. If not, the total of second choice votes of each candidate was to be divided by two and the quotient added to his first choice votes. If this gave no one a majority, the total of third choice votes for each was to be divided by three and the quotient added to the sum of first and second choices. If no majority was obtained by the time all preferences had been treated in this manner, the candidate having the most votes as a result of all additions was to be declared elected.

WAR AND THE HIGH COST OF LIVING

[From the *Annalist*, August 17, 1914.]

An index number is a means of showing fluctuations in the average price of a group of commodities. The *Annalist* Index Number shows the fluctuations in the average wholesale price of twenty-five food commodities selected and arranged to represent a theoretical family's food budget.

AN EMPLOYER'S EXPERIMENT WITH UNION METHODS

EMPLOYERS' PICKETS, as a counter move to picketing by the union, were a recent development in the strikes of Chicago waitresses. The center of interest shifted last May from the restaurants of the Henrici Company to the Knab restaurants, nine in number. As told in *THE SURVEY* for May 23, this employer refused to renew his contract with the unions in order to become a member of the Chicago Restaurant Keepers' Association.

His union waitresses struck and at once began "silent picketing" with placards pinned on their shirt waists, calling attention to the strike and saying to the public

WITH YOUR ASSISTANCE
WE WILL WIN OUR STRIKE
AT KNAB'S.

Knab objected vigorously to this picketing, but could not stop it, for the waitresses simply walked back and forth in front of his restaurants during meal hours, and there was no charge on which he could prosecute them. Finally it occurred to him to try the same tactics. He detailed some of his non-union waitresses to walk back and forth by the side of the union pickets, wearing placards with such statements as

I AM ONE OF KNAB'S
WAITRESSES. KNAB IS
FAIR.

HAS KNAB THE RIGHT
TO SELECT HIS OWN WAIT-
RESSES? THAT IS THE
ONLY MATTER IN DISPUTE.

The union waitresses believe that this was done with the intention of provok-

ing trouble. But if such was the purpose, it was not accomplished, for the union girls had learned in their struggle with the Henrici Company to control their actions. They even hailed the move with the declaration that although Knab had objected to picketing he now did it himself, and that therefore perhaps his objections to signing the union

contract might similarly disappear.

Knab contends that he pays union wages or better, and gives union hours. The union says he did not do this until on January 1 he signed the contract which he refused to renew on May 1, and that his latter action was one step in the efforts of the Restaurant Keepers' Association to crush the union.

A UNION PARADISE AT CLOSE RANGE—BY JOHN A. FITCH

BUTTE, MONT., is famous all over the country as a closed-shop union town. It has ranked with San Francisco in the public mind as a labor paradise, with the advantage, if any, in favor of Butte, because of its small population and single large industry making it easier to handle.

Strange stories are told of Butte. A commercial traveler told me of a brother drummer living there whose house needed a coat of paint. He planned to save money by doing the job himself during a vacation. For this infringement on the rights of the workingman, the union demanded his discharge—and got away with it.

A Butte business man saw an advertisement in a magazine one day, depicting a completely equipped bathroom, luxurious to the last degree. It so took his eye that he unthinkingly sat down and ordered the whole outfit. It arrived in due course. Not a plumber in Butte would install it.

The union rate for carpenters in Butte is \$7 for an eight-hour day. That doesn't mean that you pay only \$7 a day, however. Carpenters can be hired only through master carpenters, and they have a fixed scale, too. Carpenter work actually costs therefore, \$9 a day. So also with plumbers. The journeyman gets \$8 a day and the master \$4. \$8 plus \$4 equals \$12, which is what you pay.

All workers are organized in Butte, from miners to waiters, from machinists to bootblacks. And the closed shop is the invariable rule.

It was in this Eden of unionism that a storm broke out a few weeks back. A riot took place, property was destroyed, heads broken, one man killed and others severely wounded, and a party of men had to flee from the town to avoid instant and violent death.

What had happened? Was there a strike or a lockout in progress? Was some employer trying to smash the union, and were there scabs to be beaten up? Far from it. No one had breathed a whisper against the closed shop. The broken heads belonged to union men, and the breakers of heads carried paid-up union cards. Union men put 500 pounds of dynamite under the Miners' Union Hall. The leader of the fugitives was Charles H. Moyer, president

Probing the Causes of Unrest

X

The tenth of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

of the Western Federation of Miners, and the men who would have killed him had been for years members of Butte Local No. 1 of that same organization.

It was not to inquire into this riot that the United States Commission on Industrial Relations went to Butte and held public hearings the first week in August. Their itinerary which included Butte was mapped out last February. In the course of the commission's hearings, however, some of the causes became apparent.

But first, a brief statement of what actually occurred. June 13 is Miners' Union Day, the anniversary of the organization of the Butte local. It is to Butte what Labor Day is elsewhere. There is a big parade in the morning, with bands. The miners march first, and after them come all the other unions in town. There are between 6,000 and 7,000 miners employed in Butte, for it is the home of the Anaconda Copper Company, the great subsidiary of the Amalgamated Copper Company.

All the miners belong to the union—the Western Federation of Miners. Yet there were not 500 miners in the parade this year. Thousands of them lined the streets instead. When the parade, with Riley, president of Local No. 1, riding at its head, reached a corner where two of the principal streets of Butte meet, a sudden attack was made. Riley was thrown from his horse. The 500 were beaten and told

to go home. The parade ended right there. Then the attacking party went to the union hall and "audited the books," as one miner told me. They destroyed them, smashed windows and furniture, and took the safe from the denuded building, blew it open and took \$1,065 from it.

Then they proceeded to organize a new union, known as the Butte Mine Workers' Union. After that things were comparatively quiet for a time. Charles H. Moyer, president of the Western Federation of Miners, came to town to see what could be done in the way of conciliation. It is said by the insurgents that he did not confer with any but the "conservatives" who remained loyal; that he surrounded himself with an armed guard, and that when he finally called a meeting, the invitation to attend it was not general.

Accordingly, a few members went into the union hall, and several thousand surrounded it, waiting to see what would happen. Both sides were apparently nervous, and when some commotion occurred on the street it is said that those in the building opened fire on the crowd. The fire was returned, with no effect on the brick walls. Then some one cried, "If we can't get Moyer out of office any other way, let's blow him out." Dynamite was secured from a nearby mine, placed at intervals under the walls, and the building was wrecked. Moyer and his associates would have been killed had they not climbed through a rear window while the dynamite was being placed, and made their escape in automobiles.

The hearings developed that the eight-hour day is universal in the copper mines and smelters of Butte and Anaconda. There has been a state law to that effect since 1901. Somewhat modifying this favorable condition is the fact that there is no regular Sunday shut-down, the mines operating practically continuously seven days a week. In this connection the amazing fact developed that not only does the Western Federation of Miners have no rule against seven-day labor, as the United Mine Workers have, but the membership generally insist on being permitted to work seven days a week.

When Butte Local No. 1 of the Western Federation of Miners, was organized in 1878, a wage scale of \$3.50 a day for all underground workers was established. So far as the testimony shows, there was no change in this scale until 1907, when an attempt was made to raise it to \$4. This was opposed by the Anaconda Company, and the agreement reached established a sliding scale, based on the selling price of copper, with a minimum of \$3.50 a day. Under this scale wages reached \$4 for a time, but have averaged \$3.75.

The Butte mines are deep and on the lower levels the ventilation problem is

acute and the heat intense. The Anaconda Company has installed fans that force air into the mines. The increase of forced ventilation in the last ten years amounts to more than two million cubic feet of air per minute. Last year \$275,000 was spent for this purpose, according to C. F. Kelly, vice-president and general manager of the company.

In spite of that it was shown that the tuberculosis death rate among the miners is high. Two investigations of tuberculosis in Butte have been made. One, by an agent of the Industrial Relations Commission, placed the responsibility for its prevalence on mining conditions. The other, by Dr. Tuttle, formerly state health officer, laid more emphasis on insanitary home conditions, and insisted that it was impossible to tell whether the mines, home conditions or alcoholism were the leading cause.

The Anaconda Company has an arrangement with a private hospital, by which it collects and turns over to the hospital \$1 per month from each miner, in return for which the hospital agrees to treat the miners for everything except contagious or venereal diseases. This system came in for a vigorous denunciation from Dr. C. H. Horst, health officer of the city of Butte. He laid the prevalence of tuberculosis directly to this system.

"To cure tuberculosis you must take it at the beginning," he said. Instead of doing this, he declared that when the hospital doctors find a man has tuberculosis they do nothing for him but send him back to the mines where he works until he can work no longer—then he dies. "These doctors contract to take care of the miners, but they don't do it," said Dr. Horst. "They continue to collect the \$1 a month, however."

Dr. Thomas J. Murray, head of the Murray Hospital, which has the Anaconda contract, admitted that only non-contagious diseases and injuries are treated. He testified that during the last year the hospital has received \$6,000 to \$8,000 a month from the miners.

The complaint of the insurgent Butte miners may be reduced to two main points: the fact that mining conditions have not improved more rapidly, and the levy of special assessments, which they consider excessive. The former was emphasized in the testimony. Thirty-six years is a long time to wait for wages to advance 7 per cent—from \$3.50 to \$3.75 a day—especially when other crafts in the town are getting \$7 and \$8 a day. The cause for this was declared to be domination of the union by the Anaconda Copper Mining Company. The evidence of such domination the witnesses found in the actions of the faction in control.

A curious fact developed that surprised the labor members of the commission. The Butte local has had no regular machinery for the adjustment of grievances. It has apparently ac-

quiesced fully in the assertion by the company of its right to discharge men at will with or without reason. In 1912 several hundred men were discharged by the Anaconda and other companies for no other reason than that they were members of the Socialist party; and the union after sending two committees to the management and getting no satisfaction, took a referendum vote and decided to drop the matter.

On another occasion a strike was ordered by referendum vote, against a system of records established by the company. The officers simply failed to call the strike and nothing further was done.

Great dissatisfaction prevailed over the assessments levied during the last

appealed, and the meeting sustained the chair's ruling.

There were other minor grievances. The president got into a fight with a miner and was whipped, whereupon he secured the offender's discharge. It was admitted even by "conservatives" who remained with the old union that the faction in control had been high-handed, that assessments had been forced on the union, and that the 600 or so who could crowd into the union hall had not been representative of the miners.

What the final outcome will be remains to be seen. The insurgents claim 95 per cent of the miners of Butte. Those loyal to the old union concede 75 per cent. A movement is on foot to

UNION HALL, BUTTE, DYNAMITED BY THE INSURGENT MINERS

year. Part of the time dues and assessments together have run as high as \$5 a month.

The charge was made that for years the union has been run by "company men." The union hall would hold only about 10 per cent of the members. It was charged that whenever any matter of moment came up the company would let men whom it trusted go to the meetings on company time, with instructions as to their votes.

It was charged that this element kept itself in power by controlling the machinery of election. A movement was made to have voting machines installed. When this question came up in a meeting the president declared it lost and refused to recognize a demand for a division of the house. At a meeting where an assessment of \$3.50 a month for the Michigan strikers was voted, a member moved to submit the matter to a referendum vote, and the president refused to put the motion. The member

amalgamate the Western Federation of Miners with the United Mine Workers of America. The insurgents say they will go in if there is a real merger, and the Western Federation of Miners completely swallowed up. But if there is to be a "metal department" of United Mine Workers with the old Western Federation officers in control, they will remain aloof.

Meanwhile Charles H. Moyer, who was beaten and shot, and deported from Calumet, Mich., because he was so dangerous a radical, doesn't dare come to Butte for fear of what the miners will do to him. And in Butte the miners who stick to the Western Federation of Miners—the mere name of which strikes fear to the hearts of all who feel called upon to guard the country against anarchy—are known by many as conservatives and company men. It all goes to show that you can't believe everything you see in the papers—even the labor papers.

A TRAMPING trip through the mountains offers many chances for change of thought. One can in a week's time sleep in the open, in a hay-mow, on top of Mount Washington in a stage bunk, in a mountain hut, and in a first-class hotel. Meals can have as wide a range, but none are more interesting than those taken when lack of evening clothes sends one around to the "help" dining hall or the steerage, as some call it.

One finds a mixed group of college and normal school students, young immigrants, servants from the country towns and, most striking of all, the itinerant hotel workers. This class, like that found in asylums and other public institutions, enjoys travel. A summer in the mountains and a winter in Bermuda, Colorado next, then California and back to Atlantic City by way of Asheville. Many of them make "big money" but few retain much.

The housing conditions of these helpers deserves a special study. Guests seldom know much about the life of those who serve them. One manager talked freely about his difficulties. The most troublesome class, he stated, were the college men or as he called them "the school boys." They are efficient but they find it hard to see that the rules that apply to others are for them as well. They are used to privilege and want to carry on their larks even when others are seriously disturbed by them. Is this a vestige of the days of privilege when the college had its own court?

ONE finds many Dartmouth men in charge of the mountain huts, the stage houses, etc. Some of them are remarkably fine fellows. This college seems to have studied splendidly its out-of-door-life possibilities and to have worked out well its own winter life. The book issued by the Dartmouth Outing Club would be a good source of suggestions on the natural development of physical activities for any institution.

THE automobile folk dash by furiously and look pityingly at the walkers who have stopped for a bath in the Saco and to read Vernon Lee's *Ariadne of Mantua* while afternoon tea is preparing over an alcohol burner. At the foot of one mountain a big machine stopped, and out of it father, mother and

two grown sons—splendid types all of them—took cots and tents for a camp. But to most of the riders there is nothing but rush—two minutes for the "Great Stone Face"—"Under a cloud—too bad—drive on," and then the hotel for the night.

A COMPANY of camp fire girls in the free life of the mountains is a sight that would shock some of the conservatives. But what womanliness bloomers do make possible for outing trips! Walls and fences can be passed gracefully without worry about limbs and petticoats. The feminine yields to the human.

THE visitor to the average boys' camp wonders why some form of productive activity does not appear in the schedule. I have seen hundreds of bushels of berries wasting near a camp where seventy boys ate berries expressed from Boston!

This summer a company of boy scouts have done a good work in trail making down the Wild River. It is hoped that the success of the experiment may be made known in a form that will reach many camp leaders.

DOWN on the Piscataqua is developing a camp of unusual significance. The son of the poet, Sidney Lanier, and his wife have succeeded in steering clear of the shoals which so easily strand those seeking freedom from convention. One finds there a wholesome, sane, in-

telligent, happy life for adults and children.

The most distinctive development is that of the festival. Peter Dykema of Wisconsin University, James Oppenheim, Miss Porter of the Children's Theatre, and many others have contributed to a festival life which includes the daily bean and berry picking as well as the great frolic following haymaking. A pageant rich in color and symbolism, it represents the movement of life in the camp. The *Pioneers* was written by James Oppenheim as a part of one of these celebrations.

The heart of the camp appears in the scenes in Bible Drama given on Sunday afternoons in the Pines. Sidney Lanier recites the greater part of the text, standing like a prophet of the new order in the center of the grove, while around him form the settings of the old Bible stories. Early in the season there is the Creation; later comes the day of the Cross; and, at the close of the season, the Nativity. A small organ and a violin furnish the music. The costumes are very effective but simple. The audience, especially the children, have learned by participation in production to feel themselves a part of what others produce. Altogether one feels that the spirit is much like that of Ober Ammergau at its best. There is excellent acting done by many of those taking part yet the few necessary preparatory exercises are themselves religious exercises.

A VISIT to some of the encampments of cadets and a study of their drills and mock battles raises again the question that came first when I studied the military service of young Italians and Germans. The Peace Society ought to publish a report on those elements in military training which deserve to be freed from militarism and carried over into general education.

AND now I am back at the summer home where one's first energies go to insuring a supply of wood, water and milk. The farmer's wife to whom I appealed looked at me wonderingly and said, "Why don't you use condensed milk? We do." For cream and milk our country community has been obliged to fall back upon railway express service from the city. Surely it is not the simple life here but it is different.

THE DELIVERY BOY

MADELEINE SWEENEY MILLER

I'VE noticed that no one has bothered to write
The praise of a poor little shivering mite
Like me in a story or leather-bound book
To read in the glow of a warm ingle-nook;
No painter sees art in my wind-blistered cheeks
Or picturesque poses in me ever seeks;
I'm nothing unusual, nothing sublime,
I'm only worth while when I "get there on time."
I'm never too tired to be sent out at night
At someone's request for fresh thrills of delight;
It may be a dress, or it may be a flower,
Whatever it is, it must come on the hour.

How seldom the voice at the door tells
me "Thanks"?
How rarely one heart from the great
human ranks
Inquires of my soul if it be weak or well,
When maybe I'm verging the borders of Hell.
For no one has thought me a subject for song
Or singled me out from the hustling throng;
I'm nothing unusual, nothing sublime,
My gentlest endearment is "Get here on
time."

—From *Songs from Smoke*.

SOCIAL AGENCIES

OUR DORMANT STATE INSTITUTIONS—BY ROBERT W. KELSO

No COMMUNITY of English-speaking people has thus far in history continued long without the development of systems for the relief and repair of broken citizenship. Sympathy for the unfortunate is sometimes given as the cause of this development. The true reason is collective self-defense.

Whoever in a community transgresses the rules by which the entire group of citizens regulate their rights and advance the common good is a menace to the common weal and must be made by force to conform to the laws. Whoever in such a community falls ill and is thereby incapable of self-support becomes a burden upon anyone who will give him aid.

In an enlightened state the tendency is ever to throw such a burden upon the mass of the public, taking the cost from taxation. And if there be in that community any citizen who for lack of stamina or through defective mind cannot maintain himself and his, he too becomes a burden, which modern civilization tends to place upon the shoulders of the public.

To maintain such burdens the state institutes methods of incarceration for delinquents and enters upon systems of relief in institutions and aid in the home. However obvious the play of sympathy for the unfortunate may be in the carrying out of these enterprises by the state, the fundamental purpose must always be the protection of the entire group, that is to say, the public welfare.

If this analysis be accepted, it must follow therefrom that in the process of administering state institutions the individual to be relieved cannot constitute the sole consideration. The first object is the public well-being; the individual case comes second and is to be interpreted only in the light of the first.

And there is another consideration arising from these premises. If the welfare of all the people is the primary consideration, it must follow that every individual falling into public distress or coming to public charge, whether innocently or otherwise, is the proper subject of study on the part of that public to the end that like dependency and care may be prevented in the future.

The briefest inspection of public institutions throughout the country will show that this fundamental reason for the existence of such state enterprises is largely lost sight of. Food, furnishings, fuel, the farm, all the endless detail of the prison, the hospital or the school loom large in the minds of the authori-

ties. This is so in the very nature of things; for always where two lines of thought, each calling for action, are presented to an administrative officer, of which the one is abstract, demanding a study of the principles of government, and the other is concrete, presenting problems of purchase, of furnishing, of assigning tasks, of construction of buildings, it is inevitable that the abstract process with its greater demands upon logical thought and imagination will suffer.

The defect therefore lies not so much in the personnel of present administrative forces as in the system by which our state institutions are carried on. One or two familiar examples will serve to show the defect, and foreshadow a partial remedy.

Rip Van Winkle finds his way to a state institution. He is taken in and found to be suffering from a frosted foot, the result of tramping on the highway. He is unknown to us till we see his face. The foot yields rapidly to treatment. Rip is given light work in the bakery, and it is only then discovered that he despises work as a child hates castor oil.

Time goes by; the weather moderates. Spring has come and Rip departs, better nourished than before, better clothed, clean-shaven,—for all of which the public has paid. The door closes after him and we see him no more—till cold weather. Behind Rip stands a record which concentrates its energy upon a frosted foot. He is known only by that foot. Yet in truth that was but a minor injury; the real trouble with Van Winkle was his aversion to work. It is by perseverance in manly toil that we fulfill each man his station in this world. That is the philosophy of enduring government; but Rip is not of such a cult. Yet he is among us and of us, and if he does not support himself the rest of us will certainly be obliged to pitch in and do it for him. He represents a fragment of the dead load which we as a community of citizens must carry upon our shoulders unless perchance we can discover some remedy for his aversion to work. But we didn't advance our research very far into the causes of that weakness by confining ourselves to his frosted foot.

Let us view the point from a slightly different angle in another example. Delia is the mother of several children. She has recurring fits of insanity, during which she receives the best institutional care and treatment that the country affords. The records of one state institution are filled with the history of her several attacks and the treatment given.

One of Delia's boys is serving sentence for crime—he likes to burn buildings. Consequently another institution carries a record of his commitment, his duties and his treatment.

There is still one other institution interested. Delia's oldest daughter has had to be "sent away" and her illegitimate child turned over to the public to support. She herself shows beyond doubt that she is feeble-minded and is probably delinquent only because she is defective. A third institution, therefore, is laboring with this girl, devoting time, energy, and public money in an attempt to give her back to the community better than she was received.

There is by the average procedure of today no systematic way in which these three institutions may know that they are interested in one and the same family. Each is dealing with its charge as an inmate whose existence for institutional purposes begins at the moment of admittance and terminates with discharge or at the end of parole. To make an exhaustive study of the other children, the husband, and the progenitors of the group is apparently beyond the scope of each or of all three institutions.

It is easy to guess at the causes of

The Japan Peace Movement is the monthly organ of the Japan Peace Society and the American Peace Society of Japan. It is printed in two languages. Its front cover is in English and its back cover in Japanese, as shown above.

dependency in this case. But it remains a guess. Not knowing the facts, we guess at them; and guessing at the facts we can do no better than guess at the causes of the problem proving so costly in blood and money. Almost unlimited opportunity is constantly slipping by for using the institution as a laboratory.

It has sometimes been argued that the administrative force of modern public institutions is far too busy to make special study of its system of keeping records; of its relationship to other public enterprises; of its laboratory data at present lying idle in the records; and that consequently all such assistance must be hired at great expense. The difficulty with the argument is that its view is too narrow.

It is true that the working force is usually below a proper quota and that superintendent and staff are constantly overworked. But it does not follow that the machinery for research cannot be produced without excessive cost. The frequent interpretation of the proposal to create such machinery is that the intensive study of any phase of the institutional field means the employment of numerous statistical clerks at so much per month or per year. This is the point at which the view is too narrow.

Research in the field of sociology requires skill of a high order and cannot usually be bought in the shape of a statistical clerk. Its best mode results from the close co-operation of a group of skilled persons each fired with the spirit of discovery and an ambition to add to the fund of human knowledge.

And such assistance can be had for the asking. At the present day it would be necessary only to make known a willingness to aid and abet the study in all ways open to the administration. Hundreds of colleges, professional schools, scientific associations and organizations formed for the purpose of special research stand ready to furnish talent at any time it may be assured of welcome by the public institution.

In some localities such studies have been undertaken with results that have gone far beyond expectation. And a valuable by-product has been contagion of the zeal for betterment, so that the administration of the institution has reacted with a fine spirit of service.

A humble example, within the writer's personal knowledge, will serve to illustrate the point. On the island of Penikese, in Buzzard's Bay, Massachusetts maintains a hospital for lepers.

Location upon this no-man's-land resulted from the cry of "unclean" with which the public inhumanely met the problem of segregation for lepers. To the authorities in charge of the hospital it soon became apparent that unless a motive above the mere love of gain were permanently assured the tendency of the institution must be toward the condition of a colony or exile for outcasts, rather than a modern hospital providing the best known means of care and treatment.

Those same authorities believed that every public institution should be constituted a station for scientific research.

Adding their problem to their belief they reasoned that not only should such a hospital as Penikese with its admirable facilities for isolation be made a base for the scientific study of leprosy, but also that the very life of the institution as a hospital depended upon inspiring the staff with an intense scientific zeal.

The desire to secure the talent for a special study of leprosy was made known to the heads of Harvard Medical School. The response was immediate. At the present time, after the lapse of a year, the conclusions from preliminary studies are adding to the world's knowledge of this disease. The staff at Penikese is fired with ambition to accomplish more than kindly care and treatment; and the patients who formerly were often seen to flee to their cottages upon the approach of a visitor, now importune the physician with requests that they be allowed to contribute something, though it be ever so little, to his experiments.

As a part of the co-operative plan, the resident physician is made a fellow of the Medical School, and his superior officer in the school is visiting pathologist. Experiments are carried out in collaboration in which the talent and the facilities afforded by the School's great laboratories are brought to bear. The work is further supplemented by a medical advisory committee. So far as the public taxes are concerned, the outlay has been limited to a negligible charge for travel.

Magnify this small example a thousand times by bringing about the same condition in some of the populous institutions which present so many problems of dependency, of sickness, of mental defect, and it becomes apparent how well worth while it may be to enlist the bona fide students who are numerous in every community in a careful survey and analysis of all the functions of our state institutions.

A NORTH CAROLINA ANSWER TO SOUTH CAROLINA —BY S. R. WINTERS UNIVERSITY OF NORTH CAROLINA

South Carolina has enacted a law prohibiting white people from teaching in schools where Negroes are taught unless the consent of the county Board of Education is first obtained. Gov. Cole Blease, in championing the bill, said, "Any white man who will sit at the presidency of a Negro college, in my opinion is about as low as it is possible for any man with a white mother to get and is unworthy of the association of any decent gentleman."

The activities of students who are members of the Y. M. C. A. at the University of North Carolina indicate that the spirit of this South Carolina legislation does not characterize the feeling of all white people toward the Negroes. For these students at

Chapel Hill, N. C., have undertaken a campaign for the betterment of the Negroes of their community.

The University Y. M. C. A. had long felt that its work should not be confined altogether to the campus. It recognized its duty to co-operate in efforts for community uplift. And it considered the Negro settlements as vital parts of the community.

The entering wedge was a series of lectures on Negro life in the South. Imported speakers, members of the university faculty and students took up various aspects of the problem.

The actual study of the Negro settlement covered occupation, location of homes, home ownership, number of children in families, size of house, water used, etc. The investigators found health conditions above the average of Negro settlements in the South.

While there was room for improvement in sanitary conditions, yards and home surroundings were fairly clean. A case in which a pig was kept in the house with only a partition and a door between the sleeping quarters of the pig and the people, was perhaps the most extreme instance discovered. A large proportion of the Negroes own their own homes.

The most important educational effort is a night school, chiefly for Negro boys from 12 to 20 years old, who are at work during the day. Ten college students are helping in this school, which is conducted five nights each week. Arithmetic and history are the favorite subjects of the Negro student, and in them he makes progress most readily. Grammar seems difficult to grasp and the school aims to drill it into the student by requiring him constantly to write themes. A good example is shown at the left.

The interest of the pupils is shown by their regular attendance. The expenses of the school are paid from subscriptions raised by the pupils.

"DOING THE PAST WEEK"

"the greatest thing that happened to me Doing the past week"

"Was trouble about my work, on the past Wed. as I thori my work was don all wright and neetly don mr. Jones came in. ask me how was getting along. I of corse told him all wright Sir."

"He then looked up ward and sed I dont think so. Would you call this room clean with all of these spider webbs in it. No sir. No sir. I just hadnt seen them. I then went to work and cleaned them out."

"that caused me to think about my other Building, soon as I had finished there I went strait to the Pebody Building, first thing I don was to clean the spider webbs out."

"Prof. Noble came in and sed you are thortful you are the very one we need around here. I then thanked him."

"that made me think that a wise man wont make the same mistake twice so I must be wise."

CUTTING THROUGH POVERTY HILL

Pecking at Poverty Hill by individual effort is slow work. Organized effort acts like a steam shovel. From cartoons by the Associated Charities of Des Moines, Iowa.

JOINT CONFERENCE OF CHARITIES AND SOCIOLOGICAL FORCES IN COLORADO—BY C. R. HENDERSON

THE EXTENSION division of the University of Colorado brought together on the heights and in the clear atmosphere of Boulder, a "sociological conference." In a week of discussion men and women of various professions, representing many points of view, considered vital human interests. On the opening evening, in the vast hall of the university, some historical aspects of philanthropy were presented.

It was urged, with authority, that the disposal of garbage, consideration of sewer gas and plumbing, and pure food laws, while esthetically and economically interesting, have comparatively little to do with health; that more attention should be given to tuberculosis, infant mortality, venereal diseases. The chief means of arming the community against disease is education, instruction and training in hygienic habits. Medical colleges are called upon to train health officials, and communities are urged to employ them and provide adequate funds, since health has its price. Rural hygiene, with reference to Colorado conditions, was noticed.

The meeting on charities and correction opened with a strong paper on public outdoor relief. This form of relief is necessary, and almost universal; in the few cities where it has been abolished the results are in dispute. This form of charity, while inevitable and desirable, is also dangerous, especially when disguised as "mothers' pensions." To save outdoor public relief from bankruptcy, it must use the friendly visiting service whose value has been demonstrated in voluntary charity organizations. The state has resources and can be depended upon, but it needs to be supplemented by private organizations.

The Colorado prison system of working convicts ("citizens") on the mountain roads was sympathetically explained. The system of reformatory institutions of the state was described and their chief defects pointed out.

At almost every session emphasis was laid upon the school, the university and other educational institutions. Very im-

pressive was the plea that while the church loyally helps the school in guiding the young, the sensational newspaper and the depraved theater are agencies of depravity. It is unjust to charge the public school with failure to shape character when so many vicious influences are permitted to gain control of youth.

Naturally just now in Colorado, industrial problems excited the most intense interest. The striking miners were represented by their attorney and several members of the unions. A lawyer representing the corporations declared that there is only one question at issue. There is not and never has been any grievance; the trouble has all been made by walking delegates backed by public officials too cowardly to enforce the laws protecting life and property. The only thing to do now is to hang the assassins and their supporters. Generally, however, there was manifest a desire to see all sides of the problem.

At the last session many of the constructive suggestions of the week were summarized in a statement of a "social program for state and nation." All sane citizens agree that law must be obeyed, life and property be held sacred, and liberty guaranteed by government. But men are coming to believe that government is more than a big policeman with a club; that it has moral duties and is the agency and instrument of the common will, its end the common welfare. Democracy protects property, even that of corporations guilty of fraud and corruption, but it also insists that property must justify itself by its beneficence. Whether this responsibility is enforced by compelling combinations to dissolve into competing units; or by license and control through commissions, or through public ownership, the people are determined to find some way to be masters.

A social program for wage-earners and all who are economically dependent while politically free and powerful will permit and regulate collective bargaining and meeting combination with combination; will provide a system of public labor exchanges and reduce the irregu-

larities of demand for labor; will protect the physical integrity of workers against accidents and disease; will increase industrial efficiency and earning power by technical training; will provide impartial and inexpensive tribunals for the settlement of disputes; will build up a system of social insurance to secure increase when men are disabled by sickness, accident, invalidism, when unemployed, and when death removes the stay of the dependent family.

This is not "paternalism" but democracy; and it will make law respected by making it worthy of moral reverence; it will make armed conflict and violence rare, by giving justice to all on equal terms.

TEACHERS FOR THE FEEBLE-MINDED

THE INCREASED demand for training in teaching mentally defective pupils is shown by the experience of New York University with its summer demonstration school, held for the first time this year.

This school, conducted on Sullivan street, New York city, has seventy feeble-minded girls and boys, three years or more backward mentally, drawn from the neighborhood. It is believed to be the first experiment of the kind ever undertaken. It is conducted for the benefit of those enrolled in the University's Department of Education for Defectives, of which Henry H. Goddard, director of the department of research of the Vineland Training School, New Jersey, is director. There have been eighty registrations for the work of this department this summer—a number far exceeding the expectations of the university authorities. Most of those enrolling expect to teach ungraded classes in the public schools.

New York University will introduce this fall a two-year course in the teaching of mental defectives, awarding a certificate to graduates. It is hoped to make the demonstration school, which this summer is under the supervision of Meta Anderson, supervisor of special classes in the Newark, N. J., public schools, a permanent part of the winter work of the university.

EDUCATION

A MAYOR AND A BIG CITY'S EDUCATIONAL PROBLEMS—BY WINTHROP D. LANE

THE MAYOR of New York city has joined hands with the board of education to solve for that community the most pressing problem before the public schools today—the problem of vocational education for young boys and girls.

Herman Schneider, dean of the College of Engineering of Cincinnati, and William Wirt, superintendent of public schools in Gary, Ind., who were retained by the board of education some months ago to study the needs and opportunities for vocational instruction in New York and to make recommendations, have submitted their reports.

Although the contents of these reports have not been given out in detail, it is known that both specialists have made recommendations in line with the types of vocational schooling for which their names have come to stand. Dean Schneider has become noted for a co-operative system of part-time instruction. Scores of manufacturing, railroad and construction companies in Cincinnati co-operate in educating students by permitting them to alternate between shop and school in two-week shifts.

The essence of Superintendent Wirt's regime is his effective use of the school plant, which makes it possible to house many more pupils than is the rule, and his "vocationizing" of elementary grade instruction. He has cut down the exodus of those who heretofore have become "tired of school."

When retained, Dean Schneider was asked to render his opinion specifically with reference to the need and opportunity for co-operative part-time schooling, and Mr. Wirt was asked to make recommendations affecting the elementary grades. Their reports enjoy the status of expert advice. A committee of the board of education was recently appointed to study the problem of vocational education in New York, and this committee will make use of the reports.

The retaining of Messrs. Schneider and Wirt came as a direct result of a recent trip west by New York's thirty-four-year-old mayor, by Thomas W. Churchill, president of the board of education and by other city and school officials. The trip was undertaken for the express purpose of getting light on New York's educational problems. Visits were made to Cincinnati, Gary and Chicago. It was reported that another purpose of the trip was to find a man to fill a vacancy recently created in the board of superintendents. A specialist in vocational education was wanted—so the report ran—to work out a comprehensive plan for that type of schooling in New York city. This position, which

must be filled by the board of education, is still vacant.

The somewhat unique fact that the mayor of a great city has taken a vital personal concern in the city's educational policy, and the probability that his influence will be felt in carrying that policy through, lend unusual interest to his views on the problems involved. In an interview granted to the writer Mayor Mitchel said:

"We hope that the reports of Dean Schneider and Superintendent Wirt will be such that their recommendations can be adopted in large part. We want to do something at once.

"New York city has three educational objects before her. She must establish adequate co-operative industrial training for pupils of school age, that is, a system of part-time instruction in shop and school for those who are old enough to learn a trade. She must establish a system of continuation schooling by which those who have been forced to leave school and go to work—adults and youths alike—may be given opportunity to return to the class room for a few hours each week for further self-equipment. Finally, she must introduce prevocational instruction. By this I mean there must be an enlivening of the elementary curriculum to retain the interest of growing boys and girls and to lay broad foundations for possible industrial careers later.

"We have made a beginning with continuation and with prevocational instruction, but we have done nothing with co-operative schooling. I do not doubt that our manufacturers and employers will meet the city half way in the introduction of this type of instruction. It may be that there are some industries or trades in which, because of the character of the work or the conditions of employment, it is unwise to attempt co-

operation. I do not know enough about industry to answer that."

"Do you think that it would be possible to discover fundamental principles underlying all, or most, modern trades or industries, which could form the basis of prevocational instruction for boys and girls in the grades?" was asked.

"I doubt it, though here again those who know more about industry have first right to speak. I am afraid the common denominator—the set of underlying principles—would prove too small to be of much educational value. It was proposed that a study be made in New York with the express object of getting information on that point. I have been in favor of such a study for the simple reason that the data may become useful some time.

"New York city is not going to regard vocational education for girls as a problem distinct from vocational educational education for boys. We shall meet the one as adequately and carefully as the other."

For two years New York's board of education has been more and more interesting itself in vocational education. In 1909 the expenditure for salaries alone for day vocational instruction was \$3,722; in 1913 this amount was \$84,000; and in 1914 it was \$140,000. The first experiments in prevocational instruction in the seventh and eighth grades (conducted in two schools) were made during the past year. This is true also of day continuation classes.

President Churchill, of the board of education, declared in his latest annual report that "we are not doing nearly enough along the lines of vocational education" and that "no other problem is of more concern to the board of education than this." City Superintendent of Schools Maxwell has said: "In my judgment, what our schools most need today is a great extension of the opportunities for industrial education."

MOBILIZING WITH THE NATION'S EDUCATIONAL FORCES

THOUGH WE ARE not over-prone these days to look upon the "bold teacher's doctrine" as necessarily "sanctified by truth," yet many of us are apt to listen attentively when educators gather together and unburden their minds. And we strain the ear a little more than usual when the teaching forces of the United States mobilize annually in the sessions of the National Education Association, as they did last month at their fifty-second meeting in St. Paul.

Of course they discussed everything from the function of education in a de-

mocracy to musical terminology. The temper of these 5,000 teachers toward the "emancipation of women" was indicated when a resolution favoring woman suffrage was passed with little opposition. "Equal pay for equal service" was also a popular recommendation.

One felt, as he listened to pronouncements in favor of greater social and educational freedom for women, that many of these were delivered in the spirit of "last shots," just to make sure that the enemy was dead. When a speaker declared that Jane Jones had as much right to become a lawyer or

doctor as John Jones had to become a cook or dressmaker, there was no longer any fire in the eye or challenge in the tone. There was little expectancy of disagreement with the statement that women as well as men ought to be trained for social responsibility or for life in the twentieth century. One had a feeling that declarations of this sort were almost as needlessly cautious as the twentieth "trenched gash" in Banquo's head.

Nevertheless a whole session was given to discussing *The Status of Woman*. Mary E. Woolley saw in President Jordan's statement that "the twentieth century, above all others, will be strenuous, complex and democratic," a hint of the kind of preparation women must have to live in this century strongly and well. The earnest woman of to-day said Miss Woolley, does not look upon education as a personal acquisition, nor does she consider that schools exist in order that she may be "highly accomplished."

Home-making, said Miss Woolley, which is only one of the many kinds of service demanded of women to-day, must broaden into a conception not to be confined within the walls of a single dwelling. The home-maker's "responsibility includes the home of the other woman, the woman who is living in a tenement, not differentiated by the word 'model'; whose only 'sleeping porch' is a fire-escape, which must also serve as the family store-room and the family coal bin; who has never heard lectures on sanitation—probably does not know the meaning of the word—and is so accustomed to inner rooms, where sun and air have never penetrated, to close hallways and foul odors, that light, airy, sunny rooms would seem like a bit of heaven brought down to earth, as indeed they are; whose children learn life not from the wholesome influences of the home but from the unwholesome influences of the street; who ekes out an existence by an unending round of weary toil and never knows what it is to have a living wage.

"In other ways the 'home maker' of the twentieth century has a very much wider responsibility than her grandmother—a responsibility for the industries taken out of the home and entrusted to bakeries and restaurants, laundries and soap factories, canneries and dairies, mills and tailoring establishments; a responsibility for pure food and clean streets, hygienic school rooms and wholesome amusements, for the prevention of contagious diseases of the body, and the elimination of drunkenness and the social evil, the contagious diseases of the soul. Above all, upon her rests the responsibility for the child life of the nation, that it may not be defrauded of the child's right to play and happiness, education and good influence."

A Social Worker's Criticism

Both the National Education Association and its Department of Superintendence, the two most representative bodies of school teachers and administrators in the country, have apparently decided to turn deaf ears to Byron's admonition to seek roses in December or ice in

WILLIAM WIRT, CARY, IND.
One of the vocational education experts making plans for New York

June as soon as true in critics. In pursuance of a seemingly deliberate policy they are inviting the social workers of the nation, who are reputed to frown every time they look at a school, to come and tell them what is wrong with public education.

At St. Paul three instances of failure by the public school were pointed out by Sophonisba P. Breckinridge, assistant director of the Chicago School of Civics and Philanthropy, whose view of the school as an instrument "for testing present social relationships and for securing improvements in social conditions" must have startled many teachers.

The first failure she mentioned includes those cases in which the child's school experience makes little impression because his home conditions are bad. With respect to these, Miss Breckinridge asked whether the school habitually does all it can, not only to discover them, but to bring reconstructive influences to bear on the home situations.

Again, there is a class of pupils, said Miss Breckinridge, whose needs the school as yet fails to meet. Among these are immigrants and those who leave school at the earliest moment allowed by law to take up wage-paid work. What can or ought to be done for these the educator must decide, but the decision ought to be based, said the speaker, on information furnished by those who know out of what surroundings the children come and into what kinds of employment they go.

The third failure cited by Miss Breckinridge embraces those cases in which the attendance of the child is either not secured at all or secured inadequately. From the standpoint of the social worker, to whom school attendance is an important factor in family restoration and industrial efficiency these losses on the part of children, said Miss Breckinridge, seem of enormous importance. There is need of devices within the system and of co-operation with outside agencies that will bring this waste to a minimum.

On Teaching Sex Hygiene

There has been a pronounced forward movement in the attitude toward teaching sex hygiene in the schools, says J. Stanley Brown, if we compare the discussion at St. Paul with that before the Department of Superintendence at Richmond, Va., last winter.¹ Mr. Brown is superintendent of Township High School, Joliet, Ill., where he has introduced instruction in this subject. We quote from a report he wrote for *THE SURVEY*:

"Bitter and arbitrary opposition, which in many quarters this new subject has met, seemed almost gone and the resolutions of the entire body of the N. E. A., while cautious concerning the fitness of the person giving instruction, were positive in declaring that such instruction should be given in the public schools.

"All were agreed that the home has its work to perform and that it is essential that both father and mother be prepared to give the kind of instruction needed and to co-operate with the teacher.

"By common agreement the subject is not to be lugged into the class room in its entirety but is to be given in connection with various studies. Eugenics, eugenics, race preservation and divorce are wrapped up in the big idea of sex and ought not to be dragged into the pool of the 'sexual' as if sex and sexual meant the same thing.

"It is agreed that best results come from teaching boys and girls in special classes. It was clearly pointed out that the treatment of disease, resulting from violation of sex laws, ought to be considered in just the same way as the treatment of any other disease.

"It is maintained that teaching on this subject ought to be graded in just the same way as teaching on any other subject and that instruction ought to begin as early as the third or fourth grade and proceed in a logical way through the adolescent period. Only such information should be given at each stage; the grade of the pupil indicates can be properly assimilated, and it is maintained that the parent or guardian may always have the right to ask that the child be excused entirely from such instruction.

"In order that teachers themselves may be properly prepared to give instruction, it was urged that normal schools, colleges and theological seminaries should provide adequate courses for teachers in sex hygiene, and that by so doing there may be a wiser and more friendly co-operation of the three great forces in society, the school, the home and the church."

Vocational Education

"The problems of vocational education are like a piece of tough beefsteak—the more they are chewed, the bigger they get," writes R. R. Lutz, of the Division of Education of the Russell Sage Foundation, in reporting the St. Paul discussion on this subject for *THE SURVEY*. He goes on:

¹See *THE SURVEY* for March 14, 1914, page 746.

"The Committee on Vocational Education and Vocational Guidance started the ball rolling with 'A Proposed Terminology.' There can be no doubt that this report will aid in establishing a common basis for future talking and thinking, in spite of individual differences of opinion regarding the definitions and classifications proposed. The report is largely based upon the theory and practice of vocational education in Massachusetts.

"The question of training and qualifications of teachers gave rise to a sharp division of opinion. A St. Paul manufacturer defended the policy of employing journeymen mechanics as teachers in vocational schools and cited the experience of the St. Paul Institute, where a marked increase in enrollment and general efficiency was obtained, he said, by substituting shop-trained for school-trained teachers. Most of the principals and superintendents present disagreed, claiming that the best results are secured with teachers who have had both school and shop training, or by employing school and shop men in equal proportions.

"Some of the Westerners protested against the blind following of precedents in matters of legislation and educational policy, established by a few Eastern states, particularly Massachusetts. The Indiana vocational education law adopted last year came in for a good deal of criticism, and it was openly intimated that its defects had their origin in the fact that it was drafted by Easterners who were unfamiliar with local conditions.

"The half-time co-operative school plan, of which Cincinnati and Fitchburg are the best known examples, seems to be gaining ground very slowly in other communities. Reports from the directors of the four-hours-a-week schools in Wisconsin are very encouraging, although only a small proportion of the instruction given in them can be classed as vocational. There is general opposition to the dual system of control, but the Wisconsin men point out that in that state 'it works.' The general trend of development seems to be toward vocationalizing the common school curriculum, a modification of the subject matter taught in the schools without materially changing the present forms of organization."

Rural Education

"The St. Paul meeting made the usual annual plunge into the whirlpool of rural education," writes Van Evrie Kilpatrick, president of the School Garden Association of America. He adds, in a report to THE SURVEY: "This year, however, it seemed a little deeper and more sustained in its struggle to keep afloat.

"It is notable that confusion in failing to discriminate clearly between agricultural education and rural education still exists. There is great unanimity of agreement that rural education should include agricultural education; but the practice over the country at large shows that rural education is really as yet far removed from agricultural education. The notion of education in the rural districts is, traditionally, that preparation

for life which enables the farmer's boy or girl to make a living in the city.

"It was clearly pointed out that greater efficiency in the rural schools could be secured only by enlarging the unit of supervision, making it at least as large as a county. This lifts the work of an individual school out of the pettiness of the small neighborhood. It is more apt to bring into the field a trained expert.

"For several years the atmosphere of the N. E. A. has been more and more charged with discussions of agricultural education. It is held to be as fundamental as industrial education. Almost all of the advocates of a bettered rural education emphasize its importance. Some of the speakers indicated the slight degree, however, to which it has really reached the rural community. The point was made that during the last decade there has been rapid growth in the number of agricultural schools and agricultural courses in normal and high schools. This, together with the constant discussion of agricultural education, gives hope that the next decade will see its actual and widespread acceptance in the rural schools of the country.

"As in former meetings the training of teachers brought out the most discussion. It was almost grotesque to listen to the proposals to make out of a city girl a successful teacher in the country. One speaker went so far as to say a city girl trained in agriculture could teach agriculture to the farmers better than a young farmer who had not been trained in agriculture. I am sure the little that either could do would hardly be a desideratum. This suggestion only goes to illustrate how lamentably weak the preparation of the rural teacher now is. Another speaker most forcibly brought forward the point that agricultural education can be taught successfully only by men. He contended that it was a gross waste of time and money to send a girl into the country for a few months, or for a couple of years at most, and expect work that was worth while. Under such management of teachers the barn-like rural school, with its wretched surroundings, poor sanitation and patch of weeds, will continue to exist.

"The organization of boys' and girls' clubs, as well as adult clubs and even other forms of rural endeavor, were brought forward this year for the first time. It was held that if the successful organization of many thousands of children into tomato clubs, potato clubs and other agricultural clubs, is necessary to socialize and unify the work in rural communities, then it is high time the public school awakens to these new means.

"Doubtless there is much of value in the social centre unit in rural education. This means has been used to bring the home and business plants into co-operation with the school plant. It seems to me that no greater thought has come to us in modern educational trend than this suggestion to utilize the home, factory, farm and office as parts of the educational equipment of our public school system. Leaders in the betterment of all school work must early

adapt themselves to this new idea. It will enable educational work to be increased a hundred fold; duplication will not be necessary; intimate co-operation will be brought about; interest will be increased; all agencies in the community will be unified in one great effort to increase educational results."

On Teachers' Pocketbooks

If the country doesn't presently know what is paid to every person engaged in public teaching and whether this amount has kept pace with the increased cost of living, or whether it is so low as to make teaching a sweated industry, it will be through no fault of the association's Committee on Teachers' Salaries and Cost of Living.

Under the direction of this committee three extensive studies have been prepared. The first,¹ by Prof. Robert C. Brooks, of Swarthmore College, presents measurements of the increase of the cost of living in connection with studies of the social and economic status of teachers in typical cities. It shows, among other things, that many teachers are compelled to seek supplementary employment to make both ends meet and that the very profession having most to do with children is compelled by low income to keep the number of its own offspring at a minimum.

The purpose of the second study, by Scott Nearing, was to indicate how the methods of economists in applying standard of living measurements to groups of wage-earners may be extended to groups of teachers.

The third study, just issued as a bulletin of 465 pages by the United States Bureau of Education, is an exhaustive compilation by James C. Boykin and Roberta King of the salaries paid teachers of all ranks in city school systems; of salaries paid state and county superintendents and rural school teachers; and of salaries paid in universities and colleges in state normal schools, in trade, manual training and industrial schools, and in schools for special classes of pupils, *e. g.*, blind, deaf and feeble-minded.

While interesting facts may now be gleaned from these statistics, such as that the average salary of elementary school teachers in cities of between 100,000 and 250,000 is \$791 and in cities of between 50,000 and 100,000 is \$688, their chief value is the use of them promised for the future. For example, there is a similar mass of statistics dealing with teachers' salaries in all parts of the country for 1903-04. During the nine years between that study and the present one wholesale prices have risen, according to reports of the U. S. Bureau of Labor Statistics, 17.6 per cent, and retail food prices 25.9 per cent. It will be possible, therefore, by proper use of this latest report, to ascertain where teachers' salaries during that period kept pace with the standard of living and where they fell behind. This and other deductions are promised by co-operation of the National Education Association with other agencies.

¹See THE SURVEY for May 24, 1913, page 272.

TRAINING CITIZENS WITH "SPUNK" FOR SOCIAL SERVICE—BY EDWARD ALSWORTH ROSS'

PROFESSOR OF SOCIOLOGY, UNIVERSITY OF WISCONSIN

WITHIN THE LAST twenty years many of our colleges and universities have caught something of the social view of things. But in the schools naïve commercial ideas prevail. Our more promising youth still issue from the class room into practical life with glowing visions of a personal and private success. They have been told of the wonderful chances to rise and have been stimulated with the assurance that the harder they studied the sooner they would get up in life. "Out in the world," we tell them, "there is the great game, and there are the great prizes. Go in and win." Upon many of us it has not dawned that one aim of our public schools should be to make it impossible for the boys to accept the game as they find it.

Into the public mind have filtered during the last twenty years many of the newer ideas about the meaning of industry and trade. But, on the other hand, business men have been drawing together into associations and harkening to the utterances of their big dominating personalities. While the social view has been making headway in the general public, the contrary manner of thinking has been hardening and defining itself within the business world.

Commercialism has become self-conscious and aggressive. It insists that business is an arena in which the strong-hearted and the capable contend with one another for the Supremely Desirable, *i. e.*, money. In this battle, strength has a place and cunning has a place. The "tricks of the trade" are to be tolerated as we tolerate the feints and ruses of the prize ring. Obviously, the rules of the fight should not be changed while the fight is going on, and, of course, the fight is going on all the time. To tie down the combatants with rules limiting the use of their superior strength, adroitness, or cunning, spoils sport and is unfair to the "better man."

In these commercial battles, natural resources, working men and child toilers come to be looked upon as mere raw material to be moved about, husbanded or sacrificed, as the exigencies of the fight may demand. As to the consuming public—for the sake of which in sooth, all such enterprise exists—it lies vague in the dim background with no interest in the fight save as humble and admiring spectators. The hampering of the contending business men with pure-food laws, sanitary requirements, safety regulations, anti-combination acts, and finally the meddling of a trade commission on the alleged behalf of the consuming public, is held to be an intrusion and an impertinence inflicted on "legitimate business" by the demagoguery of "politicians."

In some of the professions likewise the combat idea is well-established. The typical newspaper man is by no means apologetic of the sensationalism, red-

ink, fakes, deceitful headlines, and spiced news, by which he has beaten his rival in circulation.

Most of the lawyers are warm defenders of the time-hallowed contentious procedure by which our courts ascertain the right and wrong of disputes, despite the obvious consideration that the stronger side ought to win the case, not the side with the stronger champion.

In spite of the impression social ideas have made on the worker and the producer, commercialism has gone on developing within its sphere until it is becoming a religion. Boards of trade and chambers of commerce are its temples. The business interests are its priests. Its holy days are Monday to Saturday. Its promise is prosperity. Its first great commandment is "Let us alone." Its plea is "Suffer little children to come unto me and forbid them not." Its beatitude is "Blessed is the employe who demands nothing and expects nothing, for verily he shall not be disappointed." Its favorite parable is of the man who burned down his barn to get rid of the rats.

This whole conception of business as a jungle fight, with its implied admiration of the money-maker as a wonderfully powerful and clever fellow, its thinly veiled contempt for a man who wins only a livelihood, its cool ignoring of the public for whose sake business exists, belongs in a class with trial by ordeal and judicial combat. Slowly there is rising in the popular mind the idea that businesses and professions are not owned by the men who, for the moment, are engaged in them, that they are but instrumentalities for meeting the wants of the public, not roped rings for the conduct of a prize fight; that while oceans of legal verbiage are poured forth on the question whether or not this or that business is "affected with a public interest," there is, in fact, no legitimate business or profession that is not affected with a public interest, and should not be required to square itself with the ascertained social welfare.

The social service that is supreme is not some bit of charitable work, but the following of one's calling as service, not as exploit. Education for social service is to open the eyes of the young to the social nature of their work in life, to purge their minds of a current false notion that to enter one's life work is to take a hand in a poker game or put on the gloves for a prize fight. It is to persuade them that it is wisdom to spend wealth for more welfare, but folly to spend welfare—even somebody's else's welfare—for the sake of more wealth, that industries should be run to yield dividends rather than profits, that a "living wage" must come before a "living dividend," that commercialized sports, commercialized amusements, commercialized newspapers, and commercialized vice are tumors, not flesh, that "prosperity" in the business man's sense is but one element in social well-being and not always the greatest.

The next social service is to fight the

anti-social tendency of the combat regime. Education for social service ought not to damp the primal impulses of moral indignation. Six-sevenths of American teachers are women, and there is danger lest they, with their lady-like ideas of conduct, quench the natural pugnacity of our boys below the point of even chivalrous spunk. Certainly, a woman-taught generation is showing an alarming willingness to take oppression and robbery lying down. The good-government movement, I notice, attracts many mild-mannered gentlemanly citizens quite bluffed by ward heeler's invitation to the use of the natural weapons. I fear our schools are turning out too many sissies, and that the rough greedy element are taking advantage of it. I for one deplore the lady-like citizen. Social service implies not only a willingness to be spent for the common good, but, as well, a capacity for ire and hard-hitting.

One way to divert the people from fundamentals is to get them hurrahing for petty betterments. I sometimes suspect that trivial social service is employed to side-track people from economic reform. The kept newspaper is strong for "swat-the-fly," anti-roller towel, and "clean-up," movements. Likewise, it seems as if little charities for news boys or tenement babies or hospitals prosper greatly just because they raise no embarrassing questions and leave the public with a soothing illusion that something is being done.

It seems to me sometimes as if the springing-up of a great variety of petty charities which annoy nobody, antagonize nobody, and produce but trifling results, is to be interpreted as an endeavor to switch the public mind from the big social services involving questions of fares, prices, wages, hours, and conditions of work, which antagonize prominent people but which also hold forth the possibility of raising the plane upon which great groups of us live. Not that there is a purpose behind it all; but those who start innocent charities get support and put them through; while those who promote movements that lessen somebody's profits or dividends or rentals get the cold shoulder and fail. So that the promoters of social service learn the lesson: "Ask for reading rooms, or fresh air, or teddy-bears; don't ask for less risk or fewer hours, or for more pay or more rights."

A democracy, then, will use its schools to counteract the anti-social spirit that too often radiates from the big masterful figures of commercial life. It will rear its youth in the ethics of brotherhood, team-work, and responsibility. In educating for social service, it aims at something greater than lessons in kindness and consideration. It presents life from a new angle. It meets current notions of success and reward with more exacting ideals growing out of a new vision of social welfare. It aims to turn out youth ready not only to make their calling a service, but to grapple with the old egoistic carnivorous type and eject him from places of influence where he can be a sinister pattern and pace-setter for the next generation.

'Delivered last month before the National Education Association at St. Paul.

BOOK REVIEWS

SOCIAL FORCES IN ENGLAND AND AMERICA

By H. G. WELLS. Harper Bros. 416 pp. Price \$2.00; by mail of THE SURVEY \$2.15.

THE WORLD SET FREE

By H. G. WELLS. E. P. Dutton. 307 pp. Price \$1.35; by mail of THE SURVEY \$1.47.

What refreshment there is in the bold thinking on large lines to which Wells leads us? An essay in Social Forces dwells buoyantly on the advantages of our modern escape from the bonds of place: "We are off the chain of locality for good and all. . . . People

have hardly begun to speculate about the consequences of the return of humanity from a closely-tethered to a migratory existence." It is an inspiring idea and it applies to thought as well as to matter. For there is no use in availing ourselves of all the trolley-routes and steamship-lines in creation, if our minds stay sluggish and provincial.

Now Wells is an author whom it is impossible to read sluggishly. He has a knack of making our minds migrate; and never was that knack more felicitously shown than in these two books. In both, he leaves his clever but to some of us unpleasant and narrow studies in sex-relations, to revert to that earlier field in which his originality is more marked and his contribution to the common life more distinctive. Here is the Wells of Anticipations, New Worlds for Old, and A Modern Utopia; and we welcome him back.

Social Forces is a collection of the fugitive pieces of the last few years, so arranged that they present, as Wells himself says, a summary of his most characteristic thinking. The book contains a relentless criticism of England—her military ineptitudes, her industrial follies,—mingled with a patriotism so keen that one does not quite know how to connect it with the prediction of the Great State in which nationality will have vanished.

It contains a criticism of America just as relentless, not particularly fresh, but interesting in the centering of hope at four points not often seen from one and the same station: the good-will of the plutocracy, the scientific work of the universities, the Socialist movement and the possibilities of American women. It presents incisive discussion of many minor themes. But the gist is found in the pages on the Great State—pages as searching and fundamental as Wells has ever written.

He is as much a Socialist as ever, despite rumors to the contrary; but his eager mind discards with impatience the current Socialist trick of reposing in large formulae, which ought to be starting points and degenerate into cant when treated as finalities. He seeks new alignment of forces, new definitions of social types. One disagrees with him frequently, but finds him unfailingly stimulating. His trend of thought is as he confesses, Utopian; indeed in the essay on The So-Called Science of Sociology, he claims that the business of the true sociologist must always be the intelligent forecasting of the Ideal State, rather than the meticulous study of specific remedies for social disorders. But his Utopianism, if it separates him from all "planless progressives," is at least unique in its practical cast and its scientific basis.

The World Set Free is an imaginative projection of the ideas in the other book. It is stirring romance. It is also, in the author's own mind sober forecast. It opens with a grim picture of the fearful possibilities inherent in scientific war-making, and passes swiftly through panoramic cataclysms perfectly credible though all but unthinkable, to the emerging of the Great State and the conquest of a splendid peace.

What lingers in memory is not the picture of Paris and Chicago destroyed by atomic bombs, nor of Holland lost under the sea, but the scenes where the few sensible folk left from the general destruction gather on those Alpine slopes which Wells has always loved, to check the world-wide Reign of Terror with matter-of-fact pluck and wisdom, and, half-conscious of their task, to lead society into a new era.

Above all, one will hardly forget the nobility of the final pages where the man who has done most to guide the great transformation lies waiting death in the surgical hospital among the Himalayas, and forgets his own approaching extinction in converse concerning the future of the race which he has lived to serve. The elevation of tone, the terse, restrained writing, deserve high praise; almost they suggest that other death-scene, in an Athenian prison where Socrates waits the poison and the dawn.

If ever we have grown weary of forecasts based on scientific advance and mechanical progress rather than on more religious forces, these pages will be salutary reading; for here the idealist in Mr. Wells has free sway, and he proves himself of the family of the prophets.

Social workers certainly need these books. We have got to plod along soberly at our task of relief and prevention; but it is comfort to be lifted above the whole sweltering mass of misery and

stupidity, to look off to far horizons and breathe deep of the winds that oversweep us from the hills of hope. Wells helps us, not by offering individual freedom—poets and sages in plenty stand ready to do that,—but by showing from his high thought-levels an emancipate race, which is still the old humanity we know.

We return to our posts, rich in clearer power to choose the right direction of effort. The best thanks we can proffer will be to put our invigorated selves more effectively than before under the leadership of his two captains in the secular march toward social freedom,—Intelligence, and Good-will.

By William A. McKeever. The Macmillan Company. 72 pp. Price \$.50; by mail of THE SURVEY \$.56.

peace, contentment, and spiritual poise predominating elements of his character."

Efficiency in some one or more of the "trunkline industries" as an essential part of the education of every boy and girl, whether rich or poor—first, as a necessary means to educate and develop the character of the child; secondly, as a basis for a truly social life, and only thirdly, as a means of livelihood is the message of this book.

His suggestions are simple, direct, practical, and detailed enough to be tried out in any family. They are of less value to parents and teachers in congested city districts than to those in suburban, village, and country districts. Even so practical and sympathetic a student of boys as the author fails to make suggestions that are really adequate to the needs of the city boy who lives within a crowded "apartment" or "slum" district. Some way must also be found to give this boy his "innings."

As for other boys, happy are they who have parents intelligent enough and sympathetic enough to provide the work and play conditions, under their own guidance and supervision, from kindergarten to maturity, that this little book recommends.

It takes boys, homes, and industrial conditions as they are and shows how to

make constructive use of them, and always with the boy's welfare and the development of an efficient citizen uppermost in mind.

"It is a vicious theory that only those who are to be compelled to work with their hands should be educated industrially."

Two of the most valuable features of the book are its suggestions for the educative use of vacations and his attempt at a quantitative statement of how much work, play, sleep, etc., boys need at different ages.

Taken as a whole Professor McKeever's books on the training of our boys and girls make a valuable contribution to our literature of educational purpose and technique.

HENRY W. THURSTON.

TRAINING THE GIRL

By William A. McKeever. The Macmillan Company. 341 pp. Price \$1.50; by mail of *THE SURVEY* \$1.62.

Dr. Richard C. Cabot in his *What Men Live By* names work, play, love, and worship as the activities that make up real human life. The four parts of this book on *Training the Girl* are really based on the same four activities.

All four motives appear and reappear throughout the book, but each may truly be said to be stressed as follows: Work in Part One on Industrial Training; Play in Part Two on Social Training; Love in Part Three on Vocational Training and Worship in Part Four on Service Training.

The book is written with rare good judgment, familiarity with and insight into the lives of active girls, and with a deep conviction that only by teaching the millions of our young people, both poor and rich, to live a life of work, play, love and worship can they hope to be happy as individuals or efficient as citizens in a democratic society.

The author goes over with the reader the life of a girl from infancy to maturity and in a great variety of concrete, simple, suggestive ways shows the real problems of training involved in each situation and a good way to meet each problem. Almost never does he recommend mere suppression of an instinct, or activity or troublesome manifestation of energy in the growing girl. On the contrary, the controlling principle of his method is one of sympathetic guidance of activity and desire for growth into proper channels and more fruitful forms.

The subject of dancing, of the many discussed, the author failed most completely to handle. Here his method of guidance and control was abandoned and suppression accepted as practically the only alternative. This is simply to admit defeat in the face of one of the greatest problems facing conscientious parents and teachers of the young. It is to be hoped that the author will take courage from his own faith in young

people and his unusual power of interpretation of their activities and essay this problem again.

To parents of the so-called middle classes especially mothers who are trying to live in close sympathy and companionship with their girls this book should be most helpful. Even the topics of the Table of Contents are of themselves helpful and suggestive. There are also good bibliographies at the end of each chapter.

This passage well illustrates the social ideal of the author: "We sincerely desire and hope that the girl destined to a life of industry and the other one destined to a life of affluence shall always know each other through and through; that they shall be prepared to dwell in the same community with the highest possible degree of mutual sympathy and good fellowship. We desire also that the girl of industrial life shall be so masterful in her place as to receive a large increment of joy and satisfaction from her work, and as to be not altogether envious of her sister of the so-called upper ranks. And we desire that the other one shall have been made so intimately acquainted with ordinary girlhood work and industry as to be prepared to think lovingly and sympathetically of all the women who toil, and as to be deeply imbued with the thought of doing her part toward the amelioration of their condition" (p. 7).

Whether or not the author looks forward to a day when "amelioration" will have led to some more fundamental changes in the conditions of those who must get their living by the work of their hands is not clear to the reader who desires to see a genuine industrial democracy. In any event the education herein recommended looks with at least half-open eyes toward the East.

HENRY W. THURSTON.

WAR AND THE PRIVATE CITIZEN

By A. Pearce Higgins. P. S. King and Company, London. 200 pp. Price postpaid \$1.30.

what all law should be, a growth and development, and very naturally reflects a state of mind and advancement in civilization of the people formulating it. The constant tendency, particularly of late years, has been to ameliorate the harshness of all law. This is particularly noticeable in the increased consideration shown to non-combatants, whether belligerents or neutrals.

War has always been the hell which General Sherman called it, but those who carry it on have become with the passage of years less devilish. It is a matter of only two centuries since of-

ficers captured on the field of battle surrendered not only their swords but their money and valuables; today such procedure is unthinkable. The private citizen formerly felt all the rigors and terrors of war in the pillage of his property and the ravishment of his women; today non-combatant citizens are practically uninterfered with by the belligerent forces.

Nevertheless the private citizen has many interests in war and the conduct of belligerents towards his property and particularly that property which may be upon high seas. The present work touches principally upon this phase of the subject. The first chapter treats of the effect of war on the private citizen and its effect upon his property as well as his person, showing that even though non-combatant, he may be very seriously affected by the contest between armed forces of the belligerents. The second chapter deals with the rules of international law relating to hospital ships and the care of passengers and crews of destroyed prizes.

The third chapter discusses interesting and novel matter. When Grotius wrote his work in 1625 war was not aggravated by the newspaper correspondent. Today newspaper readers demand all of the war news which the facts warrant and the imaginations of the newspaper correspondents can manufacture and telegraph, and which either Morse or Marconi system can transmit. The enterprising correspondent who charts a fast boat equipped with wireless apparatus and prowls in the neighborhood of contending fleets is a spectacle which Lord Nelson was fortunately spared.

The fourth chapter treats of the most important question of the conversion of merchant ships into warships.

The book is written clearly and interestingly. It has none of the turgid style nor technical phraseology which characterize most law books. The subject is one of general interest and is treated in a manner which while not descending to what may be called a popular style is exceedingly readable.

EMANUEL STERNHEIM.

POVERTY AND WASTE

By Hartley Withers. E. Smith, Publ. London. 190 pp. Price \$85; by mail of *THE SURVEY* \$95.

A book on Poverty and Waste, written not by a philanthropist, a minister of the gospel, a politician nor even by a university professor, but by the financial editor of a great London paper—that is a straw which shows which way the winds of current thought are blowing. It is written by a business man on a sound business basis, and will appeal to business men and to thoughtful consumers everywhere. In very simple and logical fashion, Hartley Withers, of the *London Times*, sets forth the relations between the spenders, the workers,

and the managers. His aim is to show how money spent on luxuries is wasted, and how if spent on necessary articles, such as are wanted by all classes, the prices of such articles would decrease and their production increase, because of the capital set free to be invested.

It comes home to those of us who have money enough for our wants, sometimes, that while we are eating more than is good for us, many children in our public schools are underfed; that disease gets its hold on them because of this lack of nourishment. If we could do anything, we say to ourselves, how glad we should be to equalize matters a little. Generally we are told, if we broach the subject to the wise men, that we are silly to trouble about it, that if we gave away every cent we possess and all the rich did the same, things would soon come to the same pass or *impasse*. But here comes Mr. Withers, and shows us very plainly that there is something each and everyone of us can do, and can teach our children to do.

A remedy would be found at once if those who have money to spend would grasp and act on the very simple fact that since the producing power of mankind is limited, every superfluous and useless article that they buy, every extravagance that they commit, prevents the production of the necessities of life for those who need them.

Mr. Withers does not take long to dispose of the grey-whiskered fallacy, that money spent on luxuries is justified because it gives employment to the workers and he meets various other objections to his theory very cogently.

He gives us fair and honest reasons why capital should have its just reward, and writes sympathetically of labor's struggle for a bigger share and then he points out again how easy it would be to reward labor more generously by curtailing the nation's waste.

But what is waste? He gives us a good working formula. "What I mean by luxury is anything that we can do without impairing our health of mind and body. . . . It would be absurd to lay down a hard and fast rule of spending for everybody, and then to say that any excess above that is luxury. A certain amount of amusement, a certain amount of beauty in our homes and surroundings are as necessary to real health of mind as good food is to our bodies."

Of course the gigantic channels of waste the world over are war and drink. As the workers themselves are educated to realize this, and the movement against both evils gains headway, the millions of money now wasted will be used to promote health and comfort and art, and we shall look back with wonder at our present low estate.

But both war and drink are now so firmly fixed in the saddle and riding mankind, as Emerson says, so hard, that it is good to find that in the aggregate they are not more important than the sum of many more trifling luxuries, and especially luxuries that women, who can hardly as yet exert much weight in discouraging war and drink, can discourage and even wipe out.

Among the causes of high prices are

the uncertainty of the manufacturer as to what the fashion will be, his sacrifices in getting rid of old-fashioned goods. Advertising is another of the Waste God's devices. By cunning psychological methods, it foists upon us hundreds of things we neither need nor of ourselves desire.

Mr. Withers' book is well adapted for use in club work or Consumers' League meetings. We echo the *London Times*, which concludes its review by calling attention to the fact that "it is an authority on finance who begs our richer folk to curtail their standard of extravagant living to give a better chance to the poor. All luck to him in his gallant campaign."

FLORENCE GRISWOLD BUCKSTAFF.

UNPOPULAR GOVERNMENT IN THE UNITED STATES

By Albert M. Kales. University of Chicago Press. 263 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

Professor Kales of the Northwestern University Law School presents in this volume a practically valuable study of the way our multiplied elections, offices and candidates inevitably work out the conclusion he reaches that "a practical, workable form of unpopular government has, in spite of the precautions taken to prevent it, been established in the United States." How far the exactions upon the voter transcend the possibility of intelligent voting, and therefore the limits of democracy, is graphically and startlingly detailed within brief but comprehensive compass.

Starting his inquiry in the voting booth, confronted by his own unavoidable ignorance in facing his ballots, he finds how indispensable is the "adviser," who inevitably becomes professional politician or boss, equipped with "organization" and "machine." The separation of offices, the number of elective officials, the frequency of elections—all designed to leave government in control of the many and keep it out of the hands of the few—actually concentrates power with fewer and fewer, as the increase of population leaves more voters dependent upon their advisers.

Thus an extra-legal government of "politocrats" has superseded government "by the people." The very devices intended to restore power to the electorate—the direct primary, the initiative, the referendum and the recall—however effective they prove to be on occasions, are shown to be susceptible of playing into the hands of the few.

The solvents of this crucial problem of democracy proposed in the commission form of government and the short ballot are critically analyzed. As applied to the state, commission government involves combining legislative and executive power in the hands of a legislature consisting of a single chamber.

This is deemed unsafe for the protection of property, and a second chamber

is favorably considered which would directly represent property, giving its representatives the right to propose legislation, to amend acts of the popular assembly and to enter into joint conference with it for compromise conclusions. This consideration, however, squarely reckons with the excessive concern which certain state courts have shown to protect owners from having their property taken away "without due process of law."

The unique proposal for the selection of judges is that they should be appointed by a chief justice elected at large for each district at frequent intervals, power of removal being lodged with a judicial council consisting of the chief justice and the presiding justices of all divisions.

The survey of the whole complex situation culminates in an incontestable plea for the short ballot. This volume and Alger's *The Old Law and the New Order* clearly show the fundamental reconstruction being forced upon American democracy by its expansion.

GRAHAM TAYLOR.

UNIVERSITY AND HISTORICAL ADDRESSES

Delivered during a residence in the United States as Ambassador of Great Britain. By James Bryce. The Macmillan Co. 433 pp. Price \$2.25; by mail of THE SURVEY \$2.54.

Long before his official residence in Washington, Lord Bryce endeared himself to the American people and represented the high traditions of British statesmanship by his remarkably versatile, sympathetic and vigorous studies and interpretation of the national character and institutions of the entire English-speaking world. He has taught us as he has taught his fellow countrymen to know and feel the full measure of human service which common English traditions impose upon all who inherit and share the English language and its literature, English customs and the English law.

Few ambassadors will ever leave so remarkable a monument of six years' service as this volume dedicated "in admiration and friendship" to our own illustrious senator from New York, Elihu Root.

Historical addresses on *The Beginnings of Virginia*, *The Landing of the Pilgrims in 1620*, *The Scots-Irish Race in Ulster and in America*, *The Tercenary of the Discovery of Lake Champlain*, and *On the Writing and Teaching of History*, are interspersed with studies of Jefferson and Lincoln.

Public Law and Legislation are treated in three remarkably fine essays which I wish particularly that every one who aspires to leadership in social work would read and enjoy. It would have a much to be desired steadying effect on that leadership if social workers generally were to spend a few of the leisure hours of the summer vacation

with Mr. Bryce in his wonderfully fascinating treatment of the fundamentals in human nature and character as we meet them in organized community life everywhere.

The essay on the English Common Law, which is our common law also, deserves a permanent place in English letters for its literary merit in addition to its instructive value.

Art, architecture, world peace in Allegiance to Humanity, ancient literature, "Hints on Reading," and public speaking all come within the range of these addresses, and those dealing with university life and problems, from Oxford and Cambridge in the old world to the keenest appreciation of the new state universities of our western country, have much of interest and instruction for any one who cares to know the trend and promise of modern life.

SAMUEL McCUNE LINDSAY.

VOCATIONS FOR THE TRAINED WOMAN

By Women's Educational and Industrial Union. Longmans, Green & Co. 175 pp. Price \$1.50; by mail of *THE SURVEY* \$1.66.

WOMEN WORKERS IN SEVEN PROFESSIONS

By Edith T. Morley. Routledge & Sons, London; E. P. Dutton & Co., American agents. 318 pp. Price \$2.00; by mail of *THE SURVEY* \$2.12.

It is full of valuable data for the guidance of college women who desire occupations other than teaching.

It discusses college women in agriculture, social service, secretarial service, and real estate from the standpoint of preparation, occupational opportunity, agreeability of the work, possibilities for advancement to administrative positions, and the minimum and maximum salaries. The pages are filled with very valuable information varying from the table of investments, expenses, returns, profits and other matter in regard to research work among bee-keepers, to a careful schedule of brokers' commissions in the real estate exchange of Boston.

Secretaries outstrip in numbers all others and fill every variety of position. They are found in increasingly large numbers in law firms, as official court reporters, in the administration offices of educational institutions, in social organizations, as private and executive secretaries, and as bank officials with salaries ranging from \$600 to \$1,500 a year—a few women of exceptional power and willingness to assume large responsibility receiving \$3,500 a year. This last salary, however, is reached only after a very definite demonstration of strikingly valuable powers. The real estate and agricultural women work

quite independently rarely on a salary, and their money reward has a very wide range—all the way from a bare living to \$10,000 a year for the women with the uncommon but very real "value sense."

The book reminds one very vividly of Edith Morley's compilation of the Testimony of English Professional Women as set forth in *Women Workers in Seven Professions*, published by Routledge and Sons, London, and appearing almost simultaneously. This book comes from the Studies Committee of the Fabian Women's Group and is even more detailed in description of women's opportunities.

In the two books, *Vocations for Trained Women* and *Women Workers*

in *Seven Professions*, the striking observation is the similarity of opportunities and the divergence in salary of the two countries. The English women receive in general about one-third less remuneration for the same service.

The English book is very exhaustive in detail of preparation, placement, duties, opportunities, and salaries. It enters into the matter of occupational diseases, the accommodations of the workers, discussion of the preparatory schools, civil service, and trade unions.

It is interesting and vivid in multiplied illustration of actual incidents and is vigorous and wise in comment and counsel. Both books are full of the matter of the hour and are rich in well selected and thoroughly tested content.

MARY S. SNOW.

JUST JOHN

Miriam Allen de Ford

AS MISS YORKE entered the Children's Aid office, the superintendent looked up from the newspaper she had been reading.

"I see that Mrs. Ritchie is dead," she said, "I am afraid we shall have to take John away."

Bertha Yorke sighed. John was her favorite charge, as well as her most difficult one, and she was a young visitor.

"I know it does seem a shame," said Miss Delmar, in answer to the unspoken comment, "When here at last was a family that really wanted him, and didn't mind his—his deformity; but there's no help for it. He can't live there alone with the husband. He's been neglected enough as it is, while the wife has been sick. I think you'd better go out to Brookton this afternoon and get John and bring him to the Shelter."

But it was with a heavy heart that Miss Yorke took the train for Brookton, and with a heavier one that she reviewed, as the trim little stations flew by her, with peaceful winter landscape between them, John's sad little history. John wasn't John Ritchie, or John Anything—just John. He was a wistful-eyed, brown-haired little fellow of six, with one shoulder much higher than the other, and a pronounced limp, whom the Children's Aid had rescued from a brutal father and a weak and helpless mother. They were not really his parents; he was a foundling whom someone had left at their door. The woman had taken him in and tried to raise him in the face of her husband's anger and cruelty. But she herself had finally handed John over to the society.

"I don't mind the mister whipping John," she had said, with the hopeless apathy of the very poor, "or me either; but when he kicks him down three flights of stairs, and him with his weak back, I think you'd better take him."

And they had taken him, and given him food and shelter, and baths and clothing—everything, in fact, except love, which a society can hardly be expected to provide in large quantities.

And he was very hard to dispose of. No one wanted a child who was practically deformed, and who might never be able to go out in the world and do the work of men. Once or twice inquirers, touched by the boy's pathetic brown eyes and his pale cheeks, had hesitated; but the responsibility was too great, and they had passed on to a rosy, healthy youngster.

At last the Ritchies had come. They were a middle-aged couple, a farmer and his wife, living outside Brookton, whose two children lay in the little old Brookton graveyard. Ever since the first hurt of their own bereavement had softened, they had planned and dreamed of adopting a child. But money troubles arose, and years passed before they felt able to give a child the sort of home the society demanded for it. Now they had come, full of expectation, with the usual list of requirements—a fair, curly-haired boy four years old, healthy and of decent parentage. Ellen Ritchie had been attracted at once to an angelic child whose blue eyes and red lips made him the prettiest of pictures; but her husband had wished her to look further, and be sure.

"There's John," said Miss Delmar, simply out of a sense of duty, "He's four years old, and—" And John was brought from the Shelter

The little limping, timid figure went straight to Henry Ritchie's heart.

"He's the one, Ellen," he had said, "We're going to take John home with us to be our little boy."

Ellen had been at first aghast, then dubious; but in the end she had been won over, and the two had carried off John, bewildered and yet radiant.

A new John developed in the sunshine of love and tenderness, a John who could laugh, and even sing, and who dug in the garden with his little spade just as if his back had been like every other boy's. The Ritchies lavished on him all the affection they had given their own two children; they would have spoiled any child less pure of soul.

And now Mrs. Ritchie was dead, and John would have to come back to the Shelter. The buggy drew up in front of the long white house, with its old side porch, and tears stood in Miss Yorke's eyes at the sight of the hanging crepe.

It was Henry Ritchie himself who answered her knock—but a Henry Ritchie how changed from the well-preserved middle-aged man she had known. His suit of black hung shockingly about his lean figure; he needed a shave badly; his eyes were red-rimmed and sunken. He motioned her into the kitchen with a trembling hand.

"You came to see about John, I suppose?" he asked in a husky voice as soon as they were seated.

"Yes, Mr. Ritchie," answered Miss Yorke gently, "Miss Delmar wanted to know what your plans were."

"I'm going to keep right along living here. Can't John live with me?" The question was eager, yet despairing.

"I'm afraid not, Mr. Ritchie—not unless you get a housekeeper to look after him."

"I—I can't get a housekeeper, not now," and Henry's voice trembled.

"Then I'm afraid we'll have to take him. I'm sorry—dreadfully sorry. But you know you can't, alone, take care of him as our children have to be taken care of."

Henry started. "You won't—you don't want him today? Not before the funeral?"

"I wish I could leave him,"—Bertha Yorke laid a comforting hand on his arm—"but those are my orders."

The man rose heavily. "All right," he said, "I'll dress him and pack his things and bring him down."

It was half an hour that Bertha had to wait; she could picture the man's slow, clumsy fingers fastening buttons and lacing shoes. Once or twice she heard the child's voice, raised in complaint—his face was being washed too hard, perhaps, or a pin went awry. Finally they appeared together, with John's little valise in Henry's hand.

As soon as Miss Yorke saw John

she realized that she must take him. He still wore the pretty clothes the Ritchies had bought him, but his hair should have been cut days before, there was a hole in one of his stockings, a white string projected from the side of his collar—altogether he showed the lack of experienced care. Plainly he did not know where he was going.

"Good afternoon, John," said Miss Yorke, brightly, but a bit unsteadily, "Don't you want to go up to the city with me?"

"Yes, thank you," answered John, in his quaint, unchildish way, "And with father?"

That "father" cut the visitor to the heart. "No, father's not going," she managed to say, "Father—" But Henry Ritchie was kneeling on the floor by the child, pressing him in his gaunt old arms, crying into the blue serge blouse.

"You're going away, boy," he sobbed, "They're taking you away from me—just as mother's gone—just as mother's gone!"

"Will they put me in a box too, then?" asked John, turning uncomprehending eyes upon Miss Yorke.

Suddenly the man arose, wiped his eyes, and turned to the visitor. "Don't mind me," he muttered, apologetically, "I guess my nerves ain't just right these last few days. I know you've got to do this, it's best for the boy. But I love that boy just as if he was my own—so did she. We was going to send him to school—and to college—" His voice broke again, and he turned his back abruptly on them.

Still John did not seem to understand, even when he kissed his father, and was strained in his arms for the last time, not during the ride back to the city, not in his first few days in the Shelter. But when his question, at first indifferent, then eager, then insistent, received always the same gentle but final answer, he did at last realize that he had lost his father forever. Then came days when he sat, silent and with a dreadful look in his brown eyes, all day long in a corner, and cried himself to sleep every night with agonizing, unchildlike sobs.

"I can't stand it!" said Bertha Yorke to Miss Delmar, "He looks—why, if he were a grown person I should say he looked as if he were going to kill himself!"

When John had been back in the Shelter about two weeks, Mrs. Vincent came. Mrs. Vincent was well-known, a club-woman, a reformer, with ideas and theories of her own.

"My little boy is seven years old," she said, "And I do not think it is good for him to grow up an only child. I want a quiet boy about the same age, who will teach Charles gentleness and consideration for others. I can give him every advantage; Charles has been

brought up scientifically, and so would this boy be."

John seemed to fit the case, and he was brought out for inspection. He stood there, apathetic, but not sullen—there was not a particle of ugliness in the boy's gentle temper. Mrs. Vincent looked askance at the shoulder and the limp, but at last she agreed to take him, and John was sent to her beautiful house.

At Miss Yorke's first visit, she found that John was being scientifically brought up, indeed. Mrs. Vincent described with great complacency his daily regimen—every minute accounted for, it seemed, with instructors and overseers to do properly the work which Nature would doubtless have bungled. John seemed to have stiffened, somehow—but perhaps it was only his rather strange hygienic clothing, and his appearance of having just that minute stepped from the hands of a hairdresser and a manicurist. As Miss Yorke left, she stooped to kiss the pale little face.

"Oh, don't do that, please," exclaimed Mrs. Vincent in horror, "It's not good for children to kiss them, you know."

Miss Yorke remembered the healthy, dirt-grubbing days at the Ritchies', where love and simple life went hand in hand. Her pity increased at each visit, especially after a few interviews with the Vincent child had convinced her that "gentleness and consideration for others" were not in that youth's make-up. She even spoke to Miss Delmar about the matter.

One afternoon, just before the office closed, a telephone message came from Mrs. Vincent. John had run away!

John! Run away! It seemed impossible. But so it was. The instructor in calisthenics had been unable to come that afternoon; the careful program had been disarranged, and the children had had an hour's time on their hands. Charles had spent his in the stable, with the coachman. When tea-time had come John was nowhere to be found. They had searched for an hour before telephoning the news.

Immediately Bertha Yorke went to Brookton. With the help of the police she scoured the town and its surrounding country for the missing boy. She even went as far as the Ritchie farm, but, knowing what a shock the information would be, said nothing of it to Henry Ritchie. However, when she left, at eleven o'clock, she had made sure that the boy had not been near the old house. She stayed at the Vincents' all night, thinking bitterly that her hostess was more annoyed at the disturbance of her plans than worried about John.

After a sleepless night, she dragged herself into the office. "No news," she said, wearily, to Miss Delmar, and dropped into an empty chair.

Suddenly the door opened. Miss Delmar gasped, and Miss Yorke sat up straight. For there stood Henry Ritchie, and in his arms, fast asleep, lay John!

"I found him at my doorstep at three o'clock this morning," said Ritchie huskily, standing still in the doorway. "He'd walked and hidden and tramped again since three in the afternoon, poor little fellow. He was just tucked out—he didn't wake this morning when I dressed him. All he said was 'Father, I've been trying so long to get home to you!'" Henry choked, but he went on bravely, "I brought him to you first thing. I knew I had no right to keep him—"

"Mrs. Vincent said this morning," began Bertha Yorke in the tired tone of one repeating a lesson, "If you find the ungrateful little beggar you can keep him; I certainly don't want him back."

Miss Delmar looked at John. His hair was mussed, one shoe was badly laced, and if his face had been washed, it had ended at a dusty ring around his neck; but there was the faintest touch of color in his cheeks, and as he slept, he smiled. She looked at Miss Yorke's understanding, pleading eyes, at Henry Ritchie's twitching face. Then she drew a printed form toward her, filled it out and signed it.

"Sign this," she said, handing it to the man, "It's against all our rules and regulations, but I think we're going to let you keep John. Do you want us to send his clothes and things to you?"

"No, ma'am, I don't want anything." A great and unimagined joy shone in Henry Ritchie's face, as he bent over the child. "Only," he murmured, his lips on the boy's hair, "only—just John."

tabulated in the archives of our hospitals, swell a great total before the year is closed. Yet, they escape our notice in the whirligig and rush of our daily affairs. For them there are no display headlines or clamour in the thoroughfares. Business men do not stop with blanched faces, because famine has stalked through the land in that way, nor do they pause, staggered at the horror of our law courts, the defiance of our laws.

Right here at home, we are confronted with a war against our inordinate desires to get ahead of the other fellow at any cost, to grab, to bite off a far bigger bite than we can chew.

If we could have more patience with others, if we could reserve the more critical spirit for ourselves, if we could be less greedy, if we could moderate our pace, we might avoid such appalling tragedies here at home.

SAMUEL HOWE.

WOMEN'S WAGES

TO THE EDITOR: It seems to me that false inferences would naturally be drawn from the article in *THE SURVEY* of July 25 on Wages for Women Clerks in Ohio.

The article makes no distinction between the different classes of persons employed and whether heads of families or members of a family. Many of the latter class, of course, are supported by the man who may be head of the family, and of course in such cases, it is not necessary that the wages should be equal to the full cost of living of a separate individual living apart.

A French-Canadian working in a cotton mill in New Hampshire was said to have 16 children, seven of whom worked in the mill. With full wages for each one as equivalent to full support, the income of the family would have been naturally something very large.

This whole matter of women's wages was very fully treated in a report of the Massachusetts Bureau of Labor by Carroll D. Wright, then head of the bureau, in 1884, and I think it deserves attention as it covers some of the same problems lately discussed in many papers.

The article in *THE SURVEY* of August 1 as to the state of mind of the Industrial Workers of the World and other anarchists is very interesting, as the description of a state of mind based largely on Marx's theory, aided always by violence which is now a prominent feature of all strikes whether of the American Federation of Labor or Industrial Workers of the World. This state of mind, though interesting as a problem, should not be allowed to upset all law and order. It is partly brought about, of course, by the unrestricted immigration allowed by the United States of many of the most undesirable classes of people in south-eastern Europe and other places.

ARTHUR T. LYMAN.

RECIDIVIST CONVICTS

TO THE EDITOR: Though prisons, from the earliest recognition of *meum* and *tuum*, were deemed an essential part of government, not until 1779 were there

Communications

THE AUGUST MAGAZINE

TO THE EDITOR: The best number in a year (August 1)! Evidently the regular editor is away. If you had omitted the vapid, inconclusive article on Labor Disputes in Australia and the wretched "hospital" poem, and put a title page with some meaning, instead of that weakly sentimental cover picture, you could properly have restored your old claim, "a journal of constructive philanthropy." Miss Davis's comment on current investigation commissions alone is worth the price of the paper. Common sense will tell!

J. D. HOLMES.

New York city.

SAFETY AT SEA

TO THE EDITOR: You recently published an editorial regarding the International Convention on Safety of Life at Sea which seems to me very misleading. It states, for instance, that the existing American wireless provisions are lowered. This is not true.

In the first place the Convention only applies to ships plying between ports of different countries, so that it does not affect vessels plying from one American port to another and the existing requirements for such will, of course, remain unchanged.

Article 36 specifically continues all requirements now in effect by the Radiotelegraphic Convention of 1912.

Even for international traffic—which would not come under the requirements for continuous wireless service, Article 34 provides that each government may at its discretion require such continuous service.

I am, moreover, not in agreement with your contention that acceptance of this convention by the United States would

prevent this government from later putting into effect any additional requirement which Congress may see fit to enact. Your editorial intimates that treaty provisions are supreme with respect to statutory enactments that might conflict with them, but the Constitution puts both upon the same basis, and it seems to me that any enactment of Congress after acceptance of the treaty would supersede treaty provisions.

WAR! WAR! WAR!

TO THE EDITOR: The air is filled with the cry of war! What can we do to help matters? There is one thing possible and open to everyone who stands aghast at the ruin around him, at the ignorance, disease, which bars our progress. We can begin by reforming ourselves. We can reduce the number of ignorant people in the world by one. We can inoculate ourselves with the desire to make headway for self-reformation. We can be doers, instead of dreamers. We can concern ourselves with our own limitations, and be appalled by the specter of our own ignorance. This is possible to every man and woman in the Union. We are horrified at the tragedy in Europe. We are confronted with a tragedy here.

Think of the great ravages of disease, of the white plague, of the divorce evil, of child labor, vice in many forms. True, the battle fields of Europe may be strewn with the dead and dying, all charged, as it were, against a few days in this present year. These tragedies are concentrated into a few hours, while the great ravages of disease,

penitentiaries in England. They were planned as a substitute for penal transportation, and the maximum term of confinement was seven years, except after an attempt to escape.

Blackstone in his Commentaries (IV. 370) says: "In forming the plan of these penitentiary houses, the principal objects have been . . . to preserve and amend the health of the unhappy offenders, to inure them to habits of industry, to guard them from pernicious company, to accustom them to serious reflection, and to teach them both the principles and practice of every Christian and moral duty. And if the whole of this plan be properly executed . . . there is reason to hope that such a reformation may be effected in the lower classes of mankind . . . as may in time supersede the necessity of capital punishment, except for very atrocious crimes."

Until a comparatively recent date a careful investigation of our American houses of penal detention would have failed to find indications of this primary philanthropic motive.

In confinement under the ban of the law, one is not necessarily a wicked man. I once lived in the vicinity of a state prison, and for some years spent much of every Sunday in personal contact with the inmates. I was often in the hospital, where I observed in stripes, a lovable elderly man, unselfish and unsparing in his service to the sick. He was said to be a *five timer*. Twice he had served in the prison North, and three times where he then was. To all appearance he was a sincere Christian. He certainly bore a spotless reputation within the prison walls. Too feeble for manual labor he had been assigned to hospital duty, and none ever feared his attempt to escape.

He was an enigma to me. The prison physician said the old man had some chronic ailment, he did not know what, as no treatment had ever been asked. When he died, the autopsy revealed the presence of a ragged calculus two-thirds the size of a goose egg. This led me to make further inquiry in regard to his past. He had doubtless suffered untold agony from this trouble for many years, ignorant of its nature and removability. Unable to toil and unwilling to accept charity he stole a horse, made a feint at escape, was arrested, pleaded guilty, and received a two-year sentence. Soon acquiring the confidence of the prison authorities he was made a hospital trusty. Still suffering, on the expiration of his term, he made his way with his customary fifteen dollars to the neighborhood of the other state prison, stole another horse, was arrested, pleaded guilty, received a longer sentence, and was again made hospital trusty. This he had done five times in all, after each offense receiving a longer sentence because of his incorrigibility; and at last from his prison cot went home to Heaven, as I fully believe.

In some directions things are better now than then, but there yet remain opportunities for improvement.

Los Angeles, Cal.

SOCIAL HYGIENE

TO THE EDITOR: A narrow meaning has been allowed to the term—social hygiene, and I wish to point out that as a matter of fact it has a broad meaning. We usually refer to sex relationships and their hygienic aspects when we employ the term social hygiene, but social hygiene really means all those facts which are fundamental to the physical, mental and moral well being of the people of the community.

Havelock Ellis in his interesting book *The Task of Social Hygiene* uses the term in its broadest sense.

Social hygiene comprehends much more than the fundamental principles of sanitation and hygiene. It includes the intimate subjects of birth rate, death rate, eugenics, sex education, etc.

I gave a course of two lectures weekly on social hygiene in the University of Iowa this year. It was my effort to discuss the forces that are directed toward the amelioration of the people in the most progressive communities. I attempted to show that all the lines which converge to that objective—namely, the improvement of the life of the people are properly considered under the term social hygiene.

Starting, let us say, with the improvement of the water supply, which is a sanitary problem, we move on finally to a consideration of that intimate relationship between men and women upon which the mental, moral and physical vigor of the people depends.

I think it is clear that the term social hygiene ought to be used in a more comprehensive way, and it connotes the field I have suggested more accurately than any other term I know of.

PACIFIC COAST SOCIAL HYGIENE CONFERENCE

VARIED ASPECTS of social hygiene were discussed at a three-day conference of the Pacific Coast Social Hygiene Federation, held at San Francisco and Berkeley, Cal., a few weeks ago. There were six sessions of the conference: Three at San Francisco, under the auspices of the California Social Hygiene Society, the Commonwealth Club of California and the San Francisco County Medical Society; three at Berkeley under the auspices of the University of California, the Berkeley Center, California Civic League and the American Social Hygiene Association.

Among the subjects discussed were: The work of the social hygiene society; sex education; the ethics and normal regimen of sex; social phases of the sex problem; methods of combatting the social diseases; and recent development and prospects of the social hygiene movement. Quack advertising aroused a spirited discussion.

Among the speakers were Franklin Hichborn, secretary of the Northern California Campaign Committee for the Red Light Abatement Law; Rabbi Rudolph I. Coffee of the Pittsburgh Morals

Commission; Dr. W. F. Snow, professor of public health at Stamford; Dr. R. M. Woodward of the U. S. Public Health Service; Prof. Carl Kelsey of the University of Pennsylvania.

Among the resolutions adopted were: Adoption of the name Pacific Coast Social Hygiene Federation to replace the phrase "sex hygiene," as too narrow in scope.

Endorsement of extension of the work of social hygiene societies to include

A plan of educating the public mind in respect to the nature and results of public prostitution; and

A campaign to suppress public prostitution when other agencies in the community are not effectively handling this evil.

Endorsement of the principle of the red light abatement law, and recommendation of such a law for all Pacific Coast states.

Resolutions against the introduction of social hygiene as a *distinct* subject in the school curriculum; but recommending that all normal schools and educational departments of universities train teachers in nature study, biology, physiology and hygiene so that they can present the subjects of reproduction and sex in proper relationship to these subjects.

Other resolutions recommended wider co-operation with federal authorities and other agencies in the campaign against dishonest advertising medical companies; and favored state aid until such time as social hygiene work can be transferred to the public educational and administrative departments.

POSTPONEMENT ANNOUNCED

The Fourth International Congress on Home Education, scheduled to convene in Philadelphia, under the auspices of the International Commission on Home Education and Parent-Teacher Unions on September 22-29, has been temporarily postponed on account of the war situation in Europe. The new date will be selected by the Central Committee.

OHIO COUNTRY LIFE WEEK

The one common conclusion of Country Life Week held at Ohio State University, expressed in both lectures and informal discussions, was that community improvement must come from local leadership and development.

The idea that the country church may be made the basis for much of the improvement which is sought was emphasized.

An important outgrowth of Country Life Week is the plan for a general organization of persons actively interested in rural improvement. Added point is given to such a suggestion by the fact that Ohio is now to have the services of C. O. Gill representing the National Federation of Churches and formerly located in Vermont.

THE SURVEY ASSOCIATES, INC., is an adventure in cooperative journalism; incorporated under the laws of the state of New York, November, 1912, as a membership organization without shares or stockholders. Membership is open to readers who become contributors of \$10 or more a year. It is this widespread, convinced backing and personal interest which has made THE SURVEY a living thing.

THE SURVEY is a weekly journal of constructive philanthropy, founded in the 90's by the Charity Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged magazine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise: to be employed and developed beyond the limits of advertising and commercial accounts.

Price

Single copies of this issue twenty-five cents. Co-operating subscriptions \$10 a year. Regular subscriptions \$5 a year. Foreign postage \$1 extra. Canadian 75 cents. Changes of address should be mailed to us ten days in advance.

The GIST of IT—

JUST arrived from the countries at war, Prof. Graham Taylor tells how Socialist and labor statesmen met the crisis. The threatened anti-war strikes never had a chance to start. Radicals showed that, after all, they have a lot of national loyalty in their make-up. Page 561.

THE days of savage cruelty may be revived in this war, but not the era of mashed potato and onion poultices for the wounded. Such treatment during the Franco-Prussian war was in many ways worse than that of preceding centuries, according to Dr. Alice Hamilton who writes on the War Surgery of Yesterday. Page 564.

CLEVELAND voters thwarted an attack on the non-partisan feature of the city's new charter, but let the spoilsmen take laborers out of the civil service lists. Page 557.

CONGRESS suddenly realized that uncertainty about the almost forgotten seamen's bill had a bearing on the ship registry bill. So the House passed a compromise measure, modifying the committee bill but lacking many features of the La Follette bill which passed the Senate ten months ago. Page 555.

AFTER an employer declared war on unionism, the "cancer in the vitals of the nation," and an I. W. W. leader served an ultimatum on capitalism to find a soft place to fall, a plain but extraordinary hobo told how he organized his fellow unemployed and got jobs pulling stumps. Page 558.

GEORGIA has barely crawled out of her long held position as the most backward state in child labor legislation. Page 557.

RED CROSS methods in the nations at war—from the scheme of national organization to the work of dogs trained to search out and carry aid to the wounded—are described, with pictures, some of them taken since the war started. Page 566.

EMPLOYERS holding policies in the New York state insurance fund may count on the state's lawyers to defend them against accident suits. Page 556.

LEARN how to buy, cook and eat less expensive but just as nutritious food—one prescription of Mayor Mitchel's committee on high food prices. Another is systematic plans by the public for increasing facilities by which food is brought to the city. Page 555.

YOU will want your childhood days over again more than ever when you read about a fascinating new school in the open air at San Diego. Page 570.

"LABORATORY school" smacks of a college, but it's a brand new stunt to improve health and efficiency in a department store, and it was devised by the former president of a playground association. Page 558.

We Believe

THAT home-making should be regarded as a profession.
THAT right living should be the fourth "R" in education.
THAT health is the business of the individual, illness of the physician.
THAT the spending of money is as important as the earning of the money.
THAT the upbringing of children demands more study than the raising of chickens.
THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics

THE SURVEY

COMMON WELFARE

PEACE DEMONSTRATIONS AND FIGHTING WAR'S EFFECTS

WHILE SOLID MASSES of silent people lined Fifth avenue last Saturday afternoon, New York women, most of them clad in black, marched in somber protest against war. There were only 1,500 in line, but the very simplicity and silence of the demonstration were impressive. The only sound was that of muffled drums. The onlooker felt as if in the presence of a funeral cortege.

Every nationality now at war was represented among the marchers. One division was composed of colored women, and the presence of a company of blue uniformed nurses from the Nurses' Settlement served as reminder that the work of their sisters in the Red Cross service is by its very nature a protest against the barbarity of warfare. As planned by those who organized the demonstration, which had the approval of President Wilson, no mass meeting was held.

Cleveland, Ohio, has started a form of peace effort which is expected to swell the local Red Cross fund for European relief. Peace badges, consisting of buttons bearing the United States flag and the words "America wants world Peace," are prepared and sold under the auspices of the Cleveland Woman's Club.

This carries out a suggestion made by Thomas D. West, head of a large Cleveland firm. Mr. West has also started the circulation of petitions which pledge the signers to assist in creating sentiment for the settlement of international disputes by mediation or judicial means. The pledge is also printed on cards which are given with each badge. Boy Scouts are co-operating in selling the badges.

Mayor Mitchell's committee to investigate the food supply and high prices has made its report. It attributes the rise in prices to four factors: foreign demand for our foodstuffs, holding back of supplies by producers, stocking up by store keepers and similar buying by housekeepers in advance of need.

The committee urges people to reduce the cost of living by substituting nutri-

tious foods which have not been generally used for the more expensive foods to which many have become accustomed. It recommends education, through schools, churches and public meetings, as to the relative nutritious value of foods, and how to buy, cook and conserve them. It further recommends an increase in facilities by which food is brought into the city. More than \$150,000,000 has been spent, it points out, in providing water supply. Nothing like this amount would be required to build tubes from adjacent territory into New York, which would save an enormous sum to producers and consumers of food.

MODIFIED SEAMEN'S BILL PASSES THE HOUSE

ON AUGUST 27, ten months, lacking one day, after the passage of the LaFollette seamen's bill in the United States Senate, the House of Representatives, following a general debate of two hours, finally passed a modified measure which marks a forward step in giving freedom to seamen and in promoting safety at sea. The bill passed with the general support of members of all parties, and was sent to conference.

The European war, resulting in a demand for a bill to permit the registering of foreign ships under the American flag, was the direct cause of the House taking up the seamen's bill at this time. It had been slumbering for so long in the room of the House Committee on Merchant Marine and Fisheries, that its advocates had almost given up hope of getting action at the present session. Apparently believing that the uncertainty about the seamen's bill must be ended before consideration of a ship registry bill, the House voted to suspend the rules to permit immediate consideration of the seamen's legislation pending on the calendar.

In a last effort to prevent the bill's passage, opponents claimed that its enactment into law might lead to trouble with belligerent nations. The republican leader, Representative Mann, urged that the United States should be slow to take any action affecting treaty obligations on shipping questions. Representative Humphreys of Washington, who opposed the bill's restrictions regarding crews of steamers, predicted that if the measure became a law "we would have war with Japan in thirty days." But the supporters of the bill gave little weight to these alarmist views and not even the men who expressed them asked for a roll call when the bill was called on its final passage.

Further delay has come, however, in the Senate where it is reported that the view found currency that the restrictions of the seamen's bill would interfere with the success of the ship registry bill in promoting an American Merchant Marine. Instead of appointing conferees the Senate referred the bill to a committee

TIME EXPOSURES *by* HINE

IN THE COOL OF THE EVENING

At the left, a street on the Lower East Side. At the right, a road through Van Cortlandt Park, ten miles north but still in New York city.

with the apparent intention of pigeon-holing it.

The bill is not as satisfactory to the seamen as the LaFollette bill which passed the Senate in October, 1913, nor on the other hand is it as objectionable to them as the House Committee bill introduced on June 19 last. These two bills were discussed in *THE SURVEY* for June 6, page 253, and July 4, page 355. Representative Joshua W. Alexander, of Missouri, chairman of the House Committee on Merchant Marine and Fisheries, and Andrew Furuseth, president of the seamen's union met and modified the unpopular committee measure.

The principal provisions of the modified bill are as follows:

Imprisonment for desertion is abolished and corporal punishment aboard ship is prohibited. Penalty for desertion is the forfeiture of not more than one month's pay.

A seaman may call for one-half of the wages due him upon arrival at any port.

Vessels shall provide not less than 120 cubic feet and not less than 16 square feet of space for each seaman or apprentice, with suitable ventilating, heating, lighting and sanitary arrangements.

Seamen shall not be required to do unnecessary work while ships are in a safe harbor on Sundays and legal holidays.

Three years' service at sea entitles a man to the rating of "able seaman."

Twenty-four months' service on deck on the Great Lakes or other lakes and the bays and sounds shall qualify a man as able seaman to serve on these waters.

Ocean going vessels on routes more than twenty miles off shore shall have life boat or life raft equipment to provide a place for every person on board.

Ocean going passenger vessels on ocean routes less than twenty miles from shore are permitted to go between May 15 and September 15 with 75 per cent life boatage, of which 50 per cent may be in life rafts.

On the Great Lakes, the accommodation provided in life boats shall in every case be sufficient to seat at least 75 per cent of the persons on board.

The life boats or rafts must be manned by three to seven certificated lifeboat men, according to the size of the boat or raft. A licensed officer or able seaman shall be placed in charge of each boat or pontoon raft.

Advocates of safety-at-sea and seamen's freedom legislation believe that the differences between the LaFollette bill and the House substitute are of such nature that there is opportunity for an agreement which will accomplish most of the purposes intended.

The two bills are alike in that they both repeal statutes and provide a means of abrogating or amending treaties under which American seamen are arrested, detained and surrendered to their vessels as provided by treaties with foreign nations, and under which the United States arrests and delivers to their vessels any foreign seaman who violates his contract, within the jurisdiction of the United States. Both bills give a seaman the right to demand and receive one-half of the wages which he has earned on reaching a port. The Senate bill provides for a time limit of two days in which to pay the money; while the substitute does not contain such a provision.

The LaFollette bill provides for the absolute prohibition against payment of advance wages or allotment to original creditor and makes it applicable to all vessels within the jurisdiction of the

United States. The House substitute bill has the following proviso, which is objectionable to the seamen's union: "Provided that treaties in force between the United States and foreign countries do not conflict therewith." The seamen's friends are against conferring any special privilege on the vessels of a nation protected by a treaty, to the disadvantage of another nation's vessels.

One of the objections to the House substitute is the provision which places each life boat or raft in charge of "a licensed officer or able seaman." This means that an engineer, who is a licensed officer, may be placed in charge of a life boat. The seamen say that there is nothing in their work to fit them for this service, and that the provision should be changed to read a "licensed deck officer." They lay great stress also on the LaFollette bill's requirement of two "able seamen" for life boats instead of "certificated life boat men" as provided by the substitute.

STATE DEFENDS EMPLOYERS AGAINST ACCIDENT SUITS

POLICY HOLDERS in the New York state insurance fund, one of the four choices of insurance open to employers under the new workmen's compensation act, described in *THE SURVEY* of December 20, 1913, are guaranteed state support in fighting employes who sue under the common law, alleging that they are not covered by the compensation act. In such a suit for damages recently brought by an employe the State Workmen's Compensation Commission has instructed its counsel to appear in court for the defendant.

The employer against whom action has been brought is the proprietor of a small meat market. One of his employes was

injured by getting his hand caught on a hook while hanging up a side of a beef. The commission has ruled that meat markets in which meat or meat products are manufactured or prepared by hand or machinery come within the provisions of the workmen's compensation act under group 30, which includes the manufacture or preparation of meat or meat products. The employe in this case first decided to accept compensation, filing a claim with the commission, but later withdrew the claim and entered suit for damages on the ground that his employment is not covered by the compensation act.

The action just taken by the commission is important since it has been asserted by the opponents and critics of the state insurance fund that its policy holders would not be protected against suits such as this and that such protection could be obtained only through insurance in stock or mutual companies.

SCANT LIGHT IN THE DARKEST STATE

FOR YEARS the Georgia child labor law has been the worst in the country, but a little progress has just been made. The state Legislature, recently adjourned, had under consideration a most conservative bill which passed, but only after having been made almost innocuous. The original provisions of the bill included a fourteen-year age limit for employment in mills, factories, laundries, amusement places, hotels, restaurants, mercantile and boot-blackening establishments, and errand, delivery, and messenger service. The old law fixed twelve years for factories but allowed poor children to work at ten. As passed all employments mentioned in the bill after "amusement places" were stricken out, and another concession had to be

made to conciliate the insistent specter of "the poor widow and the orphans." Now a twelve-year-old child may legally work in any of the few establishments covered by the law if his employment be approved by a commission composed of the county school superintendent, the local ordinary and the local school principal on the ground of his earnings being necessary for the support of either a widowed mother or himself if an orphan. Thus, Georgia persists in denying protection to those who need it most.

Between the ages of fourteen and sixteen, according to the original bill, a certificate from the school authorities showing the child's age, attendance at school and ability to read and write English was to be required. This was changed to a period of six months between fourteen and fourteen and one-half years of age, and the ability to read and write was stricken out of the list of qualifications for this certificate.

The prohibition of work at night in the establishments covered was to have applied to all children between fourteen and sixteen years of age. The law as passed makes it affect only those between fourteen and fourteen and one-half. The law fixes no limit for work during the day.

The influence of the cotton mill interests was principally responsible for the mutilation of the bill.

CLEVELAND'S NEW CHARTER UNDER FIRE

THE NON-PARTISAN feature of Cleveland's new city charter, which has been in effect since January 1, 1914, was sustained by a majority of nearly 1,000 votes at the state and county party primary elections on August 11. The amendment which was voted down proposed that the charter's preferential system of balloting for city officers be replaced by the old method of party primaries and alignments. It was initiated by the Socialists.

In consequence of the same election, over 2,000 city laborers face dismissal at the pleasure of the appointing officer, because, by less than 800 votes, an amendment to the charter was passed, removing unskilled labor from the classified civil service list. The passage of this amendment is considered of less importance, however, than the retention of the non-partisan election system.

Less than one-third of the city's voters participated in the election. The additional fact that the occasion was the state and county party primary is taken as assurance that among the voters was a preponderance of party workers, interested in seeing the restoration of the spoils system and party rule. Indications are that if the two amendments had been up at a regular election, their defeat would have been overwhelming.

The amendment exempting unskilled laborers from civil service was notably backed by the party machines, both Democratic and Republican. It was initiated by the so-called "non-partisan" but thoroughly Democratic city council, and passed over the veto of Acting Mayor Stockwell. When Mayor Baker, non-partisan in Cleveland but prominently Democratic in other spheres, returned home, he, too, opposed it. It met with

JUST A DOLLAR OR TWO—

WHAT THIRTY CENTS WILL BUY

Within a week and a day, citizens of Grand Rapids donated \$650 for needy babies in the city, through the milk and ice campaign fund conducted by the Grand Rapids Press, in the interests of the Free Clinic for Infant Feeding. Since the campaign formally closed, the amount of the subscriptions has increased the total to \$722—almost twice the clinic's modest request for \$400.

The first appeal was made in the Press July 10. Short articles illustrated by pictures of infants who had regained health through the baby welfare work were published daily until July 19. Additional emphasis was afforded by the cartoons drawn by the Press artist, three of which are reproduced above.

the active opposition of all the daily newspapers. But the thirst for spoils was too strong in the party men. The amendment passed by 17,413 votes to 16,648.

The ostensible cause for this amendment was the objection of departmental employers of labor, who said that civil service restrictions hampered them in their choice. The civil service examination was purely physical. A medical examination was followed by tests of ability to lift and carry bags of sand of various weights. Powerful men who passed were put at such work as digging trenches; men of medium weight at paving; and light men at street sweeping and similar work. Appointees under this system from January 1, numbered 2,058, with 614 others on a list eligible for appointment. Friends of the system declare it worked well, just as it has in many other cities.

Friends of the city's new charter are by no means satisfied with their partial victory in retaining the preferential ballot, and the Civic League declares it will, within a year, secure another vote upon the unskilled labor exemption amendment.

FOR HEALTH AND EFFICIENCY IN DEPARTMENT STORES

CHORAL SINGING followed by games and a lecture is a morning program decidedly different from the customary department store duties of arranging stock and preparing for customers. Yet songs and games open the day at the "laboratory school" recently established under the direction of the Department Store Education Association in the Lord & Taylor department store, New York city.

The association was founded by three New York women, Mrs. Henry Olshesheimer, Virginia Potter and Anne Morgan. Beulah Kennard, formerly president of the Pittsburgh Playground Association and a member of the school board of that city, has for the past year been developing the association's plan of work. Its aim is to supply a more definite preparation, physical and mental, for salesmanship.

Mrs. Lucinda Prince's School of Salesmanship in Boston is the pioneer in this field and has had the widest influence. Her work has been supplemented by a number of store schools and more recently by organized associations such as the Association of Corporation Schools. Two department stores in New York city have their own educational systems and practically all large stores have short courses for new arrivals on the force. Again, the younger employes of a number of stores have the advantages of the "continuation classes" under public school management, which carry into the store the mathematics, English and other branches that have been missed by leaving school too soon.

The Education Association, however, has gone about the matter in a way of its own. Instead of preparing formulas for training based on theory or on the experience of one or two stores, it has made a careful study of the situation for more than two years. It called in experts to determine what ought to be expected of the selling force, what was the average increase in efficiency for a period of years and what conditions affected the success of any one department or any one salesperson. Salespeople alone are considered because the office force, stenographers and bookkeepers are trained for their work.

The association was able to interest the manager of the oldest drygoods firm in New York city, Lord & Taylor, and made a careful study of that store first. They learned the conditions of work and inquired of more than two hundred girls their length of store service, their personal ambitions and what they believed to be their needs in the way of further training. Since then, with the co-operation of the stores, they have made brief studies at Stern's, McCreery's, Macy's, Loeser's, Sak's, Namm's and Matthews', and another complete survey of Bamberger's in Newark, all for the purpose of getting sufficient data upon which to build a practical educational plan which would give department store work the professional spirit it lacks.

In the experiment of starting the "laboratory school" the association could not begin with the entire Lord & Taylor store so seven representative departments were chosen. Each of these was divided into three parts, and from these classes were formed which include all the members, the experienced as well as the inexperienced, in order that to-

gether they may work out the plan.

Contrary to the usual method of beginning with talks on salesmanship the first item in this educational program is health. Lord & Taylor's new building, with its model dining and rest rooms, its gymnasium and its very complete medical department, gives unusual opportunities for successful work in this line. All the newer employes have been examined before admission to the store but for this special work even the older ones have welcomed the examination and friendly personal talk with a woman physician about ways of improving their health. Short lectures on hygiene are given and twenty minutes each morning on the floor of the gymnasium are devoted to brisk games. For the choral singing the girls have elected to come on their own time a half hour earlier. The Musical director is Carl E. Martin.

Part of the morning is given to the study of stock, of fashions or of some topic related to department work. The study of stock will not stop with a superficial knowledge of what is in the department, but will include a knowledge of materials, color and forms which will make the salesperson a real help to the customer. A moving picture machine has already been purchased and educational and scientific films will be used.

It was very largely through Miss Kennard's efforts that playground work in Pittsburgh sprang from a most humble beginning to its present high stage of development with over a million dollars invested in playgrounds, buildings and equipment. In 1913 she was appointed acting head of the Department of Play in the School of Education, University of Pittsburgh.

CLASS FIGHTERS AND A HOBO WHO SOLVED A PROBLEM—BY JOHN A. FITCH

CLASS FEELING is bitter in Seattle. That fact stood out in all the testimony before the Commission on Industrial Relations the week of August 10. There were few witnesses—employers,

union men, university professors or hoboes—who did not have something especially severe to say about existing conditions. There was little of a conciliatory nature. The testimony was mostly spirited and belligerent. And it reached its climax when two witnesses, one a large employer of labor and the other an I. W. W. leader, predicted revolution.

J. V. Patterson is president of the Seattle Construction & Dry Dock Company. He is said to be so antagonistic to organized labor that he will not receive goods at his plant from the hands of a teamster wearing a union button. Patterson delivered one of the most amazing speeches that has been made before the commission. He condemned unionism as a cancer eating into the vitals of the nation, destroying our liberties, taking away the independence of the worker. He charged the union leaders with being despots and grafters. "If our liberties are to go, the country

Probing the Causes of Unrest XI

The eleventh of a series of interpretations of the hearings, before the Federal Industrial Relations Commission, by a staff representative of The Survey.

ought to be destroyed," declared Patterson, and "I will help destroy it." He denounced the professors in the University of Washington, the ministers of Seattle, and the public officials from congressmen to mayor as "rotten." He declared that the President of the United States should go down in disgrace as "the worst enemy of the people and of labor" that the country has ever had. He threatened that the employers would start a revolution, and declared that they were ready to fight.

James P. Thompson, one of the founders of the I. W. W., was far less explosive but he was just as much in earnest when he declared that a revolution is coming in which the workers will come into control. He stated that civil government has recently broken down in three states, and said: "It will break down in all, there will be general strife and revolt." For this reason the I. W. W. is organizing, not alone to carry on the every-day struggle, but to carry on production when capitalism shall have been overthrown."

Other employers declared that Patterson had given utterance to their feelings. There is little doubt that Thompson reflected the spirit of the workers. And there was world timeliness in his statement that:

"There are two armies in the world, the army of production and the army of destruction. The army of destruction is the military army. Now the army of production feeds everybody. They produce it all, and what we want is for the army of destruction to disband and join the army of production. Then we who do the work won't have to work so hard, won't have to work so long. We will have the world's work to do but we will have more help to do it. We won't have the capitalist class. We want to put them to work. We want to do away with the wage system and establish the co-operative system in its place."

The Pacific coast is the home of the "blanket stiff" and the hobo. Its industries call them forth. Work is seasonal and jobs insecure. Lumbering is Washington's greatest industry. It is not, properly speaking, seasonal, but operation, by reason of depression or otherwise, has been intermittent. One operator testified that out of nineteen years in business his company's plant had been idle nine. After lumber come the fisheries and canning establishments which is seasonal work. There is a big run of salmon only once in four years. Then there is fruit picking and canning, and that is seasonal. There is general agriculture—seasonal again. And there is railroad construction—also seasonal.

Wages in the lumber camps are fairly good. Common labor gets \$2 a day or more. Skilled labor in the sawmills runs as high as \$8 or \$9 a day for a saw filer. But there is complaint that owing to short seasons of employment the men

make very little. They claim that they are hired through employment agents from whom, as they put it, they buy a job, and that they are soon laid off to make room for other men—suggesting fee splitting between agent and foreman. Some of the larger lumber operators maintain jointly free employment agencies in the towns. Here this practice would not be likely to occur.

The men generally pay \$5.25 for board in the lumber camps. They also pay \$1 a month hospital fee. This is a source of bitter complaint, for if they change jobs they declare that they have to pay again, and that sometimes they pay in this way \$3 or \$4 in a single month.

der her direction into the department stores, laundries, box factories and candy factories of Seattle, revealed the fact that before the law went into effect the average term of employment for a majority of the women was less than a year. This being the case, these girls could be taken on as apprentices, paid the lower wage and dismissed at the end of the apprenticeship period, making little change in the condition which preceded the law.

Mrs. McMahon also stated that the law puts a premium on child labor. Juvenile labor, which includes girls under eighteen, has had a minimum wage fixed at \$6 a week. For adult workers

REVOLUTION IN SEATTLE

What an Employer says:

"Unionism is a cancer which is eating the vitals out of this American people, and I hate it . . . I don't see the good of passing Clayton bills or any other kind of bills. That won't help us a bit because, gentlemen, you will force us to the point where we will fight you. We will rise with a counter revolution. . . . We have a right to do it. We have got to destroy you if it comes to that. That is what it is coming to. It is coming to a civil war, gentlemen, and we will fight. . . . I am ready.

"If there is any justification for the guillotine it is self-constituted power. It will come. Turn your backs on the past, don't read history. Read the vapors of the rotten professors. Read that trash, and you will soon read—you will soon read of a worse revolution than France—far worse."

J. V. PATTERSON,

President Seattle Dry Dock
& Construction Co.

An I. W. W. Statement:

"I would recommend to this commission that they say to all whom it may concern that a revolution is inevitable. We may delay that revolution a little, we may hurry it a little, but we can't stop it, and everyone who is big enough to rise above local interests and see the inevitable should do all he can to lessen the birth pangs of the new society being born from the womb of the old.

"And to the capitalist class I would say 'you are doomed. The best thing you can do is to look for a soft place to fall.'

"We would recommend to the working class that they organize as a class and depend for their labor laws, not upon the politician, but that they should organize and pass the labor laws in the union and enforce them on the job."

JAMES P. THOMPSON,
I. W. W. Leader.

Testimony before U. S. Commission on Industrial Relations

An employer testified that when a man left one job before the expiration of a month he could take with him a hospital card that would be recognized by any other employer up to the end of the thirty days for which it was issued. There were indications that this practice is not universal, however, and employers testified that all in all the earnings of lumber-jacks are not sufficient to enable them to support a family.

Professor Theresa S. McMahon of the University of Washington gave interesting testimony regarding the minimum wage law. Mrs. McMahon was formerly a member of the minimum wage commission. She stated that if a period of apprenticeship is allowed during which the minimum wage may be suspended, the good effects of the law may be lost. An investigation conducted un-

der her direction into the department stores, laundries, box factories and candy factories of Seattle, revealed the fact that before the law went into effect the average term of employment for a majority of the women was less than a year. This being the case, these girls could be taken on as apprentices, paid the lower wage and dismissed at the end of the apprenticeship period, making little change in the condition which preceded the law.

Conditions in the salmon canneries were a subject of investigation last year by Mrs. McMahon and the state commissioner of labor. She testified that violations of the child labor law were found, and that long hours of labor prevailed. When the eight-hour law for women was passed in Washington the canneries were exempted.

In some of the canneries Chinese labor is employed and Mrs. McMahon filed with the commission a copy of a contract which is in use in some of the canneries. It provides, among other things, that the

"party of the second part" may be called on at any time to work overtime after 6 p. m. or on Sundays. For such overtime he is to be paid fifteen cents an hour. If he refuses to work overtime, however, he will be fined twenty-five cents for each hour that he refuses to work.

The contract further provides that the worker must be in bed not later than ten o'clock, that if he engaged in "gambling, carousing, brawling, shouting," or making loud noises around the sleeping quarters after ten o'clock he may be fined \$5 by the foreman, or he may be discharged, in which case twenty-five cents per hour shall be deducted from his pay "from the time said contract is forfeited to the end of the fishing season"; that if he "strikes, demands higher wages or additional board or food" the contract is forfeited; that if he gets sick he must pay twenty-five cents for each meal and forfeit twenty-five cents for each hour that he does not work, and that he must pay \$3.50 "as part of the consideration for obtaining such employment" and in payment for storing any property that may be left with the employer, and for forwarding mail. All these sums are easy to collect for the contract provides that wages are to be paid at the end of the season. The contract states that board shall be furnished—"the same as is usually furnished to Chinese laborers."

Washington's industrial insurance act is well known. It is compulsory and requires employers in hazardous occupations to insure their employes in a state fund, from which compensation is paid to injured workers. The chairman of the Industrial Insurance Commission, Floyd L. Daggett, testified that the act is working very satisfactorily to all concerned.

John H. Wallace, a former commissioner and a hoisting engineer at a coal mine, followed Daggett on the stand and made a severe attack on the present method of administering the law charging that injured workmen often do not receive the compensation to which the law entitles them. He charged the commission with offering settlements for less than the legal compensation and with adopting a system of report blanks whereby the employe's report passes under the eye of his employer—with a resulting hesitancy about reporting the true facts of an accident.

The most peculiar fact about this law is that, alone among compensation laws, it makes no provision for the payment of first aid or medical expenses by the employer. A first aid clause was put in the original bill as drawn by a commission of five employers and five employes, but under the attacks of the lumber interests it was stricken from the bill in the Legislature. First aid and medical attendance is now taken care of in the \$1 a month fee that practically all working men in

the state are required to pay. A first aid bill is now before the people through the initiative and will be voted on this fall. The employers associations of the state are opposing it.

It remained for Henry Pauly, business agent of Local 22 of the Itinerant Workers' Union, or "hoboes' union of America," to give the most constructively valuable testimony of the week.

Because of Washington's seasonal industries, because Seattle is the gateway to Alaska, and because the railroads assiduously shipped laborers west last fall, Seattle's unemployment problem was serious last winter. "In the West an unskilled casual laborer who goes from job to job, following the seasons, is called a hobo. Seattle was full of hoboes.

Henry Pauly, a plain, honest, straight-speaking hobo, went on the stand to tell how the situation was met. He had shipped out to Montana last fall, on an understanding that the railroads needed labor. When he got there he found 400 hungry men on the prairie with no work in sight. Next day he was offered a job and was taken down the line to a place where the workers were on a "grub strike." He had neither money nor food so he went to work. After completing his job he had to go back to another town to get his money, and here he found several hundred men whom the railroads had brought in, mostly from the East, and who had no work. Pauly appealed to the town council and through them received an offer of transportation from the railroad, but it was for transportation west, not east. So Pauly and his fellows arrived in Seattle to swell the number of the unemployed.

There they found Jeff Davis, president of the International Union of Itinerant Laborers, trying to organize a local. Pauly helped and they made him business agent. An old hospital building that happened to be vacant was secured, the rent was paid by the Central Labor Council of Seattle, and Pauly was put in charge.

Then followed something unique in American labor history. Pauly set out to make the unemployed support themselves. He determined first of all that a reputation for sobriety and honesty and industry was essential to a successful outcome. Rules were made that every man must be in by 10:30 p. m.; that no one would be admitted unless he was willing to work, and that no one would be admitted who was under the influence of liquor. It was decided further to exclude I. W. W. men and agitators. They were barred as disorganizers. Pauly defines as an agitator one who is too much inclined to making incendiary speeches.

Then they began to advertise for work—any sort of work that did not conflict with organized labor. The Hoboes' Union is bound by an oath not to furnish strike-breakers. They began to get

odd jobs here and there. Men who got work in this way came back and put part of their money into a general fund.

Then Pauly organized men into squads to secure supplies. One squad would scrub out bakeries and receive their pay in stale bread. Another sorted "spuds" at the commission houses and took "seconds" for pay. Another squad gathered up odd and ends of lumber from building operations and carried them home for fuel. Everything was carried on the back, nothing was spent for cartage. As soon as possible Pauly made a first payment of \$50 on a stump puller and sought contracts to clear land. He got some contracts and the men who did the work shared the pay equally, after paying the balance on the stump puller.

All the while they had to fight against opposition. Someone named the old hospital the "Hotel de Gink" in derision. Pauly calmly appropriated the name, and its use became universal.

Pauly went to a business man for help and was told that Seattle had no use for him and that he and his followers ought to be driven out of town. He replied with dignity and spirit that he was a citizen of Seattle, and that he rather believed he would stay.

People said that the hoboes would not work if work were offered them. Pauly showed where twenty-five of his men had taken a clearing contract and had worked more than a month in the rainy season absolutely without shelter.

There were some holdups around town and some of the papers intimated that perhaps some of the guests at the "Hotel de Gink" could tell something about it. Pauly called in the police without warning and had them search every man in the place. A Seattle lawyer testified on the stand that "not so much as a pen-knife was found that didn't belong to them."

The men appointed police officers from their own number to maintain discipline and they organized a "kangaroo court," the decrees of which were strictly enforced. Penalties consisted of menial tasks, such as scrubbing floors or washing windows of the "hotel."

From February 17 until the industries approached their busy season so that all the men could get work, the place was made self-supporting—aside from the rent, which was paid by the Central Labor Council. From December 26 to April 27, 73,046 meals were served and 33,952 nights lodgings provided at an expense of \$1,308.85.

The Hotel de Gink closed in April and since then Pauly and a small gang of men have been clearing land on contract, sharing the receipts equally. So far they have taken contracts on a cash basis. It is Pauly's ambition to get clearing to do where small plots of land may be taken in payment. Then he will begin to settle men permanently on the land.

Labor's Internationalism Tested by the War of Nations

Graham Taylor

ATINGE of disappointment is apparent in an editorial in the *London Times* on War and Class War which followed another on Waning Hopes, while war was being declared. The *Times* inquired where the Socialists of Germany, France, Belgium and Britain are, now that "the artificial conflict," which they with other parties and factions represent, are tested by "the touch of a real one." For fifty years, the editorial reminds us, "we have been told that the united voice of the 'workers' will forbid war, and strenuous efforts have been made to put some substance into the promise. A universal strike on the advent or approach of war has been proposed and much discussed as an effectual means of frustrating it."

To this reminder the *Times* significantly adds, "if the plan had been earnestly entertained by wage-earners, it must have exercised a great and deciding influence."

But to the contrary, the Socialists must be as surprised, as all other divided groups are, at the amazing spectacle of this fratricidal strife. German Social Democrats in one army are fighting the Socialists of France, Belgium, and England in the army of the allies. The question is a fair one which the *Times* raises, "Where is the class-conscious solidarity of labor?" However, it is only fair to remember that the same question arises at the sight of Christians in a life and death struggle against Christians, Protestants against Protestants, Catholics against Catholics, the Holy Orthodox, against the Holy Orthodox, in the same irrational struggle.

There are reasons for doubting as too hasty the conclusion of the *Times* that "the class war of Socialism and the international peace movement associated with it, have evaporated and are in process of collapsing altogether." The onset of this war was too sudden and severe for anything to withstand. The German Socialists indeed proved to be no exception.

The same night on which martial law was proclaimed throughout Germany, their 79 newspapers were suppressed, their clubs and unions were not permitted to have another meeting and some of their members were summarily shot for continuing to protest against war. In France the foremost Socialist, Jaurés, was killed by a fanatical French patriot who justified his murderous deed

In this early discussion of one of the most significant experiences of the European war. Professor Taylor gives The Survey the first of his personal impressions gleaned from observation and interviews in France and England during the opening fortnight of the crisis.—Ed.

by claiming to have rendered France a service in removing the man who, in his consistent stand for international peace, opposed the measure for the three years of military service. The assassin at his arrest cried, "Jaurés was an enemy of the three-year law. He was an enemy of my country. I have done my duty." Although the deed was repudiated by everyone, most of all by the government, yet, the assassin's bullet at least rang out the warning to everything and everyone standing in the way of this fierce reassertion of nationalism.

JEAN JAURÉS

Assassinated in Paris, July 31, by a fanatical French patriot. As leading Socialist in the Chamber of Deputies and editor of *l'Humanité*, a Socialist daily, he stood for international peace, though, like Bebel, emphasizing the value to a people of its national character. At the time of the Moroccan crisis he went to Germany to urge workmen not to fight against their French brothers. He was not allowed to speak but his printed address was widely circulated by the German Socialists.

In the face of this rising tide of passion and the far more perilous military repression, the German Social Democrats held meetings and made public demonstrations in protest against the impending war at Weimar, Stuttgart, Strassburg and Berlin, until "a state of war" and martial law were proclaimed. To be sure, they did not court martyrdom as did the early Christians in their stand against the Caesars; neither did the heirs of those martyrs professing to follow the Prince of Peace, in any of the warring nations. On the contrary, the Socialists certainly became opportunists, as did the adherents of every other outstanding cause or sect, party or faction.

The French are led to war by a premier who had been a leader in the Socialist Party, upon whose arm the widow of the murdered Jaurés leaned as she followed her husband's body to the grave. Another Socialist leader, M. Hervé, who had even advised French soldiers to desert in case of war, himself applied to enlist under the colors. The *Confédération Générale du Travail*, corresponding to the American Federation of Labor, issued an appeal to all trade unionists to join in the defense of France. All these apparently self-stultifying attitudes and actions are extenuated by their hope that the war will break up the German monarchy and thus be the first step toward "the United States of Europe."

M. Vandervelde, the scholarly yet popular Socialist leader in Belgium, at the violation of the neutrality of his country by the German invasion, consented to serve in the ministry of the clerical and conservative party which he had always opposed. The *New Statesman* declares that "all the peace parties of Germany collapsed before the specter of the Russian peril, just as German aggression (for which the Russian peril is the excuse if not the justification) has frustrated all efforts of pacifist elements in the countries bordering on the western German frontier."

Even Peter Kropotkin, exiled prince of Russia, from his refuge in England declares his loyalty to his people in their war, which has already brought from the autocracy assurances of more liberty to Poland and Finland and to the Zemstvos throughout the Empire.

There was a temporary split in the British Parliamentary Labor Party

J. RAMSAY MACDONALD

As a protest against the war he resigned his chairmanship of the Parliamentary Labor Party. His career in the House of Commons has not been that of an irreconcilable extremist but that of a practical labor statesman. During the great railway strike in 1911, his firm yet reasonable presentation of the men's cause brought about a settlement of the strike.

JOHN BURNS

Labor's only member of the British Cabinet, who resigned owing to England's failure to remain neutral. Although famous as organizer of the dockers' strikes, and later as the foremost British labor leader, his political preferment has subjected him to the criticism of the extremists in the labor movement. His resignation created surprisingly little comment.

KEIR HARDIE

One of the chief speakers at the labor protest against war, held in Trafalgar Square the Sunday before England declared war against Germany. Thousands of workmen called upon their brothers in other countries to unite to prevent their governments from engaging in war. Representatives of different nationalities joined hands while the crowd cheered.

over the war issue. They, with the trade unionists and other more radical groups, had written, spoken and taken action against Britain's engaging in the impending war.

A great meeting of protest was held in Trafalgar Square the Sunday before England declared war against Germany. It was attended by many thousands of working people, some five thousand Socialists and trade unionists marching from the East End, carrying the red banner of the National Transport Workers' Federation. There were some minor interruptions by a group bearing the union jack, which, however, were quickly and quietly repressed by the police.

During the meeting a Russian, a German, a Frenchman and a Swiss embraced each other and stood with joined hands while the crowd cheered. The resolutions adopted called upon the citizens of London to express "their deepest detestation of the international war that seems to be on the point of breaking out, and upon the workers to unite to prevent their respective governments from engaging in war."

The British Socialist Party issued a manifesto to the workers of Great Britain, declaring that "it is not a war of peoples," that "the workers of Germany declared vehemently against war," that "never again must we entrust our foreign affairs to secret diplomacy," and that "only an agreement between the peoples of France, Germany and Great Britain will be solid guarantee of peace and a powerful bulwark against the encroachments of Russian despo-

tism, a result which may easily come of the present war."

After war had been declared, however, all these groups decided to discontinue opposition to the government's foreign policy and concentrate their effort to assure government protection and care for the wage workers against the rising cost of living, unemployment, and destitution from which they would

GEORGE LANSBURY

Consistent opponent of the war through the *Daily Herald*, which has attained under his editorship a wide circulation as a workmen's newspaper. He urged a strike of the workers in transportation and communication, to prevent their use for war purposes. He resigned from Parliament recently as a protest against the government's attitude toward woman suffrage.

otherwise surely suffer as a consequence of the war.

Not agreeing with the attitude thus taken, J. Ramsay MacDonald resigned his chairmanship of the Parliamentary Labor Party. Action was deferred for two weeks in the hope that the resignation might be withdrawn. John Burns also resigned as head of the local government board in the cabinet, when Lord Morley and C. T. Trevelyan also withdrew on account of their opposition to the war. Burns' resignation was received with no protest and surprisingly little comment, especially in labor circles.

The *Daily Herald*, which George Lansbury edits in the interests of industrial unionism, continues its protest against the war, although in somewhat modified form, since it actually began. Just before the declaration, in an editorial entitled, Down with the War, it alluded to the much talk and many resolutions in recent years about the international solidarity of labor.

"If the protest against war is to be made effective," it declared, "those workers who have in their power the control of transport and communication must refuse to allow them to be used for an end which will cause untold human suffering. They must strike against war. The labor leaders must act at once. There is given to the worker the opportunity to strike a blow at the very heart of the capitalist system. The weapon stands ready to the workers' hand. May they dare to be wise."

Acting on this or similar advice the Welsh miners at Cardiff refused unani-

KARL LIEBKNECHT

Socialist member of the Reichstag. Sentenced in 1907 to imprisonment for writing an anti-militarist book. He charged that the Krupps, in league with army officers, fomented war scares in order to sell armament to the German government, and was active in recent effort to force reduction of army estimates for next year. Reported executed soon after war was declared, but said to be safe in Berlin.

PETER KROPOTKIN

Russian nobleman. In early life a Cossack lieutenant, he later joined the revolutionists and was exiled as a philosophical anarchist. From his refuge in England he has declared his loyalty to the cause of the Russian people in the present war, which has already brought from the autocracy assurances of greater freedom to Poland and Finland, and to Zemstvos throughout the Empire.

EMILE VANDERVELDE

Leading Belgian Socialist who, after the outbreak of war, consented to serve in the cabinet of the conservatives. He has an international reputation as a scholarly lawyer and Parliamentary debater. At the time of the Congo atrocities he made a personal investigation on the ground. He was active in the nation-wide strike for manhood suffrage in 1913.

mously to accede to the request of the British admiralty that two holidays be curtailed in order to mine coal urgently needed for the navy. In so doing they justified themselves thus: "We do not consider it necessary for defensive purposes to ask the miners to work on these two holidays, and we decline to encourage, or in any way countenance, the policy of active intervention of this country in the present European conflict. Further, that as the International Miners' Congress has, at its meetings, adopted a resolution condemnatory of war between the nations represented, we think the present moment is opportune for the miners of Europe to make an endeavor to enforce their views upon the governments implicated in the conflict and the pending complications."

This action caused excitement in Parliament. A ministerial party member declared in the House of Commons: "If those men had acted in that way in Germany, they would have been taken out and shot forthwith. What was the government going to do in a case of this kind? The Socialist Federation was a body which had passed a resolution saying that all war was wrong and urging its members to take the necessary steps to prevent the government from getting coal. They might be right or wrong in their standpoint, but it was a proposition the state could not admit for a moment and the state should take some action against those who incited the miners not to go to work."

Dr. McNamara, speaking for the Ministry, said: "There was no occasion to give rise to uncalled-for apprehension. A great many of the men did go to work and all are at work now."

Subsequently, the Miners' Federation in South Wales decided that all existing questions, including those relating to non-unionism, should be dropped, and declared that they were willing to work at any time, day or night. The Scottish coal mine owners informed their miners that in view of the existing situation, they would not proceed with their claim for a reduction in wages. In line with this subordination of all differences to the national defense, almost all pending disputes have been settled or dropped by the London building trades, the marine engineers, electricians, boiler-makers, ship repairers, and even the transport and dockers' unions. Lists of these settlements are printed and editorially emphasized in the London papers.

Jean Jaurés, at the Congress of the Socialist Party in France, the month before he died, faced the demand that his party should support the general strike, as the most efficacious of all means of preventing war, at the International Socialist Congress which was to have been held soon at Vienna. In a remarkable oration he admitted that a strike could be effective only if genuinely spontaneous and effectively simultaneous in all countries; but he prophetically added that it would not avail where or when nationality was at stake.

In a striking editorial, indicative of the change in its tone of discussion, the radical *Daily Herald*, quoted above, thus finely applies William James's urgency of a "moral equivalent for war:"

"Cannot we still have an army, equipped not for death but for life? Cannot we fight, not each other, but our common foe—nature? Cannot we thus preserve in the inmost fiber of the people that morale we would not have stagnate?"

"It is not difficult to find that moral equivalent. It lies in the creation of a civic sense. We must engender a hatred of the errors of our civilization, a hatred so bitter and compelling that men will not endure wrong because they would regard it as sin. We want to take that pride the soldier feels in the possession of his gun, that erect posture of body and soul which can be seen as the outcome of his training, and substitute for it a pride in the tools of labor, be they the miner's pick, the surgeon's knife, or the weaver's loom."

Meanwhile, at the call of their home lands, workers all over the world are laying down their tools to go back to their mother countries and take up arms to kill each other. Surely, for the time being at least, their "class-consciousness" is superseded by their national loyalty, and yet before this war is over, or as a result of it, national loyalty may be subordinated to the supremacy of race-consciousness. But beyond all wars, behind the clouds and darkness, above the valley of the shadow of death there still shines the fixed star of undying hope—"the parliament of man, the federation of the world."

War Surgery of Yesterday

By Alice Hamilton, M. D.

AS we follow the story of the war in Belgium we are continually reminded of the last great war waged over much of the same territory, the Franco-Prussian war of 1870. Whatever other contrasts there may be between the two wars, the greatest contrast certainly will be in the treatment of the wounded. If we can trust the newspapers, we have not left savage cruelty behind in the nineteenth century; but we have, it is a comfort to reflect, left behind that crass ignorance of the nature of infection and fever which made the military surgeon of 1870 a very doubtful good, and made the lot of the survivor of a battle often much more terrible than that of his fellow soldier who was shot to pieces at once.

It is not yet fifty years back to 1870, but during those years all the advances of modern surgery have been made. Indeed, the practice of those days was in many ways worse than that of the centuries preceding it. It was the era of heavy, filthy poultices, made of anything and everything, of yeast and onions, mashed potatoes, bread and milk; for erysipelas, a cranberry sauce, and so on. The patient was fortunate who had anything as clean as flaxseed. In earlier, more primitive days, physicians had unknowingly worked out a very efficient antiseptic method of dressing wounds. The Good Samaritan poured wine and oil into the wounds of the man who fell among thieves, and for centuries oil and brandy or wine dressings and the use of the cautery were usual. Dressings were sterilized by dipping in hot wine or by baking till slightly scorched. In the Napoleonic campaigns, the great surgeon Larrey used hot oil and brandy and advocated infrequent dressings; but his successors in 1870 were under the domination of new theories of inflammation and scorned such simple ways.

Surgery of Old Times

In 1870 Pasteur had already completed enough of his work on the germ origin of disease to inspire Joseph Lister, who for four years had been treating patients in Edinburgh with antiseptic dressings and using sterilized instruments in his operations, but his methods were not given any attention in France and Germany, where surgeons still held fast to the belief that suppuration, pyæmia, erysipelas, gangrene, were of spontaneous origin within the patient. That was Pasteur's greatest service to the world—the overthrow of the theory of "spontaneous generation" of disease.

The surgeons of 1870 had a high degree of skill and also had the aid of

anaesthetics in their work; but so dreadful were the results of the most "successful" operation that one of the most eminent, Denonvilliers, is quoted as saying to his students: "When an amputation seems necessary, think ten times about it, for too often, when we decide upon an operation, we sign the patient's death warrant." And indeed, it is said that in 1868 the mortality of amputation cases in Paris hospitals was 60 per cent.

Some of the greatest Frenchmen in modern medicine served in that war and have left us records of their horror, not over the direct results of a battle, but over the terrible complications which developed in the hospitals. Landouzy tells us that pus seemed to germinate everywhere, "as if it had been sown by the surgeon," as in very truth it was. Nelaton, seeing during the siege of Paris the death of almost every operative case, exclaimed that the man who could conquer purulent infection would deserve a golden statue. The man who did that, very thing, Pasteur, was even then pointing the way and France has given him in the institute that bears his name something much better than a golden statue. One of the best descriptions of the military surgical practice of the Franco-Prussian war is to be found in Pasteur's biography.

Suppose we follow in imagination an army surgeon making his rounds of a morning in 1870. The moment he opens the door of the ward he is greeted by the familiar foul, heavy odor, which he calls the odor of the wounded. There they lie before him, pale, suffering, emaciated faces, or faces swollen with erysipelas or dull-eyed, flushed and stupid from the poison in the blood. All those who are conscious brace themselves for the agony of the morning dressings.

The surgeon goes to his first case with clean hands, and if he is a careful man, the instruments he takes out of his bag are clean from a soap and water washing at the end of yesterday's work. But he puts them down anywhere, and if one falls to the floor, it is probably picked up and used. He probes and explores the sinuses that have formed, for he knows no reason why he should not handle the wound. For dressing he puts a poultice or at the best a pad of lint, of that lint which was picked and sent in bales to the front by devoted women, but which nobody ever thought of sterilizing and which lay anywhere in the ward, on beds or floor where it would be handy.

He passes on to his next case without stopping for hand washing or to cleanse

instruments. This may be a clean case, a deep bullet wound in a healthy young man whose tissues have been able to dispose of the slight infection carried in by the shot. But when our kind surgeon leaves him, it is no longer a clean wound. The probe which he used on the man with a purulent infection has been thrust into the track of the bullet and has inoculated it as surely as the bacteriologist now inoculates a test tube.

And so he goes, this skilled and well meaning man, scattering infection in his wake, and when he leaves the ward he leaves his victims to an increasing restlessness and pain and to "wound fever" which almost surely will have come on by night; but he has no feeling of anything but duty well done. And when the next morning he removes the dressings and finds the clean wound of the day before now bathed in pus he congratulates his patient. This is "laudable pus," the best result that could have been looked for. We recognize it now as a staphylococcal infection, usually much the least dangerous form of suppuration, though always a deplorable accident. But not nearly all the cases are as lucky as this. Others have the far more dangerous streptococcal pus, with perhaps diphtheroid or gas-forming bacilli added and still others are dying of that terrible filth disease, hospital gangrene, so foul and so infectious.

Beginnings of Progress

What chance had the ordinary wounded soldier under treatment like this? Had he been carried to the nearest farmhouse, washed clean, laid in a fresh room, his wounds dressed in clean linen, he would have been infinitely better off. Even in a hospital ordinary cleanliness was not maintained. The air was always foul and pestilential, and the first dressing often put on without even washing away dirt and dried blood. No wonder that the surgeon Sédillot, writing from the seat of war, called on the friends of science and humanity to devise some way of stopping the frightful mortality among the wounded in the hospitals.

Toward the end of the war the teachings of Pasteur and of Lister began to receive attention and we find in 1871 Alphonse Guérin declaring that the cause of purulent infection was probably to be found in the germs and ferments discovered by Pasteur to exist in the air. He washed the wound with a solution of carbolic acid or with camphorated alcohol and covered it thickly with cotton wool and linen bandages,

leaving the dressing on for twenty days. In Paris during the Commune this treatment was carried out in the Hospital of St. Louis; and to the amazement of surgeons, nineteen out of thirty-four patients survived operation. Dr. Reclus who could hardly bring himself to believe it, said, "We had grown to look upon purulent infection as an inevitable and necessary disease, an almost divinely instituted consequence of any important operation."¹

The practice in our own civil war was just the same. To anyone who wishes to read a graphic description of one of our military hospitals, let me recommend Louisa M. Alcott's *Hospital Sketches*. With complete unconsciousness of the disgracefulness of the picture, she describes the foul sickening air of the wards in the Washington hospital and the agonizing scenes over the daily dressings which were done without anaesthesia, though often as painful as the original operation. She gives a naive picture also of her own and her fellow nurses' incompetence, made up for partly, it is true, by her warm-hearted devotion to her patients.

The era following 1870 was that of Listerism, antiseptic surgery. Carbolic acid was indispensable. Instruments and dressings were sterilized in it, the wound was washed with it, the surgeon

kept his hands drenched in it and the work of operating and dressing was all carried out under a carbolic acid spray. Since then we have learned the value of Pasteur's heat sterilization and we have learned to dread the effect of strong antiseptics on the recuperative powers of the tissues, which means that we have passed from antiseptics to asepsis. But this step is infinitesimal compared to that from septic surgery to Listerism.² We owe an enormous debt to the disciples of Lister, many of whom contracted Bright's disease from chronic carbolic acid poisoning as a result of continual exposure to the spray.

Modern Asepsis

The soldiers wounded in the battles of today will, if they can be reached by nurses and doctors, stand an infinitely better chance of recovering and of recovering unmaimed than did those of 1870. In other ways too they are probably more fortunate. It is said that the high speed of the modern bullet makes a small, clean wound which often produces surprisingly little injury to the tissues it passes through.

The *Journal of the American Medical Association* quotes a report on surgery during the Balkan war, written by an eminent Belgian surgeon, Octave Laur-

¹For the benefit of the anti-vivisectionists, I cannot help saying that this advance would have been delayed for years if, indeed, it were possible at all without animal experimentation.

ent. In that war amputation was rarely necessary, less than 1 per cent of the wounded requiring it; and serious abdominal operations were still rarer. The mortality from wounds in the limbs was only 5 per cent; even from wounds in the trunk it was but 35 to 40 per cent; from wounds in the head, 55 per cent.

We have learned some lessons from the great wars of recent days. In the Russo-Japanese war the importance of bodily cleanliness was demonstrated, for the Japanese with their frequent baths and their rule that clean underwear must be donned before a battle suffered far less from infected wounds than had ever been true in other wars. The ordinary bullet is germ free when it reaches its victim and whatever infection is carried in comes from his skin or clothing. In the Balkan war surgeons found the value of non-interference. A wound unprobed and treated with iodine and dressed with balsam of Peru usually healed without trouble.

We feel as if all the progress that has been made through the centuries in the realization of the value of peace and in the understanding of human relations, has been lost when we look at this war; but it is some slight comfort to know that the results of medical science have not been lost and that after modern death-dealing artillery has done its work, modern skill and knowledge will make the fate of the poor victims as easy as possible.

IN A FOUNDRY

ANNA BLANCHE MCGILL

GREATmuscled, with bare breast of Hercules,
Attentive eyes, firm hands that lift with ease
Huge dippers of the crimson liquid fire—
Seething and hissing while the sparks aspire—
Now, as the cauldron's glow his form enfolds,
He seems a stalwart god of flame who holds
Aloft with vigorous grace some molten force
To speed new worlds upon their spiral course.

O that as radiant fabled deity
Once elemental fire through space set free,
This strong flame-master of our modern hour
Might liberate for us some kindling power
To quicken and assay earth's sluggish hearts!
Would that his Toil-born sparks were Love-tipped darts!
Would that as he in some deep glow we stood,
Forging dissev'ring strifes to brotherhood!

TRAINED DOGS OF THE FRENCH RED CROSS

Mobilizing the Red Cross Forces

By Raymond W. Pullman

WITH seven nations of Europe, and now Japan as well, involved in war, societies of the International Red Cross are confronted by the mightiest task ever facing committees of succor since the beginning of the movement to alleviate human suffering in war. Are those societies prepared to meet the crisis? What is the Red Cross situation abroad?

It is too early, perhaps, to hear from societies now in active service. But it is possible to recall their growth in the several countries, and to know the particular plans by which the several organizations co-operate each with the military authority of its own country.

Only fifty-five years have passed since Henri Dunant's band of volunteers searched the field of Solferino for dead and wounded. They buried the dead and nursed the wounded whether Austrian enemy or Sardinian ally; for pain and death made enemies brothers—"tutti fratelli." With the dreadful scenes of that field in heart and memory, Dunant fought the opposition of the many who believed that "War is divine," and urged his question, Could there not be in every country aid societies that should provide volunteer nurses for wounded soldiers regardless of na-

tionality? He published the story of the volunteers at Solferino, and his story made men ponder.

Four years later Dunant's plan was approved by a *conférence* held at Geneva upon invitation of the *Société Genevoise d'Utilité Publique*. Fourteen

governments were officially represented. The resolutions passed at this *conférence* were embodied in a formal code, and a treaty was signed the following year, 1864. Out of compliment to the society taking the initiative, the new organization adopted as its emblem the Swiss flag with colors reversed—a Greek cross red, on white ground. Its motto was, "Neutrality and Humanity." For the first necessity for such work as they planned must be neutrality not only for the wounded themselves but "for field and stationary hospitals, for officials employed in sanitary work, for volunteer nurses, and inhabitants assisting the wounded."

But save for a few guiding principles, the code left each society free to determine its specific work according to the customs, needs and opportunities in its own country. Inevitably some friction occurred in the process of adjustment to existing military medical service. But rivalry and opposition have given way to co-operation. Authority has remained with war departments; the Red Cross organizations have aided by activities that make a splendid story of enterprise and courage.

In France there are recognized three societies of the Red Cross: the *Société*

MAJ. ROBERT U. PATTERSON
In charge of hospital units on American Red Cross relief ship.

de Secours des Blessés Militaires; the *Union des Femmes de France*; and the *Association des Dames Françaises*. The last mentioned has branches in several countries for French residents. Plans of each society are discussed by a committee consisting of a member of the army medical department and a member of the individual society. All three societies are under the central direction of the Marquis de Vogue, formerly ambassador to Constantinople, a man over 80, of wide culture and sensitive to the finer needs of the French people.

Every six months a statement of resources and plans for each district is sent to the government medical officer of that district who in turn reports to the war office. Activities of these societies are of four chief varieties:

1. Maintaining hospitals in home territory for the expansion of the military hospital system. These hospitals are graded as "complete" when from twenty to one hundred beds are available and equipped for at least three months. A second grade recognizes less fully equipped hospitals; a third, definite plans for such hospitals. The latest full report available (1907) credits to the *Société de Secours*, over 6,000 beds in hospitals of the highest grade; to the *Union*, over 4,000; to the *Association*, over 2,000. More than 35,000 beds were at that date planned or partly provided for by all three societies.

2. Maintaining auxiliary field hospitals on the line of communication between a scene of action and the home base of supplies. These relieve the regular field hospitals, when because of severe cases

NEW RED CROSS UNIFORM

Worn by nurses on the American Relief Ship.

the latter cannot follow the army to a new position.

3. Securing gifts—money or otherwise—and forwarding these to the soldiers indicated and distributing them to others in need.

4. Maintaining "sick rooms," *infirmaries de gares*, in railway stations along

the line of communication. A *dépôt* waiting-room or an express office must sometimes be transformed at a moment's notice into an operating room for men whose injuries require immediate operation. More frequently these rooms provide refreshment for trainloads of wounded soldiers on their way home or to a hospital, and treatment or dressing of their wounds. These *infirmaries de gares* are placed not further apart than a six hours' ride. This special branch of work is under the care of the *Société de Secours* exclusively.

The revenue of the French Red Cross comes from many sources, as in other countries. Each society has its own fund. Special fêtes are frequent. Memberships, contributions, and bequests are the largest and surest means of income.

In this excellent organization the weak point has been considered to be the training given the nurses. Too often instruction does not pass the mere rudiments of nursing. Thousands of women are said to take short courses six weeks or three months in length, which cannot, of course, prepare them for serious emergency work. A number of women study a course in hospital administration which gives them the title of *dames comptables*. The uniform of these *dames comptables* is a white dress and blue cap; that of the regular nurse is white, in both dress and cap.

It will be noted that the French Red Cross activity does not ordinarily reach to the "army zone." This has been true in other countries also.

RED CROSS DIVISION OF THE GERMAN ARMY PREPARING
FOOD FOR THE WOUNDED

GROUP OF RED CROSS NURSES IN THE JAPANESE ARMY

The German society is organized with characteristic thoroughness. Its especial strength is the training of its nurses, men and women. On the thoroughness of this training depends the strength of its plans for operation. Its nurses are in field hospitals along the line of communication, in military hospitals in the home territory. One special group of nurses receive definite training as assistants to the professional nurses. Sections of trained men serve as *Hilfs Sanitäts Kolonnen*. These "columns" are auxiliaries to the army stretcher-bearers, conveying the injured from field to hospitals or homebound trains. Information bureaus and medical rooms in railway stations are, as in the case of France, equipped by the Red Cross; the military hospital system is extended by Red Cross hospitals, at home, and by refuges for the convalescent or helpless. Hospital trains fully equipped can be rushed to a disaster or to check the outbreak of an epidemic in the army.

Completeness of equipment and unlimited stores—these seem perhaps the most significant evidence of the careful organization centering in Berlin and reaching out through every section of the Empire. The latest available figures give a total membership of nearly 500,000; 196 auxiliary hospitals; 599 railway medical rooms, and 521 convalescent homes.

Similar lines of Red Cross work in all countries need not be described repeatedly. Space demands that only certain unique features of the work be indicated.

In Austro-Hungary the Red Cross organization has a direct official relation to the *Reichs-Kriegs-Ministerium*, or

war department. Several societies cooperate in typical Red Cross work, though keeping their distinct titles. The division of responsibility assigns to the Red Cross the furnishing of supplies, and to the government the personnel and direction of activities. Work is similar to that in Germany though less extensive. The costume is, in many cases, that of a church sister.

The smaller societies of Belgium and Servia are perhaps facing their first great test, although Servian physicians and nurses gave important aid during the Balkan wars.

In Russia, the Red Cross is practically a state organization. Part of the society's revenue comes from the government, a proportion of the charge for passports being set aside for Red Cross work. Russia claims to be the first nation to plan for peace activity. Possibly, incomplete organization may explain the rivalry nevertheless resulting when in a war crisis two groups of people attempted the same task. The Russo-Japanese war taught an important lesson in this matter of field economics. During the war, Red Cross hospitals were operated quite independently of the government institutions. So it befell that sometimes a Red Cross hospital would be placed just across the road from a government establishment. Comparisons resulted. Food was better, it was said, under Red Cross direction, and salaries were higher. A soldier who recovered in the Government hospital was expected to go at once to the front again; the Red Cross usually sent him home for thorough recuperation.

Such obvious objections to a double system could not long remain unnoticed.

But the real secret of such rivalry lay in zeal for service. A Delegate-General of the Red Cross was heard to say during the action in Manchuria, that only with the greatest difficulty could he prevail upon his workers to remain anywhere but in the thick of the fight. Since the government permitted their presence within the army zone, all relatively safe positions along the line of communication lost interest! No danger was too keen, no risk too great for these Red Cross nurses.

The training of their nurses is perhaps the strongest point in the Russian Red Cross. It is most thorough and trains nurses for all civil and military hospitals. These nurses—many of them women of high social position—are called "Sisters," although wearing a modification of hospital uniform rather than an ecclesiastical dress.

The Japanese society is a descendant of the *Hakuaisha*, or Society of Universal Love, through which the native humanity of the Japanese had long found expression. But these eager observers of other civilizations noted the better organization of the Red Cross societies, their more scientific training of nurses and more efficient work on field and in hospital. So in 1875 Japan applied for admission to the Geneva Convention. The *Hakuaisha* had at this time thirty-eight members; at the time of the war with Russia, the Japanese Red Cross had more than a million members. Its hospital at Tokio is in peace a training center for nurses and a charit-

able institution accommodating over 400 patients. It becomes in time of war a military reserve hospital.

Membership in the society is honorary, special, or regular. Deeds of valor are recognized in a spirit of fine sentiment—not only is a medal given, but "mention is made to the Emperor."

During the war with China, 1894, women Red Cross nurses first worked in military reserve hospitals and by their quiet skill, overcame all opposition. Two well-equipped hospital boats proved their worth during the Boxer trouble. The society has the usual bases of hospital supplies, railway medical rooms, trained nurses, men and women, for war emergency; and a bureau of information about prisoners.

The present war will afford opportunity to test the efficiency of Red Cross dogs. In several countries, Germany, France, Belgium among others, dogs have been trained for police service and more lately for special Red Cross duty on fields where soldiers falling in long grass or into ravines, would easily remain undiscovered by human searchers. The dog best fitted for this purpose has proved to be a cross between collie and bloodhound. Around the body is wound a long web band with certain medical supplies in its folds—stimulant and first aid material, so that the soldier may do something for his own relief while the barking of the dog attracts the attention of the Red Cross corps.

Nothing can be said in this brief sketch about the Belgian "Little Sisters," about Italy's *La Croce Rossa*,

*Baron Okuma: Fifty Years of Japan.

Spain's *Rudanos Cruz*, or the many British societies that follow in the footsteps of Florence Nightingale. Enough of the Red Cross story has perhaps been told to show that the hordes of soldiers facing the fire of their enemies' guns may have this consoling assurance: their injuries will be more skilfully treated, they themselves more carefully nursed, than has been possible before in any country's warfare. Significant too is the fraternity of such work. Whether the title of a society can be read without a dictionary or not, the Red Cross emblem tells at once its message of brotherhood beyond the bounds of nationality.

A fundamental part of the code of Red Cross work is the exchange of services between countries without violation of neutrality. The American Red Cross has already received calls for help. France cabled for 10,000 stretchers, more than were immediately available in this country. Absorbent cotton, rubber gloves, iodine and other first aid supplies have also been called for. A hospital ship will shortly start for Europe equipped with doctors, nurses and supplies. This ship is probably the first to be sent out under such conditions. The most nearly similar case was the "field hospital," completely equipped, which the German Red Cross gave in 1904 to Russia. The American ship is painted white with a red stripe from prow to stern. Sailing under the Red Cross flag, it is protected by the treaties of Geneva and The Hague and can enter any harbor to discharge its beneficent duty.

The necessity is imperative that the American public realize the opportunity afforded by these Red Cross treaties of neutrality. After the recent disaster in Salem, \$600,000 was within a few days received for relief work. Within two or three weeks after the Ohio flood, nearly \$2,000,000 was given for the relief of the sufferers. For this was at our very doors; full and graphic reports reached us through the newspapers. Yet these disasters represent but a small part of the real suffering caused by the present war in Europe. We have not full details of this suffering; we have no adequate conception of the state of actual want and misery. When a battle wages for days men lie on the field wounded, suffering thirst and fever, for hours before they can receive aid, unless there is an armistice while the dead and wounded are cared for.

The American Red Cross asks for prompt and generous co-operation through money gifts. It lays emphasis on the value of small contributions. A gallon of iodine costs \$10. A little Red Cross bottle of iodine can be had for 15 cents. Treatment of 15 cents worth of iodine may help a man to live, —a 15 cent contribution may turn the balance between death and life.

This story has dwelt on only the war activity of the Red Cross. Its work at home in times of fire and flood and tornado, needs but an allusion to be gratefully recalled. When shall the nations beat their swords if not into plowshares, at least into surgical instruments for the relief work that is still needed even in days of peace?

WHERE LESSONS COME FROM REAL THINGS

The Parker School in the Open Air at San Diego, California

By W. Templeton Johnson, Architect of the School

TWENTY years ago, Col. Francis W. Parker was a pioneer in modernizing the education of children. His work in connection with the schools of Cook County, Ill., was thought revolutionary at that time. But with the passing of years his methods have been pronounced constructive and sound.

Three of the fundamental principles which governed the work of Colonel Parker were:

"The needs of society determine the work of the school;

"The supreme need of society is good citizenship;

"The purpose of the school is to present conditions for growth into ideal citizenship."

The Francis W. Parker School of San Diego, modeled after the widely known school of the same name in Chicago, was established in December, 1912, to carry forward and amplify Colonel Parker's ideas. But another purpose was sought also—that of adapting the architecture to the educational aims. The editor of the *American School Board Journal* has said of the school:

"We have given a good deal of attention to the subject of school architecture during the past twelve years, and I confess that your adaptation of the open-air idea is not only a novel departure but the establishment of some principles which must become universally accepted if the open air school is to succeed."

For the first few months there were only kindergarten and primary classes, but the school has grown so fast that it now includes all the grammar grades, and will have a high school department in the fall. It is financed by people interested in progressive educational methods; and the building, equipment, and the courses of study are planned to give each student the very best possible chance to develop physically, morally and mentally.

If a child is in perfect physical condition his mental and moral possibilities are correspondingly advanced. With this in view the building is designed to have the air as fresh in the classrooms as it is out of doors, and a great deal of the actual school work is done in the open air. Careful measurements are taken at intervals, of each child, but the school is not yet old enough to make these measurements of any statistical value. However, results of this healthful environment are shown by the fact that while in the public schools of San Diego there have been during the winter the usual number of cases of children's diseases (measles, mumps, etc.), there has not been a single contagious disease among about sixty children at the Parker School.

The purpose of the school, in a broad sense, is to break through the iron bound curriculum of our school system and evolve a type of education related to the problems of daily life; an education which teaches pupils to think and to solve problems by their own initiative

rather than by accepting blindly the statements of teachers or textbooks. To "help" and to do real things are natural tendencies among children, and the plan of the school is to capitalize and develop these self-active impulses as a basis for school work.

Our schools have too often been looked upon by students as prisons where the best hours of every day are spent. If a course of study is arranged which makes learning so attractive that the pupils want to stay after school hours, it must be working in the right direction.

To illustrate—A twelve-year-old boy came to the Parker School. He had been pronounced incorrigible at the public school and his parents were at their wits' end. His teacher had kept him in after school day after day. She said it was doing him no good and only wasting her time; however, there was nothing to do but follow the usual custom. At the end of his first day's work in the new environment, the boy went home and said "Mother, they don't have any rules [to break] at that school." The next week

WHERE GOING TO SCHOOL IS NO HARDSHIP

LEARNING HOW WORDS LOOK

PERSEVERANCE

PRACTICAL LESSONS FROM TODAY'S DESSERT

he said, "Mother, it's an awfully long time from Friday till Monday. I wish I could go to school on Saturday."

If this boy had continued to be kept

in during his school career he would, to say the least, have received a poor education; but in a small group with teachers who can understand him and direct

his enthusiasm, he is doing splendid work and making his parents very happy.

In planning the curriculum one of the main ideas has been to suppress as far as possible the abstract, and to do real problems with real equipment. The training of the hand and eye goes forward with that of the brain and the interest aroused is far greater than it would be in a purely textbook course of study.

For example, an arithmetic class is engaged in figuring the lumber necessary for an additional out-door room which will be built by the children themselves. A class in environmental history has made excursions to the site of the first Presidio in southern California and to the ruins of the old Franciscan Mission, and has since then acted in the open air a little play consisting of incidents in the life of Fra Junipero Serra who founded the mission. A printing-press has been installed for publishing a school paper. One of the classes has assumed the cost of the press as a class

, COACHING ON THE MOUNTAINS—OR CANOEING ON THE BAY

STUDY ROOMS CAN BE OPEN AT ONE SIDE IN ANY WEATHER

debt and will operate the paper as a business enterprise to pay off gradually the indebtedness.

Every week one class does something for the entertainment of the rest of the school and it is astonishing how fast the children gain self-possession and lose all shyness and diffidence. Each group of children has made a garden of both vegetables and flowers. Biology is to be imbibed by raising pigeons, rabbits, etc., and "Investigation Lane" is a portion of the playground where any group of children may make anything from a sand model to a play house, provided that the work started is carried through till finished.

In its site the school is peculiarly fortunate. Physical geography is at its very door. The school is built on the edge of a beautiful canyon overlooking the San Diego river valley. To the east rise range after range of mountains. Far off to the north beyond miles of flat mesa are the snow-capped peaks of the

San Bernardino range. To the west is Mission Bay, and separated from it only by a narrow strip of beach, the Pacific Ocean.

San Diego is becoming known as the city with the shortest thermometer in the world. The climate is remarkably temperate in both winter and summer,

LESSON

the sun shines over three hundred days in the year and the winds are so gentle that conditions are almost ideal for the establishing of open-air schools.

The Francis W. Parker School is designed to make the most of these climatic conditions, but a similar scheme could be used in any city which has not a really severe climate by simply having the students dress warmly—warm clothing costs less than doctors' bills.

In planning the school the architect worked toward three fundamental and desirable ends:

To make the air in the classrooms as fresh and pure as the outer air;

To construct a practical and efficient building at low cost;

To achieve artistic effect by good proportions and pleasing color rather than by the use of lavish and expensive ornament.

As the school grows the building is being erected on the multiple unit plan, and when entirely completed it will form a hollow square with an open court about a hundred feet square in the center, surrounded on all sides by a covered portico. All the class rooms open on this portico, and their inner walls are arranged with folding, sliding doors, by means of which the rooms may be thrown completely open on the portico. Both the folding doors and the wide French windows which glaze the outer walls have transoms above them, so no matter what the weather conditions, one whole side of the rooms can be entirely open.

A great deal of money has been wastefully spent in ornate and costly school buildings which are intended to be monuments to their architects and to make a striking impression on visitors. The initial cost of these elaborate buildings is very high and with the rapid progress in American methods of education, school plants soon become antiquated. It would seem much wiser to spend at least part of the money which goes for mere show, in relieving the overcrowding prevalent in so many schools, and in paying adequate salaries to obtain efficient teachers.

In building the Parker School no money has been spent on lavish decoration. Although the materials employed have been the best of their kinds, expensive materials have not been used. The school is one story high, and as the fire hazard, as far as it affects the safety of the pupils is entirely negligible, the building is of frame construction covered with stucco. The flat roof is asphalt and gravel and the parapet walls are crowned with red Mission tiles. Instead of using concrete columns and a tile roof for the portico, which would have been attractive and commensurately expensive, wooden posts are used with a composition roof painted to match the tiles on the parapets.

It seemed foolish in an open-air climate to use a closed corridor as a means

of communication between classrooms. A portico, besides being a decorative feature, saved the expense of one additional wall. It seemed equally foolish to spend money on an elaborate heating and ventilating plant. None has been provided. The classrooms have small wood stoves which are used on wet days but hardly ever for any other reason, as the pupils are dressed for out of doors.

All the wood work in the classrooms is stained dark brown, the walls being painted a warm tan which makes a good background for pictures. The patrons of the school believe in the subconscious influence of art, and the bareness and stiffness of the old time schools is avoided by hanging artistic prints and photographs and by using movable chairs and tables instead of desks.

The kindergarten is designed as a miniature home. The large sunny class room is made as home-like as possible with an open fire-place tiled with low reliefs of deer and rabbits, birds and dogs.

Next comes the kitchen where reading, writing and arithmetic are the by-products of the pupils' interest in learning to cook. Many of the necessities for the school lunches are grown in the children's garden. When the vegetables are harvested they are weighed on the kitchen scales; the blackboard comes into use for writing down recipes and for figuring the costs of the few supplies which must be bought from the grocer.

Beyond the kitchen is a tiny bedroom all light blue and white, where tired tots may rest or lessons be given in dusting or making beds. The white curtains have blue birds flying along their edges, stencilled by the children, and the blue and gray rag rug is the work of many little weavers.

In the kindergarten one may see a group of children making aprons in order to keep clean in the kitchen. At one of the manual training tables on the wide covered porch, a boy is measuring and putting together a miniature chair. A little girl is mending a broken toy for the Christmas present of some child less fortunate than she. All are doing real things,—things there is a reason for doing, and are taking the keenest pleasure in their work. Without knowing it they are learning self-reliance and logical thinking, thoughtfulness and consideration for others.

Among the older children the methods employed in the kindergarten are simply carried forward and amplified. The classes are small, so that much individual attention is given; and as the grading is entirely flexible, pupils showing a particular aptitude may progress rapidly.

There is no rigid enforcement of si-

"INVESTIGATION LANE"

FACING A GARDENER'S PROBLEMS

lence in the classrooms; the interest is such that usually any talking is about the subject in hand. It was thought that having the rooms open on the portico where there is more or less passing, would perhaps be a distraction, but experience has proved this a groundless apprehension.

The spirit of the school at Christmas is a revelation to the visitor. It is not "What am I going to get?" but "How much pleasure can I give?" The children bring fruit and vegetables to school, apples are polished, celery and potatoes scrubbed, each child contributing real labor in making attractive the baskets that are filled to be sent where there is real need. Broken and discarded toys are repaired and painted to go where they will bring happiness. Under the Christmas tree are presents, things the children themselves have made. A boy drags a cart across the room to a little brother too small to go to school. A little girl darts to her mother with a

wicker scrap-basket neatly finished. It does one good to see the transparent joy on a boy's face as he hands his father a leather purse he has made all himself. It is the true spirit of Christmas.

In his address at the opening of the new school building, President Hardy of the San Diego State Normal School, said that the Francis W. Parker School will be to the public schools of San Diego what Stanford University has been to the University of California. If the school can be an inspiration for the public schools it will go far toward achieving its mission.

After graduating from college, one of the students of the Francis W. Parker School of Chicago, became an instructor in a large eastern preparatory school. After a time he wrote to his family—"The ——— school prepares for college but the Parker School prepares for life."

There can be little doubt in our minds which is the more important.

"BEAUTY FOR ASHES"

By Albion Fellows Bacon

CHAP. XI. CONCLUSION

A glance backward over the White Road that led out from home, and forward to the hill-top and the vision of a New World.

BATTLE SONG

There are great things to do while the careless ones sleep,
There are heights to be won, there are ramparts to keep;
And the call that we heed is not Fortune or Power,
But the need of a hero,—the cry of the Hour.
We have dreamed of a time when the world should be bright
With the dawning of Peace and the triumph of Right.
But our slumber is shaken; the dreamer must waken:
He must rouse him to battle, and gird him to fight.

A. F. B.

"AND what are you going to next? Suffrage?" asked a friend.

"No, housing reform; housing till I die. I have only made a good beginning," was my answer.

There is so much to be done! Contemplating the vastness of the field, and the smallness of the force that is at work, I am reminded of the legendary "seven maids with seven mops" attacking the ocean to "try to sweep it clear." Almost as hopeless seems our task. In our state alone how many mops are needed! And beyond our borders—dismaying thought! If, in all the cities, every house that is past repairing could be pulled down or burned up, how great would be the crash, how heaven-high the conflagration! It would be a veritable crack of doom and glare of Judgment.

But this is only a pleasant little picture, to cheer housing reformers while we wait; for, "at this poor dying rate," as the old hymn says, our country is not to be cleaned with a crash.

In my own state, and particularly in my own city, I can hear the actual sound of rotting timbers falling. Our strong city administration is carrying on the work of housing reform most vigorously, and by means of our state law and various ordinances, is either making over or tearing down everything bad in the way of buildings.

"This city must be cleaned up," Mayor Bosse's edict has gone forth, and all departments are entering into the work.

"I couldn't sleep for several nights, after my first round of our tenements, thinking of the little children I had seen in some of those dreadful places," said Edward Kerth, our building inspector. Needless to say, he will do thorough work. And now our organizations of business men have just passed strong resolutions pledging their support to the movement, and have created a joint housing committee. Their plan includes the building of good houses for working men, as well as the wiping out of our slums.

It is a most helpful sign that our

architects are taking hold with right good will, and that their state association is pledged to housing reform. Not only will this make the enforcement of the law much easier, but the value of their interest and their recognition of their responsibility for the public welfare can hardly be overestimated. It is to them that we may look for the development of better, more durable, more convenient and more comfortable houses, that shall be within the reach of the hitherto neglected classes. It is to them that we must look, in the absence of civic experts, for the redemption of our cities from their unnecessary ugliness.

The Law at Work

In my own city I have seen not only the action but the reaction of housing reform. Many people labor under a delusion that I am an official with a salary.

"I thought you ought to know about the family back of me," comes buzzing over the telephone, every few days, with a description of one more case of overcrowding or unsanitation.

"I am glad you are interested," I say, and right glad I am, "and the Building Inspector will appreciate your help. Won't you call him up, please—No. 462?"

Fewer complaints come to me now from angry landlords and weeping women, as the tenement law is better understood. But even the tenants who suffer most grumble occasionally when we try to pull them out of an old house before it falls over them, especially when they are misled by shrewd landlords about the law. I have a soiled and misspelt letter, in a pencil scrawl, whose message shows the sharpness of another wit than that which directed the hand. It appeals to me to stop the demolition of a notorious old tenement, whose ribs were bare of boards and whose condition beggars description. "We thought you were our friend," the letter says. "We don't know where to go, and, if you can't stop the workmen, will you shelter us yourself?"

The inspector assured me that they

found better places—indeed none could be worse. One of the families, I found, was Lucindy's! Her husband had died, and she was trying to keep her little ones together. We were glad to see her rescued once more, and installed in a better neighborhood.

Above and beyond the tenement law and its enforcement, a wonderful result has come from the educational campaign of the last six years, in the awakening of public sentiment. Where the law compels one decent building, sentiment builds or repairs a score, and whatever is done by sentiment always goes far ahead of the demands of the law. More than cutting windows in some hundreds of old houses, or than saving the yard spaces behind as many new ones, is it to cut windows into the minds of the people and to give them broader standards.

Some sins that used to be committed in ignorance in Indiana will never be repeated. Builders are voluntarily making better plans; many, through an awakened sense of propriety; others in anticipation of future restrictions.

One of the most significant results has been the building of an entire mining village upon nearly model plans, giving the miners sanitation, conveniences and many comforts, providing spring water, and giving each house its garden—things hitherto unheard of.

"We used to build a miner's shack for \$100," said the owner. "These cost over \$1,000, but they pay a good percent."

All this sounds so smooth and so pleasant that it might lead the reader to believe that no law is needed. Alas, those who make it necessary will not listen to the appeal of sentiment, which has a strong voice but no "teeth." Only the law, which has a bite as well as a bark, can make them hear.

"You will go on, and carry your work into other states, won't you?" I am asked. And a magazine answers for me, "She will never rest until every state has a law as good as her own."

"A weary lot is thine," methought, reading that comment. Happily, the

National Housing Association, to which I belong, goes far afield and is organized to answer the appeals for help and expert advice that are coming in from all sides. Still, there grows a pile of letters upon my desk asking for lectures, for help in starting housing campaigns, and what not, and it isn't in the heart of a housing reformer to refuse.

The Appeal of the Slums

But whether it be a chamber of commerce, a civic association or a woman's federation that gives the invitation, I hear always, above it, the faint, far-off call of little voices, and see the beckoning of little shadowy hands. And so it happens that I see more and more of the misery of our cities.

"If you could stay over another day we would show you the beauties of our city," almost everyone says when, after a tour of the slums, and divers meetings and conferences, I am being borne to the train. Once in awhile I do visit the good residence sections and parks and I always get a glimpse of them, coming and going from the slums. We dash across the business streets, lunch in a great fine building and I see the state house, when there is one. It is always a matter of interest to me, as well as curiosity. I like to figure out how long it would take to get from the senate chamber to the house of representatives. Some of them are too far apart, but I like those that have no place for the audience, except the gallery, and those that are well ventilated. As to the marble stairs, and all that, the shortest way up takes me!

It isn't missing the beauty spots of a city that I mind. If I am imported for the purpose of issuing jeremiaids and making miserable as many people as possible, I must be glad if I succeed, and be content to leave the "pleasures and palaces" to other guests, who come on gayer missions. The part I do mind, though, is having to be remembered, like a wasp, for its sting. But there are always happenings that warm my heart—and new friends.

One of the greatest encouragements in this journeying, has been meeting others interested in the same work, who have been through similar struggles and, often, are further along the road and know how everything will work out.

I can never forget our first National Housing Conference. I felt as a two-eyed person might who had lived in the Land of One-Eyed people, for a long time, and then came back to the Two-Eyed country. It was a relief to be with a whole association of people who saw as I did, without having to explain, argue or apologize. In fact, every one of them would have dared to ask for more than we had in our tenement law. They thought we hadn't asked half enough for Indiana. It was most encouraging.

I remember one lovely luncheon, during the conference, at which we discussed ashes, garbage, alleys, and such things, for several hours, continuing the discussion at an after-meeting until dinner time, and then carrying it on till midnight. And still earnest groups gathered in the corridors, and lingered on the steps. Every kind of civic expert was there, and it was a joy to find out just how to do the things that one was puzzling over alone.

Along the White Road

It is far, indeed, that the White Road has led me—through the village, to the city, across the state, and out into other states. And it has been uphill all the way. But with every turn of the road there is a broader view. There are surprises, too, at every turn,—such beautiful surprises, and so many of them, that I have come to expect something unexpected around every corner. Some of them are good times. Some are unlooked-for help. The best and the most wonderful of them are the friendships. And I was looking only for thorns and flinty places—and brickbats, I remember!

True, there is weary climbing and hard fighting still in store; but there are the little resting-places, where one can stop and take a full breath, and look out over the view.

It is a glorious thing to be standing at the gap of Opportunity, to be in the sweep of great movements, in the current of all good purposes, in the company of lofty souls. It is great to feel that one is living, even now and here, the eternal life, and to rest in the poise of a perfect trust in the divine will. Only so can one wait with patience and serenity for the issues of life. Only so can one bear to look down into the shadow, and hear the wail of the helpless and suffering, and feel their burden as one's own.

The Gain of the Years

Looking back over these years, and the struggle to which they have been devoted, I am thankful that they have given me more, and not less, faith in both God and man. I am glad that I can see the most hopeful phase of the forces that hindered. I am grateful for all the forces that helped—the personalities, rather; for every force was represented by some strong man or woman, and it is they whom I remember.

Of all the forces arrayed against housing reform, selfishness, ignorance and indifference were those that hindered most. I really believe that ignorance is the prime cause, for most of those who are indifferent would arouse to action, if they could know. And a majority of those who fought us, through selfish interest, would cease to oppose, I believe, if they could see how much misery their selfishness costs. But they

will never know fully, unless we could put into the penalties of our tenement law that the owners of slum property should be incarcerated for a term in their own tenements.

I remember how, in my first campaign, I tried to excuse the landlords because housing reform was a new thought, and they perhaps did not know better. But now, for six years, housing reform has been taught from one end of the state to the other. It has been preached by pulpit and press. Chambers of commerce have endorsed it, boards of health have insisted upon it. Charities organizations have begged for it, women's clubs have demanded it. Pictures have been published and thrown upon screens, describing the dangers and horrors of slums; and if people do not yet know that "it is no better to kill a man with a house than it is to kill him in the street with an ax," it is time they did.

Strange Slum-Owners

Still, we have been amazed, even this year, to find who are the men and women who own the most of the worst houses. Wealthy, many of them, for slums are paying property; respected, because the community does not know the source of their revenue; prominent in society, but their friends live in the best part of town, and never pass by their property. They are church members, some of them, and even build churches or help build them with their revenues.

There can be no doubt that these persons know the value of sanitation, also of light, air and space, for they live on choice corners, or other good sites, and their homes have every sanitary device.

I know one town where two men own practically all the wretched dwellings of the poor. "One of them buys up old box cars, and makes them over into shanties," we were told. This man is disliked and not even respected. The town realizes that his deeds are an abomination, a wrong to the poor and a menace to the community, but they do not realize it keenly enough. Not one citizen has thought to lift a finger to interfere with him.

In other cities one is surprised to find the easy-going forbearance of the large body of high-class real estate men towards the few sharks who own slum property, even though their own property is injured in that vicinity, the fire hazard increased, and the slum owner has a large and undue advantage over them, in many ways.

It is pleasant to turn from the forces that hindered housing reform to those that helped. I wish I might have a chapter on "The Men Who Helped," and express the gratitude that is due to every man who has unselfishly done his part towards this much of bringing

in the Kingdom, whether he be politician or preacher.

Those three campaigns in the Legislature were a wonderful experience, and if I have come out of them with a deeper faith in humanity, it is a high tribute to the men of Indiana.

In those three campaigns, standing, as I have, on the outside of parties and politics, I have seen some things that strangely puzzled me, but, as no one has given me a more satisfactory interpretation than my own, I shall hold to my own conclusions until wise men agree. When I first went into public life I made up my mind to make the most and the best of conditions as they existed, of men as I met them, and of politics as the majority allow them to be. In fact, one cannot do otherwise; for obviously, one cannot work with conditions as they are not. Yet I have seen many earnest but ineffective people fail to secure by legislation the splendid ends they had worked zealously to achieve, because they insisted on the impossible, and would have none but their own methods. It is just as if we should take our corn to a miller, and demand that he should reset his burrs and change his whole method of milling. If there be only one mill, we must take our grist thither or leave it unground.

An Impartial View

Having no hand in the management of political affairs, I may leave to the various parties the care of reaping the thorns in each other's fields. It has been my pleasant task to gather only the grapes, and I am fain to accept the divine guarantee that they were grown upon grape-vines. It is only fair to say that I have encountered far more figs than thistles, and fewer thistles than what seems to be a sort of cacti that, I firmly believe, could be Burbankized for human good. Would they might be, and that we might include in the conservation of vital resources, those great powers for good that are so wasted by constant warring in the struggle for supremacy.

"Don't you believe for one minute that those politicians would have worked for a tenement law if they hadn't thought it was a good thing for their party," a friend said.

"Why, of course," I told her, "I wouldn't have gone to three legislatures and asked for anything that sensible business men wouldn't think was a good thing. One's faith in men doesn't depend on their doing foolish things because we ask them to. And, of course, no good politician will ever 'turn down' the Homes of Indiana. But nobody could ever make me believe that that was all there was of it."

And then I tried to tell her of the splendid hearty way they had given their service, and of the noble qualities that had so often shown themselves.

In order that this story shall not fail of its purpose, let me say, first, that it has been my intention to show that if any one so timid, and so physically unfortified for hard marching and fighting, could stand the strain and meet with some success, surely no one else should fear to try.

What is Service?

It has been far from my thought to hold up public work as the most valuable service. Rather, I have tried to make it plain that no one but a genuine Daruma, who is weighted so as not to be "upsettable", should go into the range of cannon-balls. In the words with which Mrs. Blythe comforted Mary Ware, whose sole idea of public service was the former's kind of torch-bearing:

"A torch is a torch, no matter where you put it; and sometimes the lights streaming from cheerful home windows make better guides for the benighted traveler than the street-lamp, whose sole purpose is to give itself to the public."

Most strongly have I desired to show how much can be done by women's organizations, by simply demanding right legislation; and to show their equally important part of helping to enforce legislation, after they get it. I should like to show the very valuable work that has been done by clubs in raising funds to employ civic experts, but the suggestion must suffice.

Too much cannot be said, however, of the service into which even the most modest and timid may enter by joining in the work of federated clubs, or civic organizations, to carry on the great educational campaigns for moulding public sentiment that must precede and follow every legislative success. This assertion is made by the majority of speakers on reform platforms. What is not said, however, or is touched too little and too lightly, is that the fundamental necessity of all this work is the securing of data, the knowing of actual conditions that call for reform.

"Know your City"

"Go and see for yourself," is my parting plea to every audience, no matter of whom composed. "Know your city," is a motto that I wish might be sounded daily by a megaphone, in the ears of every one who presumes to have any part in the control of chambers of commerce, civic associations, school boards, social service circles, churches, women's clubs, etc. They should be made to see that if they are to give intelligent service, they must know their city as the politician knows it, as the police know it, as the drain-man and the man who reads gas meters know it—because the outside and the pretty places we already know well.

They should know their city, who try to manage its affairs, as a merchant knows his business, in all its details; as a doctor knows his patient, in all his

weaknesses. They should know it by means of surveys and sanitary maps that X-ray every defect, and by civic institutes that exhibit its greatnesses and meannesses, its overlapping or undermanning of departments, its schools, factories, trade, traffic, institutions—all its "works," from the city hall to the saloon, from the choice residence district to the slum quarter.

How else shall we understand the causes that are piling up social wreckage, faster than our schools can educate or our churches evangelize? How else can we ever know with certainty the city's resources of wealth, which pours in, in large streams and runs out in many leaks? How else shall we be able to help our city's morals, of which one-half are in darkness? How else reckon with the city's political forces, of which the stronger part, the root, is underground, like the horse-radish? And how shall we control public health, safety and welfare, unless we can keep our finger on the pulse of private health and safety and welfare.

Home—the Beginning

And so we come back to the home, where this story started. All roads lead back to it. The squad that goes out to hunt up the evils that prey upon us, whether they follow the lead of the charity worker, the district nurse, the mission worker, the health official, the probation officer, the detective, or the anti-tuberculosis specialist, will take a circuit and all round up and meet together in the place where the housing reformer has gone straight to the core of all the trouble—the homes that society forgets, neglects, abandons.

I have not told anything about the trails of the civic improvers or city beautifiers converging with those who track the fly, the germ and the imp, because in so many cities they go on a careful détour, and avoid these places. And yet these hideous, offending bad residence districts, where visitors are never taken and nobody likes to go, cry most loudly for help, with all their ugly mouths and discordant voices, smiting the passerby in ear and eye and nose. What assault they must make upon those who live amidst them!

Yet these need beautifying, more than any other parts of the town. I have often wondered why so many civic clubs begin and end their beautifying with lawns, gardens and parks, instead of houses. The reason must be that it is easier. Or else, it is a misconception of what a city is, and what it is for; a failure to recognize that a city is mostly made up of homes, outnumbering all other buildings; that the streets are there to lead to the homes, and the stores are there to supply the homes; that for the homes all mills grind or weave, all wheels turn, all traffic exists, and all the business of the city goes on.

BAY WINDOWS AND PANELING GIVE VARIETY TO THIS BLOCK OF APARTMENTS

People forget that though the parks are there to supply the lack or to augment the delights of the homes, they can never take the place of space or beauty about the homes; that, when the mills are empty and still, and the streets deserted and dark, when the parks and gardens have only a solitary sentinel, the human life that quickened them in the day time has all withdrawn into the homes. Thither at night the toiler comes; thence at dawn the toiler fares; but his treasure remains there, the little ones, the mothers, the old people who must stay. And where these are, is the Heart of the City.

Not Houses but Homes

In our state we have settled upon a simple translation of the term "housing reform" into "the betterment of the homes." This takes away the cold, forbidding aspect of the subject, and insures a larger audience when we lecture. The public smelled fresh mortar and new pine whenever the other term was mentioned, and had in mind an arraignment of carpenters and masons. But the real meaning of "housing reform" comes out when we put in the "home." The house lives, lights twinkle in the windows, smoke comes out of its chimneys, and the public can smell supper and hear the children at play. But we have made them smell the yards, too, and hear the children cry.

"The Homes of Indiana," has proven a magic watchword for housing reform in our state. Already two other states have caught up the battle cry, and we hear "The Homes of Kentucky," and "The Homes of New Jersey." Would that the cry might ring on till we hear "The Homes of the Nation."

Now, we have many prescriptions for housing reform, from many schools of medicine. Belonging to the allopathic school, I must hold to legislation as the best cure, though I am ready to welcome most heartily everything that can show by results that it will help our sick cities. Not all civic doctors will consult, however, and housing legislation is attacked by others than "skin builders" and slum landlords.

The comedy of the situation lies in the fact that the half who attack housing laws complain that they do not go far enough; the other half charge that they go too far. If we could pit the two parties against each other, it would save our breath.

To the first we must give the answer of Solon, when asked if he had provided the best of laws for the Athenians: "The best they were capable of receiving."

To the others, who complain of the law's exactions, we can best answer by pointing to our better class of real estate men, who take an honest pride in doing the right and proper thing, and who give so much more to their tenants than any

housing law demands (for much less percentage of returns than slum owners receive), that they feel insulted when asked if they give water and sewer connections, and repairs.

As education advances, housing laws will be extended, but their extension will be mainly to other classes of buildings, and to higher standards of decency and safety. And yet I could die happy were it possible to leave, by means of housing laws, no more than the Irishman's legacy: "I bequeath to every man the free air of heaven."

Simple wish! Preposterous supposition!

Could our forefathers ever have believed, when first they trod the lonely shores of this country, and looked out over its vast unpeopled wastes, that we should be fighting today for the very air we breathe? No more than that we should cease to have the breath of Freedom. Nor do we dream how much harder the fight will be in the day when monstrous cities shall cover our plains, the cities where, we are told, the greater part of our population is to live.

For at present, our cities have been growing much faster than they have been improving. We are speeding on to greatness, while we are crawling out of barbarism—that barbarism that submits to filth and lack of sanitation and preventable vice and disease.

A Fight for Free Air

Anyone, with an untrained eye, can look about and name the elementary problems of sanitation that we have failed to solve, or at least to handle. It needs no civic expert to do that, but it would need a prophet to tell us when we shall achieve them.

Light and ventilation—when the space that insures them is held dearer than life, and when even our little towns have dark rooms?

Cleanliness—how many really clean cities have we? If they have clean streets, how about their alleys? If they have water and sewer mains, how many lots have access to them? Garbage and ashes and trash—the worry of the wealthy, the terror of the poor—how many cities deal adequately with them today? In most cities, every kind of waste is stored at the back door, for a day, a week or a lifetime.

And until these simple essentials are mastered, how can we hope for the higher things? Perhaps, even now, in their cradles are the legislators who shall enact the laws that shall bring some of these fundamental reforms. It is best to begin on these future legislators in their cradles, and then follow them up in the kindergarten, school and college. It saves the frantic letter sent just before election.

Some day we shall appreciate safety and sanitation enough to pay for them;

and all the experts,—and we have many of note—cannot give these things to us before that time. Some time we shall appreciate space in our cities, as we appreciate all desirable things when they begin to disappear. Later, Beauty will be called in and set in the place of honor, among "practical" people; no more crowded out, no more apologized for, no more even kept for "solitary festival." I am glad that those years are past in which I dared not publish a verse, and spent my time in hunting up dollar-and-cents arguments—and there are many—to show that bad housing is bad business, and that slums do not pay. And this was because of having to fight men who assumed that it was not "practical" to give decency and sanitation to everyone.

Allies in the Fight

It is only necessary, now, to refer skeptics to the more than forty commercial organizations that have taken up housing reform by housing laws. It is enough to point to the practical men who have actually built model houses to rent that are durable and well built, comfortable, homelike, private, that have veritable cupboards and sinks, and real bath tubs. They are on pleasant streets, with a good view, have trees, grass and flowers, rent for less than some of our most miserable and squalid slums, and pay a fair profit.

Leaving the skeptics gazing at this pleasant sight, it is a relief to slip away to a quiet place where the vista opens upon a view that rests my soul—a view of things whose practical nature no one will ask me, at least, to defend—planned towns! garden cities!

Ever above the quivering heat of noon in the desert they have hung like a dim, fair mirage. Does any one ever look upon them more wistfully than a housing reformer? We draw near to them, as the children of the tenements come and press their faces against the tall palings of the forbidden garden, standing without in the dust, peering in at the ranks of lilies, the winding walks, and the fountain-splashed bowers. And we have a place inside, too, for even as in the Garden of Buddha there had to be a constant removal of blight and decay; and the jealous guard upon destructive forces, the constant weeding and pruning—this need, there will always be in all places where men live.

I had hoped that we might have, before this, the simple initial enactment permitting town-planning in our state. It must come soon, or we shall pay dearly for the lack of it. Where we can get people to listen, let us plead for generous space allowances, especially in our new city enlargements. The sanitarian and the artist and the unhampered architect, all will agree to this.

Even the "crazy-quilt" city can give much in the way of beauty to dignify

the characters of its people, that will bless them from their windows—if they have windows. It can give improved streets and alleys, parks and gardens, upon which even the mean dwelling may lift its eyes and take cheer. As far as monuments, fountains, or public buildings may be in sight, in vista or sky-line, nobility may be brought into the daily lives of the people. To those who have outlook, may all view be given. But to those who are set back, overtopped and shut in, the character of the premises becomes all important and leaves the problem between the tenant, the landlord and the neighbors.

Poverty, in Tale and Truth

We will find ourselves coming out somewhat behind those enchanting story-book descriptions of poverty, that deal with "poor-but-honest" and "patched-but-clean" people. The "scoured deal table," the "shining tins," the "geranium in the window," the "prints on the wall," always sound so delectable. As children, we could never quite decide whether we would rather be fabulously wealthy, and sit on diamond chairs, or be poor after this wise; but we strongly inclined to the latter. I know that settlement workers, often, with great taste, a little money, and infinite labor, perform miracles of paint and paper upon certain old houses, and make them look as good as the story-book kind. Would we had more of such people, to plant more oases in our arid brick wastes!

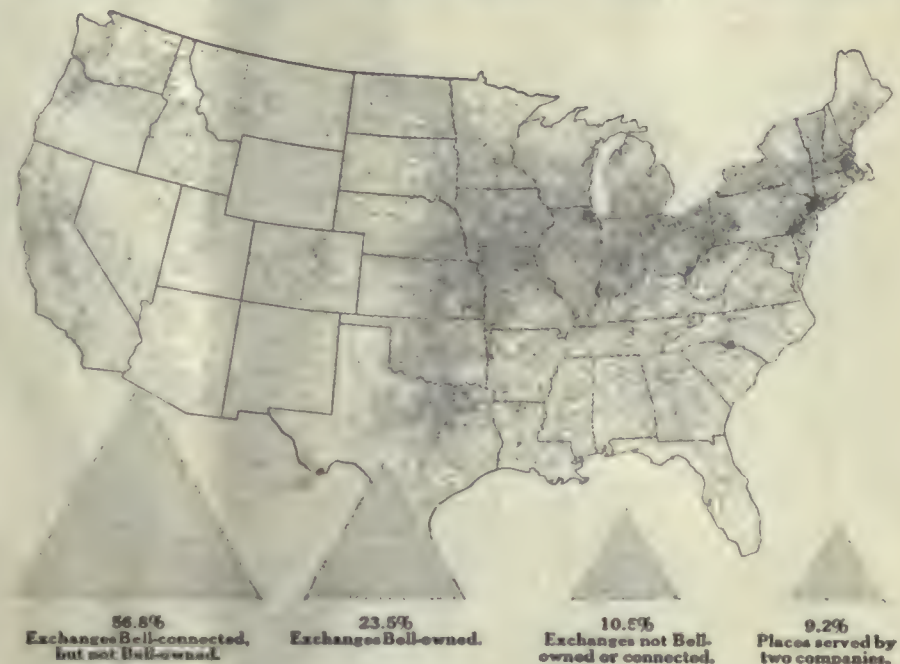

But not all the old houses can be transformed that way, not even by the "municipal scrubbers," welcome as they are. And the reason is that some old houses were flimsy and mean even in their newness, and now in their decay are beyond reform. To try to beautify them with paint and paper, is much like gilding a skull.

The premises are even worse, with loathsome cellars, yards soaked through with grease and sewage soaked and hard with cinders. All that could redeem such a place would be to burn the house, blast out the foundations, fumigate the hole, cart away the composite horrors of the soil, and fill in with fresh, sinless country earth—though we should pity the earth worms in their new environment!

This is a formula for the owner, not the tenant. What the tenant can do, with little means and less taste, is pitiable enough. I have seen tenants expending work on old houses—work as hopeless as efforts to educate an imbecile—that would have made a decent dwelling most attractive. Yet I can testify that the house looked worse than before, because the extra scrubbing wore off more of the old paint.

I have said enough in other chapters, of the efforts of many poor folk to make things more homelike, of their

What the Telephone Map Shows

EVERY dot on the map marks a town where there is a telephone exchange, the same sized dot being used for a large city as for a small village. Some of these exchanges are owned by the Associated Bell companies and some by independent companies. Where joined together in one system they meet the needs of each community and, with their suburban lines, reach 70,000 places and over 8,000,000 subscribers.

The pyramids show that only a minority of the exchanges are Bell-owned, and that the greater majority of the exchanges are owned by independent companies and connected with the Bell System.

At comparatively few points are there two telephone companies, and there are comparatively few exchanges, chiefly rural, which do not have outside connections.

The recent agreement between the Attorney General of the United States and the Bell System will facilitate connections between all telephone subscribers regardless of who owns the exchanges.

Over 8,000 different telephone companies have already connected their exchanges to provide universal service for the whole country.

A Remington-Made Typewriter

For Every Taste For Every Need For Every Purpose

There never has been such a typewriter line.
For completeness and comprehensiveness, it is
hard to see how this line can ever have a rival.

WHATEVER the need of the typewriter user, whatever the purpose for which he intends to use the machine, whatever his preference for one form of construction over another, there is bound to be some typewriter in the great Remington line that will suit his purpose—*his every purpose*—better than any other machine. It matters not what purpose—whether straight writing or any variety of special work, including writing, adding and subtracting—there is always a Remington-made machine that exactly fits the need. Variety endless, but only one standard of quality—THE BEST.

Remington Typewriter Company
(Incorporated)

New York and Everywhere

reaching out for brightness and beauty. It seems to be, as Maeterlinck says, "A groping about the walls of life," to find some chink where the light streams in.

There must be something in this universal craving for beauty that testifies to our universal need of it. It must be meant to lead us back to the Garden, by the unerring perceptions of the delicate antennae of the soul. We feel that craving as a deep thirst, the longing for the woods and fields, the open shore, the stretches of cloudland. Confinement is irksome and work is hateful, at times, not for itself, but because it shuts us in, away from the green and blue-and-gold, from the Something that draws us. And when we leave the town and go to the country places, how we feel their restfulness sweeping in upon us, in a great tide.

How much the beauty of physical environment can contribute to moral beauty, or be reflected by it, we do not yet know. I am convinced that we have not yet begun to estimate its value, in our environment, as we shall in years to come. We think of it as desirable though in no way essential; but until it is exalted to a place of more dignity, we shall not have it in our national life. With all our rugged strength we shall be like the unfinished temple, "wanting still the glory of the spire."

The Meaning of Beauty

How shall we, then, come to a higher estimate of beauty? Only by taking it to be "that divine thing the ancients ever esteemed it," as Emerson reminds us.

The restorative and healing power of beauty seems to be well established. We can well understand why the sick or deranged have, as a part of their treatment, the view of green pastures and still waters; why cheerful flowers are brought about them, and soothing music is played for them.

The reformatory value of beauty may not be so well established, though some day the purgation of beauty will supplant the purgatory of pain. Thinking of the rebuke that purity gives to the impure, greatness to meanness, truth to falsity, the power of "good for evil," we can but wonder why beauty should not be used more for both formative and reformatory purposes. In fact, we acknowledge its value in our careful selection of those things that must be before the eyes of our own children.

When society comes to value one child more truly, we shall have, for every community, a country homestead where that child can go who needs special encouragement. It will not be a penal place, nor even a place of reform; it will be held out, rather, as a dear delight and a reward. But when society values the child enough, and realizes what the child means to the

BUSINESS Manager of Institution, one hour from town; must understand food values, household management and accounts. Send detailed information in writing to Room 705, 52 William Street, New York.

state, and what the home means to the child, it will provide even better, for then the child will have, in its own home, all that a home should give, in its vital essentials.

There will be safety. There will be the chance to be well, to be pure; room to grow and breathe in; the sacred privacy of the home circle—all those things that are the birthright of every child. And there will be, in some way, beauty, to which the soul of the child naturally turns as does a plant to the light.

Yet why should we need to plead for beauty, when we have the words of its evangels, the "ever living poets," to whom has been given a share of that Spirit that is to "preach good tidings"? They have taught us that there is some power in beauty to "bind up the broken-hearted," and to "comfort all who mourn." How often we invoke the very beauty of their words to do this, and set them to music or to flowers. How often, too, they release us from care, by "the opening of the prison," whose portals yield to their gentle touch. They have shown us beauty that we missed. They have yet to "open the blind eyes" that, in the midst of loveliness, gaze unseeing.

A Vision

All of this swept over me on that day, not long ago, when I went back to the ridge where my childhood was passed. Standing on the top of the ridge, I looked across the sweep of the valley to the far ranges of the blue hills that lay beyond. In a meadow the sheep were grazing. Faint and far off came the country sounds, strained to a clear sweetness through that pure atmosphere. It was the Sabbath, and in the little church they were singing hymns.

In the churchyard, under the dark cedars, I could see the flags upon the soldiers' graves. "My country"—it had never meant so much to me! A sudden rush of feeling seemed to claim comradeship with those who had fought on other battlefields.

How profound was the Sabbath peace! How sweet was the air! The old spell of the view came over me. There ran the road to the valley, then climbed the hills, to the sky. As a child I had felt it beckon and lure me, with dreams of the cities that lay beyond. I had thought of them, with a child's imagining, as one sees temples and spires in a sunset glory, and hears their far-off chimes. I had wondered about their poets, their artists—all the beauty that must be there.

But now—I had seen the cities! And the glamor was gone. Instead, there was the shadow enfolding them, the shadow that all of our effort has never been able to lift. And there, in the shadow, are the poor, the toiling. Instead of the chiming of bells I could hear, far away, a great chorus of those whose groaning and crying mingled with the roar of the

Modern Sleeping Porch Fitted with Wilson Blinds

Practically makes an Outdoor room of the ordinary porch, a room at night, a porch by day. Most practical and useful form of Venetian yet devised; excludes the sun; admits the breeze. Keeps out the rain.

mills and the din of the streets.

Like the shadow of clouds passing over the fields came another thought—the thought of the great cities that some day may be there, blots on their greenness. But it passed. The fields lay untroubled, the great cup of the valley was brimming with sunshine, the sky swept down over the valley and closed in about me.

The Presence was there! It filled all the vast spaces, near and far.

I reached out my hand, as in childhood, to its tangible sureness. It will still be there, I felt, when, having done our small part, we are gone. When the cities are built, underneath their foundations will be the divine plan.

Even now that plan seems nearer fulfillment. Men are coming to see the fuller meaning of life. The levels of living are set at a higher plane. The units of measurement are larger, the standards of value are fairer—for ourselves, for all men, as we learn that we have natures and needs alike.

In wonderful ways great teachers are leading the people, marshaling the forces that shall finally lift them out of the shadow. There are the small forces, such as the gentle ministry that gives oneself to the needy. There are the mighty forces, the great movements to fight disease, to promote purity, to protect the laborer, to save the child. There are the countless methods of education. There is the pleasant drawing, as by the light touch of a child, along the paths of the playground, to health and strength.

To these have been added, in later years, various methods of redeeming the home.

Too much of these forces has been needed to clear away the wreckage among the ruins. But now we can look across the "waste places" that shall be rebuilt, the "desolations" that shall be raised up, to that joyful day of the prophecy when all of this social effort is to have its flowering in the beauty of a higher life for all humanity. The "beauty" that, the prophet proclaimed, shall be given for "ashes," is to be, the translators tell us, as the garland crown of the bridegroom that shall replace the symbol of mourning, the ashes upon the head.

The ashes—all that chokes the spark of life, all that is a part or a reminder of hopeless despair—are to be put aside.

The low and bestial life, all that is groveling, is ashes.

Disease, vice, dissipation, are ashes.

Strife, discord, lawlessness, are ashes.

Toil without rest or recreation, is ashes.

These are to be cast away, and instead we shall have the redeemed life, the reinstated family, the restored home.

It is to be the crowning of life with its radiant graces, its shining and supreme joy!

INTRODUCE YOUR FRIEND TO THE SURVEY

Haven't you a friend who *ought*, as the saying goes, to be a reader of THE SURVEY, one who would really appreciate the issues if he but knew the magazine well?

Why don't you introduce us to him? Below is a special offer which we hope will make this possible.

Renewal of your own Subscription and a New Subscription for a Friend—\$4.00

Mail us \$4 and we will not only renew your own subscription from any date, but will also send THE SURVEY to any address in the United States for one year.

This offer is good only until September 30, the close of our fiscal year. It is strictly a "home stretch" offer.

The GIST of IT—

OREGON'S minimum wage law, sustained by the state court and now before the federal Supreme Court, was studied in its operation and results by the Commission on Industrial Relations. Page 593.

ALL Americans stranded abroad became friends instantly by virtue of their citizenship, writes Robert W. deForest, who served on the American Citizens' Committee in London. All were eager to help and the committee's clerical force included men on \$25,000 salaries. Page 589.

HOW the London committee set to work—with sub-committees on everything from diplomacy to baggage—is told by one of the editors of the daily newspaper it published. Page 591.

RAPID-FIRE stamps and posters in the war against war; the movies now enlisted. Page 585.

WAR measures in England include important social legislation to deal with home conditions. Parliament, in the midst of gigantic military preparations, passed, among other relief bills, an improved housing appropriation—to provide employment for the building trades and housing for the people. Page 588.

DESPITE local riots and European war, Dublin's Civic Exhibition was a success. Red Cross classes and food supply conferences were added activities when war came. Page 599.

SEPTEMBER 14 is the next district day in the House of Representatives, and those who have been urging legislation to wipe out the Washington alleys hope the House will act favorably on the substitute bill which has come from the Senate. This is the bill which was passed while Mrs. Wilson lay sick unto death. It prohibits alley dwellings after July 1, 1918. Friends of the housing movement look for supplementary legislation providing for reform in a manner which will be fair to both tenant and owner of alley property—by some method such as that provided in the original House bill.

BEAUFORT has a half time city manager who also serves as secretary of the Chamber of Commerce. The town believes it has solved the small city's problem of securing an efficient executive. Page 600.

CITY hospitals are more than places to board and treat sick people. The modern idea of their function is expressed by the superintendent of the Cleveland city hospital as "a medical means to a social end—public welfare." Page 597.

STREETS are the real playgrounds of 600,000 children in New York. Police Commissioner Arthur Woods has therefore closed to traffic one block in each of nineteen streets from 3 to 6:30 p. m. Social workers have volunteered as play supervisors. Page 600.

THE SURVEY

COMMON WELFARE

FOR A PUBLICITY CAMPAIGN AGAINST MILITARISM

SO FAR from causing a temporary abandonment of the propaganda for universal peace, the war has spurred on the advocates of disarmament, mediation and judicial means for settling international disputes. They feel that this is the very time when educational effort can be most effective, with popular attention so impressed by a realization of the horrors of war.

Attention was called in these pages last week to the peace parade in New York and the peace badges suggested by a Cleveland business man and sold under the auspices of the Woman's Club.

Another suggestion has been received by THE SURVEY from Mrs. Elizabeth Tilton, of Boston, whose publicity campaign in Massachusetts against alcohol commanded public attention in remarkable degree, as told in THE SURVEY for March 21, 1914. Drawing upon this experience, she writes to the editor:

This war is a tragedy, of course, but it seems to me it is time now to recover from the great shock at the blow civilization has received and say to ourselves—not, Who, is to blame, but What are the dangers accruing that we can allay and What good can we make come out of it all? In other words, our plain duty is to shield and reconstruct civilization as fast as we can. How? A peace parade? That was good as a first, quick move.

"I believe, however, that the time has now come to say 'How can I help to make this war the last?' I believe we must all think whether the peace people have not been right all along when they

avored disarmament. Nations cannot be trusted with armies.

"I believe a national stamp committee should be formed to issue educational stamps, to be sold by some head committee or by some magazine for 25 cents a hundred. These stamps should be used on the backs of letters and should ring the changes on this idea."

Such poster stamps would be used, Mrs. Tilton believes, by women's clubs, business houses, associations of various sorts and individuals. Large firms might be induced to use them for one day on all outgoing packages—as was done in Boston in the anti-alcohol campaign. She urges that the sale of the stamps ought to be undertaken at once by some agency with country-wide influence, and by co-operating local committees. The proceeds from the sale of the stamps should be turned over to the Red Cross, she suggests.

The movies would also be utilized, according to her plan. They will be filled, of course, with pictures showing the glory of war, the spirited movements of troops. To counteract this influence upon the youth of the land she would have especial effort made to provide the movies with pictures showing the seamy side of war and its terrible human costs. She has already prepared posters and lantern slides which are in use in Massachusetts.

The cartoon by John T. McCutcheon in the Chicago Tribune, reproduced in THE SURVEY for August 29, "The Colors," should be printed in colors and widely circulated, she suggests, with pictures of actual war scenes that tell the story step by step.

In a recent despatch, H. G. Wells says, "when this war is over all Europe will cry for disarmament. Will the United States help?" Quoting this challenge, Mrs. Tilton writes:

"The only way to get the United States ready to help is through instant

education, by every publicity means possible. To me it will be tragic if the flower of youth go down to death in Europe and nothing comes of it but a little re-arranging of the map of the world. But if a disarmed democracy steps out of the ruins, or is even brought nearer, there will be something to show for all the health that must be ruined, the hearts that must be broken, the poor that must be poorer, and the hungry made more hungry."

HELPING THE HOME TO COMPETE WITH THE STREET

"BACK TO THE HOME" is the movement being promoted in Oregon by the Oregon Social Hygiene Society to keep boys and girls off the streets at night. Last winter the vice commission reported that by actual count one agent, employed two successive evenings, found 1,215 children under eighteen on the streets between 8 p. m. and 12.30 a. m.

From another source came the information that during 1913 a small group of high school boys often invited girls to go to the theater and took them instead to a house which they had provided for immoral purposes. Among younger children it was found that a great many attend moving picture shows at night, unchaperoned, two or three times a week, and that some boys frequent billiard halls and pool rooms.

Repression is not the antidote offered by the Social Hygiene Society to counteract these evils. Rather its purpose is to help the parent make the home a competitor with the streets, the public dance halls and the theaters. Back to the attractive home, the fun-loving home, the understanding home, is the real significance of the movement.

Twenty-five definite ways of accomplishing this end are suggested in a leaflet distributed by the society:

"In building a home," it advises, "better begin with a large yard and a small house—and remember that a small yard is better than none.

"A 'shack,' though rudely constructed, will serve well for a fort or an Indian cave. Let the boys make the shack themselves.

"A work bench in the basement may be the cause of developing a world-famous architect—or add much to the happiness, usefulness, and health of a plain man.

"An older girl might take a great interest in sweet-pea growing if her father would contract with a cafeteria to use the whole product for table decorations—or she might give them to invalids and shut-ins.

"Abraham Lincoln used to play one-o'-cat with the neighboring boys. All fathers cannot be Abraham Lincolns, but they can play one-o'-cat with their boys.

"A few electric lights strung out in the yard will make family croquet more novel and interesting for the summer evenings.

"Mothers can take their daughters with them when calling, and, of course, leave their gossamer at home."

— A — PROTEST AGAINST WARS

"Peace on Earth, Good Will Toward Men"
"Malice Toward None; Charity for All"

All persons desirous of increasing public sentiment to protest against war, aid the advancement of settling international disputes by mediation or judicial tribunals and assist the humane work of the RED CROSS can do so by wearing one of these peace emblems.

Price, 10 Cents each, or 3 for 25 Cents

Production and sale of peace badges under the auspices of the Women's Club, 1146 Euclid Avenue, Cleveland, Ohio. Cash orders from organizations and business firms are solicited.

CLEVELAND'S POSTER AND BUTTON
CAMPAIGN AGAINST WAR

"AMERICA WANTS WORLD PEACE"

A PLEDGE

AM in favor of world wide peace, and I will wear this "Peace Button" to assist in creating universal sentiment in favor of settling international disputes by mediation, or judicial means.

Production and sale of Buttons under the auspices of the Woman's Club, 1146 Euclid Avenue, Cleveland, Ohio.

Profits from the sale of Buttons to be given to the Red Cross Society.

DECISION IN INDIANAPOLIS STREET CAR STRIKE

INDIVIDUAL CONTRACTS between the Indianapolis Traction & Terminal Company and its employees, relinquishing the right of the employee to certain privileges under an arbitration award given February 14, 1914, were held to be invalid by the arbitration board in an opinion handed down August 26. The opinion of the arbitration board was given as a sequel to the Indianapolis street railway strike of 1913, in pursuance to an agreement made between the employees and the company to submit their differences to arbitration.

The original grievances were submitted to the five members of the Indiana Public Service Commission but after objections had been made by the employees to two members of the commission, it was finally agreed that the permanent arbitration board should consist of only three members of the commission, Thomas Duncan, John F. McClure and Charles A. Edwards.

It was the contention of the employees,

acting unofficially through their union organization, that individual contracts signed by certain new employees of the company forfeited their right under the award not only to belong to the street railway men's union but their right to one Sunday off each month. The arbitration board sustained these contentions but denied the employees' right to solicit new members of the union on the property of the Indianapolis Traction & Terminal Company. The right of the company to employ special Sunday men is recognized in the latest award.

The officials of the union pronounce the award as favorable to the employees in every material point.

JOINT BOARDS TO TRY CITY EMPLOYEES

MARCUS M. MARKS, president of the Borough of Manhattan, New York city, has originated a plan which provides that a city employee under charges shall be tried by a joint board composed of borough employees and officials. The first two trials under this plan resulted unanimously for dismissal.

The new system is an adaptation of the employers' and employees' joint tribunal idea to the development of which, as a means of adjudicating labor disputes, President Marks has devoted much study.

"In the past" said President Marks, describing the plan, "a commissioner has been the sole judge of the sufficiency of the charges, and his own condition of mind completely determined the result. Now, under the new plan, two fellow employees are selected by lot, and form an equal part of the jury called together to advise the president as to the disposition of the case, the other two being officials representing the department.

"It has been feared by those who were timid about the proposed plan of trial that fellow-workmen would invariably side with the man under charges. My long experience with the labor movement gave me an opposite conviction. I knew that when workingmen were called upon as judges, their sense of fairness and justice was fully as keen as that of employers.

"Discipline and *esprit de corps* will be improved by this system, for the men will carry back to their fellows the story of a 'square deal'; the punishment of the guilty and absolute fair play and vindication for the innocent.

"I hope, not only that this innovation will become a permanent feature in the borough offices, but that it will spread by adoption in all other city departments, and later to the state and federal governments.

"So far as my knowledge goes, the new system of trial by 'joint board' is an entire departure from precedent, either here or abroad, and a new advance in democracy."

HOSPITAL FOR THE NATIONAL CARE OF LEPERS

DR. W. C. RUCKER, of the Public Health Service, is working to have the federal government establish an institution for the care of all lepers in the "continental" United States, and entrust its management to the Public Health Service.

Leprosy, he says, is undoubtedly on the increase. Though it is only mildly contagious, yet as we know so little of the mode of contagion we are forced to resort to segregation of all the known cases, for once the disease has begun to spread in a community it never recedes till active measures have been taken.

Strict segregation is, however, most difficult to carry out under present conditions. Only three states have hospitals for lepers, and these find them excessively expensive since the overhead charges are divided among so small a number of patients.

Dr. Rucker proposes to gather all the lepers in the country into a national hospital such as many countries far less wealthy than the United States already have. He would settle the question of disputed diagnosis, which has been the source of great difficulty during the ill-defined early stages of the disease, by referring each case to a board of physicians of the Public Health Service who are specially skilled in this disease.

Dr. Rucker gives an interesting sum-

mary as to our knowledge of this ages-old disease. It reads more like a summary of our ignorance. The route of entry of the bacillus is not definitely known, nor do we know the length of its incubation in the body of man. There is no positive means for diagnosing its earliest stages; no wholly satisfactory method of treatment has been devised; the period of its greatest infectivity is unknown. Two facts, however, can be certainly maintained: segregation and personal cleanliness are the only known weapons against leprosy.

EMPLOYMENT BUREAUS IN SCHOOLS

FREE EMPLOYMENT bureaus in public school houses form the latest development in Wisconsin's social center activity. These have come about through the co-operation of the Wisconsin Industrial Commission with the educational authorities of two towns, Sauk City and Osseo, where school principals have become paid civic secretaries.

The appointment of these principals is in line with the conclusions of the recent social center conference, reported in THE SURVEY for August 8, that the most needed next step to make the center effective "for practical service of every sort" is the leadership of paid civic secretaries. These school principals have been made deputies of the Industrial Commission in carrying out the work of the employment bureaus.

available as specified by the prime minister, not only for "all expenses arising out of the existence of a state of war," but for "assisting the food supply, for promoting the continuance of trade, industry and business communications, whether by means of insurance or indemnity against risk or otherwise, and for the relief of distress."

The establishment of a state insurance office to underwrite the war risks on ships and cargoes, was most obviously necessary to keep commerce at sea and to assure the inflow of food supplies. Yet it was referred to in the press as the "most dramatic" of these emergency measures. So far from superseding the usual marine insurance, however, the government only encouraged the extension of such insurance to cover war risks by assuming 80 per cent of this extra-hazardous risk for 80 per cent of the premiums.

No sooner had the war scare prompted the hoarding of food stuffs and the raising of prices than the cabinet appointed a committee on food supplies. Various traders' organizations at once began to co-operate with it in reporting and publishing maximum retail cash prices which ought not to be exceeded for three days in advance. Parliament supported the government in assuming control of the maximum prices for food, urged the exemption of farm horses from requisition for military purposes, and by a one-clause bill, bearing the title of "the unreasonable withholding of food supplies," invested the Board of Trade with the same powers for requisitioning food stuffs as the naval and military authorities exercise.

This act is depended upon to anticipate or check any attempt to "corner," or to speculate with, or arbitrarily raise the price of, food. Although its authority is to be used only at the discretion of the government, it is relied upon to have a steadying effect on the public apprehension. This summary governmental measure to prevent distress on a national scale was preferred to the proposal of a non-party parliamentary committee to deal with the situation. It was put through its three readings and passage at a single session of Parliament.

From the opposition came the additional suggestion that the government would consider the desirability of preventing well-to-do-people buying up large stocks of provisions. Lord Cecil branded this practice as a scandal and hoped the government would take measures to strengthen the criminal law against it. Leading dealers assured the government that in no case would they supply customers, however well-to-do, with more than normal supplies. The possibility of "an equitable distribution of food stuffs throughout the Kingdom at fixed prices by government agency," is intimated. The national Board of Ed-

SOCIAL MEASURES PROMPTED BY THE WAR—By GRAHAM TAYLOR

EVEN THESE darkest war clouds which have ever enveloped the civilized world have some silver linings which light up the gloom a little and throw a glint of hope into the future. Under the necessity, urged by overpowering emergency, advanced relief laws and measures have been enacted, especially in England, with unprecedented rapidity and unanimity. The old adage, "Necessity knows no law," is superseded by parliamentary acknowledgment that necessity demands more and better laws.

England's prompt recognition of the need for such legislation may be due partly to her earlier and later experience in dealing with distress. The warning from her experience during the period 1797 to 1817, covering the Napoleonic wars and the conflict with the United States, has been vividly brought home to heart and conscience, and to the very instinct of national self-preservation, at the menace to her food supply and the employment of her wage-earners. The memories of prohibitively high cost of living, food riots in the towns and at the ports to prevent the shipping of grain, of starvation wages and scarcity of work, of burdensome poor rates and the growing work-house population, of the

military occupation of mill towns and the parliamentary grant of one million pounds for relief work on roads and canals a hundred years ago, are still very much alive, especially in the leaders of this third generation of British working people.

England's recent experience with her social legislation has sufficiently demonstrated both its practicability and necessity, so as to sweep all opposition into co-operation with the war relief measures. They extend the operation of some of these advanced laws and enact new ones far more radical than any legislation hitherto proposed or passed. The practical demonstration of that brave grappling with the problems of peaceful industry now furnishes Parliament and people with a base line for defense against poverty, unemployment and misery with which war menaces every homeland engaged in this fatefully exhausting struggle for national existence. Thus only can the sudden and unanimous co-operation of the opposition with the government in framing and enacting these new measures be accounted for.

First and most comprehensive of them all was the vote of credit authorizing the expenditure of \$500,000,000 to be

ucation requested the local school boards to provide for the feeding of school children. To this and other ends the schools were reopened before the summer vacation ended. By order of the king and queen plain and simple living is the daily rule at the royal table. The co-operative stores, which handle a large percentage of the retail trade in England, have so far managed to undersell other provision merchants by protecting their members from the somewhat higher prices prevailing elsewhere. The Rochdale Co-operative Society formally disavowed all intention of sharing any profit from rising prices.

In Paris likewise the dealers at the central markets in co-operation with the police combine to fix a scale of maximum prices to be charged at wholesale and retail, and to prevent selling in large quantities to single customers. A proclamation was issued in Holland forbidding the storage of food except for current consumption. Municipal shops supplying provisions at little more than cost, are operated by municipalities in Switzerland, Austria and Germany.

To prevent financial panic and bankruptcy or undue pressure for debts, the "moratorium" act was passed by Parliament, authorizing the king by proclamation to extend to September 4 the legal term for the payment of indebtedness on bills of exchange and certain other obligations. Further extension to October has been announced. Among the exemptions to which this delay does not apply are wages and salaries, liabilities not exceeding \$25, the pay-

ment of rates and taxes, debts due outside the British Isles, dividends on interest on stocks, funds or securities, withdrawals from trustee savings banks and payments due under the workmen's compensation act, old age pension and national insurance. Rents were not exempted for fear of accumulating burdensome indebtedness upon the workers. Reservists' allotments from their wages to their families were paid in advance, to cover the first month's rent in their absence.

Very particular and considerate care is being taken to forefend wage-earners from unemployment and to secure the reservists and territorials from the loss of their occupation after the war. As president of the Local Government Board, Herbert Samuel announced in the House of Commons that many traders and manufacturers were patriotically keeping their mills and works in operation by reducing working hours instead of dismissing any employees; that the Road Board had a reserve of some millions of pounds which could be spent on new work employing many laborers; that the development commission also had funds available for large construction work; that the government departments would maintain and, where possible increase, the number of their employees. Mr. Samuel also issued a circular reminding all town and county councilors and officials that it was their duty not to curtail their undertakings and reduce their staffs, but to maintain and increase their operations.

The War Emergency Workers' Com-

mittee, representing all the labor groups, vigilantly watch the situation and offer suggestions and co-operation to the government. The Cabinet has appointed an advisory committee on distress which includes both John Burns and J. Ramsay MacDonald, together with officials of departments most closely involved. Local committees, having the same title and function, are being organized throughout the country and include representatives of the trade unions, boards of guardians, philanthropic organizations and the local authorities. It is thus hoped to promote "the mobilization of labor" as effectively as the mobilization of troops and ships.

The most significant and original of all these relief measures are two national housing enterprises. One, for the building of cottages for rural laborers, had been initiated, but not put into operation, before the war. Housing Bill No. 2, however, was proposed and unanimously carried through distinctly as a war relief measure for the employment of the building trades and for the provision of improved dwellings in town and country. It appropriated \$20,000,000 for the building of houses and cottages to be let at economic rent in the United Kingdoms. The bill was announced as more of an investment than a charity and its operation was restricted to one year. The money will be advanced on loan for such local use. The opposition expressed its approval of the measure and facilitated its passage, Bonar Law remarking, however, that "under ordinary circumstances such a measure would have taken some considerable time."

The Local Government Board explained that it would arrange with public utility societies and local authorities to proceed under the act to provide houses where they were most needed. Housing thus becomes a national issue, both by the act authorizing expenditure for housing the people as legitimate in times of peace and by the emphasis laid upon this policy in appropriating so large a sum promptly to carry out and extend it, as one of the most effective emergency measures to protect and nourish the resources of the homeland.

In concluding its statement of how the funds provided by the vote of credit would apply to "the relief of distress," the government informed the House of Commons that it would co-operate with the Prince of Wales's National Relief Fund, Queen Mary's Needlework Guild for soldiers' garments, the Red Cross Society, with Queen Alexandra as patron, and all other private voluntary agencies. The Government Advisory Committee on Distress would endeavor both to prevent overlapping and to promote co-operation, especially between official and voluntary efforts. Most significant was the government's final word: "While the Poor Law authorities should deal with present paupers, the re-

PEASANT REFUGEES, HOMELESS AND HELPLESS IN THE STREETS OF BRUSSELS

lief of distress would as far as possible be carried out by other bodies. The poor law was being kept rather in reserve, and all other methods would first be adopted before we fall back on that last line of defense."

Thus that first week in August, which threatened Europe with the greatest destruction which has ever overtaken its civilization, was signalized by the most constructive, or reconstructive, legislation ever enacted in any one week throughout the long history of the Brit-

ish Parliament. And this was done in the rush of Parliament's gigantic defensive and offensive preparations for war.

Although all these are temporary measures to meet the emergency demanding immediate relief from the present or possible disasters of war, yet they cannot fail to affect profoundly the social legislation and administration which had already become the permanent policy of the British Empire and of its county and municipal governments.

ing the important Continental languages, with European friends, the situation was anxious enough. To the inexperienced student or teacher, with no amount of ready money at hand, and without the ability to communicate with friends, the situation was terrifying.

Here was an opportunity for Americans to get together and to use their power of quick organization and inventiveness in dealing with a situation entirely novel and calling for immediate action, and if ever there was a demonstration of these qualities that demonstration was complete. Wherever Americans were, whether in Germany, France, Austria, Italy, Switzerland, England, Scandinavia, or elsewhere, they got together. They pooled their resources, however scanty. They counselled together as to what to do, and so far as my knowledge goes (and it is fairly extensive) they succeeded in obtaining transportation to the nearest important city, and there they organized as only Americans could for mutual help. This organization usually grouped itself around the American ambassador or the American consul. In some instances the ambassador or the consul took the initiative in calling an American committee to its aid. In others the committee formed after advising with the American representative. In all instances, so far as I am aware, co-operation between such committees and the nearest American representative was complete.

Wherever Americans happened to be at the time when the "cyclone" came, they were almost always able to reach some point where there were other Americans, usually some city of importance where Americans were or soon became numerous. There were fortunately available among this assemblage of new-found friends (for all Americans involved in a common misfortune became

FIRST AID TO STRANDED AMERICANS IN EUROPE— By ROBERT W. de FOREST

VICE-PRESIDENT AMERICAN RED CROSS; MEMBER, AMERICAN CITIZENS COMMITTEE IN LONDON

IF THERE could be any bright spot in the dark cloud which has suddenly enveloped Europe it is the quick and effective way in which Americans have organized to help their fellow-countrymen, and particularly their fellow-countrywomen during the appalling month of August. There were probably about 80,000 Americans in Europe at the time when war followed immediately upon mobilization. They had no warning—the situation came upon them with the suddenness and unexpectedness of a cyclone.

It is quite evident from the English and German "White Papers" that diplomats were alarmed when Austria served her ultimatum upon Serbia. The European financial world undoubtedly had some sense of danger a day or two before the cloud burst, but the average American, traveling for pleasure, seldom reading and seldom able to read the local papers, had no warning. Unthinkable as was a general European war, equally unthinkable and inconceivable was the situation which immediately developed.

Replete as the press seems to have

been with stories of stranded Americans, it is not possible for those who did not witness the situation to realize it.

Letters of credit and other forms of credit became immediately valueless. Paper money was refused outside of the country of issue. English paper, French paper, German paper, with which most Americans who travel provide themselves, was valueless outside of the country of its issue. Nothing but gold and silver "went," and gold and silver disappeared almost immediately from circulation. The traveling American without coin or paper of the country in which he happened to be was without money.

All communication ceased. The trains ran only for soldiers; the telegraph and telephone could be used only for government messages; communication with friends was impossible; automobiles could not be had because the government impressed them all. Even cabs and horses disappeared from the streets of many European cities. To the able-bodied American, with ample resources, experienced in European travel, speak-

friends instantly by virtue of their citizenship) men of experience in business affairs—bankers, lawyers, executives of great corporations, social workers, men and women.

Out of such groups committees were formed, or, to speak more precisely, formed themselves by some process of natural selection. Where American representatives had executive ability and were resourceful such committees placed themselves under the leadership of the American representative. When they were not, the committee was accorded the lead and the American representative co-operated, or at least fell into line. Indeed, they could have done nothing else. I know of no instance in which the help of such committees was not warmly welcomed. Except for their organization our embassies and consulates would have been swamped. Their organization supplemented the official force by a large body of men and women of the highest efficiency. There was no lack of volunteers—everyone was not only ready and willing, but anxious to help. Mere suggestion that funds were needed produced them. No one was ashamed to do anything. In London we joked about our clerical force, who drew salaries of \$25,000 apiece, but the humor of the situation was that it was true, though our committee paid nothing.

My generalization as to the formation of such committees and their effectiveness in all important cities may be too broad. My own personal knowledge relates to London, Paris, Brussels and The Hague. I believe myself to be thoroughly informed with regard to Berlin, Munich and Swiss cities which had their headquarters at Berne, but I have sufficient confidence in my fellow-countrymen to believe that they acted in the same spirit and with substantially the same effectiveness elsewhere.

The London committee was presumably the most highly organized, naturally, for it had to deal with the largest number of people. It was upon London that almost everyone centered their devious and various routes from the afflicted Continent. The London committee had an excellent card index system. It had special committees on finance, transportation, hotel accommodation and relief (relief for men, relief for women), lost baggage, exchange of steamship tickets etc. It published a daily bulletin, which gave each successive day's registration as well as general information. The Munich committee did the same. Its daily was entitled *American Notes*. I wish to pay my tribute of praise to my own countrymen, and I can do it no better than by applying the closing editorial of our London bulletin to all the Americans who helped, wherever their place of activity:

"When the bomb of war broke, every

mainstay of our civilization seemed for the moment to perish for those Americans abroad. Inter-communication ceased, the family relation was often sundered, necessities were denied, money lost its value, homes were unobtainable by even the ill and aged, and 80,000 Americans were helpless and appalled—the foundation of their normal life had been wrenched away, and help, direction and comfort from strong men and women was their greatest human desire. This was the necessity of the hour which the noble men and women of the committee and their assistants met with a capacity and sympathy which has fully aided the afflicted and has won the respect and admiration of all who know the true measure of their achievement. No demand of service was refused, no want left unsatisfied.

THE WORK OF THE AMERICAN COMMITTEE OF LONDON—By S. STANWOOD MENKEN

ONE OF THE EDITORS OF THE AMERICAN BULLETIN PUBLISHED BY THE LONDON COMMITTEE

ONE OF THE interesting developments of the war has been the method adopted by Americans abroad to help each other. Upon the outbreak of the war there were, in Europe, according to the best estimate, well on toward 80,000 Americans. Many of them were without funds; others were separated from relatives and friends at a time when intercommunication, even by mail, except with great delay, was impossible.

It will be recalled that the war between Austria and Serbia was declared on July 29, 1914, and that subsequent declarations followed in the course of a few days. The outbreak of the war was a signal for concentrated exodus. At the same time hotel accommodations were not readily obtainable in London. The most striking preliminary to the war was the termination of the value of paper money throughout Europe. By July 29 paper money was not accepted in Paris in payment of bills nor change given. Some silver was obtainable, but gold had entirely disappeared being absorbed either by individuals or by the great state banks which were securing it for reserves.

In London conditions were somewhat better, although not generally so. In England as in France, moratoriums had been decreed, which closed the banks and made it not only difficult, but practically impossible for American banking firms and companies like Cooks or the American Express to meet credits generally, at first. Their resources were limited to cash in hand prior to the moratorium. There was no basis for exchange of moneys of different states. In a word, the corner-stone of barter, as we moderns know it, had been swept away and the richest found themselves in the position of a modern Robinson Crusoe who, though he had a chest of money was unable to use it. Firms like J. P. Morgan & Co. and Brown Bros.,

That these men and women had the capacity to do so was no accident. They had sprung from a race of pioneers whose forefathers had made existence possible only by accomplishing the seemingly impossible.

"Their ability was the result of a life's upbuilding in force, self-control and kindness. They could act when all was chaos, because life with them had been a training school for high efficiency. Thus they met the situation in all its difficulties and realized the highest objective of mankind in service to their fellows in the broadest sense. In this work they had the assistance of scores who had made a vocation of public work. High on the roll of honor will stand those who gave their best with generosity and chivalry, full worthy of the ideals of our generation."

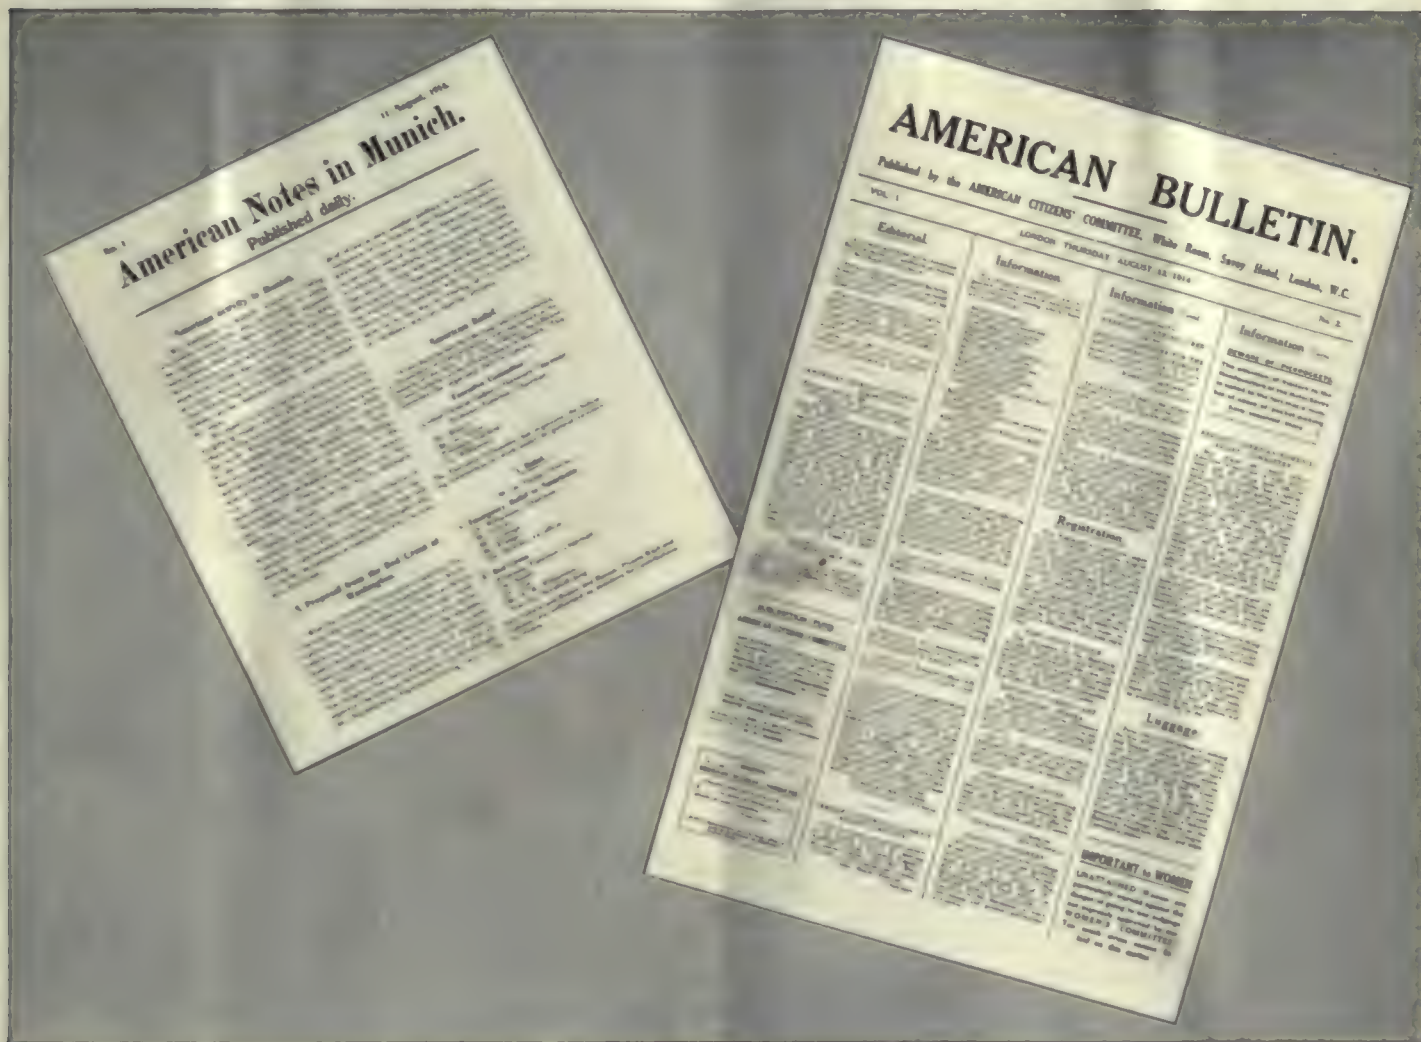

notwithstanding the fact that their supply of funds were cut off, managed to give their clients limited amounts, though wisely doing so only after judging their necessities.

Under these conditions, of course, an exodus from Continental Europe was natural and the objective was London, not only because of its language and nearness to home, but because of the consciousness of safety in being among those whom we regard as of the Mother Country. A spirit of panic was succeeded by one where American common sense prevailed. Local committees organized in different parts of Europe aided in this movement, but by August 1 the influx of Americans in London became so intense that hotels were filled and the great city was overcrowded with Americans striving to get home. Many were without funds and some were separated, not only from their families but also from their baggage, which the railroads generally had been unable to carry.

Instances of particular hardships were of families who had lost members of advanced or of tender age, with the result that there was a distress of soul, such as those absent from the scene can hardly conceive. To meet this situation Frederick I. Kent, vice president of the Bankers Trust Co. of New York, associated with William Porter of J. P. Morgan & Co., George D. Smith, J. P. Day, Thomas P. Shanley, James G. Cannon and many others in the first rank of American men of affairs, called a meeting at the Waldorf Hotel. At this meeting an executive committee was organized, and officers and sub-committees named.

The division of this committee into sub-committees indicates its activities. Oscar S. Straus gave of his broad experience in diplomatic affairs as an examiner, assuming the great burden of inter-communication with the American ambassador.

The immediate thought of every

PAPERS ISSUED TO GIVE INFORMATION TO STRANDED AMERICANS IN MUNICH AND LONDON

These newspapers were published daily by the American citizens' committees. In Munich an executive committee was organized consisting of the consul general, I. St. John Gaffney; Henry L. deForest, Professor Fullerton, Dr. Leslie D. Bissell, Dr. Williamson, and President Harry A. Garfield of Williams College.

Mr. deForest was made director of the relief committee, which was subdivided into a committee on emergency relief to Americans, with Dr. Williamson as chairman, and a Red Cross committee with Professor Fullerton as chairman. President Garfield was made director of the committee on information which was subdivided into committees on news, with Elbert F. Baldwin as chairman, on transportation, with Mr. Eilers as chairman; on letters, telegrams and registration, with Edward Roesler as chairman; and on banks and credits, with Mr. Wattriss as chairman.

Mrs. Dr. Nordhoff-Jung, chairman of one of the Red Cross committees at Washington, secured information as to government plans for the care of the large numbers of wounded expected to arrive in Munich. Subscription lists were opened among the Americans, and more than \$10,000 was raised.

American on arriving in London was to get to the embassy. Our ambassador, ably assisted by First Secretary Laughlin and Assistant Bell and others, was simply overwhelmed. They had to deal with a vast quantity of diplomatic correspondence of greatest national moment and while they were filled with a consciousness of the great duty before them they were so thoroughly inundated that they welcomed the formation of this committee and upon its organization were enabled to turn over to it the usual type of cases requiring relief. From time to time Mr. Page who was exhausting himself in his work would attend the committee meetings in order that he might be more fully in touch with the situation.

Acting upon the suggestion of the writer, resolutions were adopted demanding that Austria and Germany guarantee the free passage of ships chartered by the ambassador and requesting that Washington take steps to procure such consent, provided that the ships going out under such conditions return free of cargo. As a result of Mr. Page's efforts this result was obtained. He was also successful in arranging to have funds forwarded by the United States government and to have army transfers sent should they be needed.

The financial question was handled under the direction of Mr. Kent, together with Mr. Hetzler and Mr. Cannon, bankers of experience. Mr. Hetzler, chairman of the general committee took these duties upon himself, in addition to the many others which he had assumed, and as a result devoted his entire time, night and day, to the work, as did several others.

Through this committee it was immediately arranged that the bank checks of the American Bankers Association should be paid. For several days these were the only checks on which coin was paid in London. To measure the extent of the relief from these payments would be impossible. Those who were fortunate enough to possess these checks shared the proceeds thereof with others, and through this source, life became livable to many who had not known where the next meal or carfare was to come from. Shortly afterward they also arranged that the American Express Company, which had an immense clientele, should make like payments to their customers and further relieved the situation in London by obtaining advance of large sums upon the guarantee of American bankers, which became immediately available, with the result that the financial situation soon was such that every worthy American could obtain funds. In this work the committee was greatly aided by an organization which had existed for some years in London, called the American Residents Committee, of which the chairman was H. C. Hoover,

the vice-chairman the American consul-general, the honorary secretary F. C. Van Duzer and the treasurer Clarence Graff. Its directorship was a strong one, containing among others the great merchant H. Gordon Selfridge. This committee had had broad experience in dealing with the American derelict and with a body of trained workers acting under their direction and aided particularly by Mrs. H. C. Hoover, did much that would otherwise have been impossible, particularly in helping the women who appealed to the committee. Mrs. Hoover had had a thorough training in charitable work, after the San Francisco earthquake and immediately gathered a corps of assistants for the relief committee of which she was a member.

The 30,000 pounds which the American Residents Committee raised probably did more to directly relieve actual suffering than anything else. This committee worked, not alone to insure the comfort of American woman-kind, but to guard them from attack of the unscrupulous. This latter matter became so serious that detectives were employed to prevent undesirable persons from frequenting the rooms when it was found that in some cases they were offering lodgings in houses of known bad reputation. The matter was regarded so seriously that Mrs. Hoover organized a corps of volunteers who met each train and who provided escorts to the women to lodgings which had been thoroughly investigated.

In all this work the committee was ably assisted by a squad of about thirty boy scouts, under the direction of an able captain. These boy scouts rendered voluntary service continually as messengers, custodians and otherwise to the committee.

All this work was done at the Hotel Savoy in great rooms on the embankment side, which the hotel donated for the use of the committee. The main room of the great floor was a ball-room seventy-five feet by sixty feet in depth. There was an upstairs room half that size while a number of other rooms of ample proportions were used for committee purposes. On entering the main committee room you would meet with signs indicating the locations of the different committees. On one side the Women's Relief Committee held forth. Next to it was a great bulletin board full of questions as to lost persons. Then there came the Transportation Bureau, under the direction of Joseph P. Day, the well known real estate man.

Owing to the demands of the admiralty there was a constant change in the sailings, and in addition the committee investigated the needs of persons who were anxious to get away, provided accommodation for those with the most pressing claims on a basis of merit, "merit" being lack of funds or ill

health, and provided for the transfer of tickets over the lines which would consent to such a course. The committee was really a medium for the transfer of the steamship tickets, and the whole procedure was so organized as to make actual conditions easier and send away those who should receive first consideration. The loss of friends and the location of those who had arrived in London was handled under the direction of L. H. Somers, who had from the first volunteered to give his whole time to the work of the committee.

A baggage committee was organized to handle loss of baggage and seek recovery of the same. At first this was under the direction of Mr. Gaston, and upon Mr. Gaston's going to the Continent, Mr. Potts, an official of the American Express Company, took charge of the matter. Then there was a committee to find Americans stranded on the Continent. This was in charge of the Rev. C. Seymour Bullock.

At the suggestion of Mrs. Hoover it was decided to publish a newspaper in order that information desired by our citizens should be readily secured. Each day this paper, which was issued to a number of 6,000, was distributed among all the hotels in London and was eagerly sought for each morning by the crowds of Americans who gathered in the committee room. This crowd on the average numbered 3,000 to 4,000.

The upper rooms of the committee were devoted to the cashing of checks, the exchange of money and the issuing of passports, the American ambassador having established, under the direction of one of the assistants, such a department. At first a charge of \$2 was made for passports, but later the ambassador secured a waiver of this charge.

The headquarters of the committee became a source of supply for information. It was a gathering place for Americans who made it their headquarters and was altogether the busiest conceivable place in London. To measure the work done by such men as Mr. Hetzler, Mr. Duane, Mr. Breed, Mr. Straus and Mr. Kent is impossible.

To measure the extent to which the common sense and sympathy and power of organization of the American Committee in London aided the distressed is impossible. We can only outline the method of meeting an extraordinary situation through the self sacrificing labor of over one hundred noble men and women.

Their work is not done; it is only beginning. Of course, many of those who initiated the labor had to leave for home, but in leaving they had a consciousness that Mr. Kent and Mr. Duane were remaining to continue the work in association with the American Residents' Committee and that matters had been so arranged that every stranded American would be helped.

INDUSTRY

UNEMPLOYMENT, CHARITY AND THE MINIMUM WAGE IN PROCESS—BY JOHN A. FITCH

INDUSTRIAL CONDITIONS in Oregon are closely similar to those in Washington. So it was natural that in the Portland hearings before the Industrial Relations Commission there should be much of the same sort of testimony as that brought out in the previous week's hearings in Seattle.

Lumber is the great Oregon industry. As in Washington, there are periodic shut-downs of lumber mills and logging camps, due to business depressions or other causes. The other industries are essentially seasonal, as salmon fishing, canning, the picking of fruit and hops. Oregon, therefore, has its problem of unemployment.

According to Father Edwin V. O'Hara, who has been co-operating in an investigation of the subject under the auspices of the American Association for Labor Legislation, there is employment in the summer months for 30,000 men in the various industries. In the winter, however, in normal times not over 23,000 can find employment. For the greater part of the resulting unemployment he blames the lumber industry, which, according to his figures employs 15,000 in summer and in winter lets 5,000 of the men go.

Father O'Hara recommended that the state and municipalities try so far as possible to have public work done in the winter. The public buildings, road building and so on, might just as well be done in the slack season. His second plan is to induce people who own logged-off land to have it cleared in the winter months.

The unemployment situation was discussed by several witnesses. A. E. Wood, professor of social sciences in Reed College, Portland, ascribe it in part to the seasonal industries of the Pacific coast, and in part to the immigration, from other sections of the country, of men who have falsely been led to believe that there are unusual opportunities in this section. Another witness declared that many men come expecting to go on the land. When they arrive they find the amount of capital that must be applied before the land can begin to be productive is so great as to place it utterly beyond their reach. These join the ranks of the wage earners.

It was the acute unemployment situation of last winter that led to the housing of the idle men in the Gypsy Smith tabernacle—as was described in THE SURVEY of March 28, 1914.

Dr. Wood told how these men were organized. Their methods were quite similar to those followed by the men at the "Hotel de Gink" in Seattle, though they did not join the Itinerant Workers' Union. The men at the tabernacle

Probing the Causes of Unrest

XII

The twelfth of a series of interpretations of the hearings, before the Federal Industrial Relations Commission, by a staff representative of The Survey.

were assigned to committees. There was a committee on "rustling for grub," another on kitchen, another on order and one on seeking employment. He testified to their orderly conduct. In spite of the great number of unemployed men in Portland there was much less crime last winter than usual.

Dr. Wood obtained detailed information from 447 of the men. Of these 214 claimed to be at least partially skilled. Out of 1,200 separate answers to the request for the reasons for leaving their last three jobs, 810 stated that they were laid off, either because of a depression, or unfavorable weather, or the finishing of the job. 102, out of 326 replying to this question claimed to belong to a union. Ed. Gilbert, a laborer and one of the leaders of last winter's unemployed, testified with some bitterness about their efforts to get work. A fine strong type of man told how he hated to accept charity.

"It was work we wanted," he said. "We went to the unions for help, and they were more horrified over the thought of what people would say if there were hordes of unemployed on the streets than they were over the fact that men were starving."

Neither the unions nor the churches nor the charitable institutions would help them find work, he declared. Once a man was on the point of letting a contract to them to clear a piece of logged-off land, Gilbert said this man's neighbors threatened that if he put those "vagrants" to work on his land they would drive both owner and men out of the country. So that fell through, and the organization, formed for the purpose of finding work, had to accept charity.

Asked what his solution of the problem would be Gilbert replied "Give us work."

As might be expected, there was considerable curiosity on the part of the commission about Oregon's minimum wage law.

Father O'Hara, chairman of the Industrial Welfare Commission; Armadee Smith, a member; and Caroline J. Gleason, secretary of the commission, testified regarding the operation of the law.

Father O'Hara said that in 1913 a law was passed prohibiting the employment of women and children for more than a reasonable number of hours a day or at less than an adequate wage. The same law created a commission to determine standards of reasonableness and adequacy.

In making its findings the commission has depended on committees representing employers, employees and the general public. These committees have made recommendations which the commission has power, after public hearings, to reject or approve. So far it has approved of all recommendations made. The standards that have been set are as follows:

In Portland in the mercantile business the minimum weekly wage is \$9.25 for experienced adult workers and the weekly hours of labor fifty, with prohibition of all work after 6 p. m. The same standard was fixed for office work, while the minimum for factories was placed at \$8.64 a week of fifty-four hours. It was the latter ruling that brought the law into the courts. It has been sustained in the Oregon Supreme Court and is now before the Supreme Court of the United States. For occupations outside of Portland the minimum is \$8.25, and night work is prohibited after 8:30 p. m.

Miss Gleason described conditions prior to the passage of the law as "not so bad as in the East," but bad enough. Women were found who did not have enough to eat. One girl was discovered who spent her last cent on Saturday and expected to fast until Monday, which would be pay day. The minimum wage law is supposed to put an end to such conditions.

No evidence has come to light either that any appreciable number of women have been discharged as incapable of earning the minimum or that the apprenticeship clause is being taken advantage of by employers. The latter contingency is safeguarded, according to Miss Gleason, by the fact that a woman who is paid less than the minimum can collect back pay by legal process. There is some danger, she said, that a woman might take advantage of an employer by representing herself as inexperienced and so get a job at a dollar a day as a learner and then, at the end of the year, prove herself experienced and collect back pay.

THE GYPSY SMITH TABERNACLE CONVERTED INTO A HOME FOR PORTLAND'S UNEMPLOYED LAST WINTER

Perhaps the most interesting witness was C. E. S. Wood, a Portland lawyer who confessed that he was an anarchist. He told the commission very courteously that they were seeking palliatives and would accomplish nothing. They will get nowhere, he told them, unless they get right down and try to understand what makes economic classes and class conflicts.

The greatest evil of all, he declared, is the holding of land for speculative purposes. Let every owner who does not make use of his land forfeit his ownership, and let it revert to some man who will use it. Here on the one hand are millions of acres of land in the West lying idle and unproductive, he told the commission, and on the other, thousands of men starving because they can't work it. If the "paper title" to land, inherited from feudalism, were taken away, unrest would largely cease.

Mr. Wood pointed out that the courts have distinguished between "superior" and "inferior" uses for water. The use that is prior to all others is for drinking purposes. After that need is supplied other rights may be recognized, but before this primary necessity all other rights become void. He would have the same distinction applied to land. The superior use of land is to provide food. Therefore any idle land capable of producing food should be turned over to someone who will use it for that purpose. Not all land is productive, however. This is often true of mineral land. The superior use of such land would be the production of those minerals. Mr. Wood suggests, therefore, permitting the coal companies to remain in possession of land where they are actually operating mines. Their title to the land would be their use of it. But he would not permit them to hold any land unused. All unworked coal lands should be thrown open to anyone who would stake out a claim and establish a title by mining coal.

If there is as much class feeling in Portland as in Seattle, the witnesses called did not give free expression to it. Only one real belligerent appeared. This

was an employer who classified society into "employers, employes, and the barnacle on the body public."

"There are these three classes," he declared, "and no others."

A VITALIZED MASSACHUSETTS LABOR BOARD AND ITS TASK

MASSACHUSETTS now has a real Board of Labor and Industries. There is now a probability that the labor laws of the Commonwealth will be enforced. Those who have followed the sad history of the former board will realize how great is the departure indicated by the two statements.

The last legislature of Massachusetts provided a Board of Labor and Industries to administer the statutes enacted to conserve the safety and life of the workers. The statute provided that one of the members of the board should be a physician or a sanitary engineer. The first board consisted of James A. Lowell, Channing Smith, William Acton, James W. Crook and Mrs. Mary H. Dewey, no one of whom was a physician or a sanitary engineer.

When this board had under consideration the appointment of its commissioner of labor, the executive officer of the board, it considered such men as R. G. Valentine, John Mitchell, Owen R. Lovejoy, John A. Fitch, Don D. Lescohier, L. W. Hatch, John Golden, Charles F. Gettemy. Robert N. Turner, a lawyer and politician, was urged for the place, and the objection that he knew nothing of actual factory or labor conditions was met at last by the suggestion that he be made deputy and acting commissioner until the board could agree upon a person to take full charge of the office. Mr. Turner so served as deputy for some months, until he was finally made commissioner, after some members of the board felt that he had been sufficiently educated by them to serve in that capacity.

When Mr. Turner was made commissioner, the labor interests felt that they were not properly protected, and they

Pressed for an explanation, he said that a barnacle is one who lives on the other classes without working, or who gets a following by persuading others that they are ill-treated and dissatisfied.

were, therefore, assured that they could name the deputy commissioner. Some fifty or more names were presented to the board, including those of Arthur M. Huddle, Emily G. Balch, Mabel Gillespie, Henry Sterling, Frank McCarthy, Edward J. Decourcy. Finally Cornelius J. Carmody, chairman of the State Labor Legislative Committee and a friend of Mr. Turner, was appointed.

Since by no construction could any member of the board be regarded as a physician or a sanitary engineer, it devolved upon the board to exercise particular care in the appointment of its second deputy who, under the statute, should be "especially qualified to supervise the enforcement of laws under the jurisdiction of the board which related to the health of persons employed in buildings used for industrial purposes, and shall be charged with that duty." No "medical deputy" was appointed during the early life of the board.

Constant complaint came before the board, either from the reports of inspectors or directly to the board itself, about serious injuries to the health of the operatives, particularly of women and children. There were many cases of spinal curvature, headaches, hemorrhages, anaemia, skin disease, eye trouble and a host of other ailments of occupational origin. All health questions presented to the board were met with the statement that they must be deferred until the medical deputy was appointed so that he could pass upon the complaints in conformity with the statute. When these complaints had accumulated to such an extent that action seemed imperative, the board met the demand by appointing a man who had no pretense to medical or sanitary

education and whose sole claim to the qualifications called for by the act were that he was employed by the Board of Health in draining Neponset swamp lands! Protest was made by people who felt that his ability to dig a ditch did not qualify him to pass upon curvature of the spine, on the delicate questions of eye strain and pelvic disorders. When the facts were presented to the governor and the council, they declined to confirm his appointment.

The attempted appointment of this deputy challenged the attention of the governor to the entire conduct of the board. As a result of his investigation, the governor was convinced that the board had been acting with disregard of its duty in many respects, and also that its composition was illegal because of the fact that there was no sanitary engineer or physician among its members. When neither Mr. Lowell nor Mr. Crook resigned at the governor's request that one of them should step out to make way for the sanitarian called for by the statute, the governor dismissed from office the entire board, including William Acton, the member supposed to represent labor, and Mrs. Mary H. Dewey, whose work on behalf of women and children workers had been distinctly useful.

The reasons assigned for the dismissal of the board were four in number: First, that the board was illegally constituted in that none of the members was a physician or a sanitary engineer; second, that the board had violated the regulations of the Civil Service Commission and had kept in its service an employe contrary to the rules of the commission; third, that the chairman of the board, either as an individual or as a member of the board, had sought to break down the civil service regulations of the commonwealth; fourth, that the members of the board were not working in harmony and the differences between them had impaired efficiency.

State-wide interest at once centered upon the personnel of the new board. The governor has constituted it as follows: Chairman, Alfred W. Donovan of Rockland; John Golden, Selskar M. Gunn, Alfred H. Quessy, and Mary H. Dewey. In reappointing Mrs. Dewey, Governor Walsh said that her attitude regarding reappointment was as clearly distinguished from that of some of her fellow members of the old board as was the value of her services, including, as it does, a thorough knowledge of the labor laws, an ability to do work among women, and an ability to assume their point of view.

It was believed by many people that the old board was organized in the interests of the proprietors of the great industries of Massachusetts. A glance at the qualifications of the four members of the new board makes it apparent, say the critics of the old board, that the new board is organized in the interest of all concerned—the public, the workers in these industries, and the proprietors.

Alfred W. Donovan of Rockland, chairman, is president of the E. T. W. Wright Shoe Company. He is a frequent speaker at meetings of boards of trade and similar bodies the state

over. His standard of ethics is shown in a recent remark. One of his associates rather sneeringly commented upon his apparent failure to make as much money in the shoe business as some of his wealthy friends. Mr. Donovan replied that he had not made as much money as he could have made, but he had made as much money as he ought to have made.

The textile industry employs more working people than any other industry in the state. It is not represented in the composition of the board, however, by a manufacturer but by John Golden, known the country over as a labor leader. He is a resident of Fall River; was born in England in 1862; came to this country in 1891, and worked as a mule spinner in Fall River. He is president of the United Textile Workers of America, a member of the American Federation of Labor, a member of the Mule Spinners' Local Union of Fall River, of the Commission on Minimum Wage, of the Executive Committee of the National Child Labor Committee, and fills many other important offices.

Selskar M. Gunn was graduated from the Massachusetts Institute of Technology in 1905, department of public health; he was biologist of the Boston Bio-Chemical Laboratory, 1906; biologist State Board of Health of Iowa, 1906-1908 and lecturer on state hygiene, at the State University of Iowa at the same time; health officer, Orange, N. J., 1908-1910, and as such had charge of health inspection in factories. He then studied the hatting industry with particular reference to the prevalence of tuberculosis. Since 1911 he has been assistant professor of public health at the Massachusetts Institute of Technology.

He was expert sanitarian of the bureau of economy and efficiency of Milwaukee; assistant secretary general of the Fifteenth International Congress of Hygiene and Demography. He has written many articles on public health and is editor of *American Journal of Public Health*; secretary of the Public Health Association; lecturer on hygiene at Tufts College Medical School, and assistant professor of biology at Simmons College.

Governor Walsh was of the opinion that Mr. Gunn might answer the requirements of the law which states that one member of the board should be either a physician or a sanitary engineer, but in order to be sure that he complied with the spirit and the letter of the law, the governor named Dr. Alfred H. Quessy as the fifth member. Dr. Quessy, who was born in Meriden, Conn., was educated in the public schools of Fitchburg, Mass., Laval University, Montreal, the Physicians and Surgeons University, Baltimore, and Johns Hopkins University, Baltimore. Not only is he qualified as a physician to carry out the spirit of the act but he will be of peculiar value to the commission because of his nationality, inasmuch as the people of French-Canadian extraction who work in the mills in Massachusetts outnumber those of any other race.

The critics of the former board point out its inactivity in the enforcement of

labor laws. They declare that while here a lunch counter proprietor or there a shirtwaist maker may have been convicted of having worked an employe overtime, the convicted employers all told probably do not employ as many as a hundred hands. In contrast to such petty prosecutions is cited, for example, the board's record (as to "suction shuttles," involving the health of thousands of workers. The law provides that "it shall be unlawful for any proprietor of a factory or any officer or agent or other person to require or permit the use of suction shuttles or any form of shuttle in the use of which any part of the shuttle or any thread is put in the mouth or touched by the lips of the operator. It shall be the duty of the State Board of Labor and Industries to enforce the provisions of this act." When the board was urged to enforce this act, it assigned a portion of its inspection force to counting the number of such shuttles in use in the state. When its attention was called to the fact that one of its own members was using such suction shuttles in violation of the law, it appeared to be satisfied with the answer of this member that he was not punishable because he had furnished each of his employes with a crochet hook with which the employe could, with a little patience, pull the thread through after he had thrust it carefully through the eye of the shuttle. The member was not prosecuted.

Part of the old board's activities were directed toward interpreting the law. The best way to enforce a law, urged a critic of the board, is to enforce it, leaving to the courts questions of doubtful interpretation. But the board, or its commissioner, made a number of rulings, some of which have been characterized as peculiar. For instance, it ruled that "A public bowling alley does not include alleys in private clubs or Y. M. C. A.'s or like places. The same applies to a pool or billiard room, and hence there is no restriction to the hours of labor during which a minor may be employed in such places." It is alleged that the Harvard Club, for instance, under this ruling works its pin boys up to twelve or one o'clock at night. Another interesting ruling was that a minor, employed upon a wagon or automobile used in connection with a mercantile or manufacturing establishment, must obtain and hold an educational certificate, *provided his work is in part within the building*. If he happens not actually to carry the bundles out, no one can legally question his education. Another ruling was that newsboys who purchase their own papers and sell independently are not limited as to their hours of labor. Many other such rulings might be cited.

The board spent much energy also on special reports. One of its inspectors made a most interesting study of the employment of minors upon the tobacco farms in Westfield, and another valuable treatise on the history of factory inspection in Massachusetts. In the meantime, cases where dummy dust hoods, looking like the real thing but *not connected with any suction device*, continued to flaunt defiance, while the operatives kept on dying from tuberculosis.

HEALTH

A N OLD INSTITUTION ON A NEW BASIS—BY HOWELL WRIGHT, SUPERINTENDENT OF CITY HOSPITAL, CLEVELAND, O.

A MUNICIPAL HOSPITAL is an institution of organized society provided by a city to care for the sick. It is but a medical means to a social end, and this end—public welfare—must never be forgotten. The modern hospital has outgrown the narrow field of boarding and treating sick people. The time has come when a city hospital can no longer passively receive the sick from the community without considering why they became sick, or use them chiefly as material, or discharge them without interest in their convalescence and rehabilitation in wholesome living and working conditions.

The Cleveland City Hospital has been slow in outgrowing the narrow field of boarding and treating sick people. While it is young in years as a hospital, it is old in years as an institution. It has slowly evolved itself from the old infirmary which was begun in 1850, completed in 1855 and designed "to accommodate both the insane of the city and the sick and infirm poor and furnish also facilities for clinical instruction to the physicians of the day."

The legitimate parent of both infirmary and hospital was the institution built on Clinton street in 1837-1838 "which finally degenerated into a simple almshouse." Over a thousand persons were boarded and treated from time to time in the infirmary, but until 1888, when a new hospital building was completed, the average daily number in the hospital

department did not exceed 86. The report of 1884 states that an increase in hospital capacity was accomplished "by using rooms of paupers not sick." The building and development of the infirmary indicated, therefore, for many years the interest of citizens in caring for "the legal charges upon the municipality." The community as a whole regarded it as a place to stay away from, and the unfortunate regarded it and still regard it as a "place of last resort." Not until 1909, when infirmary patients were transferred to Cooley Farms, was major emphasis placed upon the hospital and its development as such.

The development of professional work at the hospital is important. In 1872, a superintendent who also had charge of outdoor relief was placed in charge of the infirmary. He evidently was not a physician. The city physician visited the infirmary three times a week, prescribed medicine for the sick, and left it with a steward "who shall entrust it to such assistants and nurses as he may deem qualified and trustworthy." Until 1891, professional services for the sick poor were furnished by a single physician who resided at the infirmary or visited it at intervals. In 1891 there were under his care 260 insane, 137 paupers, and 83 in the hospital proper.

This same year the infirmary was placed under the control of the director of Charities and Correction. It was seen at once that some more satisfactory plan

of caring for the sick was needed, and accordingly with the assistance of the medical profession and the medical schools of the city, a new scheme of medical and surgical service was adopted. This move marks the beginning of a modern city hospital and the real beginning of the performance of another function, namely, the education of physicians. As the hospital facilities gradually developed, with the opening of the Training School for Nurses in 1897, the addition of the Children's Hospital, and the separation of the old infirmary, changes and modifications in the professional service were necessary from time to time, all leading up to the formal staff organization which has recently undergone many changes.

The old medical and surgical management, or visiting staff, was divided between two so-called schools of medicine, one homeopathic, one "regular," the former constituting but one-fourth of the entire staff. Each "school" had one or two sections representing a medical school and one section representing the profession at large. Each section had a short-term service at the hospital each year. The staff appointed itself and was practically a self-perpetuating body. Thus representatives of two so-called schools of medicine, having entirely different methods of treatment were placed on service together and there were certain results contrary to good order, discipline, and efficiency.

The plan of assigning patients in their regular order of admission, three to one service and one to the other, did not at

MAIN BUILDING, CITY HOSPITAL

Its capacity, 240 beds, including 36 beds in children's department, gives a large opportunity for the study of general cases.

all times work out to the best interests of patients and hospital. Again, because of limited operating-room space, there were frequent conflicts as to time, etc., with the attendant inconvenience to surgeons. The plan necessitated a double system of charts and records in different colored inks; also, two kinds of drugs and two laboratory systems. All this was unnecessary and expensive, and caused confusion in the training of nurses.

Again under the old system of medical and surgical management there were no chiefs of service,—that is, no one person responsible for the conduct of the service and the attendance of the visitant. It is recorded that "Dr. D. failed to see 6 cases in 48 hours." If a visitant for any reason could not attend to his duties a meeting of the executive committee was apparently necessary to obtain, when possible, a substitute.

There was no continuity of treatment. One visitant on a collegiate service might order spirits for a tuberculosis patient. The next visitant on a non-collegiate service might not wish to order spirits. One visitant might favor a liberal diet and no tub baths in typhoid fever, while the next directly following might not feed and might give all tub bath treatment.

No one person was responsible for making complete records; hence, house officers, nurses and attendants had to learn again and again as the services changed.

It must be remembered that when this scheme of medical and surgical management was worked out, it was probably the only system that could for a time satisfactorily meet existing conditions. Great and everlasting credit is due the originators of the plan and of the rules, who have served the hospital so well through years and years. Many of them have rendered devoted service, often bringing and using their own instruments, apparatus and supplies when the city failed to provide them, and some have at all times made the hospital their first interest in life.

But conditions changed. This problem confronted the authorities of the hospital in 1913, "Is the medical and surgical management, in consideration of the opportunities and conditions at hand, so selected, constituted and organized as to carry out efficiently and effectively the functions of a hospital and best promote the interests of patients, practitioners and the welfare of the community at large?" Many even of the old management believed that it was not, and thoroughly agreed that a new plan of management should at once be devised and put into operation.

According to the new plan of medical and surgical management adopted for Cleveland City Hospital, the administrative and executive head of the hospital is the city Director of Public Welfare. He corresponds to the board of trustees in a private or university hospital, and has final authority in all matters except those concerning professional treatment.

The superintendent is the general manager of the hospital. He is responsible for the administration of the affairs of

the hospital. This includes authority to appoint and remove all employees, including assistant superintendents, resident physicians, the head of the training school and all other heads of administrative departments and their subordinates, subject at all times to such civil service rules as apply, and with the approval of the department of public welfare. All officers and heads of departments are responsible to the superintendent. He and his assistants have control of all admissions to the hospital and the final discharges. The medical house officers are responsible to the visiting staff for the proper performance of their professional duties, but in all matters of personal conduct and administrative or general duties they are directly and wholly responsible to the superintendent.

The visiting staff has absolute authority to dictate the professional treatment of all patients admitted to the hospital. All the professional work of the hospital is grouped under two divisions, medical and surgical, each in charge of a division chief.

Under the medical division there are grouped the following departments, each in charge of a department head: General medical, neurological, dermatologi-

HOSPITAL RESEARCHES

"The spirit of the laboratory in its highest sense must permeate our words and the clinical atmosphere of the wards must unite with that of the laboratory. The educational function of the hospital must be evidenced in progressive, united and purposeful research."—AMERICAN JOURNAL OF SURGERY.

cal, children's contagious, tuberculosis. Under the surgical division there are grouped the following departments each in charge of a department head: general surgical, orthopedic, genito-urinary, nose, ear and throat, eye, obstetrical. There is a pathological department under the direction of a department head.

For the present there is no separate contagious department. All cases of such nature are assigned for the present to the general medical department, to the children's department, or to both. Nor is there an orthopedic department or genito-urinary department. Cases of such nature are assigned for the present to the general surgical department.

The chief of the medical division serves as head of the department of general medicine. The chief of the surgical division serves as head of the department of general surgery. The chief of each division is on duty the entire year and is at all times responsible for the working efficiency of his division and for the professional treatment of all patients assigned to his division. The head of each department is also on duty the entire year and is at all times under the direction of the division chief, to whom he is responsible for the working efficiency of his department and for the professional treatment of all patients assigned to his department.

Under each department head there is a sufficient additional number of visiting physicians and surgeons so that each patient is visited by the department head, the assistant department head, or by

one of such visiting physicians or surgeons each and every day. Visiting physicians and surgeons serve for not less than four months of each year.

Some advantages of this plan of organization are these:

1. It places definitely the responsibility for the professional care of patients.

2. It insures working efficiency and cooperation between departments.

3. "Continuous service" throughout the year affords the best opportunity for the study of disease, and for the carrying out of some definite policy or plan in the observation and treatment of individual cases and of group cases.

It makes possible uniform standing orders for House Officers; it necessitates keeping only one system of charts and records, one kind of drugs and only one laboratory system, and it insures uniformity in the training of nurses.

It is further believed that the functions of city hospital as mentioned above, can best be carried out and the interests of patients, practitioners and the community-at-large can best be promoted if the medical and surgical management of the institution is entirely under the control of Western Reserve Medical School and if all nominations to the visiting staff are made by the faculty of that school.

The training of students and practitioners is an important function of a hospital and is becoming more and more recognized as such. The future practitioner of medicine can receive his practical training only in the wards of a hospital, where for a requisite period of time he comes in intimate contact with diseases and has an opportunity of watching its natural history under the guidance of his teachers. A teacher of medicine, caring for patients that are being seen and examined by medical students, is stimulated to his best endeavors. He is constantly under criticism, as it were, and is being watched by a body of men before whom he naturally wishes to appear to best advantage.

It is to be emphasized that this plan will promote post graduate instruction as well, so that medical men may have an opportunity of adding to their knowledge and skill. The instruction that is afforded to students and practitioners redounds to the advantage of the community at large, which is thus provided with a more competent body of physicians. It is a recognized duty of the State to educate practitioners of medicine.

For several reasons it is likely that a hospital whose staff consists of a body of teaching men will do most in the way of research and in contributing to the advance of knowledge. The teachers are the picked men of the profession. They have the training, incentive and ability to promote investigation. Their professional advancement in every way would be favored by research. Having a good field to work in, their ambitions would be stimulated.

The outlook for the Nurses' Training School is, under the new system, very encouraging. The school has been hampered in the past by this, among other causes, that Ohio has not yet provided for registration of nurses. Until this is done, desirable candidates will seek their training in other states.

The beginning of social service work was in 1910, when William A. Kenney was appointed "to investigate admissions to the hospital." How this department has in this short time grown under Mr. Kenney's devoted care, is suggested by the following summary of his latest report:

New patients.....	612
Patients from previous year...	132
	744
Referred and sent by other social agencies	132
Investigation for financial conditions.....	114
Provided for family while patient was in Hospital.....	8
Secured admission to other hospitals.....	82
Cases deported.....	12
Homeless patients.....	41
Secured services of district nurse.....	52
Patients' follow-up treatment.....	9
Referred to other social agencies of city..	101
Secured appliances for patients—braces, etc.....	3
Secured special care in homes.....	14
Obtained admission to homes for aged....	6
" pensions for aged folk.....	2
Homes for woman with child.....	22
Obtained clothing for patients.....	34
Home investigations for placing aged, imbecile, defective, feeble minded, etc..	51
Secured change of surroundings.....	8
Aided friendless.....	4
Investigations to identify the unknown...	9
Secured legal aid.....	26
Returned to legal residence.....	14
	744

To perfect this social work, the hospital should have accommodations for convalescent patients—a few simple cottages with opportunities for recreation and light work. It should have, also, a dispensary or out-patient department.

Another need of City Hospital is increased laboratory facilities. Modern medicine does not admit of professional treatment of the sick based only upon a clinical diagnosis. A pathological or other laboratory diagnosis is absolutely essential as a basis for scientific treatment. It is proposed to establish this year in the main hospital building a central laboratory. This would be used not only for routine pathological, bacteriological and clinical laboratory work, but for scientific investigation and research. With the co-operation of the university it is hoped to provide at least working equipment.

It requires no great stroke of imagination to look ahead and see a completed University Hospital, affording great opportunities for the education of physicians and nurses; affording wonderful opportunities for scientific investigation and research, preventing disease as well as curing it; to see, first, pavilions for the sick poor, secondly, beds for people of moderate means, and, finally, private rooms which those of means may occupy and be treated by their own physicians; to see in the near future a more efficient social service department, closer co-operation with the district physicians and public health nurses; more effective co-operation with all community agencies;—in short, a great teaching hospital, serving Cleveland as a medical means to a social end.

STATE SUPERVISION OF TUBERCULOSIS SANATORIA

THE ERECTION of sanatoria all over the country bears witness to our increased knowledge of the curability of tuberculosis and also of the danger of leaving at large advanced cases of this disease to scatter infection.

There has been a generous response in a great many communities to the call for public funds for the establishment of tuberculosis hospitals, but there has also been a good deal of disappointment in the results obtained in these hospitals, which in some mysterious way seem to fail to justify the money expended on them. In a recent number of the "Modern Hospital," Dr. H. Longstreet Taylor tells why such failures occur and how they can be avoided.

Dr. Taylor is the president of the Advisory Commission of the Minnesota State Sanatorium. This body, it seems, does not concern itself only with the state sanatorium but assists with expert advice county bodies which are about to erect their own institutions, and supervises by monthly visits the conduct of all such institutions.

The commission helps select the site of a new hospital, and its plans and specifications. What is even more important, the selection of the superintendent is subject to its approval. Nor is it only an advisory body. As the state pays half the expense (up to \$5,000) of site, construction and equipment, and later pays \$5 a week for each charity case cared for, it is in a position to enforce its suggestions.

This central control makes possible a close co-ordination between county institutions, which care for the advanced cases, and the state hospital which takes only the incipient. Small county institutions are favored because the smaller the district served the easier it is for the patients' relatives to visit them, and especially this must be made as easy as possible with regard to advanced cases.

It is unnecessary to point out the advantages in efficiency and economy made possible by this system of supervision of all the sanatoria in a state by a committee of experts. In many of the smaller institutions it would be impossible to secure the services of an expert as superintendent but monthly visits by such a body as this would soon bring all the institutions up to one standard.

FOR NEGRO HEALTH

A unique pamphlet has been issued by the Tuskegee Institute. It is prepared by Monroe N. Work, editor of the Negro Year Book and relates to the conservation of negro health. Mr. Work does not overload his pages with many statistics and diamond type. Instead he has selected a few vital facts and pre-

sents them in terse form. Here is the reproduction of a page:

ARE WE CURING TUBERCULOSIS?

A searching study of the reasons for the comparative failure of our efforts to prevent and to cure tuberculosis is made by Dr. Pottenger, of Monrovia, Cal., and published in the medical journal of that state.

The solution Dr. Pottenger finds lies in the word "early." We must learn that tuberculosis is contracted early in life, from 70 to 90 per cent of the children being infected before their fifteenth year. We must learn that it is almost as vitally important to detect tuberculosis in its early stages as it is to detect cancer in the early stage. What we used to look on as an "early" tuberculosis, we now know to be "late," an extension into new tissues or a renewed activity in an old focus. We must learn that everything depends on a prompt recognition of the disease and an early treatment. Often a delay of two or three months means the difference between a hopeful case and a grave one.

Finally we must learn that the earlier the treatment is begun the shorter the time required for a cure. It is wrong however to let the victim and his family think that the time will certainly be short and that all he needs is rest, fresh air and good food. Many months may have to pass before he is safe and the care of a skilled doctor is absolutely essential.

Two important pamphlets have recently been issued by the National Association for the Study and Prevention of Tuberculosis. One, by Dr. Thomas Spees Carrington, discusses the construction of tuberculosis hospitals and sanatoria, and the other considers the effect upon surrounding property of tuberculosis institutions. This latter pamphlet reports earlier investigations of the effect of such institutions on the health of the neighborhood, "presents the results of a new questionnaire study and investigation of institutions in different localities, digests of typical laws governing sites of hospitals and gives opinions of boards of health and insurance companies on this matter as well as court decisions relating to the location of hospitals, dispensaries and so forth." The pamphlet emphasizes the fact that all evidence whether interested or disinterested, as in the case of court decisions, bears out the conclusion that a tuberculosis hospital is neither a menace to the health of a neighborhood nor a detriment to surrounding property.

The University of Minnesota will open this fall a school of public health under direction of the university medical department. The list of required courses already announced includes such subjects as public health laws; statistics; hygiene—personal, school and industrial; and town planning; housing; labor problems, etc. Elective courses are offered in laboratory methods, epidemiology, psychology, dairy chemistry and other subjects. The M. D. degree is to be a pre-requisite.

CIVICS

THE DUBLIN CIVIC EXHIBITION—BY ANNA LOUISE STRONG

IN THE MIDST of wars and rumors of wars with almost every external handicap which circumstances could impose, the Civic Exhibition in Dublin was organized and carried to a successful conclusion. The date of opening, July 15, made it impossible to make preliminary arrangements for excursions from the north of Ireland, since no one knew what upheaval the famous 12th of July would bring.

The end of the first week of the exhibition saw a profit of \$2,500 above running expenses, with the prospect of doubling or tripling the amount for each successive week, when there came the Dublin riot, engaging the attention of all Ireland to the exclusion of everything else. Amusements of all sorts ceased, for a nation was in mourning. After a few days, the attendance at the exhibition again increased. Thousands of passengers were scheduled for almost daily excursions from all parts of Ireland. It was at this juncture that war was declared, troops mobilized, and all excursion arrangements cancelled by the railways. Even the buildings in which the exhibition was held, might, it was feared, be commandeered at a day's notice as a barracks.

In spite of this succession of discouragements, when I was hurried out of Ireland a week after the declaring of war, the exhibition was already beginning to make a daily profit. Conferences on the food-supply with authoritative representations by the Department of Agriculture were swiftly substituted for the originally planned conferences, Red Cross classes were carried on, and an enormous model of the war-area indicated the progress of the war.

It seems at present likely that the exhibition will pay for its running expenses and some of the expense of organization. The many contributors whose gifts covered the preliminary expenses of construction, will be able to point with pride to a permanent result in the reclaimed Linenhall Buildings. For years these buildings have been a dingy, unused heap of mouldering stones. Now they have been converted into an imposing combination of endless halls, rooms and corridors, which may be obtained at a nominal rent for an enormous civic museum and social center for the neighborhood, as well as an exhibition hall admirably arranged for future exhibitions.

The chief credit for the conception and execution of the exhibition must be given to the Countess of Aberdeen. She had many helpers from Ireland, Scotland, England and America, but she herself, working according to her custom from eighteen to twenty hours a day, furnished the driving force that insured success.

The Dublin Civic Exhibition presents a commingling of commercial and educational elements somewhat different from the usual exhibition in the United States. There were numerous money-making features, run in part directly and in part as concessions. These included dining-room, tea gardens, motion-picture and concert hall, American soda fountain, a ball room, and a merry-go-round.

There were also exhibits of Irish industries, brought in without apology, on the ground that industrial stimulation is the first thing needed in Ireland, before civic advance can proceed to any lengths.

The Civic Exhibition seemed to fall roughly into seven main divisions: Child welfare, town planning, Department of Agriculture and Technical Instruction, other government boards, exhibits from Irish cities, industrial exhibits, and amusements.

To these should be added a most striking food exhibit. Working-class budgets from all parts of Ireland were presented in this exhibit, red and white sticks being used to show the amount of nourishment and energy derived by those families in comparison with the amount needed for health. A most effective presentation of the food products of Ireland, covering imports, exports and home consumption, was made by means of large paste-board cubes. This exhibit proved most valuable after the declaring of war by showing the public their hopeful situation as to food production.

The child welfare exhibit was among the most popular sections, as its ideas were framed in simple language, with many living demonstrations, electrical devices and models. I went from the United States to organize it, as the Countess of Aberdeen wished to introduce the uniform size of background, the short crisp statement and the general intermingling of cartoons, models and aphorisms which have marked recent exhibit development in the United States.

The town planning section was the largest, most thorough and scholarly of all the sections. Professor Patrick Geddes of the University of Edinburgh was the organizer, not only of the town planning exhibit, but of a remarkable school of civics, which was largely attended and which dealt with the historic development of the city and its problems. The old Linenhall Buildings were also discovered by Professor Geddes on his explorations through the slums of Dublin, so that he has been, in large measure, the inspiration of the exhibition.

Plans for a "new Dublin" were hoped for as the outcome of a competition initiated by the Earl of Aberdeen, Lord Lieutenant of Ireland. He offered a prize of 500 pounds to the author of the best idea for replanning Dublin. In consequence of the war situation it has been decided to postpone the time for receiving these plans until April, 1915.

Other people imported to help with the exhibition were John Nolen of Cambridge, Mass., whom only the press of other engagements prevented from remaining as the director of the entire exhibition, and Benjamin Rastall of the Municipal Service Bureau, New York, who gave expert help in organization and administration, and was to arrange for an industrial conference to end in an industrial survey of Dublin. The war has, for the present, postponed these plans.

Especially interesting to Americans were the displays from the Land Commission and the Congested Districts Board, two government boards which have expended millions of pounds in buying up from land owners tracts of land occupied by peasant tenants, and then reselling them by instalments, often with the addition of other land to make an economic holding, to the peasant tenants.

The land question, in Ireland, with a stable agricultural population, of which generations of peasants have been at the mercy of generations of land owners, the problem has been acute. At present men who hope that in fifty annual instalments they may pay for their ten acres, so that their grandsons may own them in fee simple from the government, are stimulated to make improvements which were never made when they might lead to increased rent.

PLAY ZONES IN NEW YORK STREETS—BY CARL BECK, UNIVERSITY SETTLEMENT, NEW YORK

THE RECENT ORDER of Police Commissioner Arthur Woods, closing to traffic from 3 to 6.30 p. m. one block in each of nineteen streets in congested sections of New York city in order that children may play in safety, gave joy to tens of thousands of children and relieved thousands of parents from anxiety. Moreover, it indicated a new social spirit in that department of public service which has been often criticized for lack of such spirit.

Other cities have made a success of such "play zones." The Playground Association of Chicago maintained several, securing the co-operation of the police department, providing equipment for volley ball, playground ball and other games, and placing a trained play leader in charge of each zone.

That the streets of New York are the real playgrounds for 600,000 children was brought out in a pamphlet *The City Where Crime Is Play* issued last spring by the People's Institute. The order of Commissioner Woods is a recognition of the part the police may take in crime prevention. It puts the police in the relation of "big brother" to the children in their play.

Social workers have volunteered to help administer and supervise the play zones. For the zone in front of the University Settlement, resident workers arranged an "opening day." The oldest resident, who recently served as park commissioner, provided a street organ for dancing. Another resident turned the crank. Others led the dancing and tried to supervise the crowd of children that collected.

The police commissioner's inspector of the traffic squad in charge of the street play zones was invited into conference at the settlement. It was a new kind of work for him, but he saw at once the importance of roping off an arena, and providing reliable supervision. The police department furnished six stanchions. The settlement agreed to furnish rope and supervisors. With a schedule for street-organ concerts three afternoons a week, a roped arena, and an extra policeman to help the volunteer supervisors, most of the original difficulties disappeared. While the girls danced, the

boys played basketball, goals being provided by the settlement.

When store-keepers complained about the inconveniences of closing the block to traffic, a letter from the police commissioner was shown them, appealing particularly for their co-operation. Out of twenty-eight store-keepers, twenty-five said it was a "fine thing!" Complaint came only from a junk dealer, a wagon works and a sales stable. The neighbors have organized a citizen's advisory committee, consisting of fourteen citizens, among them store-keepers, the head-nurse of the milk station and settlement workers.

In taking his progressive step, Commissioner Woods had the encouragement of the Park and Playground Association of New York city. In addition to the zone on Eldridge street, eighteen other zones are in operation, nine on the lower East Side, twelve altogether in Manhattan, two in the Bronx and five in Brooklyn. Each zone is under the voluntary supervision of a local settlement or organization of some kind.

In the case of the lower East Side, the East Side Neighborhood Association called a conference of all the managers of street play zones in that section with a view to devising practical plans for handling the children, providing play leaders and supervisors, and co-operat-

PLAY OF THE
CHILDREN

ing with the Bureau of Recreation of the Department of Parks in a scheduled use among the ten play zones of the street organ which that department has loaned. Settlement residents feel that they are not equipped to assume continuous supervision of street play zones, and that eventually the responsibility of getting maximum play results from the street play zones should be that of the Bureau of Recreation of the Department of Parks.

THE BEAUFORT PLAN OF CITY MANAGEMENT

ONE OF THE oldest settlements in the South, in the conservative state of South Carolina, the town of Beaufort, believes that it has developed a scheme which may solve the problems of city government for towns of 5,000 population or less.

For large cities the commission form of government has proved successful, and for cities somewhat smaller the city manager plan is giving satisfaction. But Beaufort could not afford this plan and besides there was not need of an expert's entire time in the affairs of the city government.

So a plan was evolved of combining into one job the executive work of the municipality and the direction of the affairs of the Chamber of Commerce. The person who performs this two-fold function is to be called the city supervisor, giving half of his time to the city and half to the commercial body. His salary of \$2,400 will be paid half by the city and half by the Chamber of Commerce.

Beaufort has not, strictly speaking, a commission form of government, but its council of seven members is chosen by the people at large. The Mayor is also recorder or city magistrate and there is a city clerk, city marshal and a city health officer. The town owns its own water works and electric light plants, each under charge of a special commission.

The city supervisor will have charge of all city property and city business, subject to the advice and directions of the council. He will thus have supervision over city accounting, building and maintenance of streets, sewers and drains; planting and care of trees; disposal of garbage; building of sea-walls

and all structures; care of the guard house and public buildings and of the police, as well as other duties which the actual working out of the plan will determine. The office of mayor with a nominal salary will continue, that official presiding at meetings of the council and acting as city magistrate.

In the work of "boosting" the community, the city supervisor will be subject to the Board of Directors of the Chamber of Commerce. Among his first duties in this field will be the co-ordination of the work of the Civic League, the farm demonstration agent and the director of the tomato clubs with that of the Chamber of Commerce. He must direct his energies to include the interests of the farmers, the retail and wholesale merchants and boat owners and pilots. There will also be a traffic department to look after freight rates and transporta-

tion facilities, a publicity department to advertise the town and county and a department to place newcomers, all under the eye of the city supervisor.

The plan was first suggested by A. V. Snell, managing secretary of the Charleston Chamber of Commerce, who started the city manager plan in Sumter, S. C. He outlined it at a mass meeting arranged by the Beaufort Chamber of Commerce.

The advantages of this combining of offices are readily apparent. The city offices now become headquarters of the Chamber of Commerce, a rest room for farmers and their families while in town and an assembly room for the Chamber of Commerce. The city clerk becomes office manager for the Chamber of Commerce, and the City Hall becomes a center of more varied community activities.

NEW RECREATION CENTER

A new recreation center built by Neighborhood House of Santa Barbara, was dedicated August 11 with appropriate ceremonies and the singing of Anna Garlin Spencer's social hymn, Hail the Hero Workers of the Mighty Past, from THE SURVEY's social hymn number of January 3.

The center was built with a civic spirit which aroused the enthusiasm of the entire community. As one workman expressed it when he was lending a hand to clean up and put the chairs in place, "Working on this building wasn't like any feeling I ever had; it was like working on a home."

There were speeches by Mrs. Emmett G. Ord, secretary of Neighborhood House Association, Margaret Baylor, who has been in charge of Neighborhood House for four years, and others.

SUBMISSION

Submission? They have preached at that so long,

As though the head bowed down would right the wrong.

As though the folded hand, the coward heart

Were saintly signs of souls sublimely strong;

As though the man who acts the waiting part

And but submits, had little wings a-start.

But may I never reach that anguished plight

Where I at last grow weary of the fight.

Submission: "Wrong of course must ever be

Because it ever was. 'Tis not for me
To seek a change; to strike the maiden blow.

'Tis best to bow the head and not to see;
'Tis best to dream, that we need never know

The truth. To turn our eyes away
From woe."

Perhaps. But ah—I pray for keener sight
And may I not grow weary of the fight.

MAKING IT RIGHT

[Five hundred and seventy permits to work in stores or factories were given out by the new working paper department in the board of education building during the past week.]

Willie is little and spindle-legged and Mollie is wan and white.

And both are a little bit under age, but both are so clever and bright.

And it's foolish to send them to school, you know; the family's to feed and keep.

The prices on everything's awful high, and nothing at all is cheap.

It's hard on the working folk, you know, but the coppers have made it a crime.

If Willie and Mollie are sent to work before it is proper time.

Yes, Willie is little and spindle-legged, and Mollie is wan and white.

And both are a little bit under age, but both are so smart and bright.

And we'll take 'em to get a permit—see? And then it will be all right.

Sammie is thin and he limps a bit, and Rosie can't sleep at night,

For her cough, and they's both of them under age, but both are so clever and bright.

NEWSPAPER VERSE

By MIRIAM TEICHNER

The phrase "newspaper verse" has entered the language as a term of reproach. "Newspaper wit" is almost in the same class. Yet both may become weapons in the fight for a finer life. As writer of a column of verse and humor in the Detroit News, the author of the accompanying poems stirred many folk in that city to a clearer sense of the multiform relationships of their own lives. She is now reaching a daily audience in New York.—Ed.

And they're wild to go to the school and learn; they want to write and to read,
But it's foolish to let them waste the time when the family of nine are in need.

And if they work before their time, the coppers sure will get 'em.

But if they get a permit, why the city'll have to let 'em.

Sammie is thin and limps a bit, and Rosie can't sleep at night

For the cough, and they's both of them under age, but both are clever and bright.

So we'll take 'em to get a permit—see? And then it will be all right.

Frieda complains that her eyes are sore, and Hans says his breath feels tight.

And they's both of them little and under age, but both are so clever and bright.

And Hans wants to study the law, he says, and Frieda, she wants to teach.

But it's silly to let them waste the years, whatever their rich friends preach.

There is food to buy and clothes to buy, and the city says that it's wrong

To let them work while they're young, but the time before they'll be big is so long.

Yes, Frieda complains that her eyes are sore, and Hans says his breath is tight.

And they're both of them little and under age, but both are so clever and bright.

So we'll take 'em to get a permit—see? And then it will be all right.

Oh, pitiful Willie and Sammie and Hans, you're little and puny and white,

But all of you cost so much to keep, and you all are so clever and bright;

And there's much to buy and the price is high, and that is the only cost.

That matters much; it's a little thing if your short little youth is lost.

Oh, pitiful Mollie and Frieda and Rose, you must enter the awful mill

That will take you and break you, and quickly make you weaker and whiter still.

But all of you cost so much to keep, and you all are so clever and bright.

That all you need is the permit—see? And then it will all be right.

ROSE MAKERS

[From a liner ad in an exchange: "Work given home to good artificial rose makers."]

June—just look here!

You, who are coming so soon;

You will be jealous, I fear.

Rose-in-hand, June.

June, you, the rose-maker par excellence,
You, with rose-fingers of velvet-soft bliss,

You, in your rose-showered, rose-bowered haunts,

You, with your lips like a rose-petal kiss,

What do you think of a liner like this?

What do you think, as the spring world you roam,

Of weary young girls who take rose-making home?

"Working" at rose making? Petals of white,

Crimson and pink like the summer dawn's light;

See how their fingers are hurrying there; twining and twisting; their roses are fair,

And still—it is work. See—they finish a rose;

See how it nods there, and shimmers and glows,

Almost as fair as your own roses, June, Hundreds are finished from morning to noon.

Hundreds again, from the noon-tide till night,

Crimson and yellow and coral and white. Aye, but 'tis work. They are weary, you see.

June—you make roses with frolicking glee, June, you, the rose-maker par excellence.

You with rose-fingers of velvet-soft bliss, You in your rose-showered, rose-bowered haunts,

You with your lips like a rose-petal kiss, What do you think of a liner like this?

A LITTLE volume entitled 'Prentice Songs' by a Pittsburgher whose "prentice" social work has been in the district offices of the Associated Charities and the neighborhood around the Irene Kaufmann Settlement includes thirty-nine titles. Not a few of them are filled with healthy, boyish sentiment for college days, for the poet's mother, Latin professor etc.

It is curious how long it takes some social workers, especially the sensitive and cultured, to outgrow a kind of sentimentality in outlook; and, of course, the conventional phrase besets us all. Our critics tell us that we can not escape it by any such facile road as some imitators of Whitman travel. They find more promise in a writer like Mr. Baird, who has fed his spirit on fine things, and will in time "sing his own song instead of echoing chansons from other men's throats." Gibson and Masefield are pointing the way to sincere work which has learned all the past has to teach, and at the same time lays hold of the stirring motives in the common life.

There is a promise of social verse to come in the selections that are reproduced here, but as yet Mr. Baird shows lack of apprehension of the big motives that are stirring the Pittsburgh working life. He is at his best in the gossip of the scrub woman, but there is no Pittsburgh picture which compares for concreteness with the Bethlehem court-yard he describes in *Mused Mary in Old Age*:

"The court-yard in the flickering torch light, filled
With huddled travelers sleeping 'neath the sky,
The kneeling camels of a caravan,
The patient asses dozing by the wall,
A smell of roasting meat at little fires,
The shouts of mellow sellers, the low drone
Of reverend elders bending to their prayers,
Barking of street-dogs, porters' blasphemies,
The laughter of a girl, the mellow flute
Of some rapt lover, and the tinkling tune
Of sheep bells foldward moving through the dark."

Toils in the Dark

The morning hands have counted three,
and creep
Down the blurred dial's tarnished yellow glow,
The stars are journey-weary, and below,
The day-o'er-labored city glooms asleep.

O'er factory roof and tenements the darks
Have spread their kindly curtainings to veil
The ugly squalor, and beyond, the pale
Ghost hills are gemmed with amethystine sparks.

Only the tinnient clangor of a gong
Cleaves the thick silence, or belated feet
Re-echo on the pave, or in the street
A rumbling market wagon crawls along.

Life yields to death an hour's mastery,
Save in wealth's dim gray towers, pied with light,
Where patiently the women ply by night
Their lowly trade and unsung industry.

Verses from

'PRENTICE SONGS

By

George M. P. Baird

Gaunt, wistful women, widowed ones, old wives,
White ringless mothers, girls from oversea,
Slatterns and shrews, a span of poverty,
The nightly scavengers of human hives.

Back-breaking lot is theirs to scrub till day
In silent office cell and echoing hall,
Where their lax footsteps like a menace fall
And down the tomb-white galleries die away.

All through the dark, toil these who cannot find—
In life's stern struggle—bread beneath the sun,
From menial night a poor dole must be won
By these to whom the broad day is unkind.

Ignorant, cheerful, unhorizoned, brave
To strive for one close little room called home,
For child or sickman or old mother lone,
Or burial surance gainst a potter's grave.

Work brings its social joys, they meet at three—
Much as their wealth-born, leisure sisters do—
Open their meagre luncheon stores and brew,
Above the mop-room jet, their gossips' tea.

Their talk is commonplace, loquacious, crude,
With, "I said this," and, "She said that to me,"

Slang troped with picturesque redundancy,
The news and scandal of the neighborhood.

Sordid details of bargaining and debt,—
The rents grow higher, will they never stop?
This one has found a cheaper butcher's shop;
Young Aggie's fellow won a boxing bet.

Spring Alley had a wedding yesterday
And kept a party, 'twas a grand event:
Drunk Dugan cursed his dying sacrament
And blessed ground's forbidden to his clay.

How someone's mister's breaking work-house stone—
He left her just before their seventh came;
How next door Mary took her recent shame,
Refused Bill's name and gave the child her own.

Its rumored that two rival charities
Are planning Christmas baskets for the poor,
And—if one only knows the ropes—one's sure
To win a dole from both philanthropies.

Jim Shannon's home again, he's been away
Tramping the road since last year's panic came,
He has consumption, and the doctors claim
One lung's gone and he hasn't long to stay.

Thus on a hundred humble themes they play
While the half-hour lasts, then back, to work
Till the new light wans purple through the murk,
And the laborious night gives place to day.

Time by the lowest margin metes our age,
Not by our boasted wealth shall History judge,
But by the wrongs of such as these, who drudge
Birth-bound to want and hopeless heritage.

What though we rear proud towers with golden walls,
What though we rend the treasured earth for spoils
The just years will remember but the toils
And impotent bondage of our humble thralls.

A Prayer

O give us strength to face our day
With courage, as Thy sons of old,
To lift our voice in prophecies
Against the gods of stone and gold;
Give us to see and understand
The heart of man and to forgive,
Give us the faith to touch Thy hand,
Teach us, O gentle Lord, to live.

Amen.

Unconquered Sonnet

A brave song for the unfulfilled,
The hope undaunted striving on
Though youth and power and joy be gone,
The broken life that dares to build
Upon its ruins, the soul filled
With valiant discontent, the wan
Night-watcher faithful to the dawn
The heart no fate or fear hath stilled;

Where the black city's greed hath drawn
Its squalid cordon, Faith still sings
On Patmos still, some later John—
Sees visioned truths of higher things,
Still 'mid the toilers bravely on
March humble prophets, captains, kings.

To the Mother Land

I saw a gaunt grey woman—
When the weary sun was falling—
Yokefellow to an ox,
Dragging home the plow,
While her idle sons
Lolled in the dooryard calling
"Give us food and drink", and O
Mother, it was thou.

I saw a fisher's widow—
When the grey surf was breaking—
Beating in across the shoals
Where death tugged at the bow,
While her shore-safe sons
Paused in merry making,
Crying: "Share thy catch", and O
Mother, it was thou.

I saw a beggar wife—
Through the road dust toiling—
Sorrow in her tired eyes,
Pain upon her brow,
While her sluggard sons at home,
Eager for the spoiling,
Whined: "Part us thine alms", and O
Mother, it was thou.

Communications

The latch-string of the Communications Department is out to all readers of THE SURVEY. Lively debate and good cheer are to be had within. But the space available for the department makes necessary the following house rules:

1. Communications of 250 words or less, criticising, protesting against, or developing something published in THE SURVEY, will be published, so far as possible, in the first issue after receipt.
2. All other accepted communications will be published in the order received, if space remains after the letters described in paragraph 1 have been used.
3. The maximum length of communications is 500 words, except in cases where the writer convinces the Editor that more is needed. The extreme limit is 1,000 words.
4. Contributing Editors and authors of signed articles will be given an opportunity for rejoinder in the same issue in which letters of criticism are published.
5. In discussions back and forth between readers, each succeeding letter is limited to half the length of the previous one from the same contributor.
6. The Editor reserves the right to reject letters which he regards as libelous, letters of spite, letters on subjects outside the field of THE SURVEY; and for other good and sufficient reasons which he would be prepared to defend.

NEGRO BOYS MAKE GOOD

TO THE EDITOR: Five years ago T. C. Walker, a Negro lawyer of Virginia, induced a judge to suspend sentence on a Negro boy about to be sent to prison, and to give the lawyer charge of him. The judge warned the lawyer that the prisoner was "a tough case." But treated with kindness and given the first real chance of his life, the boy made good.

The lawyer, who had accumulated an independence, decided to give part of his time and means to the reformation of other such boys. The first year he spent \$150 in traveling expenses, beside caring for the boys in his own home until he could get them adopted in families of the right type.

He interested Dr. Mastin, state superintendent of charities and correction; and Dr. Mastin interested Governor Mann. The legislature gave Dr. Mastin authority to take from prison all Negro boys of fifteen years or under; and he has been turning them over to this lawyer ever since. In three years, Dr. Mastin tells me, 150 boys have been placed out, and 143 of them are making good. The lawyer's traveling expenses are now paid by the state, but he gives his time and services. He tells me he has more good homes open than he has boys to put in them—a fact which witnesses strongly to the social vision of the better class of Negroes in Virginia.

The Negro club women of the same state have recently paid \$5,000 cash for a farm for delinquent Negro girls. The state has appropriated \$6,000 for the first building, a dormitory for 20 inmates; and two white women of Vir-

ginia have given each \$1,000 toward it. The institution is to be on the cottage plan, and is to be managed by the club women.

Kentucky has for some years appropriated three or four thousand dollars a year for placing Negro waifs and delinquents in good Negro homes, and for supervising their care. The work was begun by Negroes, but now state aid is regularly given under a board of white trustees.

The remarkable reformatory work done among young Negroes by Sam Davis, an Alabama Negro, was noticed at length in the Birmingham number of THE SURVEY. No state aid has ever been given this enterprise, which I am told reforms 95 per cent of its boys.

In Augusta, Ga., a Negro, Paul Moss, sold his home and his shop six years ago, and bought a few acres on the edge of town, where he has taken and cared for, at his own charges, about 180 waifs and delinquents. 160 of these have been placed out, and 150 of them are making good. So far he has been unable to get them adopted. Most of them are taken by white people, who support and clothe them, and send them to school, in return for chores. Most of Paul's help comes from his own two hands; and just now his house having burned and the insurance money having disappeared in a bank failure, he and his twenty boys are in a bitter case.

But this unaided work, Sam Davis's in Alabama, and the two cases cited of enlightened state co-operation with Negro effort, show conclusively that good citizens may be made of budding Negro criminals by just those methods which accomplish that result among whites.

Do these facts indicate racial criminality, or the common human result, in any and all races, of neglected childhood? And are prisons and courts as desirable, or as cheap, for us of the South, or for any people, as wholesome conditions and development for the children of the poor whether white or black?

POLISH SOCIAL WORKERS

TO THE EDITOR: The Polish Social Workers' Club was organized last November. Since then it has grown in membership as well as in the scope of its work.

The aims of the club are: To acquaint itself with the various phases of social work; to assist each other whenever possible, to win the confidence, moral support, and co-operation of the Polish people in social work and to correct mistaken views and clear away misunderstandings concerning social work among the Poles. To accomplish this the club has used the Polish language at its meetings which have been held successively at the various Polish institutions; it has invited prominent social workers to address its members; it has published the proceedings of its meetings as well as special articles on social work in the Polish daily newspapers and it has co-operated with the Chicago Tuberculosis Institute and other organizations in their work in Polish neighborhoods.

The club has a committee for the distribution of Polish books and magazines among the inmates of charitable institutions where there are no books for the use of those unable to read English. The club also plans to arouse a greater interest in social conditions among the Poles by providing speakers on the different phases of social betterment at the patriotic celebrations held periodically to commemorate different events of Polish history.

We are anxious to get in touch with Polish social workers in other cities.

SEX HYGIENE

TO THE EDITOR: A writer from Boston writing in your magazine some time ago upon the sacredness of sex hygiene [January 10], stated: "The evil is upon us; it flourisheth like a bay tree; religion and the churches have done nothing for us, what shall we do? It is sadly true that the churches and religions of today cannot refute this charge." Without a doubt this is to a certain extent true, but yet it is too sweeping to say that the churches have done nothing, for who could or dare imagine the state of affairs if the influence of the church were entirely eliminated?

The churches must admit, however, that they are not doing what should be done, and that they are yet helplessly gazing on, endeavoring, as do those outside the church, to place the blame at the threshold of others.

To deal with this problem and to better conditions, the churches would have to do exactly what any other guiding influence must do to be effective—recognize the extreme folly of silence and prudery, and endeavor by education and admonition to remove the results of ignorance and perverted ideas in regard to sex.

To do this the churches have two problems to solve, the greater of which is that of trying to get hold of and keep the boys of adolescent and pre-adolescent years. And it is at this most impressionable and crucial time in their lives that the influence and teaching of high ideals of the church and home should be applied and felt in their lives. But such is not the case under the present conditions.

The churches, too, must face the storm of opposition against instruction in regard to sex as do the medical profession, the press, school officials and individuals who have realized the tragedy of silence. In spite of their convictions in the matter, the churches have not dared even as much as these to give such instruction within their portals in the face of an age-long prejudice.

The writer also stated that such blame could not be laid to the churches of earlier times. In view of what I have just said with reference to the churches' position in the matter, I think this can be plainly shown to be due largely to the changed environment and home life in which the lad of today finds himself. The modern conveniences and rush of our twentieth century home life, have separated the heretofore indispensable boy from his domestic duties. No longer does the boy need to stay near his mother to cut and carry wood, or to run errands. Today, the boy—a bundle of possibilities for good or for evil—must get his enjoyment, his pastimes, his counsel and his youthful impressions on the street, in the playground or the school yard.

Such remarks as: "If I had only known," "Why is it wrong?" which I have heard, and the results that I have seen have awakened me to the enormous value of prevention over cure in this matter and also of the seriousness of shifting responsibility in the administration of the preventative education. What better place to begin than in the school, where the danger of playing with fire can be taught before a lasting scar is received?

SAID OF THE SURVEY

TO THE EDITOR: I herewith enclose my check for the renewal of my subscription to THE SURVEY which has become almost as much a necessity for me as food and shelter. It has always been good, I think, but is greatly improved of late. Personally I owe a great deal to THE SURVEY as a factor in bringing about a gradual but complete change of attitude on my part toward all that pertains to the "common welfare."

JOTTINGS

TAKE-IT-BACK DAY

Recognizing a shortcoming common to all humanity, the little town of Carmen, Okla., has assumed some responsibility for the frailty of its citizens. A "Take-it-back Day" has been inaugurated, the worthy purpose of which is the return of every article borrowed during the past year—umbrellas not excepted. It is reported from Carmen that a number of persons who harbored grudges took advantage of the good feeling prevalent on "Take-it-back Day," and "made up."

FOR DELINQUENT BOYS

The Brooklyn Disiplinary Training School, the only city institution which provides for delinquent children, all the others being private, has been discontinued. The reason for this action is that since its beginning the school has been inadequately housed in a building far from modern and has always been hampered in its work for lack of facilities. It is planned to have the State Training School at Yorktown Heights (not yet in operation) take some of the boys and the rest will fall to private institutions.

The many friends of the Brooklyn School, however, insist that there is need of such a school to fill the gap between probation and long-term institutions. The matter is now before the Social Welfare Committee of the Board of Estimate and Apportionment.

THE PRISON COUNCIL

The National Committee on Prisons and Prison Labor indicates the broader activities which the National Committee on Prison Labor has assumed along with its new name. At the third annual meeting, held in June at Ardsley, N. Y., an executive committee was formed from experienced representatives in every state, to determine the policies of the committee and its course of action in the different states. Sub-committees were elected to cover special fields, the whole forming a council of management with Adolph Lewisohn, chairman, and E. Stagg Whitin, secretary.

The committees are:

The Committee on Federal Prisons, George Gordon Battle, chairman; Legal Committee, Prof. George W. Kirchwey, chairman; Committee on Social Hygiene, James Bronson Reynolds, chairman; Committee on Organized Labor, Collis Lovely, chairman; Committee on Honor Men, Charles Henry Davis, chairman; Educational Committee, Mrs. John H. Flagler, chairman; and Jail Committee, Hastings H. Hart, chairman.

The executive offices of the committee are at Columbia University, through the courtesy of the president and officers of the university, and are under the direction of Julia K. Jaffray and Joseph D. Sears.

The GIST of IT—

PRESIDENT WILSON'S proposed three years' truce for the Colorado coal strike grants no recognition to the union, nor does it grant the claim of the operators "to run their own business." Walter E. Weyl compares it with Roosevelt's intervention in the Pennsylvania anthracite coal strike of 1902 and says: "What was then a bold, almost a revolutionary, step now seems a reasonable proposal, shocking to no one and approved even by conservatives." Page 608.

THE war caused the postponement of the Canadian Conference of Charities and Correction which was to have been held this week in Toronto.

WITH experience ranging from Dr. Grenfell's Labrador work to the tenements of America's great cities, 125 Red Cross nurses, with 30 surgeons and a cargo of hospital supplies, sailed for war stricken Europe on the "Red Cross." Page 605.

HOW employers "put the screws" on a California editor whom they considered too favorable to labor unions was told in the editor's testimony before the Federal Commission on Industrial Relations. Unfair boycotts and other "tyrannies" by the unions were charged. Testimony was also heard concerning the Wheatland riot and subsequent developments. Page 609.

UNIVERSITY students gain practical experience in geological surveys and at agricultural experiment stations—why not also in the affairs of government as a training for public service? Page 614.

THE Massachusetts Peace Society, 31 Beacon St., Boston, and the Massachusetts Women Progressives, 287 Washington St., Boston, are selling "peace petition post cards"—25 cents a hundred, the money to go to the Red Cross. They are the latest development from the suggestions of Mrs. Elizabeth Tilton, reported in THE SURVEY for last week, urging a publicity campaign against militarism. The post cards are addressed to President Wilson and on the back is a petition protesting against war and calling upon the government "to work with all governments for world-wide disarmament and arbitration," with a place for signature underneath.

A ten day survey of public institutions in Peking disclosed miserable poor-houses, but good orphanages and the beginnings of a scientific hospital system. Page 616.

FAVORABLE report by unanimous action of the committee on labor has pushed the federal child labor bill a step further on its way toward passage in the House. A supplementary report urging the constitutionality and necessity of the bill is to be made by the chairman of the committee. Page 606.

A woman investor, who came to feel that dividends were the unpaid wages of other women's sons and daughters, wrote to the president of a corporation. Her letter and his reply discuss the ethics of the matter. Page 611.

THE SURVEY

COMMON WELFARE

AMERICA'S RELIEF SHIP TO EUROPE

WITH A GREAT red cross on each funnel and a broad band of red around her glistening white hull, the good ship Red Cross swung clear of her dock in East River on Labor Day. Saluted by every steamer along her route, she steamed up the Hudson and anchored off Riverside Drive. Viewed by thousands and identified at night to shore watchers by a brilliant electric lighted red cross, she deferred her departure for war-stricken Europe only long enough to secure a crew made up wholly of Americans, just as she had already taken on hospital units composed exclusively of American-born doctors and nurses.

This is the first ship ever sent from the United States on a Red Cross mission. On board are thirty physicians and 125 nurses. At their head is Major Patterson, U. S. Army Medical Corps. Of the doctors themselves, seven came from the surgical staff of Johns Hopkins Hospital; New York hospitals furnished four; three came from teaching and medical directorships, and the others from practice in eleven different states: Tennessee, Maryland, New York, District of Columbia, New Jersey, Ohio, Pennsylvania, Indiana, Maine, Missouri, Massachusetts. One of them, Dr. Ryan, has just returned from a Red Cross mission in Mexico.

Three doctors will be in each "hospital unit," with twelve nurses. There will be ten such units. Five extra nurses are being taken to fill vacancies caused by accident or sickness, remaining in reserve until needed. The present plans are that "a double unit will be landed at Falmouth, England, for use by the English medical au-

thorities, and the double unit assigned to Russia will also land at Falmouth and proceed to their destination by way of Copenhagen. A third double unit will be landed at Havre for the French; and double units for service with the German and Austrian armies will be landed at Rotterdam, in Holland."

The nurses are all graduates of training schools. Their superintendent is Helen Scott Hay and her assistants are Misses Hertsler and Bowman.

In the selection of these women preference was given when possible to those who had special operating-room experience or experience as public health nurses. The personnel includes superintendents of nurses in large and well-known institutions; heads of visiting nurses' associations; chiefs of operating-rooms; instructors in nurses training schools; anaesthetists; hospital social service workers, and members of the Army Nurse Corps. Miss Gladwin, who will supervise the group sailing on another vessel for Serbia, served as Red Cross nurse during the Spanish-American war, both in hospitals and on transports; during the Russo-Japanese war, she was stationed at the Hiroshima Base Hospital; and she was in full charge of

the nursing work during the Ohio floods.

Another nurse, Miss Bentley, sails under leave of absence from the Cleveland Hardware Company, of whose social service department she has for some time had charge. Miss Keil, formerly of St. Luke's Hospital, New York, was for several years with Dr. Grenfell in his work in Labrador.

Nor is the spirit of readiness among nurses alone. The families who have the harder task of staying behind are showing the same high-spirited devotion. "I shall miss her, of course," said one mother who came to see her daughter off. "But she has grown up in the idea of service; her father was a physician; I am proud to have her go."

The Red Cross expedition will fully exercise the best skill of every surgical nurse. And doubtless there will be plenty of use for the resourcefulness of those with experience in public health work. The knack of turning ironing-boards into operating tables and dish-pans into sterilizing bowls in the clutter of city tenements will prove valuable when it comes to making farm houses serve as field hospitals, changing railroad stations into operating rooms and devising equipment out of whatever happens to be at hand.

According to official statements, the hold of the ship contains eight complete surgical equipments, each consisting of at least eight cases of surgical instruments and appliances. Also "between 300,000 and 400,000 pounds of absorbent and non-absorbent cotton, more than 200,000 metres of gauze, more than 50,000 metres of starched gauze for splints, 15,000 pounds of bandages, 30 gallons of iodine, 2,000 cans of ether, 2,000 cans of chloroform, 48 dozen pairs of rubber gloves, and thousands of liga-

To the Red Cross Relief Ship

ANNE P. L. FIELD, in the New York Evening Post

O SHIP of Solace putting out to sea
With the compassion of a nation's heart
Thy precious freight! Bound for that distant part
Of this strange warring world, whose destiny
God alone knows! Thy lot it is to be
Our healing messenger, tracing thy chart
With the calm courage born of perfect art—
O Ship of Solace, we have faith in thee!

Go thou from these serene blue-girdled shores
And plunge thy cleansing prow in bloody tides!
Sweep onward through the blackness—through the roars
Of belching cannon! Go where'er grief guides!
Long as a plank shall last, pursue thy way—
For Love shall be crowned conqueror some day!

AMERICAN DOCTORS AND NURSES ON THE "RED CROSS"

The doctors all wear khaki and army hats. The nurses embarked in full Red Cross uniform. A number had above their Red Cross badges the gold bar which indicates previous experience in "fire and flood and tornado."

tures. These supplies were repacked in a warehouse before they were placed aboard, in order that they may be apportioned properly to the countries to which they are to be distributed."

Calls for assistance have come from practically every country.

"The Greeks asked for nurses and surgeons, and said they would pay for them," writes Miss Boardman. "We answered that we would pay all we could send. Turkey wants 100 cots, in addition to nurses and surgeons. We shall endeavor to meet all demands upon us as rapidly as possible. So you see there is going to be plenty of work in the way of organizing relief forces for us who stay in this country. As matters stand, we are embarrassed with volunteers. There is no difficulty about finding people ready to go."

One example of this readiness is that of the two nurses of the Boston group who were in Canada for a vacation when the call came for volunteers. They telegraphed their applications and returned at once. Another nurse, also on vacation, had to drive seventeen miles for her examination and twenty more to the train. Two in Seattle came as far as Chicago at their own expense, taking the chance of passing the examination, and being accepted.

At the last moment it was discovered that there were members of the crew who had as yet only their first naturalization papers, and thus could not be considered as American citizens and therefore could not sail on the ship because of the neutrality laws. The British and French consuls protested against the presence of Germans in the crew. The ship is loaned to the Red Cross by the Hamburg-American Line.

The Seamen's Church Institute and the Seamen's Christian Association helped to secure a crew not only American in nationality but experienced in sea-

faring, so that conditions of safety as well as neutrality may be observed.

The Red Cross officials mention gratefully the special co-operation of the New York Board of Health. Dr. Goldwater arranged for the physical examinations of those going from New York city, and for their immunity treatment for typhoid and small-pox. The five nurses who go from positions on the Board of Health have been assured of reinstatement on their return.

ENGLISH TOWN PLANNING EXPERT FOR CANADA

IMPORTANT NEWS has just reached American housing workers and city planners. Thomas Adams of the English Local Government Board has resigned his position in England to accept that of town planning adviser to the Canadian Commission of Conservation.

Mr. Adams has had direct charge of the practical work done under the provisions of the British housing and town planning act of 1909, and has guided such developments as that of Ruislip, which greatly impressed the members of the National Housing Association who visited it last July. This work has shown that the dreams of the reformers can be realized not only in occasional garden cities and suburbs, but throughout the country.

His success in England has given Mr. Adams an international reputation that led to his being twice called to America to address meetings of the National City Planning Conference. The first visit was in 1911 as a guest of the City Planning Conference in Philadelphia. Last spring he returned to take part in the conference at Toronto. While in Canada he gave the authorities his assistance in drafting housing and city planning legislation, and it is probably in recognition of this assistance that he has been called to Canada.

PROGRESS OF THE FEDERAL CHILD LABOR BILL

IN THE MIDST of the distractions of the European war, the unanimously favorable report of the Palmer child labor bill by the Committee on Labor of the U. S. House of Representatives was made almost without notice. A supplementary report, arguing for the constitutionality of the bill as well as for its necessity, if child labor is to be abolished in America, will be made at an early date by Representative David Lewis, of Maryland, chairman of the committee.

The House committee retained the standards which had been suggested by the National Child Labor Committee: namely, a sixteen-year age limit for the employment of children in mines, a fourteen-year age limit in factories, and a sixteen-year age limit for the employment of children at night or for more than eight hours a day. The committee redrafted the bill to make it conform to the principles of the convict labor bill which has already passed the House and has been favorably reported on by the Senate Committee on Interstate Commerce.

Instead of prohibiting any mine or manufacturing establishment, employing children in violation of these age standards, from shipping in interstate commerce any articles mined or manufactured, the first section of the redrafted bill prohibits the shipping or offering for shipment in interstate commerce of the products of any mine or factory in whose production or manufacture, in whole or in part, the labor of children is involved. It was believed by members of the committee that this would render the bill less open to constitutional objection, though perhaps making it a little more difficult of enforcement.

The phrase, "in whole or in part," is a comprehensive one, and makes the bill practically "air-tight," as the expression goes at the Capitol. For instance, a trapper boy in a mine, whose work is merely opening and shutting a door, would nevertheless be contributing to the production of coal; so would a sweeper boy or doffer boy in a cotton mill.

The friendly attitude of representatives from all parts of the country augurs the passage of the bill by a large majority whenever the measure is taken up on the floor, although this will probably not be until the December session of Congress.

The list of the men who already have announced themselves in favor of the bill includes Democrats, Progressives and Republicans. It is the plan of those interested in the bill to have a hearing before the Senate Committee on Interstate Commerce early in the December session. The action of this committee in reporting favorably the convict labor bill is regarded as an indication that it will similarly favor the Palmer-Owen child labor measure.

THE FORMATION OF THE CAPE

This dance symbolized the rise of the cape from the ocean. One large group swept forward, representing the waves of the ocean; another group came from the opposite direction, representing the waves of the bay. In tidal motion these surged toward each other repeatedly. Each time as they receded there were left behind groups representing the sand, gradually stretching out in the shape of Cape Cod. The color scheme of the costumes helped to give the effect of blue waves and sand.

The Pageant of Cape Cod

THE PAGEANT OF CAPE COD

On the Banks of the Canal
August 15-17-18-19 at 3 P.M.

THE completion of the Cape Cod canal was the occasion of a pageant designed to promote a united community spirit among the towns and villages of the cape. The four performances on August 15, 17, 18 and 19 were held on the banks of the canal at Bourne, the people taking part coming from towns fifty miles in one direction and thirty miles in the other. Harwich, Hyannis, Sandwich, Sagamore, Sagamore Beach, Bourne, Falmouth, Buzzards Bay, Wareham and Fairhaven were among the towns which took part.

William Chauncey Langdon was master of the pageant. Special co-operation came from the Massachusetts Agricultural College and Professors E. L. Morgan and R. H. Ferguson assisted by lecturing and conducting conferences in the cape towns on community planning and co-operative marketing.

The music was composed by Daniel Gregory Mason and the orchestra conducted by Brookes C. Peters. In the costuming, effects expressive of the elemental factors of cape life were attained by Marion Langdon through the use of double and triple overlays of textiles with special reference to their motion in sunlight.

For the dances or symbolic scenes with large rhythmic motion by masses of young people and children, Paula A. Matzner conducted rehearsals in five towns, and at the end brought together more than two hundred participants.

There was also a "director of co-operation," Lotta A. Clark of Boston, whose work was to arouse enthusiasm in the different towns and to guide the co-ordination of the various neighborhood talents into a comprehensive whole.

THE SPIRIT OF THE OCEAN

Posed by Paula A. Matzner who organized the dances for the Pageant of Cape Cod

The Provincetown sea captain who posed for the poster of the Pageant of Cape Cod has a record of having saved seven lives from a wrecked vessel in one November storm.

Thus not only was art recognized as a civic force but in turn civic and social co-operation was recognized as an art with the drama, music, and the dance.

The episodes of the pageant began with the formation of the cape shown by a symbolic dance; the arrival of Bartholomew Gosnold, 1602, the Pilgrims on the Cape, 1620, and later the early Quakers, 1657; Strangers and Pirates in the Offing, 1717, the Barnstable County Court, 1774; the Bombardment of Falmouth, 1814; the Commerce of the Seas, 1847; the War of the North and South, 1864, and the Contented Life, 1890-1900. Then came an episode of prophecy: The New Cape, 1914-1920, followed by a final scene symbolic of America's glory.

There was underlying truth in the pageant, based upon the part the ocean played in making the cape in early geological times and later its part in molding the character of the people.

The unfolding of the story set forth the development of the cape's land activities—the newer agriculture and business out of the older water occupations, fishing and commerce.

The new Cape Cod Board of Trade took the initiative in organizing the pageant and it is felt that much was accomplished to bring the cape towns into closer co-operation.

President Wilson's Plan for Peace in Colorado

Whereas, the industrial conflict in the coal mining fields of Colorado has disrupted the peace of those sections of the state to the extent that a state of war has practically existed for some time, and

Whereas, a temporary peace is maintained by the presence of the federal troops:

Therefore, there should be established a three-year truce subject to:

1. The enforcement of mining and labor laws of the state;
 2. That all striking miners who have not been found guilty of violation of the law shall be given employment by the employer they formerly worked for, and where the place of the employee has been filled he shall be given employment as a miner at the same or other mines of the company.
 3. Intimidation of union or non-union men strictly prohibited.
 4. Current scale of wages, rules and regulations for each mine to be printed and posted.
 5. Each mine to have a grievance committee to be selected by majority ballot at a meeting called for the purpose, in which all employees (except officials of the company) have the right to participate. Members of said committee must be employed at least six months at the individual mine before being eligible. Married men to be in the majority on each committee.
- Grievances to be first taken up individually with the proper officer of the company. Failing adjustment, they can refer to the local grievance committee for further consideration with the mine officials. Still failing adjustment the matter shall be submitted to a commission composed of three men, to be appointed by the President of the United States, and which shall be representative of each side, with the third member to act as umpire whenever necessary. This commission shall, during the three

years of truce, serve as adjusters or referees in all disputes (whether individual or collective) affecting wages, working and social conditions. Said commission shall devote primarily all the necessary time to the consideration and adjustment of such disputes.

6. It is understood as a condition of the creation of said commission that during the life of the truce

(a) The claim for contractual relations is to be waived, but this shall not prevent the voluntary agreement between any employer and their employees during the life of this truce.

(b) No mine guards to be employed, but this does not preclude the employment of necessary watchmen.

(c) In the establishment of the truce the presence of the federal or state troops should become unnecessary.

(d) There shall be no picketing, parading, colonizing or mass campaigning by representatives of labor organizations of miners that are parties to this truce which will interfere with the working operations of any mine during the said period of three years.

(e) During said truce the decisions of the commission in cases submitted shall be final and binding on employers and employees.

(f) There shall be no suspension of work pending the investigation and reaching a decision on any dispute.

(g) The suspension of a mine over six consecutive days by the company may be authorized for cause satisfactory to the commission, but not pending any dispute.

(h) Willful violations of any of these conditions will be subject to such penalties as may be imposed by the commission.

On account of the mutual benefits derived from the truce the employers and employees should each pay one-half of the expenses of the commission.

THREE YEARS' TRUCE FOR THE COLORADO COAL STRIKE—BY WALTER E. WEYL

THE PROPOSAL by President Wilson of a three years' truce in the tangled Colorado strike situation inevitably suggests comparison with the intervention by President Roosevelt in the anthracite coal strike of 1902. In both cases the conflict was held to be of supreme public interest, involving issues far wider than those immediately raised by the strike. In both cases the solution or attempted solution came from the national, not from the state government. In both cases a direct recognition of the union was withheld, and the supreme decision in labor disputes was vested in an impartial tribunal, controlled in final analysis by representatives of the federal government.

The contrast between the two solutions is equally obvious, the difference arising out of a difference in conditions. Since 1902 much water has run under the bridge. What was then a bold, almost a revolutionary, step now seems a reasonable proposal, shocking no one and approved even by conservatives. Then no state of real war existed and no federal troops stood on guard at the mines, protecting mine workers from armed strikers and strikers from armed mine-guards and militia.

The overwhelming interest of the public in 1902 arose from fear of a coal famine; the intervention of 1914 was seemingly motivated by the necessity for preserving peace during a period of trouble at home and calamity abroad.

"This is a time," so runs the President's grave message, "when everything should be done that it is possible for men to do to see that all untoward and threatening circumstances of every sort are taken out of the life of the people of the United States."

It is difficult, if not impossible, to judge in advance of the workings of the "tentative" scheme proposed by the President. Everything depends upon the spirit in which the agreement is interpreted. Everything depends upon the character and motives of the men to whom will be entrusted the supreme government of this great industry. No one can read the adjustment plan without realizing how wide is the discretion vested in the President's commission.

The union is not granted recognition; "the claim for contractual relations is to be waived"; there is to be no strike, "no picketing, parading, colonizing or mass campaigns . . . during the said period of three years." The surrender of the union's right to regulate conditions could go no further.

On the other hand, the claim of the great coal operators "to run their own business" is equally disregarded. They must obey the laws of the state; they must reinstate striking miners not actually found guilty of a violation of the law; they must meet grievance committees, must refrain from raising irregular levies of mine-guards, and must under "such penalties as may be

imposed by the commission" abide by the commission's decisions in all cases regularly submitted.

The employers are forbidden to "intimidate" union men, by which doubtless all manner of discrimination is intended, and they are equally forbidden to suspend work in their mines over a period of more than six days without showing cause and being duly authorized by the commission.

The admirable intent of the President reveals itself in every line of this memorable document, and the nation hopes that he may succeed in his efforts to end the tragedy of Colorado and bring lasting peace with justice. Whether he will succeed, however, once the proposal is accepted (if it ever is accepted) will depend, as we have said before, upon whether the compact is interpreted by sociologists steeped in the spirit of our modern times and versed in the history of collective bargaining or by beclouded though doubtless well-meaning jurists and lawyer-politicians.

In the first place, the tentative agreement, though it contains many dubious clauses, may mean an education of operators and men and the laying of foundations for an eventual trade agreement between parties respecting each other. In the second case it will mean a gradual undermining of the power of the union, a nibbling of the advantages slowly gained, a reversion eventually to the individual bargain (which is no bargain at all), and a sacrifice of industrial liberty and industrial representation to

[Continued on page 621.]

INDUSTRY

OLD AND NEW LABOR PROBLEMS IN CALIFORNIA— By JOHN A. FITCH

TWO STORIES were told before the Federal Commission on Industrial Relations meeting in San Francisco the week of August 24, and together they came close to summing up the labor problem in California. One was an old story, so far as the setting goes, the story of a struggle for supremacy between the skilled craft unions in a closed shop town and a determined, fighting Merchants, Manufacturers and Employers' Association.

The other story had to do with the events growing out of the Wheatland riot in the hop fields on the Durst ranch. That story was new, and prophetic. It revealed a class of labor hitherto forgotten and neglected, struggling together in a crude first attempt at self-expression. It brought to the fore a problem formerly kept in the background that now bids fair to be the greatest problem that California—or the Pacific coast, for that matter—has to solve.

The first two days of the hearings were given over to testimony regarding the fight for the open shop in Stockton, a town of 30,000 to 40,000 inhabitants about ninety miles east of San Francisco. For years Stockton has been a closed shop town, with all the crafts well organized. Some months ago, however, the employers organized the Merchants, Manufacturers and Employers' Association, commonly referred to as the "M. M. & E." Having enrolled in their membership 95 per cent. of the employers of the town, they announced on July 8 of this year that they would refuse thereafter to have any dealings with any union. The association had previously adopted a declaration of principles favoring the open shop, condemning tactics of coercion on the part of the unions, and setting forth their determination to sign no further agreements with organized labor.

The reasons for this action were explained in some detail by John P. Irish, secretary of the Chamber of Commerce, and C. G. Bird, president of the M. M. & E. Irish cited a number of cases of alleged improper and tyrannical acts on the part of the unions. He said that the carpenters had asked for an impossible wage scale, that the electrical workers had demanded higher wages after a contract had been taken based on the former scale, that unfit workers, discharged for good cause were forced upon the employers, and that unfair boycotts had been imposed.

He told also of a case where lumber that had been delivered on the third floor of a building was found to be without the union stamp. The owner of the building had offered to pay for the time of the shop steward, Irish stated, to

Probing the Causes of Unrest

XIII

The thirteenth of a series of interpretations of the hearings, before the Federal Industrial Relations Commission, by a staff representative of The Survey.

come from the planing mill and affix the stamp. This was not permitted, however. The lumber had to be carried down to the street, loaded on wagons, taken to the planing mill and stamped and then returned in the same way to the third floor of the building.

Another objection to dealing with unions was the necessity of making contracts, not with the workmen in the shops, but with "irresponsible outsiders." At this point Counsel W. O. Thompson inquired whether the M. M. & E. has any connection with any outside body, such as the National Association of Manufacturers.

"That is a matter that does not concern you," replied Irish. "The tendency of your question is in an unfair direction." Walter Drew, who is attending all the hearings before the commission as counsel for the National Association of Manufacturers, the Erectors' Association, and other employers' bodies, then requested that the witness answer the question, and Irish stated that the M. M. & E. has no agreements with any other organization of employers.

The open shop announcement was followed by strikes and lockouts in most of the organized trades. Anton Johansen, organizer of the carpenters' union, who is in charge of the union forces in the conflict, testified mostly in rebuttal of Irish's statements. He either denied the charges or pointed out that the aggressions complained of were contrary to union rules, and intimated that matters would have been adjusted differently if called to the attention of the higher officials of the unions. He stated that while the employers were complaining of the boycotting of one hotel, they were themselves boycotting another, by refusing to buy goods handled by the commercial travelers who stop at the same hotel

patronized by the union organizers.

The underlying truth in a situation of this sort cannot be grasped in a moment, especially ninety miles away from the scene of action. The tangle of charge and counter charge is too difficult to be unravelled in a public hearing. Much that is interesting can be told, however, and nothing was more interesting in this inquiry than the testimony of F. L. Kincaid, a land dealer of Stockton, and Irving Martin, publisher of the *Stockton Daily Record*.

Kincaid stated that he was asked one day to step into the First National Bank of Stockton. He was taken to the office of the president, who asked him if he were not interested in the *Stockton Daily Record*. He replied that he was not. The president then told him that the attitude of that paper was distasteful to the business men of Stockton. He suggested that Kincaid see the publisher, Irving Martin, who was a personal friend of Kincaid's, and induce him to change his policy. The witness said that the banker asked him to tell Martin that if he did not adopt a different policy the members of the M. M. & E. would withdraw their advertising, and to warn him further that he had better look out for his financial interests, adding that he would himself "put the screws" to Martin if he had the power.

Kincaid said that the banker told him also of a laundryman in the city named Eaves, who had refused to join the M. M. & E. The bank held an overdue note of Eaves' and had demanded immediate payment.

A few days later, Kincaid said, Eaves came to his office and told him he was in trouble. He said that he could pay the note at the First National Bank, but he had further obligations, and his creditors were pressing him. He needed to borrow some money to meet these claims. Kincaid thought then of another banker who had asked him to help him get accounts, and in whose bank Kincaid himself had a deposit. So he took Eaves to this bank, and asked for a loan for him. The banker told him that the unions were withdrawing their funds and the banks had entered into an agreement not to accommodate friends of the unions. A few days later Eaves told Kincaid that he had joined the M. M. & E. and that he had then been able to get money from the First National Bank, a statement that Kincaid verified later by conversation with the president of that bank.

Irving Martin, proprietor and publisher of the *Stockton Record*, then took the stand. He said that he had built a large addition to his plant a year or two ago, and is still heavily in debt as a result. He stated that the policy of his paper in the present controversy has been to print the news with impartiality,

and with a view to injuring no one. The method followed has been to verify every story originating with either side. It has been easier to get the union news, however, because the union men have always been willing to talk to the reporters, while at the headquarters of the M. M. & E., he said, the reporters had been treated with scant courtesy.

Some time ago, at a picnic, Martin said that a business man, a friend of his, had called him aside and told him that in this fight the employers were out to win, and would win at any cost. He said that they could not see why they should support anyone who did not help them, and thought that advertising should be withdrawn from papers not supporting the M. M. & E. He told Martin further that pressure would be brought to bear on all having financial obligations.

After that, in various ways, Martin was kept reminded of the pressure that could be brought to bear upon him. Individually and in committees, members of the M. M. & E. would wait on Martin, and object to his manner of handling the news and talk with him about his necessary dependence on advertising. They protested, he said, because his paper reported a union meeting where a boycott was agreed upon. They told him that he ought not to print news of meetings opposed to their interests.

One Sunday afternoon, Martin said, he was called up and asked if he would come to a meeting of the Typographical Union that evening. They insisted that the business was too important to wait until the next day, so he went. He was told by the men that they had heard that members of the M. M. & E. intended to withdraw their advertising from his paper. If that were done, they said, they would work without pay as long as that situation might last, and would look to the international union for strike benefits.

As committees continued to come to see Martin he tried to make them understand his position. "I told them," he testified, "that a publisher has two functions. He is a business man and an employer, but he is also a purveyor of news. An editor is a sort of a receptacle for what goes on in the community—the crime and the aspirations and hopes of the people. The good and bad both come before him. It is the duty of the editor to print the news, and he must do that even if it is contrary to his personal interests as a business man to do so." He told them he must follow this policy, even if they considered him "a traitor to his class." The committee then said that they "hadn't known before that he was a Socialist."

Martin said that as yet no financial pressure has been exerted, and while some advertising has been withdrawn there has been no concerted action. In taking the position that he has in this matter Martin has alienated from himself friends that he has known from boyhood. In business, socially and every other way his associates are the men who are now carrying on the fight for the M. M. & E. "I would do anything in the world to keep my associations with these men," said Martin, "but I must and will continue to publish my paper in accordance with my views of what is right."

The second two days of the hearings were devoted to a consideration of what followed after the Wheatland riot, described fully in THE SURVEY of March 21, 1914, by Carleton H. Parker, executive secretary of the California Commission on Housing and Immigration. Four men were killed in that riot—the district attorney and the sheriff and two hop pickers. For the murder of the first two—officers—two men, Ford and Suhr, have been convicted and sentenced to prison for life. No one has yet been prosecuted for the murder of the two hop pickers.

George L. Bell, attorney for the California Commission on Immigration and Housing, testified that after the tragedy a "drag net" was thrown out and suspects arrested on all sides and held without any charge against them. He told of a man named Brady who was able to prove that he had been in Wyoming at the time of the riot who was arrested, subjected to third degree methods in an endeavor to get him to confess some knowledge of the affair, and finally released after having been held seventy-five days in jail with no charge preferred against him and never having been in court.

Bell said that such arrests after a crime are customary. He declared that a man without money or friends, and without visible means of support is liable to be arrested at any time as a vagrant and can be sent to jail for fifteen to thirty days. He said he had talked with many men who had had this experience—their only crime being that they had no money. After a few such experiences a man becomes embittered, loses his respect for himself and for the law. The extreme importance of this practice is realized when it is understood that most of the labor in California is seasonal in character, and that few of the men make enough money to last through the year. At some time in the year therefore the great part of California's labor force may be subjected to this treatment. Bell advocated the creation of the office of public defender.

The attorneys for Ford and Suhr told of difficulties they experienced in handling the case. They were prevented repeatedly from seeing prisoners, on the ground that the men had not asked for them. Men were under arrest, they said, who had no money and knew the names of no attorneys, and who therefore could not ask to have any particular attorney sent to them.

Burns detectives were employed in the case, and, according to R. M. Royce, attorney for the defense, they "arrested men incontinently." It was charged that they subjected them to great abuse in an endeavor to get them to confess to having been implicated in the crime. W. A. Mundell, manager of the Burns Agency at the time of the riot, testified that he placed a dictograph in the cell where Suhr was confined and put a man in with him to talk with him.

It was stated by the prosecuting attorney that Suhr made a confession. Suhr repudiated this confession at the trial, however, and Royce testified that it was obtained only after Suhr had been worn out by being kept awake by having the bed clothes pulled off from him when

he lay down, and by being poked with sticks. He told Royce that he could not remember afterwards what the statement was that he had been induced to make.

Royce told also of a boy, wanted by the defense at the trial as a witness, who was, he alleged, hidden away by Burns detectives. For weeks the relatives with whom the boy lived did not know his whereabouts. Finally his uncle found him and had the Burns men arrested on a charge of kidnapping. On the way home, however, Royce said, the boy was taken away from his uncle by a San Francisco police detective, who took him to headquarters where he was turned over to the district attorney prosecuting the case. He was not again seen, Royce testified, until after the trial.

Ford and Suhr were convicted at the trial and sentenced. It is stated, however, that no evidence was presented clearly implicating either in the shooting. It is conceded by all, in fact, that Ford did not shoot. But he was the leader of the movement to get improved conditions. It is openly charged that both men were convicted, not for murder, but for "agitation." The case has been appealed.

The importance of this testimony was revealed at the last day's hearings devoted to unemployment. The men who revolted on the Durst ranch were typical migratory laborers of California. So were many of the "suspects" arrested without warrants and held without trial. There is a migratory class of labor in California because there must be. Without them the industries on which California's fame depends could not exist. The workers are migratory because the jobs are seasonal and short. When one crop is gathered they must move on to the next. If they work in the canneries, under the best possible conditions the season of employment will last only from June to December, leaving six months in which other work must be found.

But in December the rainy season begins, and work is hard to get. Hence the migratory laborers begin to gather in the large cities. Their wages when they have work is from \$2.00 to \$2.50 a day. Their earnings are gone before spring, partly through improvidence and partly through drink, but largely because of their inadequacy. It was testified that the unemployment situation is steadily growing worse.

A number of remedies were proposed. George E. Hyde, a fruit grower and packer, urged greater thrift. Wylie Giffen, another fruit grower, testified, however, that it is impossible now for a young man, however ambitious, to go out single handed and with empty pockets and acquire a fruit orchard of his own. He advocated organization on the part of the workers, and diversified farming, to lengthen the season. Other suggestions were state employment bureaus, colonizing men on the land and unemployment insurance.

The scenes are changing in California. We shall still hear of open shop fights, of closed shop unionism, of high wages in the skilled crafts. But we shall hear more and more of the unskilled, underpaid, disorganized seasonal workers. They will themselves see to it that we hear.

TWO LETTERS

EXCHANGED *between a WOMAN*
INVESTOR *and the* PRESIDENT *of a*
PUBLIC SERVICE CORPORATION

The Inquiry

Mr. Alex. Dow,
President and General Manager,
The Detroit Edison Co.

MY DEAR MR. DOW:

I have been thinking all summer about the visit I had with you. In writing this letter I am speaking with reference to that. I do not take up the subject of land and rents, and the relation that exists between land values and the high cost of living. This has to do with dividends and wages.

You told the story of the building up of that wonderful plant. It was a great work. As a plant to serve the interests of the public it was well done.

In considering the human beings involved, both as stockholders and as operators and constructionists, you made these two remarks: You said I need not laugh at the mention of widows and orphans—that it is literally true that many of the stockholders are widows and orphans. You said that you owed it to these people to so run the business as to render to them the dividends upon which they are dependent. It is a duty and a trust on your part. You consider yourself responsible to them. This is perfectly clear to me. According to the way business is now managed you are the business manager for the stockholders. That is the way nearly every concern is run. I, myself, live in such a way that I am dependent upon dividends I receive from a similar plant.

In the second place you said that, in order to carry on the business, you buy coal as cheap as you can, you buy iron as cheap as you can, and you buy labor as cheap as you can.

Labor is a commodity like iron and coal—with this difference: Iron and coal don't care how cheap they are bought, but labor does. Labor is in fact, the human race. It's the people who demanded Magna Charta from John. It's the people who attended the Boston Tea Party. It's folks.

Now, I worked it out this way: I imagine myself to be a widow with four children. My husband left me \$10,000—perhaps in life insurance. I ask you to invest it for me and you do so. I get 5 per cent., or \$500, a year in dividends. I can't live and bring up four children on \$500 a year, but I take roomers or boarders and earn what I can. The \$500 is a great help to me.

I, myself, do not earn the \$500, but I'm mighty glad to get it wherever it does come from. Never having studied business, I don't even stop to think where it does come from. It just comes, that's all. It was left to me by my husband.

I manage the best I can, and I try hard to keep my oldest boy in school till he is sixteen. The others, too, as they grow up, I keep in school as long as I can.

As they reach the age when they must go out and get a job they strike the snag! Each one must sell himself in the market where labor is bought as cheap as it can be got.

And why?

Because—I must get my dividends. So all the time my dividends were other women's sons' and daughters' wages!

Wages or dividends, then—which shall it be?

I didn't know when my children were little. I didn't think. I thought my husband left me my dividends. But I think now, when I see my sons asking for jobs,—asking, after sleepless nights trying to work it out and to screw up their courage—for a raise.

My boys must ask the manager for a raise. And the manager must make dividends, because I must get 5 per cent.

I see it now.

I see that dividends are blind. I see that dividends are irresponsible. I see that labor is my boys and girls.

And my boys and girls—how are they going to get clothes and food and shelter and culture and a home for the next generation?

If I had a vote I'd say: "Never mind the 5 per cent., but give my boys a raise.

Recognize their right to think.

Recognize their right to speak.

Recognize their right to organize to demand the dividends they create."

I'm willing to work for my part! But, O God, for a chance to live and to laugh and to be glad! For a chance to walk anywhere and not see girls who sell their souls for bread and a little joy! For a chance to see men with hope shining in their eyes!

My boys and girls.

We are all thinking. We must be coming to something. Wages are too low and rents are too high. These are

facts—however we are going to manage it.

Yours sincerely,

AGNES INGLIS.

The Response

Miss Agnes Inglis,
Ann Arbor, Mich.

DEAR MISS INGLIS:

I have read your letter of October 1 three times. Your line of reasoning (as I follow it) leads you inevitably to your stated conclusion as to dividends and wages; that whatever is added to the one must be taken from the other. This conclusion is wrong, and, since your reasoning certainly leads to it, there must be something wrong with your premises. And on later readings of your letter I see a lot of mistakes in the premises, one of which is bigger than all the others. The big mistake is the assumption that a manager or operator or manufacturer has a duty to stockholders or has accepted a trust from them which debars him from doing his duty to his own employes and to humanity as a whole.

I have met managers whose narrow conception caused them to overrate their duty to their immediate employers and to underrate their duties to the rest of creation. But the great majority, though they may lack expression, try to do all their duty to mankind. And it is nowadays distinctly unpopular and unprofitable to be a Gradgrind. When I took the Edison properties, seventeen years ago, George Peck (now dead), who was president of the then very small Edison Illuminating Company, laid down to me, in the presence of the board of directors, a rule of management which was, briefly, as follows:

First, Maintain the value of the plant. If it is not maintained there will some day be no plant to serve the public nor to give employment to labor nor to earn dividends to stockholders.

Second, come *two* things of *equal* importance, neither being subordinate to the other, namely: Pay such a dividend as will make stockholders content to have their money in the business and put in more as required. Simultaneously pay such wages, always a little better than the market, as will enable you to keep capable and satisfied employes.

Third, and finally, When the prior conditions have been satisfied, reduce the selling price to the public.

I got those instructions in '96. They were exactly in accordance with my own ideas and they have been lived up to since then. And I do not know why these instructions, modified for minor differences, should not express the ruling policy of every manager or trader in the country, excepting only those unfortunate employers, or employing corporations, who find themselves between the upper and the nether mill

stones of a fixed price for their product and a rising price for their labor. The conditions of the last ten years have destroyed the dividend-earning capacity of many such employers. Many of the railroad companies in the country (their rates being fixed by law) are in this condition. Some industries are, as a whole, in this condition—that is to say, although their selling price is not fixed by law it is fixed by competition, either domestic or foreign, while their labor cost can not be reduced by improved machinery or superior organization. And there is always one firm or another which has been forced or has blundered into it.

My company might easily have now been so situated. But I have refused consistently to make long time contracts or agreements fixing rates and, while I have reduced rates, I have been able to increase the payment to labor *per unit of time* because I was simultaneously reducing the cost of labor *per unit of production*. Whereas, if my industry had already been highly developed and systematized when I took charge of it, so that no economics of organization or machinery were possible, I should have been unable thus to increase the day's pay of the men, unless I had been permitted to raise the selling price of my product to consumers. That I would have been able to do so is inconceivable. Even though I might have had legal right and governmental consent, any material rise in price would have made my product unmarketable. (In this connection I would suggest that you read in the September *Atlantic Monthly* an article on the minimum wage). In all these years I have held that the duty lay upon me to protect not only the interests of my stockholders but those of my employes, and to so manage my relations with the public which purchases my product that while the public was well served and got relatively low prices, it nevertheless paid enough to let me distribute a fair return to stockholders and a satisfactory wage to employes. To do this with fair dealing between the three parties—Capital, Labor and Public Service—has been not only my first duty but my whole duty. Because all the other duties merge into this.

Now if you will add to your premises, that people who receive dividends are folks just the same as people who receive wages, and that managers are persons and not impersonalities, and being persons are required to do (and usually try to do) their duty to all humanity and not to part of it only, then you will be able to arrive at the correct conclusion.

Let us, for argument, assume that your first conclusion is correct and that dividends ought to be abolished. Who in that case is going to furnish the capital which is necessary for productive

industry or for merchandising? It is inconceivable that any person who has a money surplus will allow it to be used or will use it himself to provide the means for the employment of labor without receiving some return upon his investment. Do you remember the Parable of the Talents, and particularly the denunciation of the unprofitable servant? The final reproach upon him was that even if he were unwilling to take the risk of putting to use the talent committed to his care he should at least have loaned it out so that when the Master returned He would receive His own with usury. Your plan of denying the return to capital, or requiring capital to be so self denying, would result in all capital being wrapped in a napkin and buried in the ground as was the talent intrusted to the unprofitable servant.

A thing that I said to you seems to have fastened itself on your memory, namely, that I consider it my business to buy coal as cheap as I can, and iron as cheap as I can, and labor as cheap as I can. I also said, or should have said, that I consider it my duty to buy capital as cheap as I can. But I should have made it clear to you that to buy labor or capital or iron or coal cheaply does not mean to buy any of these *at the lowest possible cash price*. Cheap labor, cheap in that sense is not cheap labor in my sense. And cheap capital does not mean the capital which earns the lowest rate of interest. Labor which is not earning enough to live comfortably and to enjoy some of the good things of life is never cheap labor. And capital which stays in business because it can't get out, or which is forced into that business to try to save an existing bad investment, is not cheap capital. I have had in my day, not of my own choice, to work with underpaid labor and with underpaid capital, and it has been my happiness in the last seventeen years that I have not had to work with either of them. Your labor that is always looking for another job and "has it in for the boss" because it is underpaid or overdriven is never worth the little it gets in money. And the man who tries to operate his plant with such labor is a great many kinds of a damn fool. Moreover, he is denying his fellowmen, and his Master—if he professes to have a Master.

Likewise the stockholders who are anxious to sell their stock at a sacrifice because they can't live on the dividends it earns, or because they are afraid of a reduction of the dividend, or of an assessment, are a mighty bad asset to the corporation. They spoil its credit and when it needs money they will neither give it nor will they pledge their holdings so that some usurer can lend it. A corporation with such capital is on the way to bankruptcy. Willing capital is just as necessary as willing labor.

Let us now consider a minute your problem of the widow. What difference does it make to the widow whether the money comes to her as dividends or as wages earned by her children? For this discussion it makes no difference, because you assume that what is lost to capital is gained by labor. In actual practice I think the widow is likely to have more consideration from the children if she has a small income than if she is entirely dependent upon their contributions. Your illustration does not illustrate your case. The person to whom you really want to deny the dividends is not your widow but is the wife or daughter—or it may be the widow—of some man who receives or has left so much money that his women folks are living in extravagant idleness. When you come right down to it the only person whose dividend you can stop, without increasing the total of injustice in the world, is the idle rich person who does nothing for humanity. And the way to reach the idle rich person is to impress upon him or upon her the duty of living in a reasonable way; and of investing surplus dividends in useful enterprise which will make work for people who need work and will earn more dividends to be wisely invested. After all, your idle rich person only gets out of it what he or she eats and wears. It is not having an excess over personal needs *but it is failing to use productively that excess that is the crime against society*. And let me say right here that the woman whose dividends keep her above the necessity of manual labor and set her free to study the needs of her fellow mortals and to help them by word and act is *not* living in idleness.

The true conclusion, when you take all the premises into the account, is that dividends and wages are alike the result of productive processes which are impossible if either capital or labor be lacking. The division between the two must be equitable or society cannot endure. That it is at times inequitable is true but it is not proven that the lack of equity is always in the direction that would favor capital. The individual workman who does not give a fair day's work, and has no intention of giving a fair day's work, is an exceedingly numerous person. And the workmen's organizations which attempt to limit productive effort of their members, and equally to prevent other people doing the work, are common enough to be a troublesome factor in equating concrete facts with abstract justice. Then the fool labor leader who has only half learned his business is just as common, pro rata, as the fool employer who thinks he can make money for himself by starving his help. Take the speech of W. D. Mahon, reported Wednesday, as made before the arbitrators now considering the pay of D. U. R. em-

ployee. Mahon in the one sentence declared that dividends sent to the stockholders were paid out of the labor fund. In the next sentence he demanded that the property should not be maintained out of earnings but that the stockholders should put in new capital for maintenance or betterments. I wonder how long he imagines any business would continue, if all the profits were to go to labor and the stockholders were not only to be refused any returns but were to be assessed to make good the depreciation of equipment? And yet Mahon is a better man than the average labor leader.

You recognize that my doctrine is individualism. I hold the individual responsible. And according to my reading of history, and study of life, society in the long run always has held the individual responsible. I say *in the long run*, advisedly, because, like David the Psalmist, I have seen the wicked for a time flourish like a green bay tree. But I have also seen that each generation has a higher standard than that which preceded it; that commercial morality

has stepped up to a much higher standard in my own lifetime; and I must believe that the advance will continue. It is not a progress by rank and file. It is a succession of surges. Once in a while the surge is destructive. But no progress is progress which is not of, and within, and by, the individual.

Just by way of plaguing you, will you let me say that I am not so sure that the PEOPLE demanded Magna Charta from John. History says it was the Barons—who were not the people, not by quite a whole lot. And one of the old Norman reproaches against John was that he made much of the serfs and yeomen. And I know where John is buried between two Saxon saints, who were the saints of the common people. And I also recall that Magna Charta did not help the common people very much, not for a great many generations. It was until some time in the 18th century the charter of the classes and not of the masses.

Yours sincerely,

ALEX. DOW.

WE HAVE MOST of us known the pleasure of having a protégé. It may have come in the guise of a poor family, pupil, wife, offspring, struggling committee or pet dog—but whatever its form, the pleasure we received from it, as a protégé, was the same in every case. This pleasure may be briefly summed up as follows: we knew the joy of giving out power; we found ourselves beloved, indispensable. And there is surely nothing wrong in enjoying such a situation. Anybody would.

Now for the sequel. Our protégé, having leaned full weight upon us and taken all that we had to give, began to outgrow the need of us—acquired a surprising ability to stand alone. And did we rejoice that our care had been so successful as to be no longer necessary? In most cases, it must be confessed, we did not. We were hurt, angry,—talked about ingratitude—and our dog, who alone out of the list could not develop rapidly enough to outgrow his need of us, remains in our minds the symbol of faithfulness.

I believe there are very few persons who have not had some experience of this kind; but I also believe that a great many people realize to some extent the pettiness of wishing to retain an escaping protégé—and have the grace to be ashamed of themselves. At least this is true of personal relationships.

When it comes to the large class relations it is by no means so easy to recognize the same sort of pettiness and the attendant need for shame. The protégé I am thinking of now is the proletariat—and the other party is, generally speaking, the church, the state, or the benevolent well-to-do. These all feel that the poor are an especial charge, to be helped, educated, inspired,—and efforts at reform meet with their unquali-

fied approval.

But something has evidently been happening since the old feudal days when the protective relationship struck its roots deep into the social order. The protégé has been learning things from books of his own choosing; growing up; becoming class-conscious—and a new situation is upon us.

Of course there are still plenty of the old type, who take our charity and like to play the faithful retainer, but we have got to reckon with a rapidly increasing army of working men and women who refuse to be protégés in any sense of the word. They want neither our charity nor our advice, having quite definite ideas of their own on all matters pertaining to their own welfare and development.

And we of the privileged class? For the most part we simply can't bear it, even the nicest of us. "See all that is

being done!" we cry (meaning of course, "See all that *we* are doing!") and we point with pride to Consumers' League, social center, tenement house legislation, babies' milk dispensary and a host of other agencies for bettering the condition of the poor. And having put Tanenbaum, Bouck White and others safely into jail and branded them as "agitators," we breathe more freely again.

But this kind of thing won't do much longer. There is a great labor movement here in our midst, manifesting itself in various ways—not the movement in behalf of labor, initiated by the privileged class, but a movement on the part of labor itself: *the working people taking their own problems into their own hands*, as every healthy protégé ought to do as soon as possible.

It is easy enough to sympathize with the ignorant suffering poor whose pathetic appeal is to our emotions,—but supremely difficult when it comes to these reading, thinking, rebellious poor, who call primarily to our sense of justice and intellectual understanding,—the more so as their activities are constantly put before us in the most unfavorable light by the daily press and certain well-known publications professing to have the interests of the working class at heart.

Hence it is absolutely necessary to get our knowledge first-hand and not trust to casual reports, if we wish to form any intelligent conception of the scope and trend of the labor movement. Here are men who have a different set of values from ours; in some respects a different code of ethics. Even where their morality agrees ostensibly with ours, as on the precept "thou shalt not steal," they have their own ideas as to who is the stealer and who the stolen-from. Their respect for our courts of justice is very slight; for our professed Christianity, even slighter. And yet they would die for their own ideal of justice, and they claim Jesus of Nazareth as one of their comrades. They place the happiness of a single child in the slums ahead of the success of the vastest business enterprise, and the life of a common soldier ahead of the honor of the greatest nation.

They demand for their class, rights which the most ardent reformers sadly relegate to the realms of Utopia, and they are reaching out to secure those rights by methods of their own choosing—not ours.

To understand these men and women of the advance guard of the working class, and to appreciate the quality of their thinking, we must go to their literary output (which is enormous) and, better yet, to themselves, for until we do this, and do it sympathetically, our best intentioned efforts on behalf of the masses are going to miss fire.

And so high are the ideals of Thinking Labor for itself and for the world, that as we come to understand them, it shall happen that many of us privileged folk will gladly discard our old hopes and plans as too small and unsatisfying—ready to leave all and follow this glorious conception of the new democracy which is the gift of the workers to the world.

The Passing of the Protégé

By Nina Bull

With the United States Commission on Industrial Relations spending \$300,000 primarily in the search for the underlying causes of industrial unrest and their remedies, the point of view presented in this article is to be reckoned with as voicing the feeling of a woman born into what she would now call the "privileged class," who has since cast her lot with the Socialist Party.—Ed.

EDUCATION

THE UNIVERSITIES AND TRAINING FOR PUBLIC SERVICE—By EDWARD A. FITZPATRICK EXECUTIVE SECRETARY COMMITTEE ON PRACTICAL TRAINING, AMERICAN POLITICAL SCIENCE ASSOCIATION

THE PROBLEM of training for public service is thus admirably stated by President Lowell of Harvard:

"We no longer believe in America that a man who has shown himself fairly clever at something else, is thereby qualified to manage a railroad, a factory, or a bank. Are we better justified in assuming that an election by popular vote, or an appointment by a chief magistrate, confers, without apprenticeship, an immediate capacity to construct the roads and bridges, direct the education, manage the finances, purify the water supply, or dispose of the sewage of a large city; and this when it is almost certain that the person selected will not remain in office long enough to learn thoroughly a business of which he knows little or nothing at the outset?"

The question can be asked pertinently only of public service. Both industry and commerce in their own organizations and in the higher institutions of learning are training their leaders. Where is there a university school of public service to rank with the Harvard School of Business and Administration or with the Dartmouth, Pennsylvania or New York University schools? Why have not state universities established such schools and given such training? This would seem to be their obvious first duty. Where are there within government the facilities for training that are found in the National Cash Register Company or the Pennsylvania Railroad Company?

It is true that in public service we do have some such training but it is in the military and not in the civil side of public service. In education we have long trained the teachers of elementary schools, but high school and university teachers have not been trained. Nor have the supervisors and administrators of public education been adequately trained. The movement now well under way to train the higher grades of teachers and administrators has developed outside government and publicly supported institutions.

And yet just as in education there is advance, there are signs that the whole public service will become a vast educational instrumentality for persons who have entered it and the institutions of learning will give preparatory work looking forward to it.

A number of things have been developing in universities upon which a constructive movement could build. The

first thing we note is the recognition in connection with individual courses that recitation on certain pages of general texts is not the best method of teaching. So we have courses on Iowa problems, Nebraska problems, and California problems—a recognition that education as well as charity might very properly begin at home. Men engaged in the solution of community problems are called into the university class-rooms to tell of their experiences. Students are brought into "frequent contact with the men, organizations and activities that are studied," by inspection and investigative tours. In one field at least—legislative drafting—we pass from the investigating of the thing to actually doing it.

Students are now sent on geological surveys. Students of agriculture frequently spend their summers at experimental stations. The university is coming to recognize more and more that that there is no particular educational value in its class-rooms or laboratories. John R. Commons, as a member of the Wisconsin Industrial Commission, in Room 217 of the Capitol, is at least as effective a teacher as Professor Commons in Room 217 of the university. The sending of college professors and graduate students on traveling fellowships and the large increase of such fellowships are hopeful signs for the future.

This connection of university and government is probably best symbolized in the amazing number of college professors who are serving government. The facts for one college—Columbia—are given in a recent number of the *Columbia University Quarterly*, extending over fifteen pages. In the *Columbia University Quarterly* for September, 1912, there were given thirteen pages of Columbia alumni who were then serving in the various governmental agencies at Washington.

In spite of all these tendencies and facts, the universities of the country are not training men definitely and consciously for public service, except as they believe that the best training for public service is a generally trained man—whatever that is. College professors themselves have recognized this. The many college professors in the American Political Science Association thought

there was need for more definite and more practical training, and consequently there was appointed the Committee on Practical Training for Public Service of the American Political Science Association. This committee is "to examine and make a list of places where laboratory work for graduate students in political science can be done; to recommend to the various college and university faculties that due graduate credit be given to such places; to use its best endeavors to obtain scholarships for this laboratory work, and to secure an endowment for the building up of a trained body of public servants; and to make, if possible, a system of card records and efficiency standards for graduates doing practical work in political science."

This same committee has proposed to the universities of the country a plan by which candidates for the doctor's degree would spend one year (preferably the second) in agencies where they could receive practical training under adequate supervision. The essence of this plan is given in the following proposed standard regulation for the Ph.D.:

"Candidates for the degree of Doctor of Philosophy must pursue their studies in residence for a minimum period of three years, provided, however, that the period of residence may be proportionately extended to students from institutions in which the course of study is not regarded as equivalent to that in _____ College. In rare cases, students may, with the approval of the proper administrative authority, satisfy the residence requirement in two years."

The requirements of time for the degree of Doctor of Philosophy are wholly secondary. This degree does not rest on any computation of time, nor on any enumeration of courses, although no student can become a candidate for it until he has fulfilled the requirements of residence and study for the prescribed periods.

Candidates for the doctor's degree in political science or political economy, conforming to all the other regulations for such persons, may fulfill the resident requirements of three years' graduate study as follows: (1) Two years' resident graduate study in some recognized institution of learning, at least one of which must be spent at this university; (2) Practical work for at least eleven months in a governmental department, bureau or commission, a legislative reference library, a bureau of municipal research or similar organizations under the following conditions:

Weekly Time Report of R. C. Journey for week ending Oct. 19, 1913.

Assignment.	Mon.	Tues.	Wed.	Thur.	Fri.	Sat.	Sun.	Total Hours.
Efficiency survey of state government under Board of Public Affairs.								
(a) Banking Department	10:40	11:00	10:50	11:00	11:10			54:00
(b) Public Utilities Commission						11:30	9	20:30
Total	10:40	11:00	10:50	11:00	11:10	11:30	9	74:30

(a) that a statement of facts regarding opportunities for practical work, nature and extent of supervision of student's work and related facts be submitted to the department by the Committee on Practical Training for Public Service of the American Political Science Association or by a member of the department and accepted by the department concerned as satisfactory;

(b) that weekly or bi-weekly reports of time spent and work done be kept on the forms suggested by the Committee on Practical Training for Public Service or similar forms, and submitted to the professor in charge of the major subject of the student currently;

(c) that the institution where student is working, be visited by a representative of the department or of the Committee on Practical Training at such intervals as the department may think necessary.

Professor Loeb, of the University of Missouri, was very much interested in the plan and asked to have Rockwell C. Journey, fellow in political science at Missouri, placed in the Wisconsin Legislative Reference Library under the plan. Mr. Journey was accepted. He arrived on June twentieth and was handed this assignment:

"From now until the end of the legislative session you will be expected to attend each session of the Legislature and as many of the committee meetings as is possible. Please be present a little while before each session opens and watch the lobby both before, during and immediately after the close of the sessions. You will please watch legislation in which the Board of Public Affairs is interested, e. g., education, co-operation, northern lands, and mortgage land banks. When the Legislature is not in session observe the reference and drafting departments of the Legislative Reference Library. After each evening session you will have abundant opportunity to get in direct touch with the legislators in the post-session conferences of Dr. McCarthy and the legislators."

And so Mr. Journey saw our Legislature at work. Instead of the simple process of the text-books he saw the many "invisible" processes of law-making. He saw a lobby at work daily. He saw evidence that looked as if the various elements in a lobby united to "kill" or to have passed legislative bills. He saw how effective legislative opinion is created. He visited the rendezvous of legislators in hotels, cafeterias, etc. He saw men deliver speeches that were handed to them. He talked to legislators

who did not know that in ten minutes they had to vote on great fundamental bills. He saw, too, "soldiers of the common good" persistently fight the good fight; he saw devotion to the state that is unparalleled in the battle field.

Mr. Journey was next assigned to study the relations of a great investigative body to legislation. He was given this assignment:

"Will you make a study of the State Board of Public Affairs in its relation to the administration of state government in Wisconsin? Chapter 583 of the laws of 1911 is the statute creating the Board of Public Affairs. This probably would be a good starting point. This statute is to be changed by senate bill No. 426, which you will please follow in its course through the legislature. See assembly bill No. 1098 and watch that."

"The Board of Public Affairs is two main divisions, an accounting division and a social-economic division. The principal work of the social-economic division has been:

(1) a study of the rural schools of the state;

(2) a study of principles underlying a state budget;

(3) studies in co-operation and marketing;

(4) co-operative credit.

"The principal work of the accounting division has been:

(1) a system of accounts for all state departments and state institutions;

(2) an audit of the university, board of control and normal schools;

(3) preparation of a complete budget for the state which is the basis for all appropriation bills introduced in the legislature."

He was then taken over by the Board of Public Affairs to help in one of its investigations. He was assigned as follows:

"The Board of Public Affairs is authorized under sub-section 5 of section 990-56 of the statutes to continue its investigation into the efficiency and economy of public bodies. Under this general authorization you are hereby assigned under Mr. Campbell of the Board of Public Affairs to make a study of the actual services being rendered by the various departments of government and to set this service over against the expenditure for the various purposes of the department."

"The disbursements for the departments have been worked out for a period of ten years, 1902-12 inclusive.

The fiscal statistics for the year 1913 will be compiled by the employees of the state tax commission. The work which you will be especially assigned to has been done in a very general way. It is necessary to get more specific information and to find out more definitely what is being done. For this purpose you will have to visit departments under Mr. Campbell's direction."

In addition to this, Mr. Journey made practical studies of civil service, of state fire insurance, and of agricultural organization. He thus had a rather complete view of state government, of legislation, of investigation of administration. A typical time sheet, reproduced above, shows the distribution of his time for a week.

There remains a final problem. There is an indubitable demand for trained men for public service. The universities are responding to this demand as far as possible without disturbing too much present arrangements. Contents of courses are undergoing considerable changes in many places. Now organizations are being attached to universities rather than being made organic parts of them. A plan has been proposed and has the backing of large numbers of university professors all over the country. There is nothing especially dramatic about the plan. There are no outraged victims that have melodramatic appeal. There are none of the usual appeals to the wealthy and public-spirited men of the country, and yet there is need for money to carry on the work.

There are outraged victims of our present misgovernment in every community in the country—you and I are the victims. The proposals of this program promise no revolutionary change. It is no panacea. But it does promise on a national scale a constructive effort which will slowly accomplish revolution in our attitude and our results.

NEW COURSE FOR SOCIAL WORKERS

Dr. Lightner Witmer, professor of psychology at the University of Pennsylvania, announces a new course for social workers and teachers of abnormal children. The course will offer instruction in the principles of applied psychology with practical work in the psychological clinic and the dispensaries of the university hospital. All the resources of the university are to be made available for this work. To complete the course, student will be required to attend either four summer sessions or one summer session and one full academic year.

B. L. T. in the *Chicago Tribune* quotes the following letterhead from the Canton, Ill., public schools:

"Our High School's Aim: A democratized program of studies for each student pursued amid a socialized environment with content of each subject vitalized with vocational functioning."

SOCIAL AGENCIES

PUBLIC INSTITUTIONS FOR THE POOR IN PEKING— BY ERNEST T. SHAW, TUNGCHOU, PEKING

THE CRUCIBLE of foreign influence in China that has been gathering heat from foreign invasion since 1895 boiled over in 1900 and again in 1911. Today the age-old ideas that formerly prevailed have been brought to a state of flux and as they cool down, crystallize into a new form free from the dross of past ages. Although a true social spirit in a land of such size and with such diverse customs will be one of the last to come out of the melting pot, one can already see its embryo.

In order to hasten its growth, the committee in charge of the summer conference for the students of North China resolved to make the general topic: Social Service and the Christian Message. As a part of the preparation for this, a group of students representing three of the colleges in and near Peking spent ten days in the metropolis studying its social institutions of a public nature, and at the conference they made reports upon all the institutions visited, which included poorhouses, orphanages, hospitals, free schools, public lecture halls, prisons, a Door of Hope and one insane asylum.

The first place visited was an orphanage connected with a Buddhist temple, located on large grounds and having buildings which were light and airy, with the dormitories separated from the work rooms. It sheltered 217 boys, some of whom had only one parent, but most of whom were orphans. They were not kept as clean as foreigners like to see children, but their condition was considerably above that of the urchin on the street. Besides teaching from books for three hours a day, they are taught spinning, weaving, lithography, shoemaking, tailoring or glass blowing. The shops appeared to be well conducted, and when the boys leave the institution,

Readers of THE SURVEY will be interested in this account of the beginnings of institutional work in China where a few people are bravely struggling against prejudice and ignorance. Their tremendous task is to graft on to China's sixteenth-century life the institutions of the twentieth century.—ED.

they are probably better prepared to fill places in the ranks of industry than the average Chinese youth trained as an apprentice.

The other two orphanages visited were a product of Christianity although foreigners were not directly concerned in their conduct. One received only boys and the other only girls. It was really a refreshing sight to look at the little girls, for while their clothes were poor, they were spotlessly clean, as were their surroundings, and one could not ask to see a brighter and more eager looking lot of children. The boys were not cared for quite so well, but, as in the Buddhist orphanage, they were much better cared for than the average boy on the street.

If the orphanages were exemplary for their condition, the poorhouses visited were quite the opposite as examples of what public institutions ought not to be. In these two, conditions were nauseating. The men and boys were clothed in beggars' rags. Their bodies were filthy. They were crowded into rooms in which the air was so foul that most of the students refused to go in. Seemingly no attention was paid to sickness or wretched sores, and no regular work was provided. They were not allowed to go out and beg, but occasionally a few

of them did go out to pull rickshaws or sell odds and ends. There were a few old men and some who were maimed so that they were incapacitated for remunerative employment, but there were a very large number of men in the prime of life who ought to have been taking their places in the ranks of self-supporting laborers.

The most pathetic sight of all, however, was the row of thirty-six boys sitting on the edge of the large brick bed on which they all slept, from morning to night doing nothing but waiting until death should set their spirits free or the insane asylum open its doors to receive them into worse than death. All but one of them said that they had homes, but these were of such a temporary nature that when they had become lost on the streets of Peking, they had not been able to find them again, and the police had sent them to this place. In spite of these conditions, which seemed unbearable, they said that they were glad to get even such care as was given them. The attendants in charge of the institution were illiterate, incapable of appreciating the possibilities in that group of youths.

The third poorhouse visited made the poorhouse problem more hopeful. Originally the buildings had been used for a prison, but upon the completion of the new prison in another part of the city, this plant had been converted into a poorhouse accommodating 300 men. Everything was clean and sanitary, and adequate provision was made for the activity of the men. Different kinds of industry, including tailoring, spinning, weaving and common labor, were carried on and each man was appointed to one task or another according to his ability.

After he has learned a trade sufficiently well, if the inmate can find a shopkeeper to go surety for him, he may leave the institution and try to support himself, but the superintendent said that it was so difficult to find responsible people who were willing to run the risks involved in helping these men that only a few were allowed to go out each year. Even more hopeful than the condition of the institution was the character of the superintendent himself; he was not only working for the improvement of his own institution, but at the same time he had a grasp of the larger problems involved in relief work.

In a land where sickness has been considered the visitation of evil spirits, it is encouraging to see the beginning of a scientific hospital system. So far, the plants are not very extensive and really amount to little more than dispensaries, but the idea of hospitals managed for the benefit of the public has taken root and will grow as the number of native doctors of medicine increases.

ONE OF THE PUBLIC INSTITUTIONS WHICH HOUSE THE UNFORTUNATE OF PEKING

GROUP OF CHINESE POOR—OLD, MAIMED AND SICK—INMATES OF AN ALMSHOUSE

Only two were of any size at all, and in one case the party arrived about noon and found that all the attendants had gone out so that there was no opportunity to inquire about their work. The other had beds for twenty in-patients and furnished treatment for about five hundred out-patients. The institution was under the direction of a man trained in a mission hospital, and although there were departments for both Chinese and foreign medicine, by far the larger number of patrons preferred the foreign medicine. Very poor in-patients were treated free, but those who were able to pay were required to bear the cost of their food, from fifteen to sixty cents a day. Even surgical work was performed, but the operating room would scarcely be called aseptic.

Learning has been so respected in China that it was not surprising to find a large number of free schools, and they need no special comment. The free lecture halls scattered over the city under the direction of the board of education are novel institutions. All sorts of places have been adapted to this use, shops, schools, old temples and specially constructed buildings. On an average they seat about a hundred people, but besides their use every afternoon or evening as audience halls, they are used as libraries and in some cases as schools. On the walls hang educational pictures, maps and charts, and on the tables are kept a good collection of newspapers.

One picturesque place of this kind was located in the temple of the God of Fire; another one mixed its furniture with the apparatus of a volunteer fire company, while still a third was comfortably housed in a specially constructed building furnished with foreign seats. In all of them lectures are given every afternoon by speakers invited by the board of education. The topics seem to be left to the discretion of the speakers, but one attendant gave a characteristic answer to the question as to the purpose served by these institutions when he said that

they were intended to help the change from the old to the new.

Some of the regulations are very interesting; visitors must not smoke in the rooms or expectorate on the floors; they must be properly dressed, cannot talk during the progress of a lecture, criticize the speaker nor bring in bird-cages!

Two of the last institutions visited filled one with hope for the capacity of the Chinese to recognize their social responsibilities and their ability to bear them—the Door of Hope and the new industrial prison.

The superintendent of the former institution was evidently of the greatest refinement and delicacy, certainly necessary qualifications for one who undertakes this kind of work which often only aggravates the evil it is intended to mitigate. Admission to the institution is gained through the police, and both slave girls and unfortunate public girls are received. Everything within the institution was clean, and the girls, some not more than eight years old, not only have the advantage of this environment, but are also taught various kinds of needlework and are paid for their product. The money thus earned may be spent to buy things for their personal use or saved and used as a dowry when they leave.

The common way of discharging them is by finding husbands. The pictures of all above the age of sixteen are placed in a frame on the front of the building and middlemen searching for wives may choose one of the girls from this catalog, a procedure that sounds worse than it really is when the reader remembers that according to Chinese custom the bride never sees her husband until after the ceremony. If the girl is mistreated, she may return to the institution, but not many cases of abuse or non-support are known to the superintendent.

The institution showing the greatest development of a really scientific solution of a social problem was the industrial prison completed about a year and a half ago. The superintendent traveled

all through Europe and Japan studying prison construction and discipline, and upon his return to Peking planned the present structure himself and has determined its mode of conduct. The structure shows the result of careful planning and the entire system of management is based upon the best of the world's experience. One cannot get away from the impression that the men inside its walls are vastly better off than the majority of the Chinese outside.

Good behavior may reduce the term of a prisoner as much as one-half the sentence. All brutal forms of punishment have been abolished, and in their place is a system of rewards and punishments. For instance, each man is normally paid six cents a day wages, but good behavior increases this up to a maximum of twelve cents while breaches of discipline result in the forfeiture of part of it. Other rewards are greater freedom in seeing and writing letters to friends and relatives, extra food, extra clothes and furniture, and, for juvenile offenders, a badge of honor. The fines take the form of loss of all rewards, or of seeing friends and relatives for three months, forfeiture of reading privileges, lessening of food allowance, isolation, the dark room, and finally, expulsion from the prison, which means a return to the wretched conditions of prisons built and conducted on the old style.

There is segregation of juvenile and confirmed offenders. For the former a school is conducted under a special teacher half the day.

Various kinds of industrial work are carried on by the prisoners—weaving, woodworking, bookbinding, printing, metal work, agriculture and common labor. Each man is given the kind of work that seems best suited to his ability and the food allowance is according to the nature of his work. Their product is sold in the open market without any compunctions as to its competing with free labor, although the printing is largely used by the government.

This is the Life!

A CLASS IN EMBROIDERY

'PUT 'ER OVER, THERE!'

AN IMPROMPTU SHOWER BATH

Groups of 200 children at a time are enjoying ten-day outings at the Children's Fresh Air Camp, 11007 Buckeye Road, on the heights above the city. Dense shade, a well-equipped playground, a swimming pool, and a garden where the youngsters can dig and weed to their hearts' content, supply pleasures which most of the children never have known before. Kindly young women conduct classes in sewing and basketry and tell fascinating stories. The children sleep in permanent tents, eat practically out-of-doors in a great open dining-room, and play in open air the whole day through. Thus they get a new start in life.

The Children's Fresh Air Camp will have cared for 1,500 children in this way when it closes in September; and sent close to 1,000 other children to farms in the country, through its outing department.

The Epworth Fresh Air Camp, near Painesville, and the Salvation Army Fresh Air Camp, at Mentor, doing work similar to that of the Children's Fresh Air Camp, will raise to a total of 3,500, the number of Cleveland children carried back to Nature this summer.

THE SOCIAL NEWS BUREAU

Of the Cleveland Federation for Charity and Philanthropy

BULLETIN No. 3

THE WESTERN RESERVE PRESS, CLEVELAND

Posters setting forth in picture and caption the social work of the city will catch the eye just as well as the current events posters which many retail store windows exhibit as a means of attracting attention for the wares displayed—this is the belief of the Cleveland Federation for Charity and Philanthropy. Numbers of store keepers are co-operating by putting in their windows posters like that here shown.

Sanitary conditions are of a high standard. The rooms are light and airy and the prisoners required to wash their hands and faces twice each day and bathe twice each week, a training which would benefit the whole nation, could it be passed on to them.

The prisoners have the privilege of spending part of their wages for luxuries to use during their confinement, but the officials keep back the rest of it against the day of their release. When the doors swing open and the prisoner is given his freedom, he receives this small sum and a new suit of clothes in addition to anything he may have had when he came to the prison.

The life of the institution has been so short that it is hard to predict its value, but it certainly looks promising at the beginning.

The Yellow Dragon has existed with his parts connected not by the strong ligaments of common interest, but only the superficial bonds of yellow skin and strings of cash. The establishment of public institutions by the people themselves, designed not merely to defend themselves from foreign enemies, but to uplift their own people is a prophecy of the power and influence that will come to the nation when the spirit that is behind them fully controls the people.

CHELSEA AT WORK ON ITS OWN CIVIC PROBLEMS

NEW YORK city's first "cent-a-glass" milk station to be supported by the people of a neighborhood and not by a single person's philanthropy opened recently on a Sunday, and before noon 1,021 glasses had been bought by grown-ups and children and the station had to close for the day for lack of milk.

It was opened in old Chelsea, at Ninth avenue and Twenty-seventh street.

Chelsea's citizens are proud of this enterprise which they regard as the fruit of their self-reliance.

Eighteen milk stations in the city are supported by Nathan Straus, and serve an average of 25,000 glasses a day. But until the Chelsea Park milk booth opened there was no station to supply the 180,000 men, women and children who live between Fourteenth and Forty-second streets, west of Fifth avenue, the Chelsea district.

The Men's Club of the Hudson Guild and the Chelsea Neighborhood Association have led in this effort to help the people to help themselves. A campaign by letter raised nearly \$300, and a house to house canvass has been undertaken. Not only the funds for the station came from Chelsea but a Chelsea carpenter constructed the booth, a Chelsea plumber made the water connections, and two Chelsea widows have been given employment, selling the milk.

The Chelsea Neighborhood Association has also initiated a campaign recently against what it calls contagious social diseases. Chelsea supervising school authorities have been supplied by the association with a list of all known disorderly places in the district in the hope that this knowledge may prove useful in protecting the children who live on disorderly premises. It is estimated that one in every 250 children attending school is exposed to moral contamination from evil surroundings, that ratio representing the youngsters who actually live on tenement premises where the social evil flourishes.

"This new method of attacking the problem is logical and should undoubt-

edly bear fruit," says Edward H. Pfeiffer, executive secretary of the association. "Principals may be able, with this information at hand, to give special attention to the conduct of children living on disorderly premises, and may check indications of moral weakness before it has reached advanced stages of perversion or degeneracy."

READ-AS-YOU-RUN ADVERTISING FOR SOCIAL AGENCIES—By Carl Beck

EDUCATIONAL PUBLICITY is an important factor in every business, every campaign, every social and civic work which in order to be successful, must influence, in a large way, the human mind. Methods of publicity, therefore, are all important. Catching, convenient, economical methods are in demand. Such a method is the poster-stamp that has been for over a year a craze in Germany, has now seized Austria, Denmark, Switzerland, Holland, France and Italy and is beginning to appear in America.

The poster-stamp, like the poster itself, is a read-as-you-run method of getting attention. It is a striking combination of color or design, or both, stamp in form, gummed and perforated in sheets, and easily torn apart. Your mail some morning may have an envelope with a brilliant little paper gummed on it that catches your eye. Or the stamp may be stuck on the letter-head inside. At any rate, its charm and intrusiveness will not let you escape. The message is branded on your memory.

The poster stamp is not unlike the American Red Cross Stamps at Christmas time, or the American exposition stamps that we see from time to time.

But the Germans have carried the use much farther than that. There commercial houses, societies, clubs and municipalities have issued poster-stamps, and the children collect them like postage stamps. According to the American consul in Nuremberg there is hardly a child in that city who cannot show a collection of one or two thousand poster stamps.

Used in Germany first by commercial bodies and then appropriated by propagandist and altruistic organizations, the poster stamp is undergoing the same evolution here. The North German Lloyd Steamship Company, the New York Edison Company, the Publishers Printing Company and the Lehigh Valley Railroad are among the American business concerns that have used it. Recently *Harper's Weekly* offered a prize for the best idea of a poster stamp fitting the character of that magazine.

Last spring the People's Institute of New York city, in its educational campaign for the greater use of New York's five hundred schools as social centers, used a trial poster-stamp with effect. The design carries a simple school house of an average sized city going full blast at night as a People's Club House. Three colors help to attract attention. The message has been so worded that the stamp could be used throughout the country. Whether the object of a local campaign be to popularize a newly opened center or to stimulate contributions for its support, the stamp gives special "punch" to any written appeal to which it may be attached.

The social worker in thousands of cities in this country would in all probability welcome the poster stamp as a catching, convenient, practical means of educating the public on general social reforms and remedies in his or her local field. Here is an opportunity for national social, civic, and religious agencies to supply to local agencies, free or at bare cost, small quantities of poster-stamps, which can be got out in large numbers to reduce the cost. Thereby many a social message would ride on other messages into the minds of busy people whose over-worked attention must be broken into by "catch-as-catch can" methods.

TRAINING FOR MEDICAL SOCIAL SERVICE

To MEET the pressing demand for educated women who have a practical working knowledge of disease and of nursing and medical procedure, together with training also for social work, the New York School of Philanthropy, in co-operation with the Bellevue Hospital Training School for Nurses, announces a combined course in medical social service.

The full course of three years leads to a diploma from both schools. It consists of two years in the Training School for Nurses, during which time students are kept in touch with social work through occasional lectures and conferences provided by the School of Philanthropy, and a third year in the School of Philanthropy, during which students are kept in touch with medical and sani-

POSTER STAMP DESIGN, USED WITH SUCCESS BY THE PEOPLE'S INSTITUTE, NEW YORK CITY

tary service through lectures, conferences, and practical field work in the social service department of a hospital or dispensary, or in connection with the Department of Health.

The full student course at Bellevue is two years and nine months. In view, however, of the advanced preliminary education required for admission to this combined course, tested by the entrance examination and other evidences, students in the combined course are allowed to substitute the year in the School of Philanthropy—extending through the regular academic year from October to June—for the final nine months of the training course. The diploma in nursing is granted to these special students only on the completion of this third year in the School of Philanthropy.

The theoretical and practical courses in the School of Nursing have been condensed and rearranged with a view to meeting the requirements of women who expect to engage in social work. The diploma awarded upon graduation, however, qualifies all such students for registration under the Board of Regents.

The School of Philanthropy, on its part, accepts the two years of nurse's training, when taken under the conditions above described, as a substitute for one-half of its regular two years' course, and confers its diploma upon such students after the further year of resident study in the School of Philanthropy, during which period special attention is given to medical or sanitary field work.

A shorter course, consisting of one year in the Training School for Nurses and one year in the School of Philanthropy, is also offered. This course, however, does not entitle the student to the diploma of either school, nor to registration for the practice of nursing in the state of New York. It will prepare specifically for certain kinds of social work in which familiarity with nursing procedure is desirable.

Candidates for admission to either course must satisfy the entrance requirements of both schools. While in the hospital, students in these courses are entitled to the same living privileges as other pupil nurses, and are also subject to the same rules and regulations and authority. Students may enter the Training School on September 1, Decem-

ber 15, or March 15. The year in the School of Philanthropy begins on September 29.

For women who have already completed a course of training in a recognized school for nurses, and who are otherwise properly qualified, the School of Philanthropy offers its regular two-year course of training in medical social service. During the first year of the regular course such students will have an opportunity for field work in connection with some of the medical social service of the city. At the close of the first year they will receive a certificate from the school, and upon the completion of the second year's work under the supervision of the staff of the school they will be entitled to its full diploma. The second year may consist, in some cases, of work in a salaried position, under approved conditions, with the addition of a seminar at hours which will not interfere with the work of the position.

THE STUDY OF MENTAL DEFICIENCIES IN NEW YORK STATE

THE RECENTLY appointed New York state commission to investigate public care, custody, treatment and training of the mentally deficient hopes to present to the next Legislature a comprehensive long range program for the elimination of these defectives from society. The commission has just outlined its work.

It plans to study the number of feeble-minded in the state, the present provision for them and the methods here and elsewhere of determining and treating those who are so handicapped. It hopes further to make as thorough a study of the causes as the time and money at its command permit; also to make a special social survey of various types of communities, to determine the relationship between degeneracy and social stagnation, poverty and immorality as well as the effect of mental deficiency on both dependency and delinquency.

The commission hopes further to take up for definite consideration the responsibility of the state—

To provide for more and better institutions for permanent care.

To prevent by sterilization and segregation the propagation of degeneracy.

To provide a more scientific method of determining and treating the mentally deficient.

To more intelligently adapt the public school system to the special need of the "border-line" child.

To institute a stricter social control of marriage.

To provide for a permanent and continued census of and special supervision over all defectives.

To develop more effective birth and health registration.

To develop a sound and sane system of universal education in sex hygiene and social sanitation.

To inaugurate an adequate method of protecting all children under wholesome environment and normal home life.

DUTY OF NEUTRALS

TO THE EDITOR: We stand as a nation passively neutral. As individuals we are stirred to the depths of our lives by an intense desire to act—to use the strength of mercy and of love's true power to save humanity from destruction. How shall we turn the smiling hate of selfish souls, the blindness of greed into a will to serve?

Let us in council with the wisest and best men of the world, energetically concentrate our thought and action upon finding some way to hold aloft the standard of friends, and all that true friendship implies. Let us grasp, unite, deepen all the good will, genuine feeling and untiring activity of our day, help it to express itself in a devotion of strength, thoughts and treasure to the opportunity to truly serve the whole of humanity.

This great task is ours, the greatest task and greatest privilege which has ever presented itself to a democracy in the history of the world in its strength towards love and freedom.

ADELAIDE EARLE.

Montclair, N. J.

THE FUTURE

TO THE EDITOR: May I offer you this as my interpretation of the end of your efforts? And may I express my appreciation of the noble work being done by you?

THE SURVEY:—

I labor for the coming of a happy day to the human race.

I see children, joyous and free, their souls no longer stifled by want, their little bodies no longer ground into dividends.

I see woman liberated from the thrall-dom of sex, purified and ennobled by a chaste and voluntary motherhood.

I see man, emancipated from his industrial bondage, grow to the power and dignity of a God.

I see a human race, released from its economic servitude, develop spiritually and intellectually, beyond the dream of the most hopeful idealist.

I see a world, freed from the sordid misery that brings endless mourning to thousands, become a place of peace and happiness.

A world of brothers in which the labor of one is the labor of all—the sorrow of one the sorrow of all—the joy of one, the joy of all;

A world in which homelessness, want, hunger and cold no longer stalk, like the figures of a hideous nightmare, through our lives;

A world without potentates and titles, without war and destruction, without degradation and abasement;

A world wherein love has supplanted hate, tenderness has displaced greed, and light has dissipated darkness.

A world in which all may realize a full and abundant life, in which all may share on full and equal terms;

A world wherein joy, comfort and plenty shall be the reward of toil, and wherein human blood and human tears shall not be the price of life.

HAROLD EVERHART.

Oakland, Cal.

TRAINING CHILD NURSES

TO THE EDITOR: Society is complacent over the accomplishment of statesmanship in the pensioning of needy mothers to enable them to remain at home and give mother-care to young children. There is no apparent indication of equal concern over the neglected children of well-to-do mothers who fail in the performance of a like duty to their children, but who would resent the suggestion that they are delinquent mothers.

The practice of turning the care of young children over to immature nurse girls, who themselves are often imposed upon by the assignment to such duties, for which they are manifestly unfit, is fraught with more harm to social welfare than the half care which working mothers can afford to give with their aching heads and tired bodies.

Time was when careful mothers hesitated to give over the care of their children to others, even for a necessary rest; but now, the number of presumably careful mothers who surrender the most important duties of motherhood to immature and incapable nurse maids has grown to an appalling total.

Indeed, it would not be strange if some of the delinquent mothers who thus neglect their own children should be found among other public-spirited citizens who give time and influence to secure legislation which dedicates public funds to the employment of needy mothers to remain at home and perform their maternal duties.

We are duly and truly indignant over the exploitation of children of immature age in factories, stores, and workshops, and the deprivation of such children from school advantages secured to them by compulsory education laws; but we are not equally concerned over the more harmful practice of employing children as nurse maids.

It will not do to say too much on this subject, but it bristles with invitations to study, to all who are concerned, and especially to those who are inclined to make neglectful fathers the family scapegoats.

If it be true that the nurse-maid problem has become an important subject in social economy, it must be deserving of the offices of the social surveyors who study the conditions of poor environment and bad housing because of their injurious effects upon the lives and prospects of the children.

If it so be that children must be regularly employed to have the care of children, let there be a minimum age at which such employment may be undertaken, and some preliminary training to the young nurses who are dedicated to such service. We train nurses to care for the insane. Why not for the children?

AGAIN THE "LUNGER"

TO THE EDITOR: The itinerant consumptive of the Southwest has received some mention in THE SURVEY from time to time. His tribe apparently does not decrease, and every one of these health-gypsies has a story. Here is one:

William J—— and his wife and a one-eyed girl child of twelve appeared in San Antonio recently. They were not of the usual type of charity society visitors, the wife being a good seamstress and anxious to get work. The husband was undeniably a "lunger," and his wife apparently consumptive, although she refused to be examined for fear of learning the truth. The child, *Quien sabe?* She slept with her parents when they could not afford two beds.

The J——s claimed residence nowhere. The man claimed that he was born in Texas; the woman was born in New Jersey. They had married and lived in Pennsylvania in various towns, J——'s occupation as a railway man causing him to move frequently. Later they went to St. Louis and lived there at various times in boarding houses and furnished rooms. There the wife contracted pneumonia "and on the advice of a physician, they went to Albuquerque, N. M."

The husband went into Mexico to take a railroad position several years ago. About twenty months ago he was arrested with other Americans and lay in jail in Mexico City for seven months. His country did not protect him from the charge of being an "Americano."

In the small "dobe" house where he was confined was a consumptive Mexican. How many consumptives were released from the jail is not known.

The husband and wife were reunited at La Junta, Col. There the good-hearted railway men made up a purse and got transportation for them to Tucson, Ariz., where they arrived with \$24 cash.

From Tucson they drifted to Los Angeles, where they stayed only a short time because of the inability of the wife to get work. Thence they went to San Bernardino for three months. The wife worked at sewing and dressmaking, but did not earn enough to keep them. They gradually sold everything of value and finally "went broke." According to their statement they were practically driven out of San Bernardino by the authorities, to whom appeals had been made in their behalf, and they were shipped to Douglas, Ariz. They landed in Douglas, where they were allowed to stay nine days and were then shipped, by the mayor they claim, to San Antonio, Tex., with the free advice to get a tent and live out in the country near town.

San Antonio, therefore, now has them. The United Charities placed them in a furnished room and gave them food and

offered to place them, temporarily, in a hospital, and to place the child in an orphanage. This would give them relief until the United Charities could plan some permanent help for them. They refused to go to the hospital, and refused to be separated from their child. They threatened to go to the City Hall and sit on the steps and die or to start walking somewhere and to continue to walk until they died. Foolish, of course, but consider their state of mind.

This is one of hundreds of similar cases. Consumptives come to the West and Southwest; many of them have little or nothing to live on after their arrival and "starve or accept meager charity."

Who is responsible for the care and support of the J— family? Is the county in Texas where J— claimed he was born? Is the county in New Jersey where the woman was born? Is the county in Pennsylvania where the child was born? Are the various cities or towns in Pennsylvania, New Jersey or Missouri, where they lived for a long or short period responsible? Are the states of Pennsylvania, New Jersey, New Mexico, Arizona, California or Texas responsible? Is the Mexican government responsible? Who will fix the responsibility? Who will collect from the responsible government or unit of government?

Will *THE SURVEY* readers tell us what to do with this case? Will they tell us what to do with the hundreds of similar cases in every city and town in the Southwest? Will any national, state or local charity society send us means to care for these cases? Will the American Red Cross take care of them? No, for they have refused to do so. Will the Salvation Army, or any church of Christ help them? Will any fraternal lodge or labor union supply the funds? Will any multi-millionaire do it? Judging the future by the past, we know that appeals to any of these agencies bring us sympathy—but no cash.

The bill now pending in Congress for the establishment and maintenance of government hospitals for the indigent stranger consumptive in the Southwest is the only feasible solution of the problem. There are now available for this purpose, military and other reservations where, at small expense for repair and reconstruction, many hundreds can be cared for.

ROBERT J. NEWTON.

"SOME INFORMATION FOR MOTHER"

Some Information for Mother has now been published in pamphlet form. This article by John Palmer Gavit, managing editor of the *New York Evening Post*, showing how one man answered the questions of a child about reproduction, first appeared in *THE SURVEY* for March 7, 1914. The pamphlet may be obtained from *THE SURVEY*; price 15 cents per copy, 10 cents each for lots of 25 or more, postage prepaid.

THE WHITE FOUNDATION

With \$30,000 to start its good work the White Foundation, by the will of the late Thomas H. White, millionaire

of Cleveland, will strive for "the moral and physical benefit of the inhabitants of the city of Cleveland regardless of race, color or creed."

F. H. Goff, president of the Cleveland Trust Company, trustee of the White estate, organized the foundation. Ultimately the entire estate will be devoted to public welfare.

RODENT SURVEY OF NEW ORLEANS

The Federal Public Health Service report of July 31 announces the necessity of a rodent survey of New Orleans. Human cases of the plague come from a circumscribed area, but infection among rats seems to be widely disseminated. No infected rats were discovered in the Canal Zone, Hawaii, or Porto Rico.

THE COLORADO TRUCE

[Continued from page 608.]

the desire for an immediate peace.

With the tentative plan of settlement the President sent the following letter to the president of the Colorado Fuel and Iron Company, the chairman of the Victor-American Fuel Company, the president of the Rocky Mountain Fuel Company, and the officers of the United Mine Workers:

"My Dear Sir: I feel justified in addressing you with regard to the present strike situation in Colorado, because it has lasted so long, has gone through so many stages, and is fraught with so many possibilities that it has become of national importance.

"As you know," federal troops have been in the state for the purpose of maintaining order now for a long time. I have been hoping every day during that time that some light would come out of the perplexities of the situation, some indication that the mine operators and the miners who are now on strike were willing to consider proposals of accommodation and settlement, but no such indication has reached me, and I am now obliged to determine whether I am justified in using the army of the United States indefinitely for police purposes.

"Many things may come out of this situation if it is not handled with public spirit and with a sincere desire to safeguard the public, as well as all others concerned; perhaps the most serious of them all the feeling which is being generated and the impression of the public that no one is willing to act, no one willing to yield anything, no one willing even to consider terms of accommodation.

"As you know, two representatives of the government of the United States have been actively engaged in investigating the whole situation and in trying to reach a dispassionate conclusion as to what it is possible to do in justice to both sides not only, but also in the interest of the public. The result of their investigations and of their very thoughtful consideration in the matter has been the drafting of the inclosed 'tentative basis for the adjustment' of the strike. I recommend it to you for your most serious consideration. I hope that you will consider it as if you were acting for the whole country, and I beg that you will regard it as urged upon your acceptance by myself with very deep earnestness. This is a time, I am sure you will feel, when everything should be done that it is possible for men to do, to see that all untoward and threatening circumstances of every sort are taken out of the life of the people of the United States. Sincerely yours," WOODROW WILSON.

President Wilson's plan for a three years' truce in the Colorado coal fields has received the hearty support of Representative Edward Keating, who introduced in the House the resolution which authorized the Congressional investigation of industrial conditions in

Bausch & Lomb Optical Co.
528 ST. PAUL STREET ROCHESTER, N.Y.

the coal fields of his own state of Colorado. In speaking to the Washington correspondent of *THE SURVEY* about the President's plan, the Colorado representative said:

"It is hard to believe that the man who saved the country from a war with Mexico and who may soon be called upon to act as arbiter for war-plagued Europe, will not succeed in his effort to restore industrial peace in Colorado. President Wilson's appeal to the miners and mine-owners of the Centennial State provides a broad foundation for an honorable compromise and if accepted will almost certainly result in an enduring understanding.

"The mine owners have told us that the principal issue involved in the strike was the 'recognition of the union' and they have insisted that they would never yield on that point. The leaders of the United Mine Workers of America, while contending that 'recognition' was only one of the many demands, have not sought to minimize the importance of that phase of the struggle. President Wilson, with the rare genius which enables him to reach the heart of the subject he is considering, has submitted a plan which waives this question of the recognition of the union and at the same time safeguards the material interests of the toilers.

"I like the President's suggestion for a permanent tribunal to pass on the differences between miner and mine-owner. In the right hands, it can be worked out to the satisfaction of all of the parties

in interest. Why should not we have a court of industrial relations in every state in the Union?

"It must be apparent to right-thinking men that the time has passed when workmen may be denied the right to organize for the purpose of securing the benefits which result from collective bargaining. It will also be conceded that

the bomb and the gattling-gun are very unsatisfactory weapons for the adjustment of industrial controversies. Surely American statesmen may be depended upon to devise a Twentieth-century substitute.

"President Wilson has indicated the way, and he should receive the earnest support of both capital and labor."

Calendar of Conferences

SEPTEMBER AND OCTOBER CONFERENCE

CATHOLIC CHARITIES, National Conference of. Washington, D. C., September 20-23. Sec'y, Rev. Dr. William J. Kerby, Catholic University, Washington, D. C.

CATHOLIC FRATERNAL INSURANCE SOCIETIES, Conference of. Held in conjunction with American Federation of Catholic Societies.

CATHOLIC SOCIAL REFORM MOVEMENT, Conference of. Held in conjunction with American Federation of Catholic Societies.

ANNOUNCEMENT FOR 1914-15
WILL BE SENT ON APPLICATION

THE NEW YORK CHRISTIAN HOME for Intemperate Men—"Chester Crest" Mount Vernon, has accommodations for rich and poor men. More than ten thousand have been welcomed. Tel. 248. George S. Avery, Mgr.

HELP WANTED

WANTED—Medical social worker for large hospital in middle western city. Woman of experience and executive ability required. Address 2013, SURVEY.

SOCIAL Service Nurse with experience in Mental Hygiene and Psychopathic Work. Address Free Synagogue, 36 West 68th Street, New York City.

SITUATIONS WANTED

YOUNG MAN experienced in Boy Work wants to find place where he can invest his life in a work for the boys of an orphan's home where character-building is the supreme thing. Address 1299, SURVEY.

WANTED—Position as Superintendent of Boys' Industrial or Reform School or of a Children's Home, by young unmarried man with twelve years' institutional executive experience. Best of references. Available on or after Oct. 1. Address 2014, SURVEY.

YOUNG woman, twelve years' experience in social work, wants position in child placing, investigation, parole or probation work. Address 2015, SURVEY.

WOMAN worker, executive, wide experience as investigator and director of work with families seeks new field. Address 2016, SURVEY.

THE PENNSYLVANIA SCHOOL FOR SOCIAL SERVICE

formerly The Philadelphia Training School for Social Work, offers technical and professional training for men and women who wish to equip themselves for high grade service.

The Courses, as reorganized, include:—

Origin and Development of Social Institutions—32 hours.

Principles and Technique of Case Work—32 hours.

Medical Social Service—32 hours.

Community Welfare—96 hours.

Psychological Basis for Social Work—16 hours.

Organization and Management of Social Agencies—32 hours.

Standards of Treatment for Defectives, Dependents and Delinquents—32 hours.

Field Work—14 hours a week—in approved social agencies.

For catalogue address

EXHIBITIONS

INTERNATIONAL

GERMAN ARTISANS' EXPOSITION. Cologne, May-October, 1914.

HYGIENE, Exposition of. Stuttgart, Germany. Middle of May to end of October, 1914.

PANAMA-PACIFIC EXPOSITION. San Francisco, Cal., February 20-December 4, 1915. Social Economy Department—Alvin E. Pope, San Francisco, Cal.

PANAMA-CALIFORNIA EXPOSITION. San Diego, Cal., January 1-December 31, 1915. Director of Exhibits, E. L. Hewett, San Diego, Cal.

SAFETY AND SANITATION. Second International Exposition of. Grand Central Palace, December 12-19. Under direction of the American Museum of Safety, 29 West 39th St., New York.

URBAN EXPOSITION, International. Lyons, France. May 1-November 1, 1914. General Director, Dr. Jules Courmont, Hotel de Ville, Lyons, France.

NATIONAL

SOUTHERN HEALTH EXHIBITION, with American Public Health Association convention, Jacksonville, Fla., November 27 to December 7.

STATE AND LOCAL

COMMERCIAL AND INDUSTRIAL EXPOSITION, Grand Central Palace, New York, September 5-20. Information may be secured by addressing F. J. Oppenheimer, 500 Fifth Avenue, New York.

SOCIAL SURVEY EXHIBIT, Lawrence, Kansas. In conjunction with meeting of Kansas League of Municipalities, October 6-8. F. W. Blackmar, director

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organizes is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply.

Children

CHILD LABOR—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

CHILD HELPING—Department of Child-Helping, Russell Sage Foundation, 130 East 22d St., New York. Correspondence, printed matter and counsel relative to institutions for children, child placing, infant mortality care of crippled children, Juvenile Courts, etc.

CHILD WELFARE EXHIBITS—National Child Welfare Exhibition Committee, 200 Fifth Ave., New York, Charles F. Powlison, Gen. Sec'y, Anna Louise Strong, Director of Exhibits. Bulletins covering Results, Organization, Cost, Construction, etc., of Child Welfare Exhibits. Will assist cities in organization and direction. Exhibit material to loan.

CONSERVATION OF INFANT LIFE—American Assoc. for Study and Prevention of Infant Mortality, 1211 Cathedral St., Baltimore. Gertrude B. Knipp, Exec. Sec'y. Literature on request. Traveling Exhibit. Urges prenatal instruction; adequate obstetrical care; birth registration; maternal nursing; infant welfare consultations.

Health

SCHOOL HYGIENE—American School Hygiene Association. Pres., Dr. Henry M. Bracken, Chairman State Board of Health, St. Paul, Minn. Sec'y, Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

MENTAL HYGIENE—National Committee for Mental Hygiene, 50 Union Square, New York City, Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of insane, social service in mental hygiene, State Societies for Mental Hygiene.

PUBLIC HEALTH—American Public Health Association, Pres., Wm. C. Woodward, Washington; Sec'y, S. M. Gunn, Boston. Founded for the purpose of advancing the cause of public health and prevention of disease. Five sections: Laboratory, Vital Statistics, Municipal Health Officers, Sanitary Engineering and Sociological. Official organ American Journal of Public Health, \$3.00 a year published monthly. 3 months' subscription, 50 cents. Address 755 Boylston St., Boston, Mass.

SEX HYGIENE—Society of Sanitary and Moral Prophylaxis, 105 West 40th St., New York City. Edward L. Keyes, Jr., President. Six educational pamphlets, 10c each. Quarterly Journal, devoted to sex education, \$1.00 per year. Dues—Active, \$2.00; Contributing, \$5.00; Sustaining, \$10.00. Membership includes current and subsequent literature. Maintains lecture bureau.

NATIONAL ORGANIZATION FOR PUBLIC HEALTH NURSING—Object: to stimulate the extension of public health nursing; to develop standards of technique; to maintain a central bureau of information. Publications: Pub. Health Nursing Quarterly, \$1.00 per year, and bulletins. Address Ella Phillips Crandall, B. N. Exec. Sec., 54 East 34th St., New York City.

LIFE EXTENSION INSTITUTE, Inc., E. E. Rittenhouse, Pres. Gives life extension service to subscribers. Service No. 1 \$3.00 a year; Service No. 2 \$5.00 a year. Consists of periodic health examinations, inspection service, and health bulletins on disease prevention. Head office 25 West 43th St., New York City. Phone—Bryant 1997—1998.

NATIONAL HEALTH—Committee of One Hundred on National Health. E. F. Robbins, Exec. Sec., Room 51, 105 East 22d St., New York. To unite all government health agencies into a National Department of Health to inform the people how to prevent disease.

TUBERCULOSIS—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Charles J. Hatfield, M.D., Exec. Sec'y. Reports, pamphlets, etc., sent upon request. Annual transactions and other publications free to members.

SOCIAL HYGIENE—The American Social Hygiene Association (Inc.), 105 W. 40th St., New York. Div. Offices: Chicago, McCormick Bldg.; San Francisco, Phelan Bldg. Full information on request. Individual and society membership. The Association is organized to promote sound sex education, the reduction of venereal diseases, and the suppression of commercialized vice. President, Charles W. Eliot, Executives, James B. Reynolds, Counsel; William F. Snow, M.D., Gen'l Sec'y.

CANCER—American Society for the Control of Cancer, 289 Fourth Ave., New York City. Curtis E. Lakeman, Exec. Sec'y. To disseminate knowledge concerning symptoms, diagnosis, treatment and prevention. Publications free on request. Annual membership dues \$5.

Employment Exchange

SOCIAL WORKERS' EMPLOYMENT EXCHANGE—The Department for Social Workers of the Intercollegiate Bureau of Occupations registers properly qualified men and women for positions in social, religious and civic work. The needs of organizations seeking workers are given careful and prompt attention. Emma P. Hirth, Manager, 130 East 22d Street, New York City.

Libraries

AMERICAN LIBRARY ASSOCIATION—Furnishes information about organizing libraries, planning library buildings, training librarians, cataloging libraries, etc. A. L. A. Booklist, a monthly annotated magazine on book selection, is a valuable guide to the best new books. List of publications on request. George B. Utley, Executive Secretary, 78 E. Washington St., Chicago.

Aid for Travelers

AID FOR TRAVELERS—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y, 238 East 48th Street, New York City.

Remedial Loans

REMEDIAL LOANS—National Federation of Remedial Loan Associations, 130 E. 22nd St., N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Recreation

SOURCES OF INFORMATION ON RECREATION—A classified list of significant publications on recreation giving publisher, price, and printed description. Cities issuing reports on recreation administration are also included. Price 10 cents. Department of Recreation, Russell Sage Foundation, 130 East 22nd Street, New York City.

RECREATION—Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y. Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

The GIST of IT—

THE Colorado miners have accepted President Wilson's peace plan without reservation. The employers have asked and been granted a hearing this week at the White House. Page 625.

WHO cares a fig about the social movement in war times? War is bitter fruit for those who have been patient in waiting for advance and must now bide their time through the reconstruction period. It should make a peace fanatic of the social worker, argues Dr. Holmes. Page 629.

CHURCH societies have passed resolutions and prayed for peace while, in the name of God, the nations of Europe have rushed to war, blessed by their priests. Individual religious convictions have been shown to be inconsequential, writes Professor Taylor. Religious forces must learn to mobilize, to think in collectivist terms. Page 630.

WIVES of German soldiers have been given their husbands' jobs and wages as street car conductors. Special pension funds have been started, food prices regulated, business credits entrenched. Germany is systematically looking after its own in war times. Page 625.

EMPLOYEES of the Kansas City Board of Public Welfare asked that their salaries be cut 25 per cent to help the board over a tight financial year. Page 626.

CHILD labor statistics from the Census of 1910, just issued—special extra, four years late—show substantial gains. The total number of workers under sixteen years of age remains at almost two million, and there has been an increase in agricultural pursuits. But in non-agricultural pursuits, where the child labor movement has centered, there is an actual falling off of 129,000—three army corps. Page 628.

THE Boy Scouts are "doing a good turn daily" on 10,000 bill boards in the face of gods and men and anti-bill board reformers. Page 627.

POLYNESIAN and Japanese women and 8,000 troops in garrison complicate the vice problem in Honolulu, recently surveyed under the auspices of a girls' school. Page 626.

LABOR and capital were completely at loggerheads over collective bargaining at the second week's hearings in San Francisco of the Industrial Relations Commission. Page 632.

CHICAGO and Cook county have gone ahead by leaps and bounds in their care for the tuberculous. Page 634.

NEW YORK state has put a competent commission at work on a thorough study of the relation of bovine to human tuberculosis. Page 635.

THE SURVEY

COMMON WELFARE

COLORADO MINERS ACCEPT PRESIDENT'S TRUCE PLAN

PRESIDENT WILSON's proposal of a three-year truce in the Colorado coal fields was unreservedly accepted by officials of the United Mine Workers of America on September 15. The acceptance was ratified the next day by the Colorado miners, but not without spirited internal opposition.

At a meeting of the Colorado miners an insurgent element, led by J. E. Macdonald, a delegate, wanted to have the plan submitted to the membership for a referendum vote, but the motion was tabled. James Lord, president of the mining department of the American Federation of Labor, urged immediate and decisive action, declaring that this was "the greatest opportunity that had ever crossed the path of the working class." The peace terms were accepted by a vote of 83 to 8.

In their letter notifying the President of their acceptance of his proposal, officials of the United Mine Workers said:

"We are profoundly impressed with what you say and fully conscious of the fact that in submitting this basis of settlement you are actuated only by feelings of public concern. . . .

"It is our judgment that employers and employes through their chosen representatives ought to meet and settle their differences by mutual agreement. A direct working agreement entered into in a friendly spirit makes for abiding, permanent industrial peace. . . . However, we are mindful of the suffering and waste which this strike has thus far imposed and the additional sacrifice which will be made if it continues."

Rejection of the President's proposal by the Colorado Fuel and Iron Company was contained in a letter to the President made public September 22. While declaring itself in hearty accord with some of the truce provisions, the company vigorously objected to others, and stated that it was preparing a comprehensive plan for peace. The reply of the other coal companies was made separately, and had not been made public when *THE SURVEY* went to press. Representatives of all the companies arranged to meet with the President on September 23.

Especially objection was made by the

Colorado Fuel and Iron Company to the re-employment of "all striking miners who have not been found guilty of violation of the law," on the ground that this might require taking back more men than are needed and that many strikers are still under indictment.

Commenting on the responsibility now resting upon the operators, the *New York Evening Post* says:

"They must realize that the agreement proposed is so sincere an attempt at impartiality and justice that any recalcitrancy on their part will earn them national censure," and quotes the *Pueblo Chieftain* as declaring that the President's letter is "the first step of a determined move to bring about peace in Colorado, even though it has to be forced on the miner and the operator alike."

The *New York Sun* refers rather slightly, however, to the peace plan as a "gentleman's agreement," to be enforced by "the personal skill and power of the President of the United States, operating through an extra-legal device" which, while gratifying to philanthropic sentiment, is "opposed to every instinct of self-government."

THE WIDOW

From a photograph of the painting of the German artist, Hermann Groeber.

GERMANY'S PROMPT MEASURES FOR WAR RELIEF

ADVICES FROM Germany were not available to include in Professor Taylor's article on Social Measures Prompted by the War, published in *THE SURVEY* of September 12. Supplementing the information personally gleaned by him abroad, this note contains the first data received in this country since the war censorship was established, and gives specific intelligence regarding internal conditions in Germany.

The information was furnished to the *Chicago Daily News* by its staff correspondent in Berlin, Raymond E. Swing, whose diary notes covering the first week of the war are a most sympathetic interpretation of the attitude of the German government and the spirit of the German people.

Under date of August 13 Mr. Swing writes:

Berlin, except for the restlessness of its street crowds, has been the Berlin of its quietest day. There has been no confusion, no wild disorder since the few unruly days, no harrowing scenes of misery and grief. This means that every detail was worked out in advance, every man in Germany knew where his place was, and what he should do there. For years great minds have been thinking these things out. The plan worked.

The military mobilization is not so astonishing as the financial and economic mobilization. Germany is the only country in Europe which has not closed its bank, declared a moratorium and seen its economic life crumbled up like the ashes of a burned rag. The war had hardly started before the Reichstag voted, not only the war credit, but nearly twenty laws which will make economic existence and speedy and efficient relief in these next months possible. The shrewdest of them empowers the upper house to wipe out the stock exchange indebtedness of July, which sets the exchange back where it was before the terrible panic occurred.

The various city councils of greater Berlin acted in extraordinary session. Berlin voted a war credit of 6,000,000 marks to be used to provide the city with food. Twenty-three commissioners were appointed to care for the soldiers' families who might be in need. The

*Donkey in the
Cleveland Plain Dealer*

THE NON-COMBATANTS

pension bill supplemented the government pension by duplicating the relief of nine marks in summer. Schoeneberg voted 1,000,000 marks for the same purpose. Charlottensburg and Wilmersdorf took the same step. The latter municipality voted 200,000 marks to pay the rent of soldiers' families in need and 300,000 marks for the relief of business embarrassed by the war.

The food question was faced squarely in Berlin, where 10,000 tons of flour were purchased to supplement the 12,000 tons in store when the war broke out. After the seventh day of mobilization the government put railway trains at the disposal of the various municipalities to bring food supplies to the cities. The military authorities at once fixed food prices to avoid extortion. Shops refusing to recognize these prices could be closed. In all business paper money had to be accepted at its face value.

Response to the appeals for relief work and the Red Cross was immediate. The Kaiser founded a fund for the relief of families killed in the war by subscribing 100,000 marks himself. All the great names of Germany's industrial corporations appeared in the subscription list. Many corporations continued the salaries of employees who have gone to war. The Berlin street car company employed women conductors, selecting the wives of soldiers who have been in their employ and paying them their husbands' salaries. Everywhere women can be used they are called in to replace their husbands. Even the fire department is engaging women.

It would be absurd to deny that the very life of Germany has changed to the roots in these times. The spirit is unanimous and deeply moving. German people are as great in war as in peace.

MUNICIPAL EMPLOYEES ASK FOR LOWER SALARIES

THREE THOUSAND seven hundred and thirty-seven dollars were donated to the Kansas City Board of Public Welfare this year by employees of the board itself. In other words, when it was learned that the municipal appropriation of \$134,460.77 would not be sufficient to finance the undertakings of the board, the employees brought forward a petition for a general reduction of 25 per cent in all salaries during the last two and a half months of the year.

The pioneer effort in America to consolidate various city departments under one head, the board is a prison association, a people's institute, a labor exchange, a factory inspection bureau and many other bureaus rolled into one. Its work, which was described at length in THE SURVEY for January 24, 1914, has grown steadily in volume, and constantly spreads into new channels.

The recent report of the board for 1914, for example, shows an increase of 1,304 cases handled by the Legal Aid Bureau over those handled last year; an increase of 532 jobs secured by the Employment Bureau; an increase of 207 cases treated by the Social Service Department; an increase of 402 dances inspected by the Recreation Department; 122 more lectures held for social workers; 131 more social center meetings promoted, and an increased aggregate attendance at these meetings of 10,315 people. In the Parole Department an increase of \$5,225.13 was collected from delinquent husbands in non-support cases.

A particularly big item in this year's report is the amount of relief tendered to homeless people owing to the unemployment situation. At the municipal quarry there was an increase of 7,792 "days' work" furnished; 5,307 more night's lodgings were given to outcasts, and 6,413 more free meals supplied.

Another interesting feature of the report is the fact that there was an increase of 53 men in the daily average number of men at the municipal farms. L. A. Halbert, the general superintendent of the board, explains this by "the great influx of Industrial Workers of the World into the city to enforce a demand that they be allowed to speak on the streets without any limitation in regard to overcrowding of the streets or the character of their utterances. This resulted in many arrests and the commitment of 83 adherents of this organization to the municipal farm to serve sentences of various lengths."

Censorship of picture films and supervision of skating rinks were added this year as new activities under the board. The only lines of work showing decreased results were housing and factory inspection which were sacrificed to provide for the absolutely unavoidable rise in other costs, especially that of maintaining prisoners. In order to take care of this increased work the city administration found it necessary to appropriate \$4,460.77 in addition to the regular budget of \$130,000. This, together with the \$3,737 donated by the employees, the value of \$1,589 given in services by the street department, and improved efficiency and economy have enabled the board to carry out its plan of work.

SCHOLARSHIP FUNDS AND COMPULSORY EDUCATION

SCHOLARSHIP FUNDS, which provide weekly allowances to the families of school children whose incomes have been cut off by death, illness or other mishap affecting the breadwinner, are familiar in several states. They have been devised as an essential link between compulsory education laws and laws prohibiting child labor. Now comes a noteworthy suggestion as to a source of these funds from the Rev. Allan Pressley Wilson, of Baltimore.

Mr. Wilson suggests that these scholarships be established in each school and that the funds be maintained through fines levied upon employers who violate the child labor law. For offenses of this nature he would impose heavy fines, second and third offenders paying proportionally larger amounts.

The administering of the funds Mr. Wilson would put into the hands of the juvenile court. One or more truant officers, he suggests, might be detailed to look after such cases, or a special officer provided for them.

IS THIS A BLOT ON THE LANDSCAPE?

The Boy Scouts of America believe that the benefits of bill board advertising outweigh its defects

THE BOY SCOUTS AND THE BILL BOARDS

CIVIC ORGANIZATIONS which contend that bill boards are a blot on the landscape, a nuisance to be tolerated, if at all, only under the strictest regulation, are faced with a growing use of them by social organizations. It will be remembered that officers of the Pittsburgh Civic Club protested against such use in *THE SURVEY* for March 21.

Since that time the Boy Scouts of America have gone into bill board advertising on a greater scale than any social agency has hitherto ventured. Some ten or twelve thousand copies of the poster reproduced in miniature on this page are being spread over the United States.

The expense of designing the picture, making the plates and all the costs involved have been met by the Posters Advertising Association—an outlay of about \$10,000, as a part of the association's recent policy to give its unoccupied space to religious and social subjects rather than to leave it blank or to carry over commercial posters whose terms have expired.

The case against the bill board has been frequently and forcibly put and has won many converts. The case for the use of bill boards in propaganda is thus put by James E. West, chief executive of the Boy Scouts of America:

"It was my privilege to meet with the Posters' Advertising Association at their annual convention this summer and to have the advantage of analyzing their attitude toward the so-called 'bill board nuisance,' as well as other matters pertaining to the interest of their organization. From the character of the papers read and discussions following same, and the definite action taken, I am convinced that perhaps the chairman of

the bill board committee of the Civic Club of Pittsburgh as well as others interested in the campaign against the so-called 'bill board nuisance' would find it profitable to familiarize themselves with the aims and objects of the Posters' Advertising Association.

"Certainly no one can argue that the benefits to the public by bill board advertising should be eliminated, but I think all will agree that a sane campaign in the interests of efficient bill board posting is desirable. This is exactly what the Posters' Advertising Association is seeking to do. Permit me to suggest that others interested in this problem consider the advantages of making headway with those particularly concerned rather than with a useless campaign of criticism and destruction."

Those who are working in the campaign against bill board advertising see in this free allotment of space to religious and social bodies an adroit move on the part of the bill posters to gain popular favor. It is a counter attack, they argue, that will doubtless delay bill board regulation materially.

HONOLULU'S COMPLICATED VICE PROBLEM

UNDER THE AUSPICES of the board of trustees of the Kaiulani Home for Girls, a committee of nine men and three women, aided by a trained investigator from New York, has spent the better part of a year looking into the social evil in Honolulu, Hawaii.

Iwilei, Honolulu's "red light district," is suffered to exist by the police contrary to law, says the committee in its report. But "by far the larger part of commercialized vice and the extensive clandestine prostitution known to exist . . . is carried on outside of Iwilei."

Owing to the open-air conditions and the presence of many races with their peculiar habits, it was found impossible

to ascertain the number of women engaged in prostitution, but "it is apparent that the evil is very widespread, that social vice in Honolulu is most insidious and that its virus affects family life more extensively than one who has not given the subject, careful study would suspect."

The report assures us that venereal disease "causes here as elsewhere one-third of all the blindness, more than one-half the sterility and 60 to 75 per cent of the gynecological operations performed upon chaste married women. Gonorrhoea is more prevalent here among children under ten than in any place known to the co-operating physicians on our committee."

The committee found that the extent of the social evil is due partly to the moral codes of the native Polynesians and the Japanese (Japanese women over fifteen outnumber the natives two to one) and partly to the presence of 8,000 men of our army and navy.

Insisting upon a scientific policy of combatting the evil, the committee says that the campaign against it "must be many sided, it must plan for a persistent prosecution to cover many decades if not centuries. It must be inherently just and sane, and must advance step by step towards its culmination."

The first move must be the abandonment of the prostitute quarter; the next a "red light injunction law."

Other laws restraining landlords, husbands and parents are advocated, and finally comes a list of "prophylactic social measures" designed to check the evil. Among these are minimum wage and model child labor laws, the wider use of school plants, a municipal theater, a vocational boarding school, home and school education in sex hygiene and more adequate public playgrounds.

A PLUCKY BOY

A little boy came into a store and marched straight up to the counter.

"Well, my little man," said the merchant, "what will you have to-day?"

"Oh, please, sir, may I do some work for you?"

The merchant looked down on Robert's appealing face, and into his bright blue eyes. He was not accustomed to talk with boys, and Robert was not seven years old yet, and was small for a boy of that age.

"You want to do some work for me, do you?" asked the merchant, kindly. "I like boys that want to work; but what kind of work can you do, my little man? Why, you are not tall enough to look over the counter."

"I am growing, please, sir, growing very fast; there, see if I can not look over the

counter!" said the boy, standing on his toes.

The merchant tried to look over the counter at the boy's feet. He could not see the little toes. Then he went round the counter, and came to where the boy was standing.

"I will get nearer to you," said he, gravely,

"that I may see how you look and how large you are." And he looked at Robert for a long time.

"I am older than I look, sir," said the little fellow. "Folks say I am very small for a boy of my age."

"How old are you?" asked the merchant.

THE CHILD WORKER IN THE CENSUS REPORT OF 1910—BY E. N. CLOPPER, NATIONAL CHILD LABOR COMMITTEE

THE DECREASE in the number of children from ten to fifteen years old engaged in non-agricultural pursuits is one fact in the report of the Bureau of the Census on occupation statistics for 1910, just issued, which is cause for rejoicing. The total number of children so employed was 558,971, and the decrease from the figures of 1900 was 129,236. After a long and unnecessary delay, due to Congressional economy, official facts about the human element in industry, not as to conditions as they are now, however, but as they were more than four years ago, have been made public.

The report is concerned only with the occupations of persons ten years of age and over. Information about the employment of children under ten years was gathered by the enumerators and may be made available later. It is customary in the United States to class as child laborers all children under sixteen years of age who are at work, but the census reports only those from ten to fifteen years inclusive. Of these it states there were 1,990,225 in all occupations. Those from ten to thirteen years of age numbered 895,976.

Of the nearly two million children from ten to fifteen years of age, 1,425,362 were reported as engaged in agricultural pursuits; nearly all of these

were returned as laborers on farms and in dairies, gardens, greenhouses, nurseries and orchards. This is an increase of nearly 35 per cent over the corresponding figures for 1900, which the bureau believes was due to the difference in the basis of enumeration in the two censuses, rather than to any actual increase in the number at work, because the instructions to enumerators in 1910 as to noting occupations were much more explicit than formerly.

Because of the necessary limitations of census taking, these figures do not represent conditions even for the year 1910, but simply for the brief period in the month of April of that year when the information was gathered. Consequently the report contains some statistics that are clearly absurd when considered as representing general conditions. For example, only 49 children from ten to thirteen years of age are reported as employed in all the fruit and vegetable canneries of the entire country because very few such establishments are in operation in April, and this is all the more misleading in view of the specific authorization to employ such children granted to this industry by several states. Again, only 18 children from ten to fifteen years are returned as working in cranberry bogs because April is too early for cranberry gathering.

Among the surprising statements made is one to the effect that 355 little boys from ten to thirteen years of age were at work as laborers on steam railroads! And more than 2,000 from fourteen to fifteen years old were similarly employed! Several youngsters were entrusted with considerable responsibility in connection with the postal service, for the report states that there were at the time eight postmasters, fourteen or fifteen years old, nineteen mail carriers under fourteen, and three railway mail clerks under sixteen! Twenty-one boys and girls of the ripe age of ten to thirteen years are reported as school teachers! The federal government is charged with having had nineteen boys under fourteen years in its employ as messengers, many of whom were probably serving as pages in the United States Senate, for that august body has reserved to itself the right to employ these little boys under the child labor law of the District of Columbia. This law has a fourteen-year age limit, with a specific exemption for the United States Senate.

The bureau reports that as yet no statistics have been prepared on the occupations of children under ten years of age. These figures would be of intense interest, for such information has hitherto never been even collected. It is disturbing to think of little boys and girls, not yet ten years old, working for wages, yet this is actually held up to the children of the country, by one pow-

"I am almost seven," said Robert. "My mother has nobody but me, and this morning I saw her crying because she could not find five cents in her pocketbook.

"She thinks the boy who took the ashes stole it—and—I—have—not—had—any—breakfast, sir."

The merchant looked kindly at the boy. "I can help you to a breakfast, my little man," said he, feeling in his pocket. "There, will that quarter do?" The boy shook his head.

"Mother wouldn't let me beg, sir," was the answer.

"Where is your father?" asked the merchant.

"We never heard of him, sir, after he went away. He was lost on the *City of Boston*."

"Ah! that is bad. But you are a plucky fellow if you are small. Let me see," and he looked straight down into the boy's eyes, which were looking straight into his.

"Saunders," said he to a clerk, "is that cash boy still sick?"

"He is dead, sir; died last night," was the answer in a low tone.

"Ah, I am sorry to hear that. Well, here is a boy that can take his place."

Mr. Saunders looked up slowly,—he put his pen behind his ear,—then he glanced at both Robert and the merchant.

"Oh, I understand," said the merchant; "yes, he is small, very small indeed, but I like him. What did the other boy get?"

"Three dollars a week, sir," said the clerk.

"Put this boy down at four," said the merchant.

"There, my lad, give Mr. Saunders your name and run home. Tell your mother that you have a place at four dollars a week. Here's a dollar in advance; I'll take it out of your first week's wages."

"Work, sir—work all the time?"

"Yes, as long as you deserve it, my man."

If ever broken stairs trembled under the weight of a small boy, those in Robert's poor home did so that morning.

"I've got it, mother. I'm a cash boy! Four dollars a week! And here's a dollar for breakfast; and don't you ever cry again."

62

63

erful interest at least, as an example worthy of emulation. The American Book Company publishes the New McGuffey Third Reader which is widely used in American schools, and which contains a story entitled A Plucky Boy. This interesting lad, so the story runs, was only six years old and small for his age, yet he wanted to help his widowed mother and accordingly obtained permanent employment in a dry-goods store as a cash-boy at \$4 a week.

Several years ago one of the secretaries of the National Child Labor Committee protested to an officer of the American Book Company about the use of this story in a school book, and called attention to the modern attitude as expressed in child labor laws and provisions for both public and private relief. The officer replied that the lesson imparted by the story was valuable and so the sale of the book with this archaic and un-American tale continues.

we may add here, cares a fig about the social movement?

It was only a few months ago that I heard Walter Rauschenbusch, in the course of a speech at a public dinner, give urgent warning on this very point. He was trying to impress upon his hearers the obligation of unremitting endeavor in the prosecution of the great movements for political and industrial reform—the peril of undue patience in "biding our time"—the need of haste, as he put it. "At any moment," he said, among other things, "a great war may break upon us, and the social movement, as we know it today, will be dead for a generation, if not a century." And lo! with a suddenness and upon a scale which Professor Rauschenbusch could not have conceived even in darkest moments of foreboding, the war is here, and the social movement, along with art, literature, philosophy and religion, is indeed dead!

For who is talking in England today about national insurance, woman suffrage, or the breaking of the land monopoly? Who is interested in the enactment of the plural voting bill? What chance has Lloyd-George of living to complete his program of social legislation? Where is the campaign for franchise reform in Germany? Who cares about co-operation in Belgium, or syndicalism in France, or socialism anywhere? Is there an international labor movement any longer; and if there can

WAR AND THE SOCIAL MOVEMENT—BY JOHN HAYNES HOLMES, CHURCH OF THE MESSIAH, NEW YORK CITY

IN THE STORM and stress of the stupendous conflict now raging in Europe, it is inevitable that our attention should be absorbed by the more obvious horrors of the situation. Captured cities, burning harvest fields, desolate homes, bleeding men, weeping women and children—these are the things which are holding our interest to the exclusion of everything else. Yet there must be quiet moments, now and then, when we see more clearly and think more deeply than is possible in the hours of reading newspapers and watching bulletin boards.

Then it is that we begin to understand that there is a calamity in this warfare which is more permanently terrible than any of the surface incidents of the struggle. I refer to the awful fact that suddenly, as in the wink of an eye, three

hundred years of progress is cast into the melting-pot. Civilization is all at once gone, and barbarism come. And the one gone and the other come not for today merely, nor yet for the actual period of the armed conflict, but for years and perhaps generations thereafter.

As Harold Begbie put it recently, "Already now civilization stops—stops dead. . . . Religion, philosophy, literature, painting, and, chief of all perhaps, science, with its torch at the head of our human hosts, are suddenly flung backward; they become of no moment. Who wants to know about Immanence? Who cares to hear what Bergson and Eucken think? Who bothers about books and pictures? Who is ready to endow a laboratory or listen to the chemist and the biologist?" And who,

be said to be such a movement, what does it amount to?

Nor is it only in the countries immediately concerned in this awful struggle that the social movement has vanished. We are three thousand miles away from the smoke and flame of combat, and have not a single regiment or battleship involved. And yet—who in these United States is thinking at this moment of recreation centers, improved housing, or the minimum wage? Who is going to fight the battle for widows' pensions, push the campaign against child labor, or study exhaustively the problem of unemployment? Where is the strike in Colorado and the Industrial Relations Commission? What hope have the tuberculosis workers of selling their red seals this coming Christmas? What are the suffragists going to do to stir a ripple of interest in their cause? THE SURVEY itself, to me the most fascinating magazine now being published, is at this moment about as thrilling as last year's almanac; and I venture to prophesy that its columns will have only a little better chance of attracting public attention during the next twelve-month than my pulpit.

Nor can we hope for any revival of the social movement with the conclusion of the war. If, as now seems probable, the nations fight to the point of exhaustion, the question facing the world at the conclusion of peace will not be that of social progress at all, but simply and solely that of social survival! For days and weeks after the flood went through Dayton, the question before the community was exclusively that of feeding the hungry, clothing the naked, nursing the wounded, and cleaning the streets of mud, debris and wreckage. Only with the rebuilding of offices and homes, and the restoration of normal conditions of life, did the people give even a passing thought to issues of municipal reform and social betterment.

So with the civilized world, when "the grievousness of war" has at last swept by! With commerce disorganized, industry demoralized, wealth destroyed, fields wasted and cities razed, thousands of men slain and greater thousands wounded and crippled, multitudes everywhere perishing of starvation and wretchedness—the urgent problem for the moment will be that of keeping the world going; and for years to come that of rebuilding the shattered mechanism of civilization, creating new stores of wealth, breeding a new race of men—in a word, of recovering "by painful steps and slow" the ground gained by centuries of struggle and sacrifice, and lost, alas! in one black night of madness. Not for generations will the world's life again be normal, and men be free to think not merely of living, but of better living!

The situation is terrible! And yet; may it not be that this calamity, like every calamity, will work at last to final

and universal good? Can we not say today what Lincoln said in 1865, "The Almighty has his own purposes"? Too long have we left unsilenced and unrebuked the apologists for blood and iron. Too long have we regarded war as a passing incident and mayhap a partial good. But, now, if we do not hate this "sum of all villainies" with a perfect hatred, and highly resolve that the dead now rotting on the plains of Europe "shall not have died in vain," we are not even human!

From this moment on, every lover of civilization and servant of human kind—the social worker first among them all—must be a *peace fanatic*. He must seek for nothing before this, care for nothing above this, strive for everything through this. He must fight war as Cato fought Carthage, as Voltaire fought *L'enfer*, as Garrison fought slavery.

Nor must he be content to urge this

ECLIPSE OF RELIGION UNDER THE SHADOW OF WAR —BY GRAHAM TAYLOR

IN EVERY LAND upon which the shadow of war has fallen real religion is in eclipse. Once again Christendom is anti-Christian.

The London *Nation* with fearless frankness acknowledges that "In the second great home of Christendom, the words of Jesus, spoken to redeem mankind from just such a desolating crime as this, are as if they had never been said."

On the eve of the conflict the London *Times* editorially lamented that "for a moment at least, the religious reading of life seems to lack even the substance of a dream," while "most Christian potentates are gathering their forces throughout Europe to the shock of battle, and the Far East and the Far West are left, in their seclusion, to gaze upon the awful spectacle of a world in arms."

To be sure the warring emperors claim God to be on their side, in terms that would seem even more blasphemous if they were not so indicative of a medieval, if not pre-Christian, point of view and state of mind. What could more truly reveal this attitude than the Kaiser's call to arms? "Therefore to arms! We shall resist to the last breath of man and horse. Forward with God, who will be with us as he was with our ancestors. We may by the help of God so use our swords that when all is ended we can replace them in their scabbards with honor. And now I recommend you all to God. Go to church, kneel before him and pray that he may sustain our brave army."

What more naïve tribute to a tribal God was ever paid by the chief of a primitive clan than by the Kaiser's telegram to the crown princess: "I rejoice with thee over the first victory of Wilhelm. God has been on his side and has most brilliantly supported him. To

fight in the dilettante, academic, pink-tea, high-brow way too much practiced hitherto by the organized peace movement. He must join forces, without apology or reserve with Labor, and strike straight and sure not so much at war, as at the things which make war—first, militarism; second, political autocracy; and third, commercialism. The axe must be laid at the roots of the tree—which are armaments, dynasties, and exploitation.

And when, years hence, the works of civilization are restored and the voice of the social worker is again heard in the land, may it not be that he will see a changed world, wherein his task is easy? May it not be that he will look in vain for battleships and thrones and selfish business? And when he consults the history books, to discover when and how these things were wrought, may it not be that he will find himself reading of the War of the Nations in 1914?

him be thanks and honor."

The old emperor Francis Joseph, more feebly but no less certainly, re-echoes the claim of "God on our side."

True again, the churches of the warring nations did not fail to give some expression to their prayerful plea and hope for peace. Pope Pius X died with a prayer for peace upon his bating breath. His successor laments that "the war had aroused faithful against faithful, priest against priest, while the bishops of each country offered prayers each for the success of his own nation, yet victory for one side meant slaughter to the other, the destruction of children equally dear to the Holy Father's heart."

The Archbishop of Canterbury authorized and issued a form of public intercession, promising others as needed in due course, and appointing days of intercession. The state church buildings in all the lands at war, and other temples of the Prince of Peace also are thronged by departing troops and by the multitudes left behind in terrible suspense.

"Through all the world men and women" are described by the London *Times* as "invoking the aid of the God of Battle; priests and peoples of every nation are crying to their God that he is the Lord of Hosts, and that they alone are his chosen people; and today in every temple throughout Christendom, prayer goes up that the Prince of Peace may incline the scales of war." For the first time prayer for Christians is authorized in the Mohammedan mosques, and for the success of German arms, while in Dresden such prayer is prohibited at the English service which is held under police permit and censorship. But we query with the *Times*, "Where, in this return to chaos, are we to discern the workings of any 'power making for

righteousness'?"

Some Protestant church bodies, indeed, continued to protest against war and the spread of it, to the end of those fateful days during which the rulers of nation after nation kept on declaring war against each other. The men of these church fellowships were urged by their National Brotherhood Council and Adult School Union "at once to speak out strongly on the terrible outrage to humanity and the menacing challenge to Christianity involved in a European war, which tramples on Christianity in the heart of Christendom and betrays the name of Christ and the cause of human fellowship before the whole world."

The National Council of Evangelical Free Churches as late as August 5, upon the outbreak of war, which was referred to as "a crime and horror," issued a call for daily united prayer for peace, and called upon the churches "steadily to foster those more generous and humane sentiments which war so ruthlessly destroys, and to inculcate the duties of self-restraint and mutual consideration."

On their return from the first International Conference of the Churches in the Interests of Universal Peace at Constance, the English representatives formally expressed themselves as "dismayed beyond measure at the thought that England may be involved in the cataclysm of the present conflict," and

"for the sake of the land we love and our brethren of other lands, in the name of the God of our common worship, we appeal to our fellow countrymen not to despair, even at this hour, of discovering a just and peaceful solution." These men also represented the Anglo-German Friendship Committee, which, in both its German and British councils, included the most influential clerical and lay leaders of all the churches in both lands.

All this sounds, as an American remarked, "like passing resolutions on the conservation of natural resources on the edge of a prairie fire." It surely humbles those within the churches, who have been wont to overestimate the influence of religion as ministered by them, now to realize how little influence the churches really had in averting or withstanding this overthrow of their highest ideals and sternest standards. Were they any more influential than the brave Socialists in their anti-war manifestos? It discovers the weakness of the hope and the greatness of the need of "evangelizing the world in a single generation" to find how little of the world has been really evangelized. It discloses how futile has been the summons and dependence upon "the church" to stand out apart from and against the national and economic system of our times, as though its members were consciously and organically apart from the life and spirit of their age, or were not

involved in the errors and sins of their generation.

And yet never in the history of the church or the world have the sanity and stability of Jesus' attitude against war and for peace, against self-seeking and for human brotherhood, been more completely demonstrated than by the logic of events, ground out between the diplomatic premises and the terrible conclusions of this war.

If the churches are taught anything thereby, it is to realize how inconsequential exclusively individual religious convictions have proved to be; it is to learn "to think in collectivist terms," as the British nation is said to have suddenly and instinctively begun to think; it is to feel the necessity and acquire the art of mobilizing religious forces and resources, as rapidly and effectively in the interests of peace and progress as the war lords have succeeded in mobilizing their military and naval reserves for the destruction of civilization.

Behind their awful shadows which for the moment have eclipsed the very sun of righteousness, its light still shines serenely and omnipotent, and in that sun there is still to be discerned the form, not of any victorious nation, but the form "like unto the Son of Man," the Prince of Peace. The Hebrew seer foresaw that such as he should be "for an ensign to the people," "the Desire of all Nations," "unto whom the gathering of the peoples shall be."

"THE HOUSE OF BONDAGE"

Esther Morton Smith

THE CRY

GOD of the nameless thousand,
Hopeless and sick of soul,
Crushed in a horror worse than death,
Ruined and wronged till their last drawn breath,
Just God, is this the whole?

Thou Who art Love and Power,
Purity's self Who art,
Lo, where Thine image lies defiled,
That Thou didst fashion as Thy child,
Out of Thy mighty heart!

Thou Who art very Father,
To Thy created race,
Deep in those anguished haunts of hell,
Where shame itself is too pure to dwell,
Hast Thou a dwelling-place?

THE ANSWER

WHERE SO the cry is bitter,
Where so the need is sore,
Thou who wouldst find Me, follow Me,
Travail and toil I offer thee,
Yet with My freedom to be free,
Now, and forever more.

Thou who wouldst find Me, follow,
Into the gates of sin;
Stretch out thy hand, though all seem lost,
Pour out thy love, nor count the cost,
Lo, I am there, within!

INDUSTRY

THE WAY OF THE TRANSGRESSOR IN A CLOSED-SHOP CITY—By JOHN A. FITCH

THE SECOND WEEK of the hearings in San Francisco before the United States Commission on Industrial Relations found representatives of organized labor in that closed-shop city taking the stand to defend their movement against the furious attacks of the employers who had appeared as witnesses. Nowhere in any of the commission hearings have the tactics of the unions been so vigorously and at the same time so specifically scored as in the week of August 31.

The week began with something of a flutter of excitement, for the first witness was James H. Hough, president of the First National Bank at Stockton, who had figured prominently in the testimony of the preceding week. Hough denied having forced Eaves, the laundryman, to join the Merchants, Manufacturers and Employers' Association of Stockton by exerting financial pressure. He was not asked, however, whether he had sent a message to the editor of the *Stockton Record*, threatening him with loss of advertising if he did not change the policy of the paper, as had been charged by F. L. Kincaid; and he left the stand after a very brief examination, without having volunteered any information on that subject.

The first general subject of the week's inquiry was labor conditions in construction camps. The first witness was W. S. Wollner, from the office of the chief engineer of the Northwestern Pacific Railroad. He expressed himself as believing that conditions in construction camps ought to be made as satisfactory as possible, but he was opposed to the activities of the California Commission on Immigration and Housing, which has been trying to improve sanitary conditions in the camps. He declared that the men would not use baths if they were established, but if they were used they would be potent factors in the spread of disease. He also objected to efforts of the commission to establish a minimum of 500 cubic feet of air space for each individual in sleeping quarters. "Men don't want air in sleeping quarters," he said, "they get all they need in the day time working out of doors."

Wollner then went in some detail into the subject of the cost of living. "So far as I know," he said, "the minimum wage on railroad contract work is \$2 per day, and the maximum board charge is 75 cents, which would leave the laborer \$1.25 clear from which, if he did not use liquor, he would merely have to buy his clothes and tobacco. I should say that the average cost of the construction laborer living in a city during a

Probing the Causes of Unrest

XIV

The fourteenth of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

period of unemployment does not exceed 35 or 40 cents a day . . . so that for each day he was employed, he would be able to support himself during four or five days of unemployment.

A man can obtain lodging in San Francisco for 10 cents a night, and I would like to say here that one of my grievances against the Immigration Commission is that they are making us, or trying to make us, furnish better living quarters to men in construction camps than they use of their own volition when they come to the city."

Wollner told of a scheme which he has worked out of keeping labor constantly employed on railroad work. He proposes a central employment bureau, which would, of course, be acquainted with the needs of the entire system. It could move gangs of laborers from point to point as needed. The present custom, according to his statement, involves laying men off on one section of a railroad because the job is completed, when at the very time on another section laborers are badly needed and hard to get.

F. M. Andreani, in charge of the immigration office and legal bureau of the Italian consulate general in San Francisco, took sharp issues with Wollner on the subject of sanitation in construction camps. He insisted that men did use the better facilities if offered, and that it did make better men of them. He cited a camp in Alaska, which he had recently visited, where baths and a swimming pool were furnished, and reading rooms provided with books and papers; all of these privileges were respected and enjoyed by the men.

Andreani said that one of the most objectionable features in the construction camps in California was the absence of adequate hospital facilities. Even

though the men are charged \$1 a month for such services, there are some companies which provide no medical service whatever. He told of a man who had his arm torn off at the shoulder, who had to be carried forty-four miles to a doctor. He spoke of another who had a fractured spine, who was taken thirty miles through the woods to the railroad, and then on a train to a San Francisco hospital. The man died after a few months in the hospital.

Another man, working in a camp where every man had to construct his own bunk, fractured his leg before he had time to build one for himself. He was left lying on a blanket on the floor for nine hours before being taken to a field hospital. On account of improper attention at the hospital, the man was said to have been crippled for life.

Andreani stated that some of the construction companies are making money out of hospital fees, which continue to be levied in spite of the fact that the California compensation law requires that the employer shall pay all medical expenses for the first ninety days after the occurrence of the accident.

This witness spoke of further methods of exploitation that exist in some camps, especially where the men work for a sub-contractor. Sometimes there is delay about getting their pay checks cashed, and men are kept in camp, paying board, for a period long after their money is due. He recited some instances where, on account of fees for various purposes, and the holding back of money for board and supplies, men who had been working for several months either had received nothing at the end or were in debt to their employer.

The program for the second day's hearing was collective bargaining in San Francisco. This subject proved so interesting, however, and developed so much controversy, that it ran through Wednesday and over into Thursday morning.

Grant Fee, a general contractor engaged in building construction in San Francisco, arraigned the methods of union labor most severely. He said that there has come to be a one-man power in San Francisco labor unions, and that this power is exercised in a tyrannical manner. He denied that there is any such a thing as collective bargaining in San Francisco, and declared that the unions simply decide for themselves what wages, hours and working conditions are to be and inform the employers of that decision. He told of a tax which is being levied by the Bricklayers' Union, which requires the employing contractors to pay into the union treasury one-half of one per cent of the cost of all brick construction.

L. H. Sly, an open shop building con-

tractor, continued the indictment of union labor. Sly stated that because he does not employ union labor it is impossible for him to buy materials except under an assumed name. If he wants to buy a fire escape or a thousand of bricks he has to employ subterfuge to get them in the local market. The dealers would not dare to furnish him with these materials for fear of a boycott. He charged that his men can do from a third to a half more than the union rules permit the union men to do.

Sly stated that when P. H. McCarthy, president of the Building Trades Council of San Francisco and of California, was mayor of San Francisco, instructions were given to the Building Department not to pass any of his plans, and he had to threaten court action before he could get them passed. He stated also that the electrical work on one of his buildings was condemned by a city inspector, but after getting a favorable report by the Board of Fire Underwriters and the local electric company he threatened the city with legal action, and the work was finally passed without making any changes.

It was James Tyson, president of the Charles Nelson Company, a firm engaged extensively in the lumber business, who made the most sweeping and specific condemnation of organized labor.

"Under closed shop conditions," said Mr. Tyson, "the employer and employee. I am sorry to say, have very little in common. There is no community of interests. The union supplies the unionist with work; the walking delegate is his boss. The employer is of no consequence; he holds the sack, carries the responsibility of the operations and incidentally provides the payroll at the end of the week."

Tyson said that he objected to collective bargaining because it was a one-sided contract, the men not living up to their bargain, except when it suits them to do so. He objected to closed shop regulations, and insisted upon his right to hire and discharge men at will. He declared that union methods tend to demoralize the workmen, because it reduces the capable man to the level of the poorest. His remedies were the incorporation of unions; elimination of the closed shop, shop stewards, business agents, and walking delegates; limitation of term of office to one year; and the establishment of a standard of efficiency. "Let them sell their product the same as we do ours, according to standard and quality."

Elaborating somewhat on the general subject, Tyson said that organized labor does not keep within the law. "If they did," he said, "the Commission on Industrial Relations would never have been appointed." He cited cases of restriction of output, and said that the limit of the work in the Ship Caulkers' Association was such that he has sometimes paid two days' wages for work done in one day of nine hours.

He declared that as a result of union restrictions business is leaving San Francisco. Ten years ago, he said, there were 40,000 men employed in the metal trades of this city, and there were now less than 15,000. An oil company he is

interested in has to buy its tanks and pipe in Los Angeles. His company owns a salmon cannery. They used to buy all of their boxes in San Francisco—now they get them in Washington and Oregon. Five years ago they used to purchase all their logging engines and equipment in San Francisco, but now they have to get them elsewhere. He declared this was due to the higher cost in San Francisco which has come from union domination.

In speaking of violence, Tyson declared there could be no strikes without coercion, intimidation and violence, and that if the authorities would do their duty in enforcing order, strikes would disappear.

Asked by Counsel W. O. Thompson what a working man is to do who has a just cause for complaint and cannot get his grievance adjusted, if he cannot strike, Tyson replied, after a moment of hesitation, "I cannot conceive of such a situation."

The company of which Tyson is president operates a logging camp and sawmill in northern California. A hospital fee of \$1 is charged, but unlike most other companies, concerning which testimony has been given, no fee is charged until a man has been with the company for at least two weeks. Tyson says that half of the men in the camp have their families with them, and that there is very little coming and going. Out of a force of a thousand employees, not more than twenty-five changes are made in a month.

"ON THE FACE OF IT," ITS ADMONITION IS PLAIN

Clock at plant of Harrison Bros. & Co., Philadelphia, which with this inscription was reproduced on a poster distributed by the Information Bureau of the National Council for Industrial Safety, Chicago. The council makes weekly distributions of "Safety First" bulletins, photographs and accident statistics to its members. A pamphlet, How to Organize for Safety, has been prepared and given wide circulation.

A preliminary report recently issued by the council shows a muster of 731 members, representing 750,000 employees. Their third annual congress is to be held at the Hotel La Salle, Chicago, October 13 to 15, 1914.

To reply to the charges against organized labor, P. H. McCarthy, president of the Building Trades Council, took the stand and for three hours or more he dealt out scorn, contempt and invective against the critics of the unions. One witness had criticised the unions because he could not get good men from them when in need of help. McCarthy agreed that an employer does not like to turn to the union as an employment agency. "He likes to see a man running about the city," said McCarthy, "hopping from ladder to ladder, from staircase to staircase, and from roof to roof, pleading with foremen and superintendents for a job. Then he can play one man against another and cut their wages."

The union, said McCarthy, makes it possible for a fair-minded employer to be fair and honest. Without the union the viciously inclined employer fixes the standard. He stated that the real cause of factories leaving San Francisco or failing to locate there is high rents and inflated values of real estate. He mentioned two large companies which he said had gone to Oakland instead of locating in San Francisco simply because values were unreasonably high. He brought in figures tending to show that the cost of building in San Francisco has gone down to a marked degree at the same time that wages were going up and hours being reduced.

One of the practices of San Francisco unions that is most frequently condemned is their refusal to handle dressed lumber, shipped into the city from outside. The unions insist that the lumber must be brought in rough and milled in San Francisco. McCarthy defended this practice and said wages are lower and the cost of living lower on the north coast, where employers wished to have their lumber milled. With the high rates and high cost of living in San Francisco he said that workmen were justified in refusing to handle the product of this cheap labor.

Andrew J. Gallagher, president of the San Francisco Labor Council, also denied the statements made by the employers and insisted that the unions are fair and democratic.

The commission gave some attention to the workmen's compensation law. All of the employers examined expressed their hearty approval of the law. Only one, Sam J. Eva, president of the United Engineering Works, wanted a change. He thought that instead of requiring the employer to pay all of the compensation it should be shared between employer, employee and the state.

An interesting witness on the last day was Fremont Older, managing editor of the San Francisco Bulletin. Asked for his opinion of collective bargaining he described it as a "necessary makeshift,"—better than individual bargaining because the workers could exercise their power thereby; but a still better thing, he thought, would be "a changed ideal of human society, from mere money-getting to more altruistic ideals."

From San Francisco, the commission went to Los Angeles, where hearings began on Tuesday, September 8.

HEALTH

HOSPITALS FOR ADVANCED CASES OF TUBERCULOSIS—BY THEODORE B. SACHS, M. D.

CHICAGO TUBERCULOSIS INSTITUTE

THE BEGINNING of a campaign for improvement of conditions in tuberculosis hospitals maintained by Cook County, Illinois, dates many years back. During a period of several county administrations, the standard of these hospitals was not different from that of the majority of similar institutions in this country.

Some of the familiar features were: housing of patients in large wards, with no provision for privacy; lack of arrangements for open air treatment of suitable cases; lack of well-defined methods of treatment; lack of sufficient and efficient medical and nursing personnel; no medical or laboratory facilities for thorough study and efficient treatment of cases; a "poorhouse" variety of diet; and an insufficiency of domestic service, compelling the employment of patients to take care of the institution instead of the institution's taking care of the patients.

In February, 1912, the general situation in reference to institutional provision for tuberculous patients in Cook County, was as follows:

Chicago was building a municipal tuberculosis sanatorium for incipient and moderately advanced cases, with a capacity of 900 beds. Cook County (of which Chicago is the major part) was maintaining three hospitals for advanced cases:

1. A tuberculosis department in Cook County Hospital (capacity 320 beds), central section of Chicago, for the reception of grave or terminal cases of tuberculosis. Because of extensive building operations in the general hospital, which necessitated a reduction of the capacity of the tuberculosis department, the campaign for radical changes in this institution was postponed until the rebuilding of the entire institution was completed. The situation, however, has been improved in the last two years in the attending medical service, with the result of better study and supervision of cases.

2. The County Tuberculosis Hospital at Dunning, with 220 beds, which has been abandoned since the capacity of the Oak Forest Hospital was increased.

3. The County Tuberculosis Hospital at Oak Forest, with a capacity of 325 beds, for chronic advanced cases.

The campaign for a higher standard was directed at the Oak Forest institution, which was selected to fulfill, when extended and reorganized, the existing need of an efficient county hospital for chronic advanced cases.

To achieve the desired result the following methods were employed:

First. In February, 1912, the Chicago Tuberculosis Institute requested the National Association for the Study and Prevention of Tuberculosis to make a study of hospitals for advanced cases in large centers of population in this country, Chicago included. The aim was to get an authoritative standard for such hospitals formulated by a national organization. A committee consisting of Dr. Theodore B. Sachs, chairman, Dr. Charles J. Hatfield, Dr. Livingston Farrand and Dr. Thomas S. Carrington, secretary, was appointed by the association at its annual meeting, May, 1912. The investigation proceeded and the report of the committee was submitted at the following annual meeting, May, 1913.¹ This report was widely circulated in Chicago among the medical profession, laity, business men, various organizations and city and county officials. The result was a spread of education as to the right standard for such hospitals.

Second. In February, 1912, a resolution was introduced at a meeting of the Board of the Chicago Tuberculosis Institute, to submit a platform in reference to care of advanced cases in county institutions, to candidates of various parties for county commissioners at the impending primary election in April, 1912. The platform read as follows:

1. Increased medical service for the tuberculous patients; at least one resident physician for each seventy-five to one hundred patients.²

2. Increased and improved nursing service; at least one nurse for each thirty to forty ambulant cases, and one nurse for each fifteen to twenty bed patients; of these nurses at least one for each fifty patients should be a graduate nurse.

3. An adequate, well prepared and well served dietary of a standard set by recognized authorities in the treatment of tuberculosis.

4. The appointment of a staff of recognized tuberculosis experts to serve without pay, who shall advise and co-operate with the board of

¹See Transactions of the Ninth Annual Meeting of the National Association for the Study and Prevention of Tuberculosis, pages 54 to 66.

²In the final campaign for improved service, in the latter part of 1913, clauses I and II were modified to correspond to the standard set down by the special committee of the National Association for the Study and Prevention of Tuberculosis: "At least one resident physician for each 50 patients; at least one nurse for each 15 ambulant cases and at least one nurse for each 10 bed patients, this number to furnish all the necessary day and night service."

county commissioners in the establishment and maintenance of these standards.

The period of time left to induce prospective candidates to sign this platform, was only six weeks; yet out of 160 candidates, 72 signed the platform. The favorable response in this campaign, as well as some future developments, convinced us that platforms of political parties in our future county and city elections must contain "tuberculosis clauses."

Third. With the election of the present board of county commissioners in November, 1912, the Chicago Tuberculosis Institute requested A. A. McCormick, president of the county board, to appoint an advisory committee to study existing conditions in Cook County tuberculosis hospitals for the purpose of recommending needed reforms. A committee consisting of Dr. Theodore B. Sachs, chairman; Dr. Ethan A. Gray, Dr. Stephen R. Pietrowicz, and James Minnick, secretary, was appointed on August 12, 1913.

The investigation proceeded without delay and the results of said investigation were incorporated in a report submitted on November 28, 1913, to the president and board of commissioners of Cook County.³ This report, like the report of the National Association, was widely circulated among all classes of the Chicago community. Its recommendations called for most radical changes, amounting to a transformation of the existing institutions into efficient tuberculosis hospitals.

Fourth. The Chicago Tuberculosis Institute co-operated, through its president and superintendent, in planning the new Oak Forest Tuberculosis Hospital, which, when completed before the expiration of the year 1914, will have a capacity of 600 beds. This will be a modern hospital for the treatment of chronic advanced cases of tuberculosis, in full conformity with the standard laid down for such institutions by the special committee of the National Association, viz: housing of patients in small groups, a sufficient number of single and double rooms and wards of 4 to 8 beds, all the necessary medical and laboratory facilities, ample provision for outdoor treatment, etc.

Fifth. To provide the necessary reforms recommended in its report, the advisory committee for Cook County tuberculosis hospitals aided by the Chicago Tuberculosis Institute, made a systematic campaign among the Cook County commissioners for a comprehensive provision in the annual budget for 1914 for an efficient administration of the Oak Forest Tuberculosis Hospital.

³For copy of this report, apply to the Chicago Tuberculosis Institute, 8 South Dearborn Street, Chicago.

Courtesy of the Modern Hospital

The State Hospital at Gardner, Mass., is for the care of the supposedly incurable insane. Its 1,500 patients represent almost every known form of mental disturbance. Dr. La Moure has planned his 1,500 acres of land well, placing divisional farms on the hillsides. The work at Gardner is chiefly out-door farm work. In addition to the farm work, the patients have built nearly all the colony houses of the institution. Some of them do excellent architectural work.

This provision represented an additional item of about \$50,000. Success crowned this most persistent campaign in the history of our tuberculosis organization, a campaign consisting of repeated conferences with the finance committee of the county board and with individual commissioners, appeals at the meetings of the full board and continuous agitation of the question backed by numerous organizations in this city, the campaign throughout being energetically supported by the president of the county board, A. A. McCormick. The following comparative table gives an idea of what has been accomplished in this campaign:

OAK FOREST TUBERCULOSIS HOSPITAL	
	January 1st, 1914
	November 28th, 1913
	Allowed in the Budget
	(327 patients) (445 patients)

Resident physicians ...	1	10
Consulting nurses ...	3	9
Attendants ...	13	28
Domestic service, personnel (kitchen service, janitors, maids, waitresses, etc.)	5	23
Open Air school teacher	1	1
Paid visiting nurse & throat specialist	0	1
Paid visiting dentist	0	1
Business Manager	0	1
Dietitian	0	1
Laboratory equipment	0	\$1,000
Medical and nose and throat equipment ...	0	\$1,000

In the successful campaign just closed we had the enthusiastic co-operation of the highly efficient general superintendent of the Oak Forest institution, the well-known social worker, James Mullenbach, and the highly efficient business manager of the tuberculosis department, Ada Belle McCleery.

The management of the Oak Forest institution is at present putting into operation the reforms provided for—a task requiring much time and labor.

The progress of the gradual transformation of this institution into an efficiently managed hospital has been great-

ly stimulated by the appointment of Dr. Glenford L. Bellis, a trained sanatorium physician, as the head physician of the institution.

Thus after years of apathy in the matter of right care of advanced consumptives, Cook County is solving this problem in a way acceptable to the patient and to the community.

I submit the above methods of campaigning in Cook County for improvement of conditions in hospitals for advanced cases to tuberculosis organizations all over the country, particularly the submission of "tuberculosis platforms" to candidates at city and county elections; incorporation of "tuberculosis clauses" in platforms of political parties in such elections, and vigorous campaigns before such elections among all classes of the community.

THE PRACTICAL PROBLEMS OF BOVINE TUBERCULOSIS

THERE IS, PERHAPS, no public health question which has been the subject of so much bitter controversy not only between health authorities and producers, but between different schools of science, as the question of the danger and the control of bovine tuberculosis. For a long time followers of Robert Koch maintained that the tuberculosis of cattle was totally distinct from that of human beings, and that the milk of tuberculous cows had never been shown to produce tuberculosis in children. Gradually, however, upholders of the contrary theory, under the leadership of Dr. Theobald Smith, have won their way and the danger to man of bovine tuberculosis seems established.

The practical question, however, that which affects cattle growers and dairy men, is still far from settled, and the country should be grateful to the state of New York for undertaking a thor-

ough study of the whole subject. The announcement of Governor Glynn's commission to undertake this work will meet with general approval, for it includes men whose names command universal confidence. Dr. Theobald Smith and Dr. Herman M. Biggs are known to everyone; there are also Dr. Philip Van Ingen, of the New York Milk Commission; Dr. H. L. K. Shaw, of Albany Medical College; Prof. V. A. Moore, dean of the New York State Veterinary College, Cornell University; Calvin J. Huson, New York state commissioner of agriculture; V. Everit Macy, of Ossining, superintendent of the poor of Westchester County; H. J. Wright, editor of the New York *Globe*, also prominent farmers and breeders of dairy cattle.

RACIAL CHARACTERISTICS AND NEGRO PROGRESS

AT A CONFERENCE at New Orleans called by Dr. Oscar Dowling, of the Louisiana State Board of Health, to consider means of improving the Negro race, Dr. William C. Woodward of Washington expressed his belief that the high death rate among Negroes was not due to their surroundings so much as to racial tendency. He had seen white people living in the alleys of Washington amid conditions quite as unhygienic as any surrounding Negroes; yet among these white people the death rate was not so high as among Negroes.

Dr. Dowling emphasized as of highest importance for improving the conditions among Negroes, first, housing; second, education. In the overcrowded shacks of the Negro sections, immorality, venereal diseases and tuberculosis are rife. In the work of education he urged not only the sympathetic co-operation of white people but also the best effort of the more intelligent colored people.

Emphasis on possible improvement of

Courtesy of the Modern Hospital

The shops and rooms at the Gardner State Hospital, for sewing and weaving provide for indoor occupations and turn out practically everything from kitchen utensils to home-made rugs and carpets. As in the most modern hospitals the excited or violent patients are given active work to do. Many patients play well on the piano or other musical instruments, and excel at bowling or billiards.

the Negro race was also given in a paper written by Dr. Jacques Loeb and read at the recent meeting in Baltimore of the National Association for the Advancement of Colored People. Dr. Loeb said that it was "contrary to all known facts to say that with a pigmented skin or with a certain type of eyes, must necessarily be connected a lower degree of intelligence or moral control. . . . All known facts indicate that [mental and moral traits] are not limited to special races, but are the peculiarity of certain strains or families, independently of race. It is an open question whether with equal facilities and care the children of different races would show widely different mental and moral development."

Dr. Loeb in concluding expressed his opinion that it was contrary not only to justice but to scientific fact to deny colored people equal rights and equal economic, social and educational opportunities with white people.

A "TEACHING HOSPITAL"

The prejudice against the use of hospitals for teaching purposes is so general in this country that there is surprise over the recent gift by James Deering to Wesley Hospital in Chicago, of \$1,000,000 to be used for the care of "real charity patients" and in connection with the teaching of medicine in Northwestern University Medical School. He stipulates that the hospital is to be a teaching hospital, and that the medical school to whose faculty the hospital is entrusted must have a high standard. In this way he provides for the clinical teaching of future physicians at the bedside of the patient—the only place where it can be adequately given—but he also provides for the proper care of the charity cases in the hospital. Anyone who knows the inside workings of a hospital knows that the

visiting staff of eminent physicians can give only the most perfunctory attention to the ordinary run of cases in the big free wards,—there simply is not time for anything else; and though the man who is lucky enough to have a rare heart lesion secures as much notice as he would if he were a private patient, the poor rheumatic or dyspeptic is left to the tender mercies of the interne. But if ward rounds can be combined with teaching the situation becomes quite different, for the time and the interest of the visiting staff are more than doubled.

SIMPLIFIED PLUMBING

The folly of laws requiring expensive and complicated plumbing in houses is pointed out in an editorial in the *Journal of the American Medical Association*. These laws are usually framed more by those interested commercially in the production and installation of plumbing equipment than by public health experts, and these people are very likely to defend such legislation by exaggerated statements about the danger of escaping sewer gas.

As a matter of fact, we do not know whether there is any danger at all from sewer gas, and although the best and most expensive kind of plumbing is certainly desirable, still it remains true that the chief obstacle in the way of a town which wishes to abolish the dangerous privy vault (dangerous because accessible to flies) is the great expense of installing modern sanitary plumbing. The best way, therefore, to work for public health is to devise some means of simplifying and cheapening the equipment of an ordinary bathroom. All unnecessary refinements and elaborations in plumbing outfits are a hindrance and not a help to the health of the community.

On the first of September commenced the five months' course in public health nursing offered by the Henry Street Settlement, New York city, in co-operation with Teachers College and the School of Philanthropy. The course includes field work in district nursing, pre-natal care, obstetrics, infant welfare work, tuberculosis and school nursing, and social service work. Also lectures on the principles of public health nursing, municipal sanitation, family rehabilitation, preventive medicine and modern social problems.

The first state tuberculosis sanatorium for colored people in this country has been secured in Delaware. The site for the new sanatorium is about half a mile from Hope Farm, and consists of several acres of well-wooded and well-watered land. A temporary building has been opened, but it is expected that accommodations for twenty patients will be ready this fall. The new hospital will be administered from the Hope Farm Sanatorium.

The General Education Board has given \$500,000 to Yale Medical School on condition that professorships of the chief clinical courses be on the full-time basis, and that the schools have control of the New Haven General Hospital.

The Toronto Department of Health has organized a division of child hygiene. Appointments will, it is reported, be made by the professor of pediatrics in the University of Toronto and the health officer.

It is announced that a six-story building will be erected by the Illinois Central Railroad, opposite Jackson Park, Chicago, as a hospital for employees of the railroad and for passengers who may be injured.

BOOK REVIEWS

THE UNCONSCIOUS

By Morton Prince, M.D., LL.D. Macmillan Co. 549 pp. Price \$2.00; by mail of THE SURVEY \$2.12.

GLIMPSES OF THE COSMOS

By Lester F. Ward. Twelve Volumes: Volumes I, II and III. G. P. Putnam's Sons. Price, 3 volumes, \$7.50; by mail of THE SURVEY \$8.00.

Peace has her victories.

It is impossible, in reviewing these two books and relating them to one another, not to relate them also to the earthquake and tornado which is shaking Europe and the whole planet at this time. They are still, small voices, these two

books. They will not have many readers. But they subtly and profoundly show that war is an anachronism; that a larger constructive destiny has already laid hold on the race; that the struggle of races, considered as a dynamic force in history, has nearly ended, and that the struggle of The Race against impersonal barriers, has begun.

Why are these books, *The Unconscious* and *Glimpses of the Cosmos*, associated in one review? The first is an essay in technical, experimental psychology; the second is a documentary, mental biography of a philosopher of sociology. Dr. Morton Prince has presumably not concerned himself, save casually, with the social aspects of his theme—at least, the book under review does not show it. Lester F. Ward once told the writer that his own knowledge of psychology, in its special aspects, had been gained almost entirely from the writings of William James.

Probably Ward and Prince knew or know little of the field in which the other is eminent. But for readers of *THE SURVEY*, these books will connect themselves in an imperative way. Dr. Prince studies the inner problems of human personality, the nature of its maladies, the laws of its work and growth within the individual organism, and the means of its therapy. Lester Ward depicts the sway of the race and of society, constraining the individual soul with an enormous and complex gravity; he discusses the rôle of purposeful work in the social order, and shows in a general but conclusive way that increases in genius and happiness are waiting to be brought about through social adjustments of a creative kind; and he shows what these adjustments must be.

A word, before discussing these books in detail, as to their suggestive relation to the one preoccupation of the moment—the world-war. Dr. Prince's work belongs to the rapidly developing field of

"subliminal psychology," in which, Professor James said, the greatest scientific results of the coming century are to be looked for. Subliminal psychology has altered permanently the human outlook in one generation, through the intimate team-work labors of a great Frenchman (Charcot), a great German (Wundt), a great Englishman (Myers), a great Belgian (Bernheim), a great Austrian (Freud), and such American workers as James Prince, Sidis and Stanley Hall. The list is illustrative, not exhaustive.

The beneficent fruits, in medicine and pedagogy, of this science which is yet only at its dawn, flow back impartially to all peoples. Already, from the demonstrated facts of subliminal psychology, there emerge social duties of an essentially international kind—duties of world-wide statistical research, of changed policies toward the adolescent races, of world-wide co-operation in the restriction of drugs, of world-wide eugenic measures.

Beside any one of those needs, the shifting of a trade route or a political boundary, the sentimental domination of Slav over Teuton or of Mongol over Aryan, even the destruction of militarism which is self-doomed, shrink to unimportance. Nay—war, no matter how vast or protracted, cannot materially check the advance of this science or the changes in human life which it involves. War, or bourgeois contentment with things as they are, can deprive our own generation, our children, perhaps our grandchildren, of some of the gain, but will the history of three million years, yet to be written of humanity on this earth, be greatly impressed with such a retardation?

As for the writings of Ward—here we may observe a rugged American man, indigenous as Abraham Lincoln or a red Indian, emerging from an iron discipline in the American Civil War and passing up, through varied cosmopolitan influence, to an outlook and wisdom absolutely planetary in their breadth. A Frenchman—Comte; a German—Haeckel; an Englishman—Darwin; an Austrian—Odin; an American—Ward. Again we see the onward flood, international and inter-racial, of a science whose prescriptions are indifferent to political boundaries, whose criticisms cut as deeply into the self-complacency of England or Germany as into the egotism of the Fiji Islander, and whose dazzling prophecy includes the human race.

Now, for the essential bearing on one another of *The Unconscious* and *Glimpses of the Cosmos*. Dr. Prince prefaces his work with these words, uttered by Bergson: "To explore the most sacred depths of the unconscious, to labor in the subsoil of consciousness, that will be the principal task of psychology in the century which is opening. I do not doubt that wonderful discoveries

await it there, as important perhaps as have been in the preceding centuries the discoveries of the physical and natural sciences."

Prince's book is the second of a series of which three are promised, and which might be collectively called "An Exploration of the Soul." These are clinical and experimental studies, falling within abnormal psychology but laying the basis for a more vivid and conclusive normal and general psychology such as might be predicated from the writings of William James and of Tarde. Incidentally, the work of Prince is simply freighted with lessons for each one of us in the task which presses on each, of regulating and enhancing "the fountains of his own will."

An immediate transition from Prince to Ward is found in the following paragraph from Ward's great but little-read *Psychic Factors of Civilization*: "The preëminent service of Schopenhauer to philosophy has been that of turning the current of thought out of the old and hopeless channels of objective (intellectualistic) psychology, into the new and promising channels of subjective (emotional) psychology. Here, and here alone, is there hope for a science of mind."

And the following paragraph places us out of Prince's special field, and fairly within Ward's: "Provided that means of satisfying wants can be secured, then the greater the number and the higher the rank of such wants, the higher the state of happiness attainable. The problem of social science is to point out in what way the most complete and universal satisfaction of human desires can be attained; and this is identical with the problem of greatest happiness."

And this point is curious and significant: that both Prince and Ward are systematic determinists and monists, yet the writings of Ward are a veritable gospel of the efficacy of purposeful endeavor; his principle of "telesis," which is in practice indistinguishable from psychic and moral freedom, is shown as creating a new era not only in human life, but in the cosmos. While to the man on the street, the whole of Prince's work, beginning with his famous and classic work on the multiple personality of "Sally Beauchamp," and down through all his experimental results, is a lesson in the potency of deliberate influence, the modifyability of human character, and the possibility, to which no limit can be set, of reconstructing, liberating and aggrandizing the individual soul, here and now.

Space forbids a more detailed juxtaposition of these two books, each of which holds the forefront of a great scientific movement. But their connection in this review is not accidental. The writer is certain that general readers, and social

workers in particular, will get the best results in scientific reading when they, the readers, assume a general human standpoint and view the insulated, specialized sciences in relation to one another. This is peculiarly true in psychology and sociology, which are two sides of one thing, each a mystery unless viewed in the light of the other.

To describe the two works briefly. The Unconscious is an essay in psycho-analysis. Psycho-analysis is properly a method, or group of methods, for the disclosure of the human mind and the diagnosis of mental disease. But in the popular and scientific mind, psycho-analysis is likewise a bold and radical theory, the theory, namely, that virtually all "subconscious" mental processes are sexual in their nature. Psycho-analysis, however, as a growing technique of research and diagnosis, long antedates the time when the genius of Freud and the dogmatic reiteration of his followers invaded and captured the science, temporarily, on behalf of a sweeping and rather mystical doctrine of sex.

Prince is an original, empirical worker, and he first became widely known through his descriptions of the Sally Beauchamp multiple-personality case, a year or two after the publication of Freud's far-reaching studies on hysteria. Prince has for seven years edited the *American Journal of Abnormal Psychology*, and has for long been one of the most sanely and courageously selective and moderate workers in abnormal psychology. He has successively done much to save the American medical mind from being swept, first by the physiological theories of Janet, the great French psychiatrist, and subsequently by the sexual prepossession of the Freud school, not very successfully, for the moment, in the latter case, it must be confessed.

The present volume, *The Unconscious*, is a semi-popular work—popular to the extent that it can be fully understood by a reader who has previously known nothing of the subject, and that it gives a careful and generous statement of the various conflicting theories which may be said to rage in the psycho-analytic field. In his effort at clarity, Dr. Prince reiterates and expounds almost to weariness, but this repetition is all devoted to essentials. To dwell on his book, annotate it, and depart from it for further reading, would be a liberal education to any serious-minded person, and the student would find himself amazed at the wealth of general relationships and richness of insight into his own personal nature, which would flow from the task. *The Unconscious* can be read without a previous reading of Dr. Prince's earlier work, *The Dissociation of a Personality*. Space lacks for any kind of summary of the richly-freighted pages of this book.

Lester F. Ward's book—the last that will appear from one of the greatest souls America has produced and one of the most original and industrious brains of the century—is as bold in its conception as it is naïve and unusual in its carrying out. It is a twelve-volume mental autobiography; the present issue consists of the first three, and not the most interesting, volumes. The value which the world will place on *Glimpses*

of the Cosmos will depend on the value which, in fullness of time, it places on the message of its author as delivered in the five great books of his life beginning with *Dynamic Sociology* in 1882 and ending with *Applied Sociology* in 1907.

The writer believes that the Russian censors, who twenty years ago put the *Dynamic Sociology* in the flames, and the students of Ruskin College, Oxford, for whom Ward's writings have been more or less of a bible, sensed correctly the meaning of Ward's philosophy to the rising world of democracy and responsible liberty. The feminist movement owes one of its profoundest statements to Ward. He seems to have forecasted Henri Bergson by several years, all that is comprehensible in Bergson's principle of "creative evolution" being contained in Ward's "cosmic synergy."

Ward overthrew, exhaustively and radically, the doctrine of evolutionary fatalism, preached as a social gospel by Herbert Spencer until it became the language of the *laissez-faire* school the world over. In his *Psychic Factors of Civilization*, a noble, independent structure in the world of thought, which as the years pass remains strangely unvisited, Ward laid the theoretical connections between the organic and psychic worlds, showed the priority of feeling over reason as the creative power in mankind, and placed intellect in its relation to that part of the soul which, as all now recognize, is its more ancient and enduring part. Finally, the *Applied Sociology* is a magnificent evangel of democracy and equal opportunity, based on an attempted demonstration of the boundlessness of potential genius equally scattered through the race.

Those who share this estimate of Lester Ward's work, will not find the projected twelve volumes either tedious or, in places, trivial. Whether the remaining nine volumes will be published is to depend, it is stated, on the kind of welcome given the present three volumes. For the entire work not to be published will be a sorrow to numbers which will increase with each year. In description of the three published volumes it may be said, that Ward was for most of his life a government agent in the geological survey and Smithsonian Institute; that he came to sociology through the underlying sciences, and was an authority on paleobotany and a thorough biologist. His literary and historical culture was extremely wide, though always held with a kind of simplicity and innocent vanity which can best be described as ante-bellum.

The *Glimpses* contain, in the main, essays which range from theological polemics (Ward was aggressively Ingersollian in his young years) through all kinds of social and economic issues to discussions of the origin of life on the planet, the nature of pre-organic evolution and the classification of fossil plants. With these, go explanatory papers devoted to the several important books of his life, together with the raw materials, in successive stages of elaboration, which went into *Dynamic Sociology*. The outright biography is scattered through the miscellaneous papers, and all is arranged chronologically. The whole result gives

a kind of patient, self-reliant, granite-like impression, something of the elaborate dignity of the "elder statesmen."

But those who knew Ward, or whose lives have been deeply penetrated by his philosophy, can not treat this book impersonally; not even those who may have seen him only once, as when, immediately before his death a year ago, he spoke on eugenics in the Ethical Culture Hall in New York. An old man, white-haired, frail, beautiful; with the subtlest gracious humor; rigid in his technical exposition, infinitely non-popular, quietly announcing, on a great mooted question, a verdict—a negative verdict, which, whether ultimately correct or not, was stimulating and tremendous.

JOHN COLLIER.

THE QUESTION OF ALCOHOL

By Edward Huntington Williams, M.D.
The Goodhue Co. 128 pp. Price \$.75;
by mail of THE SURVEY \$.80.

National Prohibition a Growing Issue

Whether one believes that national prohibition will help or harm—nobody claims that it will utterly cure—one must confess that it is a coming political issue, the *National Liquor Dealers' Journal*, according to the *World's Work*, asserting that twenty-seven states would vote for it. And, of course, conditions can not have reached this pass without a real battle being on between the liquor dealers and the opposition, represented by the Anti-Saloon League, which is rapidly drawing to its side the foremost men of industry, who have to manage large groups of workers.

These men are joining the anti-alcohol ranks for various reasons, one being that the employers' liability laws have made accidents so expensive as to bring about a careful investigation of their causes. It has been found that too many accidents in large manufacturing plants work back to drink, and not to heavy drinking alone, but to moderate drinking.

Now, of course, many guns will be fired before the end, and one that has recently been let loose is a literary gun, *The Question of Alcohol*, by Edward H. Williams, M.D. Whether Dr. Williams wanted his articles, now embodied in book form, to be brewers' ammunition, we can not know, but ammunition they are. As fast as they appeared in the *Medical Record* they were, for the most part, printed over in liquor journals, and one that appeared in THE SURVEY, Temperance Instruction, was sent out broadcast by publicity agents of the liquor trade.

The little book is admirable for the brewers' purpose, seeking to undermine the two strongholds of the opposing camp—national prohibition and alcohol education—first as carried on in our public schools, later in the form of posters and exhibits.

Taking first the attack on education, this assault hits precisely where it can hit with force, on the deplorable exaggeration that seems to follow in the wake of temperance. Every advocate of anti-

alcoholism must regret this exaggeration, oftentimes making it necessary for the business men, social workers and physicians now pouring into the ranks to rehabilitate the subject before they can get a hearing.

Dr. Williams lays bare this grotesque exaggeration and misstatement, but to my mind he fails to do what the real reformer would do,—offer help for the situation. He lays the misstatements before you (rather magnifying them, it seems to me), and, with never a word for all the good text books that exist side by side with the somewhat hysterical ones, he cries out that under the knife of this grotesque education the consumption of liquor has been steadily rising, leaving the impression, in some way, that increasing consumption is due to the scepticism implanted in the young mind by our present alcohol education; anyway, it has not been effective—and there Dr. Williams drops it.

It is the place where Dr. Williams drops subjects that makes a social worker, rightly or wrongly, distrust him. He drops the subject precisely where the social worker would cling to it for dear life.

Thus, the real reformer would have given more recognition to all the good matter in the schools, and agreeing most frankly to the bad, have earnestly declared that in view of the "menace of drink" we must consecrate ourselves to veracity (nothing short of veracity having long-range power). And since history proves that all lasting reform comes slowly and through education, we must secure either federal or state committees of physicians and others to bring forward adequate textbooks in which facts are not suited to inclinations, but inclinations to facts.

A social worker condemns only to construct. Again, to help, you must not put forth pieces of truth, but all of it. Dr. Williams puts forth this piece of a whole truth, namely, that our consumption has been rising. But he does not add that all this time we have been taking into the country thousands and thousands of new drinkers.

As a matter of fact, the figures of the *American Grocer*, compiled purely for business purposes, show that the United States reached the height of its per capita consumption in 1907. Since then we have not risen, but have slightly declined. The *Grocer*, July, 1914, thereupon notes that prohibition is holding in check consumption, keeping it from rising along with immigration. So it would look to me as if all this education was beginning to tell on the mind of the people, slowly but surely.

We come now to Dr. Williams' arraignment of prohibition. Briefly he says that while liquor still flows freely in the South, prohibition has placed it beyond the reach of the very poor, who are therefore taking to cocaine. I do not know anything about the facts here,—they are, I fancy, too recent to be treated adequately. But if drug fiends are increasing alarmingly in the South because liquor, while still flowing freely, is withdrawn somewhat from the very poor by reason of its being expensive to transport, I say to myself why in the face of all this did West Virginia go dry by

such an amazing majority, and why has Virginia entered into such an enthusiastic dry contest?

Dr. Williams then takes up the question of prohibition versus insanity. He says that some people say that the decrease of insanity in Kansas is due to prohibition. Dr. Williams says that they should not make this statement, and I think that he is quite right. Prohibition has not yet prohibited enough anywhere for us to make dogmatic statistical statements.

But Dr. Williams then goes on to show that while we can not say it has decreased insanity in Kansas, we can say that this still unprohibiting prohibition would seem to have increased certain forms of insanity. There, I think, Dr. Williams falls into the same trap of those whom he accuses.

To prove his point he shows that that form of insanity called alcoholic psychosis is larger in prohibition Kansas than in wet Nebraska or South Dakota, similar states, and he draws this delightfully brewerish conclusion: that the reason that Kansas leads its sister states in this particular is that whiskey, not beer, causes most alcoholic psychosis, and in prohibition states whiskey, not beer, is the thing that men drink. So we are left with the general impression that as Kansas could not get beer so easily as Nebraska could, Kansas developed 5 per cent of this form of insanity while Nebraska developed only 4 per cent.

It may all be true, but no man on earth can say it is true simply by the facts put forth by Dr. Williams.

Truly, if prohibition is to come, it will come not out of manipulated statistics, but on broad lines—the lines of the practical business man. I am amazed at the number of business men in Massachusetts who tell me that, while they would not vote for state prohibition, they most certainly intend and shortly expect to vote for national prohibition.

Now the business manager is convinced that moderate drinking does slow down quick thinking and open the way to inefficiency and accidents. It is to eliminate drinking quite as much as drunkenness that he will vote for national prohibition, nor is he moved by being told that these normal drinkers will all take to drugs if deprived of their daily quart of beer. They are not alcoholics, and looking across the country at the millions who never touch liquor, he does not see any harm in trying to turn the average drinker into the total abstainer, first by constant education, second by nation-wide prohibition which removes private profit and ultra-accessibility.

Of course, civic clubs must be provided in place of the saloon, for men must meet, eat, talk and drink together,—but they need not drink alcohol. This is the way the practical business man looks at it, and many of the physicians that I know look at it in this way. Dr. Williams does not, and neither do the brewers.

The real prohibition, of course, is the *educated will*, the boy coming out of the home with the will as educated against alcohol as the will of the average girl is now educated against the social evil.

My honest opinion is that nation-wide

prohibition is coming here, and that it will do good work, because the community really is getting in earnest about the alcohol problem; but it will not do the work that it should do, unless social workers flank it with brilliant systems of organized education and with well-developed schemes of recreation, substitutes for the saloon.

ELIZABETH TILTON.

A HISTORY OF PENAL METHODS

By George Ives. Frederick A. Stokes Company. 409 pp. Price \$3.00; by mail of THE SURVEY \$3.15.

The title of this erudite volume might well have been a History of Penal Methods in Great Britain, since the materials are drawn chiefly from English sources. Continental and American authors are rarely mentioned. Up to the end of the sixteenth chapter

one feels that he is companion of Dante in the hopeless world, with not even Purgatory in sight. It is cinematographic melodrama which dulls the sense of moral horror by dint of repetition. The recital of these abominations in the name of justice has a practical purpose: to show us that what we call justice is merely ancient, savage revenge with a solemn mask of law and formality. The revolting facts are dragged out of corpulent note books and the references to books cited furnish a rather elaborate bibliography of the history of punishment. Even John Howard comes off with scanty respect, and at times one feels that he would like to have these former official culprits represented by counsel to see if they might not set up some shadow of defense.

The constructive suggestions of the latter chapters are in the main principles which have found frequent expression in the meetings of the American Prison Association, the National Conference of Charities and Correction and the Institute of Criminal Law and Criminology; probation, parole, education work in reformatories, parole on conditional release, humane and patient care of discharged men, and asylum treatment of those who cannot safely be restored to freedom.

There is one exception which American public opinion will not tolerate: "All who can not ultimately lead useful, human, tolerably happy lives, should be destroyed as soon as ever their condition has been determined." This same plan was proposed several years ago, but the book in which it was offered has seldom been mentioned since the first reviews. The author has not pictured to himself the effect on public morality of a wholesale slaughter of incurable offenders, nor the difficulty of deciding when they are incurable. The work colonies of Cleveland and Kansas City, and still more those of Belgium and Holland, indicate a better disposition of those who cannot be either happy or useful in competitive groups.

CHARLES R. HENDERSON.

TOYNBEE HALL AND THE ENGLISH SETTLEMENT MOVEMENT

By Dr. Werner Picht. Macmillan Co.
248 pp. Price \$1.25; by mail of THE SURVEY \$1.33.

Account of the
"Mother of
Settlements"

spiriting setting forth of the original settlement gospel and a valuable though partly discouraging account of the present situation at Toynbee Hall.

The treatment of the subject as a whole is rather confusing on account of the shifting from time to time of the angle of vision. The reader finds it difficult to know in many places whether general statements refer to Toynbee Hall, to any one of several groups and types of settlements, or to the whole English settlement enterprise.

The American reader will note an attitude on the part of the author of traditional social superiority; atoned for in a measure by that sincere and devoted concern for less fortunate brethren as individual brethren which the democratic reformer often lacks.

In his desire for an apostle as a personification of the center for the fine and rare enthusiasm which led to the founding of the first settlement, Dr. Picht develops to a further point than any previous writer the beautiful story of Arnold Toynbee; though it must be said that Arnold Toynbee had a comparatively slight direct or even indirect influence on the settlement proposal. Mr. and Mrs. Barnett, who were the real creative intelligence, occupy a relatively slight place in Dr. Picht's record; and Edward Denison, the true forerunner, is just mentioned.

The influence of Toynbee Hall as a center of humanizing culture for East London and as a training school for the public service are convincingly set forth. Hardly enough emphasis is given to the service of Toynbee Hall in placing constructive social service on an unsectarian basis. This contribution ought to be set over against what Dr. Picht truly says about the more steady and continuous vitality of the religious settlements.

One can not but feel that Dr. Picht is too deeply impressed by the unfortunate transition stage through which Toynbee Hall is now passing. He seems to take the undeveloped and somewhat cynical point of view of a leaderless group for the established attitude of the settlement. It is true, as Dr. Picht points out, that Toynbee Hall is deficient in the matter of direct, human neighborhood relations; and the neighborhood idea is undoubtedly, as he holds, the touchstone of settlement life and progress. But certain settlements—a few very notable cases on both sides of the water—have their reason for existence primarily in strong contact with certain broad phases of working-class life. The long and hon-

orable roll of men whom Toynbee Hall has sent into important posts in public life and educational service, all of whose careers show clear traces of their life and work in the East End, will prove that the "mother of settlements" has not failed to make vital connection between the centers of culture and the centers of industry.

A number of the English settlements, including most of those where men are chiefly responsible, and Toynbee Hall most of all, are today suffering from the very logic of their success. Dr. Picht quotes a member of Parliament who said that the social legislation of the past twenty years would have been impossible but for the settlements. This whole tendency, including its bearings on education and religion, has led to the drawing off of settlement leaders far more rapidly than they could be replaced.

There must in the nature of the case come a period of revival—which Dr. Picht, with all his settlement faith, hardly foresees—of the ancient English tradition of responsible and resourceful civic leadership in every local community in the kingdom, which will once more reinvigorate those settlements which are today suffering a decline. The profound significance of the settlement in bringing together separated classes for purposes of national unity, which Dr. Picht properly emphasizes, contains in itself the motive which, in the new era upon which England is entering, must mean much to the future of such a center as Toynbee Hall.

Surely also, with all the very fine records of devoted educational service in connection with the club work at Toynbee Hall, the fact that at the present moment its club work is in abeyance can only go to show that the settlement is passing through one of those relaxed interims which must be expected and must not be taken too seriously.

Of the settlements generally, numbering forty-five in the United Kingdom, we have a brief but informing account. They include a larger proportion of men residents than do our American settlements, though in some cases the men seem merely to lend their presence. Speaking broadly, they are either in charge of clergymen, who have young candidates for the ministry as their associates, or the houses are directed by women of education and much practical experience. In either case, there seem to be properly serious standards for the training of new recruits. Efforts toward inter-settlement conference and federated action are in general making good progress, though the particular type of young men whom Dr. Picht met at Toynbee Hall seem to be still in the stand-offish stage. The demand for women who have received proper training in the settlements in connection with specialized social work, public and private, seems to be much greater than the supply.

The main lines in which Dr. Picht feels that the English settlements have made their important contribution are: (1) their direct influence upon a very large number of individuals; (2) the provision of local leadership; (3) their effect on public opinion and on legislation; and (4) their creation of a wakeful social con-

science.

The difficulty at present, and for the future, he thinks, with Toynbee Hall particularly in mind, is that the power of the early ideal has waned. But the devotion of the pioneer is a thing by itself, and cannot be transmitted. The difficulty with Toynbee Hall and with some of the other important English settlements is that a consistent, determined, resourceful system is not created and maintained for securing and training earnest and capable new recruits, from among whom the leaders of the future would come.

The book contains a brief statement as to the decline of university extension and the rise of the Workers' Educational Association, as agencies of culture for the working classes; a type of effort which unfortunately seems to be hardly under consideration anywhere in this country.

ROBERT A. WOODS.

NURSES FOR OUR NEIGHBORS

By Alfred Worcester, A.M., M.D.
Houghton Mifflin Company. 266 pp.
Price \$1.25; by mail of THE SURVEY \$1.35.

Sympathetic
Side of
Nursing

This is a book sure to arouse criticism if not antagonism. We are not accustomed to hear strictures on the modern trained nurse, unless perhaps in private conversation. When we speak of her in public it is rather in a vein of unqualified praise. We assume that she has the qualities of Florence Nightingale with the addition of the scientific training possible only in these latter times. To enhance her glory we usually refer to the old-fashioned nurse of our grandmothers' day, who is invariably pictured as a Sairy Gamp.

Dr. Worcester in this book tells us that the nurse of today, and incidentally the physician of today, has not gained in all ways by the training of modern times, but that certain very precious and holy things have been lost since the old-fashioned kindly neighborhood watcher and helper gave way to the product of the modern training school.

It should be possible for every nurse to read with respect this searching criticism of her profession, for even if she feels that in her own case and that of others she knows all Dr. Worcester's statements may not apply, she must admit that by and large they do apply, and that much good would follow if his book could meet with a reception on the part of hospital training schools, open-minded and humble, instead of resentful and self-defensive.

Dr. Worcester has studied nursing in the famous schools of Europe, and when we read his descriptions of the school founded by Miss Nightingale, of the school at Kaiserswerth in which she received her training, of Pastor von Bodelschwingh and his colony at Bielefeld, and of the unique school at La Source with its tiny hospital and its clinics in the homes, we can guess beforehand what Dr. Worcester has to say about the American trained nurse.

Briefly stated—and it is a pity to have

to state briefly this sermon of brotherly love and service—Dr. Worcester says that modern medical practice is interested more in the disease than in the individual sufferers therefrom, and this attitude of the physician influences the nurse in the training school.

The training given nurses is better technically than humanly; we can feel surer that patients will be treated aseptically than that they will be treated tenderly, surer that their bodies will be kept clean than that their souls will be treated with reverence. It is not that Dr. Worcester is pleading for careless nursing. He insists on the contrary on an education more extensive than that now offered in the majority of schools, but he would have it rounded, not narrow.

Our nurses are taught to believe that they learn most when they are in large hospitals surrounded by hundreds of patients, regardless of the fact that one nurse can only serve a small number of people, and that she gains nothing from the others.

Our training schools are all hospitals; the American knows of no other kind of school. And yet the sick that the nurse sees in the hospital represent only a small part of the sick in the community, for they are almost altogether the acutely ill or the surgical cases, while the chronic, the incurable and the helpless aged, find no place in our hospitals. It is for this reason he believes that the nurse who has had an excellent record in the hospital breaks down when she attempts private practice and has to care for the nervous, the feeble, the hopelessly helpless. She has learned to do one thing for twenty patients; she needs to learn to do twenty things for one.

In the foreign training schools, which Dr. Worcester holds up as models to us, nurses are prepared for home practice in the homes of the people. Ours, taught exclusively in the hospital, naturally strive to reduce the patient's home to a hospital. "The deaconess is trained to help the home and family of her patient. The modern nurse knows how to make the home into a hospital; she also knows how to exclude the family, and too often she does not know how not to make life miserable for the servants."

There is a beautiful picture, drawn from life, of the old-fashioned "night-watcher," with her scanty science, but her abundant tenderness, and there is a striking contrast also given between the old family physician whom few of us have been fortunate enough to know and his brisk, impersonal, highly efficient, and somewhat dehumanized successor, whom we all can recognize with a smile and a sigh.

There is no space in a review for discussion of the practical suggestions made by Dr. Worcester for the conduct of a model training school. For that the book itself must be consulted. What I wish specially to emphasize is the value of the book as a revelation of our shortcomings, not only in the field of nursing, but in all forms of social work, and as a plea for that spirit that giveth life as over against the letter that killeth.

ALICE HAMILTON, M.D.

SELF-TRAINING FOR MOTHERHOOD

By Sophia Lovejoy. American Unitarian Association. 182 pp. Price \$1.00; by mail of THE SURVEY \$1.08.

That motherhood, as something more than maternity should become a profession is the thesis of this little book. And professions demand preparation and skilful technique. The author describes how a group of college-bred women who felt their total lack of wisdom as they looked into the faces of their children, undertook and carried out a two-year course of training for motherhood—under the guidance and suggestion of a mother? No, of a mere man.

Truth compels the reviewer, another man, to add, however, that the book contains much internal evidence that the most valuable lessons the mothers learned were self-taught. This is encouraging because it should lead other mothers to make similar studies.

The method of study is not very clearly described but the results obtained are such that other mothers may make use of them. The chapter on discipline will be found of special value to parents, as it clearly states the Spencerian principle of punishment and gives many concrete and sensible suggestions as to its application. The necessity of poise and self-control among parents and consistently carried-out methods of discipline is again and again urged and illustrated.

The attitude of a mother toward unsatisfactory school situations will also be found of special value. The sincere quality of the book is indicated in this passage:

"I do not claim that it is easy to be a conscientious and successful mother, but I do claim it is a duty, and may be a great privilege and opportunity, and a mother's effort will lead to success if she but persevere according to the law of cause and effect. The starting point is self-training."

HENRY W. THURSTON.

THE CHILD IN THE MIDST

By Mary Schaufler Labaree. The Central Committee on the United Study of Foreign Missions. 272 pp. Price \$.50; by mail of THE SURVEY \$.58.

This is the fourteenth text-book published under the direction of the Central Committee. "It is not a book for children, but a book about children the world over." The author, as we are told, is merely a "missionary daughter, granddaughter, wife and mother who was born into an environment of missionary intelligence and activity," and has since had personal associations with many nationalities.

The book is written with missionary spirit and purpose, but shows also how children in other lands, as well as in the United States, need opportunities for health, play, freedom from crushing labor, schooling and sympathetic companionship. The appeal is strong, and cumulative in its effect upon the reader of the successive chapters, for such an organized service to childhood the world over that everywhere the child shall at least have a chance to grow in all the directions which his nature craves and in which in all climes he shows such marvelous potentiality of achievement.

If, as John Fiske argues, the lengthened period of infancy—the prolonged appeal of the helpless child—has actually created the human father and mother out of merely animal parents, is it not scientific to expect that the same appeal of the child, made more and more effective through the whole period of immaturity the better it is understood, will slowly also recreate human society from industry to religion until all human institutions alike will serve the child in that wise, tender and parental spirit in which the highest types of individual fathers and mothers now serve the fortunate children of their own homes?

To the reviewer at least, this is the prophecy that is latent in the leadership of the little child, a prophecy that all who believe in it can do something to help realize. Mrs. Labaree's little book should add many to those who are now militant believers in this prophecy.

HENRY W. THURSTON.

CHARACTER DEVELOPMENT

By Charles Keen Taylor. The John C. Winston Company. 239 pp. Price \$1.00; by mail of THE SURVEY \$1.10.

This book seems to me sound in theory but as worked out crude and not wholly consistent with its own theory. The theory is in substance that the physical, mental and moral factors in a child's life must all be considered in relation to each other, and that

all instruction must follow the psychological stages of development of the individual child. This theory demanded that the growing child himself and especially his developing interests in and reactions upon the complex human society in which he finds himself, be taken as the chief guide in deciding both the what and the how of the pedagogy of morals.

No sooner is the reader properly prepared to find this book worked out in harmony with child psychology than he is plunged in Chapter I, pp. 40-41, into a discussion before children of six and seven years of such adult and grown-up, not to say controversial, topics as the qualifications and methods of election of the mayor, the nature and origin of the "state," the story of territorial expansion in the United States, the theory of law, and the duties of the president.

In many passages—e. g., formal manual training on p. 53, the study of Latin pp. 110-111, abstract teaching of civics p. 124, the teaching of formal grammar p. 181—formal, traditional ways of teaching are keenly criticized by the author. Nevertheless, again and again—e. g., on pp. 40-41 above quoted, p. 101 in recommending an outline of the structure of the government of the United States, p. 137 where a child of twelve is said to begin (?) to have an interest in history, and on p. 124, where the problem of city planning is tackled without sufficient preparation along the line of knowledge of the functions that must go on in them—the author falls into the errors which he himself condemns.

It would be too much to expect, however, that a pioneer book could satisfy all its critics in its choice of particular topics and their sequences. The method proposed by the author, if consistently followed, will by actual test with children of different stages of development help him and his fellow teachers to eliminate those exercises which he thinks ought to fit their stage of development but in fact are still often being imposed upon them from without and above. The impression left upon the reader is strong that the writer is trying hard to free his technique from the dogmatic and traditional in pedagogy and to follow the psychology of the child, but that as yet he is far from complete success.

HENRY W. THURSTON.

CHILDREN OF THE DEAD END

By Patrick MacGill. E. P. Dutton. 305 pp. Price \$1.35; by mail of THE SURVEY \$1.44.

Children of the Dead End is an unique autobiography presented in the form of fiction. The author, an Irish poet, starving, sits on a dung heap and marvels at the beauty of the sunset. The book grips from the first page, where the little boy is born in the house of Irish poverty. Every picture of Irish life is vital. The little boy's fight with his stupid, ugly schoolmaster, his courageous setting forth to sell himself and his labor at the hiring market at Strabane "beyond the mountains"—all is told with tender sympathy and yet with a firm touch. The wandering life of the navvy in Scotland, compelled to live in darkness and filth, is full of tragedy. But the Irish in him always loves a fight, and more than one good one is vividly described.

And through it all, the soul of the poet shines. No environment can really degrade his splendid vision of the beautiful. His pal, Moleskin Joe, is a fine fellow, and though one feels forcibly the arraignment of a social order which inflicts such hardships on hundreds and thousands of young able-bodied men, there is no escaping the conclusion that it does breed men of a fine virile type—a rough, primeval, godless crew, but none-the-less possessed of a vigorous, red-blooded manhood that unflinchingly

calls out one's instinctive admiration.

The tragedy of Norah Ryan is the deepest note of sadness in the book. The terrible price women have to pay for misplaced affection is one of the unsolved problems of our social order.

"I saw," says the author, "pictures of young women with the blood of early life in them, and the fulness of maiden promise in them walking one by one in the streets of the midnight city—young women fair and beautiful, who knew of an easier means of livelihood than that which is offered by learning the uses of sewing needle or loomspindle in fetid garret, or steam-driven mill. In the flames and the redness, I saw pictures of men and women who suffered: for in that and that only there is very little change through all the ages."

The author is master of a good English style, and the occasional verses scattered through the volume are not to be overlooked.

ARTHUR V. WOODWORTH.

RAGGED TROUSERED PHILANTHROPISTS

By Robert Tressall. Fred'k A. Stokes. 358 pp. Price \$1.25; by mail of THE SURVEY, \$1.37.

Ever since Jacob A. Riis wrote *How the Other Half Lives* we have had numberless books about the laboring classes, sometimes frankly fiction, sometimes sociological studies of varying insight and literary value. Men have joined the multitude of "unskilled" workers and lived their precarious life as nearly as it is possible to a man who knows that he can escape when he will from his distasteful surroundings. The results have made good "copy."

It is impossible, however, for the average literary man to write convincingly of a class of society in which he was not born and bred. A careful record of details of every day's existence—hours of labor, food, pleasures—all these things make up the sum of life on its material side in every class. These things can be learned by any one who chooses. But there is another, a more spiritual, side of life—life as it looks to those who live it from necessity, whose whole existence centers there.

Robert Tressall, house-painter, is the author of *The Ragged Trousered Philanthropists*; a record of the lives of a group of English artisans. Not literature, but a bit of real life, sordid, hopeless, always a losing battle against debt and disease.

In America it does not seem characteristic of the class to which Tressall belongs to be so humble minded. "What is good enough for the likes of us is good enough for our children" is not the sentiment of the American artisan who paints and carpenters and plumbs our houses.

Owen, in the book, preaches Socialism, in season and out, and somewhat tediously to his fellow workmen (and to the reader). Their dense ignorance, their stolid acceptance of things as they

are (wherein their "philanthropy" lies), is a hopeless barrier against progress. Until Owen's fellow workmen see the situation as plainly as he does there is no solution of the problem. Whether, when they do see it, their answer will be his particular kind of Socialism, or not, is beside the mark.

Communications

STRIKE PUBLICITY

TO THE EDITOR: In your issue of August 8, in an article on Strike Among Southern Textile Workers, the statement is made that the newspapers failed to give publicity to the strike in the Fulton bag and cotton mill. You are in error, as Mr. Hearst's *Georgian* gave all the publicity possible, and was so given credit by the Textile Workers' Union. I trust you will correct your misstatement.

HENRY M. DONNELLY.

[Secretary Maine State
Federation of Labor.]
Augusta, Maine.

PARENTAL SEX TEACHING

TO THE EDITOR: In my work in this city as well as in other places where I have had to deal with juvenile crime, I feel more and more the lack, the terrible lack, of sex training in even little boys and girls. These cases as they come to me are the most hopelessly depressing experiences that one can meet as you, of course, know.

I am not going to insist that all parents should approve of sex hygiene taught in the schools because that is a many-sided question and one of exceeding delicacy. But here is my plan that I wish could be given some chance. It would help all juvenile work and would give the innocents a chance.

Why can't we have some short, clear-cut, oral test of every parent who wants to enter a child in the schools, beginning at the kindergarten age? Why shouldn't the school, which is attempting to do so much for the child, know whether the parents are fit to guard the morals of their child and whether they will exercise that divine right of parents to inform their child about the mysteries of life, as we hear them so often proclaim they should? If they are not fit guardians and are too ignorant or too neglectful to teach anything as it should be taught, educate them by making it necessary for them to learn how to teach before they can qualify as the parents of a school child. Then if the parents can not qualify, the work would be turned over to a specialist.

I do not believe this would be interfering with personal liberty too much. It is the school law in most places that a child must be vaccinated before he enters the schools and many have different opinions on this subject. Vaccination affects a probable condition; sex training affects an unalterable condition. It seems to me it would not only awaken the parents but it would safeguard the child as no plan has yet done. I think parents ought to get all the examinations anyway and then the poor juvenile offenders would have a little fair play.

Nothing makes me more discouraged than to do something for a delinquent girl of thirteen or thereabouts and have

her mother say that her girl is perfectly innocent! Why should she be innocent at that age? It is far more important that she be pure! Knowledge and purity must go hand in hand!

TRUE PIONEERS OF PEACE

TO THE EDITOR: Why do we not start now to tell our boys and girls the truth about war, instead of leaving their heads full of romantic notions of military glory absorbed from current school histories and story books? Suppose we teach them who are the world's true heroes—the saviors and enhancers of life—and discourage all the youthful admiration for men whose title to fame rests chiefly on the successful slaughter of their fellows. It is high time to stop idealizing the soldier.

While the army virtues—obedience, courage, loyalty, etc.—are constantly held up to children for admiration and emulation, the army shortcomings (by which I mean not the shortcomings of certain bad soldiers, but those inherent in military life at its best) are carefully ignored by adults and children alike. Why not bring out the fact that the army in its perfection is the very negation of democracy? That it harks back to medievalism in suppressing individuality and personal responsibility, demanding instead such blind obedience to authority as we require from a slave or a horse? That slowly and surely the young recruits are turned into mere automata—highly efficient machines for killing?

The children taught thus will have clearer vision on these things than we whose minds are so befuddled with inherited traditions that we cannot recognize murder when it comes tricked out in gay trappings and is labelled "patriotism." Much as we all deprecate war and its frightful consequences, it seems extraordinarily difficult to pass righteous judgment on the vicious deeds of an army! Special dispensations are granted for the direst cruelty, trickery, robbery, arson, and all on account of those early influences which threw a lasting glamour over all things military.

Cadet corps hold grave menace for the future on this account, and the same is true of the Boy Scout movement, despite the generally admirable character of its activities. I know it is claimed that the Scouts are a non-military organization, but nevertheless the psychological effect of a khaki uniform is very powerful, and when these boys parade with the Regulars or National Guard on Decoration Day, who will deny that probably a majority are fairly bursting with pride over the conscious-

ness of being young soldiers already? Thousands of Boy Scouts are actually performing semi-military duty in England today.

There is a movement afoot in New York—the Boy Pioneers—which aims to combine the obvious advantages of the Scout idea with definite anti-militaristic teachings—not merely non-militaristic, you observe. Universal brotherhood is insisted on with all its far-reaching consequences; militarism and nationalism are shown up in their true colors. There are comrades and brothers in every land; it becomes unthinkable to bear arms against them.

Here is a suggestion for churches, schools, parents—in fact, for all who are eager to do something for the cause of international peace beyond deploring the lack of it today. When there are enough pioneers in the world—whether or no they belong to this particular organization—there will be no more wars between nations.

CO-OPERATION: ICH DIEN

TO THE EDITOR: The mere existence in our democracy of a great class of enormously wealthy persons is an anachronism. Without discussing the causes of the condition it is quite obvious that the use of riches, even from the most conservative point of view, for the peace and security of those who possess them, can not safely be selfish, extravagant and ostentatious in the presence of a "fourth estate," sensitive and observant and now just aroused to class-consciousness. The miner, whose "joy of labor" must be got by grubbing in the bowels of the earth envisages the fact that while he receives \$3 a day, the heir of one of his former bosses gets an income of some half million a year from a trust established out of proceeds from the mine in which he digs.

The discontent at the situation was once met with defiance, as voiced in Brownell's famous war ballad by the ambushed "old cove," who insisted on peace:

"Let me alone, for I've got your tin,
And lots of other traps snugly in;
Let me alone—I am rigging a boat
To grab whatever you've got afloat;
In a week or so I expects to come.
And turn you out of your 'ouse and
'ome;

I'm a quiet old cove,' says he with a groan;

'All I axes, is, Let me alone.'

But from whatever source, though simultaneously with the exposure of the great abuses of the public trusts of the insurance organizations, there has been auspiciously developed the sense of trusteeship in individual possessors of wealth and with it the ideal of "service" which is progressing with most encouraging rapidity. A large number of those whose powers are fitted for mental rather than manual use are aiming to serve, not their own groups alone, but those whose abilities are suited to different kinds of activity, with a more generous spirit indeed than has been developed in what is loosely called the "working class."

The newer thought is that this service must be exercised, not in dispensing, but in gaining the fruits of livelihood. There is no longer indiscriminating laudation of the man who has made use of opportunity to accumulate wealth, and then makes announcement that it is a shame to "die rich" and claims recognition for the gift of that which he should never have gotten.

At-one-ment cannot be accomplished under such conditions. It must be the essential ideal and the practice from the beginning. If the wealthy today can not divest themselves of their riches they can at least avert from their children the danger of entering a "parasite" class. Let capital be willed or given to aid in the establishment of every sort of co-operative organization in which the youth who acquires or inherits ability may find a proper sphere for the use of the finest energy, to be rewarded by rational and moderate compensation. The great co-operative businesses of Europe have been directed by men of such qualities as to compete with the enormously remunerated captains of industry on salaries which we consider laughably small,—tragic as it is that it should so appear!

Large sums might be placed in trust under suitable management for the use of industries when threatened by serious disturbances and insoluble internal antagonisms, to place them upon a purely co-operative basis, organized as corporations to be managed by properly chosen salaried officials,—a magnificent opportunity of service. A notable example for the individual who would lead the van in social redemption was the Jena Karl Zeiss Institution with its prosperous and co-operative business (not "profit-sharing"). The founder of this plant, who had achieved a large fortune, without losing a natural inclination for a simple life, and being inspired by a real spirit of service, placed the whole of his property in the foundation organized, he and his fellow administrators and their successors by its charter receiving a salary which is a small fixed multiple of the best workmen's wages.

A domestic co-operative enterprise, the Potomac Glass Company of Cumberland, Md., has passed beyond the experimental stage and is a useful example, not only of the system, but of the part the capitalist may have in launching it.

The organization of the company resulted from a strike of the employees of the National Glass Company which operated a factory some ten or fifteen years ago. The strike was a long and bitter one, and eventually ended in wrecking the business of the National Company and driving it from the territory. During the time the strike was being waged, there was much violence between the strikers and strike-breakers imported by the National Company. A government injunction against the strikers was finally obtained, which was disobeyed by some of the leaders of the strike and they were imprisoned for a time.

When it was seen that the National people had lost in the struggle, and that

it was only a matter of time when they would have to retire from the field, a number of its former employees determined to form a new company, which was to be conducted on a co-operative plan, and the Potomac Glass Company, with a capital stock of \$25,000, was launched. About forty of the ex-strikers subscribed for the stock, which, however, was not entirely subscribed, former Senator George L. Wellington taking the remaining part of it. He was the only outsider holding any of the company's stock, all the rest being held by the employees of the concern.

Loans from Mr. Wellington enabled the company to tide over hard times at the start. They have all been returned, and dividends have been declared as follows: 1910, 10 per cent; 1911, 32 per cent; 1912, 62 per cent; 1913, 72 per cent, and 1914, 92 per cent. There is also a monthly dividend of 1 per cent, making 12 per cent annually, and at Christmas a dividend of 20 per cent was declared, while the other day there was 60 per cent more.

The company is in excellent condition. There have been no strikes and the men work together amicably. They have a factory worth \$100,000 and book accounts of \$25,000 more. There is no indebtedness whatever, and from present appearances they will have 100 per cent next year.

The employees of the company are a first-class type of men, many of them owners of property and depositors in the savings bank, while some of them are or have been holders of positions of trust in the city or county government—altogether they are a worthy, prosperous and intelligent part of the community.

Here are examples worth following:

WAR

TO THE EDITOR: I have looked forward to THE SURVEY of August 15 coming to know what it had to say about this awful sacrifice of humanity going on in Europe. When I open it I find that its leading article is about the war, not about the frightful loss of our brothers' lives, not about the desolation, wasting at noon-day, not about the widows and orphans or the bloodthirst,—only about "our biggest records" in emigration, and how "depression in the countries affected will cause numbers to seek opportunities in this new country." I suppose it is a kind of inverted Monroe doctrine applied to the conflagration of Europe.

W. G. WILKINS.

Derby, England.

PEACE STAMPS

TO THE EDITOR: By all means let us make general the publicity campaign against militarism, as recommended in the recent numbers of THE SURVEY. The poster stamps as described by Mrs. Tilton, it seems to me, would be widely used. Keep your readers informed as to what is doing in this matter and I believe there will be glad co-operation on the part of all of us.

HARRY L. CANFIELD,

[Pastor Universalist Church.]

Woodstock, Vt.

JOTTINGS

SOCIAL WORK CONGRESS POSTPONED

The war has caused the abandonment of plans to hold the Sixth International Congress on Social Work and Service which had been arranged to meet in London in May, 1915. Preparatory work for the Congress was well under way and the executive committee announces that it will be resumed when opportunity presents.

CINCINNATI DIRECTORY

The Cincinnati Council of Social Agencies has made an interesting innovation in the Cincinnati Social Service Directory for 1914 which it has just issued. Immediately preceding the classified descriptions of the social agencies of the city, it has published a list of 59 organizations which have received the endorsement of the council. Following this list are printed the requirements for endorsement. The directory thus acts not only as an encyclopedia of the city's social agencies, but also as a means for bringing about better standards in social work.

RECENT PAMPHLETS

Everyman's Son. By Prof. Herman Schneider. Vocational Guidance Propaganda of the Consumers' League of Connecticut, Hartford. Price 20 cents.

Sources of Information on Recreation by Lee F. Hanmer and Howard R. Knight. Department of Recreation, Russell Sage Foundation, 130 East 22d Street. Price 10 cents.

Eugenics and Social Welfare, a bibliography of eugenics and related subjects compiled by the Bureau of Analysis and Investigation of the State Board of Charities, the Capitol, Albany, N. Y.

The Family and Marriage, an analytical reference syllabus, by George Elliott Howard, Professor of political science and sociology. Published by the University of Nebraska, Lincoln. Price 75 cents.

The Thirteenth Yearbook of the National Society for the Study of Education. Part 2 Plans for Organizing School Surveys with a Summary of Typical School Surveys. University of Chicago Press, Chicago, Ill. Price 75 cents.

A Guide and Index to Plays, Festivals and Masques, for use in schools, clubs and neighborhood centers. Compiled by Katharine Lord, Alice Minnie Herts Heniger and Howard Broadstreet for the Arts and Festivals Committee of the Association of Neighborhood Workers. Published by Harper & Brothers, New York city.

A List of Private and Semi-private Agencies Providing Summer Recreation or Instruction for Children of School Age within New York city, with introduction and summary. Prepared by Mabel Parker Huddleston, chairman, Committee on Education of the Association of Collegiate Alumnae. Price 10 cents of Mrs. J. H. Huddleston, 145 West 78th street, New York city.
